

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE AUTHOR.

## PREFACE TO THE SIXTH EDITION.

---

THE coincidence afforded by the exhaustion of a very large edition of this work, and the publication of a new revision of the United States Pharmacopœia, has afforded the author an opportunity of making many additions to the text, which he believes will make it fairly, if not fully, representative of the present state of therapeutics. The numerous pharmacopœial alterations in nomenclature and in the strength of official preparations, and also the many new titles which have been added, have necessitated a thorough revision of every page, particularly in order to make the second part correspond with the present standards, both of the United States Pharmacopœia and the British Pharmacopœia. Among the notable changes from the last edition are the following: Part I is entirely added, having been taken from the limited Students' Edition, thoroughly revised, and completed by adding a comparative table, giving the changes in the strength of preparations and relative dosage, in the present Pharmacopœia and the one which preceded it. Among the new therapeutic agents will be observed a consideration of the Roentgen-Ray and the Finsen Light, or Actinotherapy, Serumtherapy, Animal Extracts, Vibrotherapy, Hydrotherapy, etc., etc. Every part has been carefully revised, and, when possible, condensed, so that, notwithstanding the large addition of new material, the work has been really increased only by about one hundred pages altogether. The features of the work which have met with approval by readers, have been retained. In preparing the present edition, the author has kept in view, as heretofore, the needs of the medical student, as well as the physician, and he hopes that it will be found no less useful to those who consult it than the former editions which it supersedes. He will be very much gratified, if it will be deemed, at least in some measure, contributory to the progress of scientific medicine, and the establishment of rational therapeutics in this country.

J. V. S.

## PART I.

### GENERAL CONSIDERATIONS CONCERNING REMEDIES AND SYSTEMS OF THERAPEUTICS.

THERAPEUTICS, or the treatment of disease, makes frequent use of certain agents, which are known collectively as **remedies**. In point of fact, every preventive, reparative, or restorative means which is, or can be made, available for the relief of the sick is a **remedium**, or **remedial agent**, in a comprehensive sense of the term. It follows from this that remedies are of many kinds and of varying importance; indeed, they are almost as numerous and diverse as the causes of disease themselves. The principal **classes of remedies**, however, are comparatively few, and these may now be taken up systematically for consideration. A very important class is composed of remedial measures which seek to prevent disease, or, if it be already present, to shield the patient from the effects of unsanitary influences and thus place him under more favorable conditions for recovery than those under which the sickness originated; such are known as **prophylactic**, or **hygienic**, **remedies**. They presuppose, on the part of the medical attendant, an acquaintance with the physiological laws of the human body, and of the effects of food, clothing, climate, occupation, habits, etc., upon its functions, and the skill to apply this knowledge to the individual case. Among prominent hygienic remedies are dieting, bathing, ventilation, change of residence or of occupation, due regulation of habits, and especially regulated exercises, including gymnastics and massage. These are **sanitary**, **prophylactic**, or **hygienic**, **agents** when employed to preserve health and prevent disease; they become **sanatory**, or **curative**, **measures** when utilized in conjunction with appropriate medical remedies, as they constantly are, in the treatment of the sick. In the latter case they are also included under the comprehensive term **regimen**. It is now considered of as great, or even greater, importance to regulate properly the ventilation and temperature of the sick-room, to direct the bathing and food of the patient, and to decide whether he shall have rest or exercise, in most instances, than it is to frame a prescription nicely adjusted to the state of the case, although the latter is by no means to be slighted. Light, heat and cold, magnetism, and electricity are also capable of powerfully influencing the bodily functions, and, when wisely directed, may produce positive sanatory, or curative, effects. These **imponderable remedies**, or **forces**, as they have been called, are receiving much attention at the present day. As a result of the profound and painstaking investigations of many scientists and the careful observations of expert clinicians, the medical practitioner is now, indeed, for the first time, in a position to satisfactorily apply these remedial agents and to record the results of his studies in exact and scientific terms. **Mechanical remedies** include various surgical measures, such as acupressure, acupuncture, aspiration, bandaging, blood-letting, etc.; also the various forms of gymnastics known under the name of Swedish movements, the move-

ment cure, passive motion, etc. Last, but by no means the least in among remedies which, at least, are partly mechanical, is **massage**, attention has been already called as a hygienic agent, and to w consideration will be given hereafter in a special section, under **Ki apy**. Finally, there is a class of remedies which are considered of portance, and are so commonly used in the treatment of every con disease, that they are popularly termed "medicines"; these prop **drugs**, or **pharmaceutical remedies**. Formerly they were divid chemical agents and drugs proper, or Galenicals; but this distinc lost its force, since it has been shown that herbs, or "simples," c medicinal effects to "active principles," which are chemical in thei and which may be isolated and administered separately in order to the characteristic physiological and therapeutical effects of the dr

**Therapeutics** (*Θεραπεία*, treatment) considers the application dial agents to the treatment of disease, and the proper care of Other medical studies are only the foundation, therapeutics is th structure. As Fothergill has well said, "the ultimate aim of all me search is the treatment and prevention of disease." For convenie divided into surgical and medical therapeutics. Many systems of t ties have been formulated in times before the present application scientific methods to the study of the action of drugs and the investij pathological and clinical problems, and so-called "schools of medic tice" have been founded thereon, which have now become obsolete an forgotten. Having at length a sound foundation of accumulated kn and experience upon which to rest our practice, we are, at the pres prepared to base a system of **rational therapeutics** upon the demo and established effects of drugs in healthy and diseased conditio upon our knowledge of the nature and course of morbid processe human body. The only scientific system possible is one which (1) ei to remove morbid causes, or render them inoperative; (2) seeks t the ravages of disease, or to correct abnormal physiological action; ( to ameliorate the condition of the patient by relieving prominent sy such as pain, fever, sleeplessness, loss of appetite, etc., and (4) pla under conditions most favorable to recovery. **Symptomatic tr** which seeks merely to remove symptoms, without investigating their is obviously unsatisfactory and unscientific, but occasionally is res in an emergency when such symptoms are urgent. **Empirical tr** was the only kind of treatment possible before the mode of action effects of medicines were understood; it merely directed that certai cines should be taken for the reason that in apparently similar co their administration had been followed by good results. Owing fallacious character of the teachings of experience, as pointed out l pocrates in his celebrated aphorism, it results that pure, blind emy abounds in fallacy, and, as a rule of practice, is the poorest system c ment to follow. Where the knowledge obtained at the bedside, h is aided by sufficient acquaintance with the physiological action of already referred to, we have modern "Rational Medicine," which af the patient all the assistance which science and experience combi provide toward hastening and completing his recovery. It is an enli empiricism, which is not based on fixed law, but is progressively im in proportion with advances in other departments of science. Any

of medicine assuming to rest upon a foundation less broad than this, or on a system which is fixed and stationary, by its own terms separates itself from scientific medicine, and makes its followers a medical sect, or "school." In the course of centuries many such schools have been brought to light, and, after a brief period, have been outgrown and forgotten. Such a fate is the natural destiny of any restricted system, based upon dogma. The system of medicine which is studied as a department of natural science, and which is unrestricted by any hypothesis, or supposed law of cure, in its application of remedies to the treatment of disease, will undoubtedly vary somewhat in its results, according to the individual skill of its practitioners, the scientific attainments of the time, and the peculiarities of patients; but when statistics are correctly compiled from sufficiently large groups of cases it must be more successful than any restricted system which has been or can ever be brought in competition with it. In order to avoid misapprehension, it may be proper at the outset to explain that in the present treatise this system of scientific, or so-called "regular," medicine, will be followed. Scientific, or regular, medicine is quite distinct from any school or sect in medicine, and is equally separate from so-called "allopathy" or "allopathic practice." As every educated physician knows, there is a radical difference between "an allopathic doctor" and "a regular practitioner," inasmuch as one is sectarian and the other non-sectarian. In point of fact, at the present day there are no allopathic physicians and, of course, no "allopathic" examining boards, and all followers of scientific medicine should resent the application of such a sectarian title to designate the regular practice of medicine.

At the same time that we discard restrictions as to therapeutics and claim the right to employ whatever remedial means experiment and observation lead us to believe will benefit our patients, it should not be forgotten that the knowledge at our command is derived from various sources, and if we are willing to acknowledge the indebtedness of modern medicine even to native tribes for many useful remedies, we should not be above admitting the fact that useful lessons may also be occasionally learned from followers of exclusive schools of medicine, or so-called irregular physicians. "Every judicious physician," said Dunglison, "must be an eclectic," in the sense that he selects from every source the best means of controlling disease. In the ordinary restricted sense, an eclectic is one who confines himself to vegetable drugs, or, in other words, is a botanic physician, and in this sense it has been appropriated by a sect of physicians who were formerly known as Thomsonians, from the name of the founder. In the ranks of regular medicine, also, there are specialists in therapeutics, some confining their practice to massage or gymnastics, others to electricity, others again to bathing, or hydropathy. The qualified physician or general practitioner appreciates the value of all the various agencies that are used in treating the sick, and assigns to each its proper place in his therapeutics, directing his treatment not against disease, but to the improvement of the health of patients who are, for the time, in a diseased, or abnormal, condition.

A complete cyclopædia of therapeutic agents should include in its consideration every remedial measure which the best educated and most skillful physicians employ in treating the sick, giving to each its proper place and value. As there are separate treatises upon hygiene, dietetics, massage, balneology, and electrotherapeutics, and the importance of these subjects warrants their separate treatment, modern text-books of therapeutics are

usually restricted to treatment solely by pharmaceutical remedies, and Nevertheless, the author has given due consideration to the other remedial agencies, such as electrotherapeutics, hydrotherapeutics, therapy, metallotherapy, balneology, climatology, and hypnotism which, in the third part of this work, will be found under their titles.

### PHARMACOLOGY AND THE PHARMACOPŒIA.

**Pharmacology** (*φάρμακον*, a medicament; and *λογος*, a treatise), broadly speaking, the science of drugs. One of its branches is **Pharmacognosy**, or the study of their natural history, their physical and chemical characters, tests for purity, etc. Another is **Pharmacy**, which covers the various methods of compounding and dispensing drugs in their combinations for the treatment of disease. The place where medicines are dispensed is also called a pharmacy. Some authors have restricted the term "pharmacology" to the results obtained from the study of the physiological action of drugs, but this is more appropriately named **Pharmacodynamics**.

The **Materia Medica**, or collection of pharmacological remedies, divided into crude drugs and preparations. The latter may be made according to established formulæ, both official and non-official, or they may be extemporaneously compounded, and dispensed, according to the directions furnished by a physician. The latter are known as "magistral" preparations; they are compounded according to the formula contained in the **prescription**, of which more will be said presently. Official preparations are those recognized by the Pharmacopœia. The formulæ and directions for compounding "official" preparations are established by the authority of the pharmacopœia. Since this authority does not extend beyond the geographical limits of the country to which it belongs, it follows that England, France, Germany, Sweden, and other countries, as well as the United States, have pharmacopœias of their own. Remedies belonging to each are distinguished by initials indicating their source; thus U. S. means United States Pharmacopœia; B. P., British Pharmacopœia; F. P., French Pharmacopœia, or Codex Medicamentarius; G. P., German Pharmacopœia; S. P., Swedish Pharmacopœia. In the usual and modern acceptation of the term, a **pharmacopœia** is a medical book, issued by authority, containing a list of recognized drugs, with descriptions and physical characters, tests for purity and medicinal activity, and formulæ for their preparations. The necessity of having some standard to define the characters, establish the purity, and regulate the strength of medicinal preparations is universally conceded. Those countries which do not possess a pharmacopœia of their own usually adopt the French Codex, or the British, or the United States Pharmacopœia. Unfortunately, it may happen that preparations from different countries will have the same title, but differ considerably in strength. For example, the tincture of belladonna-leaves and especially the extract of aconite, which is a source of error in copying from English, French, or German sources, since some preparations from the United States Pharmacopœia are considerably stronger than the corresponding foreign preparations.

The **Pharmacopœia of the United States** is not issued directly by authority of the government, as in other countries, although it is adopted in the medical departments of the army, navy, and marine-hospital service, and it has been recognized as the final authority upon the purity and preparation of medicinal agents in recent Acts of Congress. It is compiled as a purely voluntary undertaking by the physicians and pharmacists, in accordance with the following arrangement: Every ten years representatives from medical societies and colleges, pharmaceutical societies and colleges, and delegates from the Army, Navy, and United States Marine-Hospital Service, meet in Washington, forming the National Convention for the Revision of the Pharmacopœia. After organization and the disposal of business, which may come before it, a standing committee on revision is appointed, which, having received instructions from the convention, proceeds to prepare and publish an edition of the United States Pharmacopœia. The first issue was in 1820, and the eighth revision was that of 1905. This went into effect September 1st of that year and has displaced the former editions. Important changes have been made in the strength of some preparations, and a number of new titles have been introduced. It is incumbent upon both physicians and pharmacists to follow the present Pharmacopœia in prescribing and dispensing drugs, especially in those States in which it has been adopted as the legal standard. Many new remedies had been brought to the notice of the profession since the previous revision, some of which have come extensively into use and possess decided merit, others are ephemeral and will soon sink into well-deserved neglect. Owing to the present degree of activity in therapeutics, it is impossible that the pharmacopœia should include all the medicinal agents used by physicians in the treatment of disease, especially those more recently introduced. Therefore, a considerable number of **unofficial drugs** are in use, some of which will eventually prove their right to be recognized and become official, while many others will never be able to make good their claim. Proprietary remedies, or preparations made by secret formulæ, are sold very largely to the public, and are sometimes prescribed by physicians, who appear to be unmindful of the fact that the Code of Ethics denounces this as a reprehensible practice. The prescribing of preparations of unknown composition is opposed to the best interests both of scientific medicine and of the public.

---

### MATERIA MEDICA.

The **Materia Medica** consists of official and non-official drugs and their preparations. It has several branches. Pharmacognosy investigates the physical characters of drugs in order to establish their identity. Medical botany establishes their place in the vegetable kingdom and their botanical grouping or relationship. Plant-chemistry determines the constituents of the drug and isolates the so-called active principles; it also teaches the chemical antidotes. In the United States Pharmacopœia all remedies are arranged under their Latin titles alphabetically, and, owing to its convenience, the same plan has been adopted in the present work. A large number of unofficial, or extra-pharmacopœial, drugs are also considered. It is possible to adopt also a natural method of classification of drugs or an

artificial arrangement into classes according to the physiological and therapeutical effects. A scheme of the latter kind appears at the conclusion of this section. The following list comprises most of the drugs in use, arranged according to their natural affinities and chemical characters:—

# INORGANIC MATERIA MEDICA.

## GROUP I.—Non-metals.

Hydrogen.	Chlorine (chlorinated lime or chloride of soda).
Oxygen (ozone, hydrogen dioxide).	Iodine (hydriodic acid, the iodides, etc.).
Sulphur (hydrogen sulphide).	Nitrogen (nitric acid, etc.).
Carbon (charcoal).	Phosphorus (phosphoric acid).
Bromine (hydrobromic acid).	

## GROUP II.—Metals (*a*) of the Alkalies and Alkaline Earths.

*Monad Metals*.—Potassium, Sodium, Lithium, Ammonium.

*Dyad Metals*.—Calcium, Strontium, Barium, Aluminum, Magnesium, Zinc, Cadmium, Silver, Mercury.

## (*b*) The Heavy Metals.

*Triad Metals*.—Thallium, Iridium, Gallium.

*Tetrad Metals*.—Lead, Tin.

*Pentad Metals*.—Phosphorus, Arsenic, Bismuth, Antimony.

*Hexad Metals*.—Chromium, Tungsten, Molybdenum.

*Heptad Metals*.—Manganese.

*Unclassified Metals*.—Iron, Nickel, Cobalt, Platinum, Gold.

# ORGANIC MATERIA MEDICA.

## GROUP I.—Carbon Compounds.

### (*a*) ALIPHATIC, OR FATTY SERIES.

Hydrocarbons.	Ether.	Ethyl carbamate.
Benzinum.	Ethereal oil.	Methylis salicylas.
Petrolatum.	Ethyl-chloride.	Chloroform.
Acetone.	Amyl nitrite.	Chloralformamidum.
Alcohol (ethylic, methylic, amylic).	Acetic ether.	Iodoform.
Aldehydes (ethylaldehyde, paraldehyde, and formaldehyde).	Glycerilis nitras.	Iodol.
	Ethyl-bromide and iodide.	Sulphonmethanum.
	Chloral-hydrate.	Hexamethylenamina
	Bromal-hydrate.	Sulphonethylmethan

### (*b*) AROMATIC SERIES.

Carbolic acid, or Phenol.	Salicylic acid.	Acetanilidum.
Creosotum.	Naphthalenum.	Acetphenetidinum.
Guaiacol.	Betanaphthol.	Benzol.
Resorcinol.	Chinolin.	Cresol.
Methylthioninæ hydrochloridum.	Kairin.	Tolnol.
Pyrocatechin.	Antipyrina (phenazonum).	Benzoic acid.
	Phenylis salicylas.	Pyridina.

## GROUP II.—Vegetable Materia Medica.

### SUBKINGDOM I.—PHANEROGAMÆ.

#### CLASS I.—EXOGENÆ.

#### DIVISION I.—ANGIOSPERMÆ.

#### SUBCLASS I.—THALAMIFLORÆ.

<i>Natural Order.</i>	<i>Name.</i>	<i>Synonym.</i>
Ranunculacææ.	Ranunculus,	Crow-foot, buttercup.
	Aconitum,	Monk's-hood.

<i>Natural Order.</i>	<i>Name.</i>	<i>Synonym.</i>
<b>Ranunculaceæ (continued).</b>	Staphisagria, Delphinium, Pulsatilla, Cimicifuga, Podophyllum, Hydrastis,	Stavesacre. Larkspur. Meadow-anemone. Black cohosh. May-apple. Golden seal.
<b>Magnoliaceæ.</b>	Magnolia, Illicium,	Magnolia. Star-anise.
<b>Menispermaceæ.</b>	Menispermum, Calumba, Pareira, Picrotoxinum,	Canadian moon-seed. Columbo. Pareira. Cocculus Indicus.
<b>Berberidaceæ.</b>	Caulophyllum,	Blue cohosh.
<b>Papaveraceæ.</b>	Papaver, Sanguinaria, Chelidonium,	Poppy. Bloodroot. Celandine.
<b>Cruciferae.</b>	Sinapis, Armoracia,	Mustard. Horse-radish.
<b>Violaceæ.</b>	Viola,	Pansy.
<b>Linææ.</b>	Linum,	Flaxseed.
<b>Geraniaceæ.</b>	Geranium,	Crane's-bill.
<b>Polygaleæ.</b>	Senega, Krameria,	Senega. Rhatany.
<b>Sapindaceæ.</b>	Guarana,	Paullinia.
<b>Erythroxylaceæ.</b>	Erythroxylon,	Coca.
<b>Malvaceæ</b>	Gossypium, Althæa,	Cotton. Marshmallow.
<b>Aurantiacææ.</b>	Aurantium, Limonæ,	Orange. Lemons.
<b>Sterculiaceæ.</b>	Theobroma, Sterculia,	Cacao. Kola.
<b>Ternstroemiaceæ.</b>	Camellia,	Tea.
<b>Guttiferae.</b>	Cambogia,	Gamboge.
<b>Canellaceæ.</b>	Canella,	Canella.
<b>Vitaceæ.</b>	Uvæ passæ, Vina,	Raisins. Wines.
<b>Zygophylleæ.</b>	Guaiacum,	Guaiac.
<b>Meliaceæ.</b>	Azedarach,	Pride of China.
<b>Rutaceæ.</b>	Ruta, Cusparia, Bergamum,	Rue. Angostura-bark. Bergamot.
	Diosmeæ.	Buchu.
	Xanthoxy'ceæ.	Xanthoxylum, Prickly ash.
	Pilocarpus,	Jaborandi.
<b>Simarubææ.</b>	Quassia,	Quassia.

## SUBCLASS II.—CALYCIFLORE.

<i>Natural Order.</i>	<i>Name.</i>	<i>Synonym.</i>
<b>Rhamnaceæ.</b>	Rhamnus purshiana, Rhamnus frangula,	Cascara sagrada. Buckthorn
<b>Celastrinææ.</b>	Euonymus,	Wahoo.
<b>Aquifoliaceæ.</b>	Prinos,	Alder.
<b>Anacardiææ.</b>	Mastiche, Rhus glabra, Rhus toxicodendron,	Mastic. Sumach. Poison-ivy.
<b>Burseraceæ.</b>	Myrrha,	Myrrh.
<b>Leguminosææ.</b>	Papilionaceæ. Glycyrrhiza, Scoparius, Tragacantha,	Licorice. Broom. Tragacanth.

<i>Natural Order.</i>	<i>Name.</i>	<i>Synonym.</i>
Leguminosæ. Papilionacæ (continued).	Santalum,	Saunders.
	Kino,	Kino.
	Balsamum Peruvianum,	Balsam of Peru.
	Balsamum Tolutanum,	Balsam of Tolu.
	Abrus,	Jequirity.
	Physostigma,	Calabar bean.
	Hæmatoxylon,	Logwood.
	Krameria,	Rhatany.
	Chrysarobinum,	Chrysarobin.
	Senna,	Senna.
	Cassia,	Purging cassia.
	Tamarindus,	Tamarind.
	Copaiba,	Copaiba.
	Piscidia,	Jamaica dogwood.
	Acacia,	Gum arabic.
Rosacæ.	Erythrophlæum,	Sassy-bark.
	Indigo,	Indigo.
	Cydonium,	Quince.
	Rubus,	Blackberry.
	Rubus idæus,	Raspberry.
	Rosa,	Rose.
	Cusso,	Kousso.
	Quillaja,	Soap-bark.
	Amygdala dulcis,	Sweet almond.
	Amygdala amara,	Bitter almond.
	Prunus,	Prune.
	Prunus Virginiana,	Wild cherry.
	Laurocerasus,	Cherry-laurel.
	Carica papaya,	Papaw.
	Caryophyllus,	• Cloves.
Papayacæ. Passifloræ. Myrtacæ.	Pimenta,	Allspice.
	Chekan,	Cheken.
	Myrtus,	Myrtle.
	Cajuput,	Cajeput.
	Eucalyptus,	Blue gum.
	Granatum,	Pomegranate.
	Colocynth,	Bitter cucumber.
	Elaterium,	Squirting cucumber.
	Pepo,	Pumpkin.
	[mæ. Brvonia,	Bryony.
	Conium.	Hemlock.
	Orthospermæ. Asafætida,	Asafetida.
	Galbanum,	Galbanum.
	Ammoniacum,	Ammoniac.
	Fœniculum,	Fennel.
Cucurbitacæ.	Anisum.	Anise.
	Anethum,	Dill.
	Carum.	Caraway.
	Sumbul.	Musk-root.
	Cœlospermæ. Coriandrum,	Coriander.
SUBCLASS III.—COROLLIFLORE.		
<i>Natural Order.</i>	<i>Name.</i>	<i>Synonym.</i>
Caprifoliacæ.	Sambucus,	Elder.
Cornacæ.	Cornus,	Dogwood.
Rubiaceæ.	Cinchonæ. Cinchona,	Cinchona bark.
	Coffeæ. Coffea.	Coffee.
	Gambir,	Gambir.
	Enuragoga. Ipecacuanha,	Ipecac.

<i>Natural Order.</i>	<i>Name.</i>	<i>Synonym.</i>
Valerianæ.	Valerian,	Valerian.
Caprifoliaceæ.	Viburnum,	Black haw.
Compositæ.	Pyrethrum,	Pellitory.
	Absinthium,	Wormwood.
	Tanacetum,	Tansy.
	Santonica,	Santonica.
	Anthemis,	Chamomile.
	Matricaria,	German chamomile.
	Eupatorium,	Thoroughwort.
	Taraxacum,	Dandelion.
	Lactuca,	Lettuce.
	Arnica,	Leopard's-bane.
	Calendula,	Marigold.
	Grindelia,	Grindelia.
	Inula,	E'ecampane.
	Lappa,	Burdock.
Lobeliaceæ.	Lobelia,	Indian tobacco.
Ericaceæ.	Uva ursi,	Bearberry.
	Chimaphila,	Pipsissewa.
	Gaultheria,	Wintergreen.
Sapotaceæ.	Gutta-percha,	Gutta-percha.
Styracaceæ.	Benzoin,	Benzoin.
Oleaceæ.	Olivæ oleum,	Olive-oil.
	Manna,	Manna.
Loganiaceæ.	Nux vomica,	Nux vomica.
	Ignatia,	Bean of St. Ignatius
	Gelsemium,	Yellow jasmine.
	Spigelia,	Pink root.
Apocynaceæ.	Apocynum,	Canadian hemp.
	Aspidosperma,	Quebracho.
	Strophanthus,	Strophanthus.
Asclepiadææ.	Asclepias,	Pleurisy-root.
	Hemidesmus,	Indian sarsaparilla.
	Condurango,	Condurango.
Gentianææ.	Gentian,	Yellow gentian.
	Chiretta,	Chirata.
Convolvulaceæ.	Scammony,	Scammony.
	Jalap,	Jalap.
Chenopodiaceæ.	Chenopodium,	American worm-seed.
Solanaceæ.	Scopola,	Scopola.
	Capsicum,	Red pepper.
	Belladonna,	Deadly-nightshade.
	Hyoscyamus,	Henbane.
	Stramonium,	Jamestown weed.
	Tobacco,	Tobacco.
Scrophulariaceæ.	Digitalis,	Fox-glove.
	Leptandra,	Culver's physic.
Labiatæ.	Rosmarinus,	Rosemary.
	Lavandula,	Lavender.
	Mentha piperita,	Peppermint.
	Mentha viridis,	Spearmint.
	Thymus,	Thyme.
	Hedeoma,	Pennyroyal.
	Marrubium,	Horehound.
	Melissa,	Balm.
	Origanum,	Wild marjoram.
	Salvia,	Sage.
	Scutellaria,	Skull-cap.
Pedaliaceæ.	Sesami oleum,	Benne oil.

## SUBCLASS IV.—APETALÆ.

<i>Natural Order.</i>	<i>Name.</i>	<i>Synonym.</i>
Polygonaceæ.	Rheum,	Rhubarb.
	Rumex,	Yellow dock.
Phytolaccaceæ.	Phytolacca,	Poke.
Myristicaceæ.	Myristica,	Nutmeg.
	Macis,	Mace.
Laurinææ.	Cinnamomum,	Cinnamon.
	Camphora,	Camphor.
	Sassafras,	Sassafras.
	Coto,	Coto.
Aristolochiaceæ.	Serpentaria,	Snake-root.
	Asarum,	Canada snake-root.
Santalaceæ.	Santali oleum,	Sandal-wood oil.
Thymelacææ.	Mezereum,	Mezereum.
Euphorbiaceæ.	Elastica,	India rubber.
	Cascarilla,	Sweet wood.
	Stillingia,	Queen's root.
	Tigllii oleum,	Croton oil.
	Ricinus (oleum),	Castor-oil.
	Kamala,	Rottlera.
Piperaceæ.	Piper,	Pepper.
	Cubeba,	Cubebs.
	Matico,	Matico.
Salicaceæ.	Salix,	Willow.
Juglandaceæ.	Juglans,	Butternut.
Hamamelaceæ.	Hamamelis,	Witch-hazel.
	Styrax,	Storax.
Cupulifera.	Quercus,	Oak.
	Castanea,	Chestnut.
Urticaceæ.	Ulmææ.	Elm.
	Moreæ.	Mulberry.
	Artocarpææ.	Fig.
	Cannabineæ.	Indian hemp.
	Cannabis Indica,	American hemp.
	Cannabis Americana,	
	Humulus,	Hops.

## DIVISION II.—GYMNOSPERMÆ.

<i>Natural Order.</i>	<i>Name.</i>	<i>Synonym.</i>
Coniferæ.	Pinus sylvestris,	Scotch fir.
	Abies excelsa,	Spruce fir.
	Abies balsamea	Balsam fir.
	Pinus palustris,	Turpentine pine.
	Thuja occidentalis,	Arbor vitæ.
	Juniperus communis,	Juniper oil.
	Juniperus oxycedrus,	Cade oil.
	Juniperus sabina,	Savin.
	Serenoa serrulata,	Saw-palmetto.

## CLASS II.—ENDOGENS.

<i>Natural Order.</i>	<i>Name.</i>	<i>Synonym.</i>
Smilacææ.	Sarsaparilla.	Sarsaparilla,
Liliacææ.	Allium,	Garlic.
	Scilla,	Squill.
	Aloe,	Aloes.
	Veratrum viride,	Green hellebore.
	Colchicum,	Meadow-saffron.
Melanthaceæ.	Sabadilla,	Cevadilla.
Orchidææ.	Vanilla,	Vanilla.
	Cypripedium,	Ladies'-slipper.
Scitamineæ.	Zingiber,	Ginger.

<i>Natural Order.</i>	<i>Name.</i>	<i>Synonym.</i>
Scitamineæ ( <i>continued</i> ).	Cardamomum,	Cardamom.
Iridæ.	Iris,	Blue flag.
	Crocus,	Saffron.
Palmaceæ.	Areca,	Betel-nut.
Aroidæ.	Calamus,	Sweet flag.
Gramineæ.	Farina tritici,	Wheat-flour.
	Avenæ farina,	Oatmeal.
	Amylum,	Starch.
	Triticum,	Couch-grass.
	Hordeum,	Barley.
	Maltum,	Barley-malt.

## SUBKINGDOM II.—CRYPTOGAMÆ.

<i>Natural Order.</i>	<i>Name.</i>	<i>Synonym.</i>
Filices.	Aspidium,	Male fern.
Lichenes.	Cetraria,	Iceland moss.
	Litmus,	Litmus.
Fungi.	Ergota,	Ergot of rye.
	Ustilago,	Corn-smut.
Algæ.	Chondrus,	Irish moss.

GROUP III.—*Animal Kingdom.*

<i>Class.</i>	<i>Order.</i>	<i>Name.</i>	<i>Synonym.</i>
Mammalia.	Rodentia.	Castoreum,	Castor.
	Ruminantia.	Moschus,	Musk.
		Serum antidiphtheriticum,	Diphtheria antitoxin.
		Glandulæ suprarenales	
		siccæ,	Dried suprarenal glands.
		Glandulæ thyroideæ siccæ,	Dried thyroid glands.
		Sevum.	Suet (mutton-suet).
		Adeps lanæ,	Wool-fat (purified).
		Gelatinum,	Gelatin.
		Carbo animalis,	Bone-charcoal.
		Fel bovis,	Ox-gall.
	Pachydermata.	Adeps,	Lard.
		Pepsinum,	Pepsin.
		Pancreatinum,	Pancreatin.
Aves,	Cetacea.	Spermaceti,	Spermaceti.
	Gallinæ.	Ovum,	Egg (of domestic fowl).
	Sturiones.	Ichthyocola,	Isinglass.
Pisces,	Teleostei		
	(gadidæ).	Morrhua oleum,	Codliver-oil.
	Hymenoptera.	Mel,	Honey.
		Cera,	Wax.
Insecta,	Hemiptera.	Coccus,	Cochineal.
	Coleoptera.	Cantharis,	Spanish fly.
Helminthes,	Annelida.	Sanguisuga, or hirudo.	Leech.

In the above comprehensive scheme, which is essentially that of Lauder Bruton's "Pharmacology," remedies are arranged with reference to their natural affinities, and in this classification relationships are manifested which ordinarily might be unnoticed by the student. It will be observed that drugs are derived from various sources, and vary greatly in their properties, physical and chemical. They all agree in one attribute, however, which is of influencing bodily functions in such a manner as to

make them useful in the treatment of diseased conditions. The nature of these effects and the manner of their manifestations it will be the purpose of the following pages to show, especially in Part II, where drugs are discussed individually and in detail.

### SCIENTIFIC SYNONYMS OF NEW REMEDIES.<sup>1</sup>

Most of the remedies of recent introduction bear names which give little or no clue either to their chemical composition or therapeutical properties. In preparing the following list of synonyms an effort has been made to give the correct chemical designation of the drug named, as well as the brand, or trade, name adopted by the manufacturers, and it is hoped that the list will prove useful to those who have calls for such remedies under their chemical titles.

<i>Scientific Name.</i>	<i>Trade Name.</i>	<i>Scientific Name.</i>	<i>Trade Name.</i>
Acetamidosalol .....	Salophen	Bismuth methylene digallate .....	Bismal
Acetphenetidine .....	Phenacetin	Bismuth subgallate .....	Dermatol
Acetphenone .....	Hypnone	Bismuth chrysophanate .....	Dermol
Acetylsalicylic acid .....	Aspirin	Bismuth cinnamylate .....	Hetoform
Acetylsalicylic acid .....	Acetysal	Bismuth bilactomonotannate ..	Lactanine
Acetylsalicylic acid .....	Xaxa	Bismuth pyrogallol .....	Helcosol
Acetylannin .....	Tannigen	Bismuth phosphate .....	Bisol
Acetylsalol .....	Spiroform or Vesipyrin	Brominized oil .....	Bromipin
Albumin iodoform .....	Iodoformogen	Bornyl valerate .....	Hysterol
Aluminum carbonate .....	Alchol	Butipyrine .....	Trigemine
Aluminum naphtholsulphonate ..	Alumnol	Codeine brommethyleate .....	Eucodeine
Amidopyrine .....	Pyramidon	Calcium betanaphtholsulphonate ..	Asaprol
Amylene hydrochloride .....	Stovaine	Copper nucleinate .....	Cuprol
Ammonium ichthyolsulphonate ..	Ichthyol, Thiolin	Casein sodium .....	Nutrose
Ammonium ichthyolsulphonate ..	Ichthosan	Chloral ethylcarbonate .....	Uralium
Ammonium ichthyolsulphonate ..	Ichthosol	Chloralformamide .....	Chloralamide
Amylum formaldehyde .....	Amyloform	Cotarnine hydrochloride .....	Stypticin
Antipyrine acetylsalicylate .....	Acopyrin	Cotarnin phthallate .....	Styptol
Anhydromethylene sodium citrate ..	Citarin	Creosote carbonate .....	Creosotal
Amylene chloral .....	Dormiol	Creosote carbonate .....	Ciba
Antipyrine, caffeine citrate .....	Migrainin	Creosote salicylate .....	Salocreol
Antipyrine-ferric chloride .....	Ferripyrin	Diacetyl morphine .....	Heroin
Antipyrine-ferric chloride .....	Ferropyrin	Didymium salicylate .....	Dymal
Apomorphinbrommethyleate ..	Euporphin	Diethylbarbituric acid .....	Veronal
Argentum (See Silver.)		Diethylmalonylurea .....	Veronal
Atropin methylnitrate .....	Eumydrin	Diamidophenol hydrochloride .....	Amidol
Benzoylacetyl peroxide .....	Acetozone	Diiodomethyl salicylate .....	Sanofom
Benzosulphinide .....	Saccharin	Dioxybenzol-hexa-	
Benzoyl guaiacol .....	Benzozol	methylenamine .....	Hetralin
Benzylmorphine hydrochloride ..	Peronine	Ellagic acid .....	Gallogen
Beta-eucaine mandelate .....	Euphthalmine	Ethyl carbamate .....	Urethane
Bismuth albuminate .....	Bismuthose	Ethylene periodide .....	Diiodoform
Bismuth cinchonidindiodide .....	Erythrol	Elixir chloræthanal alcoholate ..	Somnos
Bismuth dithiosalicylate .....	Thioform	Ethylmorphine hydrochloride .....	Dionin
Bismuth fluorbromphenyl .....	Fluotal	Ethyl salicylate .....	Sal-ethyl
Bismuth oxiodogallate .....	Airol	Ethylidene diethylether .....	Acetal
Bismuth betanaphtholate .....	Orphol	Ethyl chloride .....	Kelene
		Epinephrin hydrate .....	Adrin
		Ferralbumin .....	Ferratin
		Gelatin formaldehyde .....	Glutol

<sup>1</sup> From the Report of the Committee on New Remedies of the New York State Pharmaceutical Association for 1906. *American Druggist*, 1906, page 36.

<i>Scientific Name.</i>	<i>Trade Name.</i>	<i>Scientific Name.</i>	<i>Trade Name.</i>
Gelatose silver .....	Albargin	Nicotine salicylate .....	Eudermol
Guaiacol albuminate .....	Histosan	Piperazine quinate .....	Sidonol
Guaiacol cacodylate .....	Cacodyliacol	Paramidophenol hydrochloride ..	Rodinal
Guaiacol benzoate .....	Benzosol	Pyrocatechindimethyl-ether ....	Veratrol
Guaiacol carbonate .....	Duotal	Phenylurethane .....	Euphorin
Guaiacol cinnamate .....	Styracol	Phenetidine citrate .....	Citrophen
Guaiacol salicylate .....	Guaiacol-salol	Potassium-creosote	
Guaiacol valerate .....	Geosot	sulphonate .....	Sulphosote
Hexamethylenamine-anhydro-		Potassium-guaiacol sulphonate...	Thiocol
methylene citrate .....	Helmitol	Potassium-guaiacol	
Hexamethylenamine .....	Aminoform	sulphonate .....	Kasucolum
Hexamethylenamine .....	Urapurgol	Potassium ortho-oxy-	
Hexamethylenamine....		chinolinsulphonate .....	Chinosol
Ammonio-formaldehyde		Pyrogallol monoacetate .....	Eugallol
Hexamethylenamine .....	Cystamine	Pyrogallol triacetate .....	Lenigallol
Hexamethylenamine .....	Cystogen	Resorein monoacetate .....	Euresol
Hexamethylenamine .....	Formin	Quinine guaiacol bisulphonate...	Guaiquin
Hexamethylenamine .....	Uritone	Quinine ethyl carbonate .....	Euquinine
Hexamethylenamine .....	Urotropine	Quinine ethyl carbonate.....	Aristochin
Hexamethylenamine-salicylate..		Quinic acid anhydride .....	Sidonol, new
Saliformin		Quinine-phenetidine ethyl	
Hexamethylenamine-ethylbromide..		carbonate .....	Chinaphenin
Bromalin or Bromoformin		Silver citrate .....	Itrol
Hexamethylenamine-tannin ....	Tannopin	Silver citrate .....	Antiseptic Cr��d��
Hexamethylenamine-quininate. Chinotropin		Silver, colloidal .....	Collargol
Hexamethylenamine-quininate Chiniformin		Silver ichthyolsulphonate ...	Ichthargan
Hydrargyrum colloidal .....	Hyrgol	Silver lactate .....	Actol
Iron nucleinate .....	Ferratogen	Silver proteinate .....	Protargol
Ichthyol albuminate .....	Ichthalbin	Silver proteinate .....	Novargan
Ichthyolformaldehyde .....	Ichthyoform	Silver protalbin .....	Largin
Iron paranucleinate .....	Triferrin	Sodium acid oleate .....	Eunatrol
Iodochloroxychinolin .....	Vioform	Sapocarboll .....	Lysol
Iodized oil .....	Iodipin	Sodium oxycyanocinnamate ..	Zymphene
Isobutylorthocresol-iodide ....	Europhene	Sodium lygosinate .....	Lygosine
Lactylparaphenetidin .....	Lactophenin	Sapocresol .....	Creoline
Lithium quinate .....	Urosine	Sodium perborate .....	Euzone
Lithium benzoate .....	Uristamine	Sodium pyrocatechin	
Limolin .....	Citarin	monoacetate .....	Guaiacetin
Menthol valerate .....	Validol	Sapoformal .....	Lysoform
Methylacetanilide .....	Exalgin	Succinic peroxide .....	Alphozone
Methylene bromtannin .....	Bromotan	Sulphonethylmethane .....	Trional
Methylene dicotoine .....	Fortoine	Sulphonmethane .....	Sulphonal
Methylene-ditannin .....	Tannoform	Tannin albuminate .....	Tannalbin
Methylmorphine .....	Codeine	Tetraiodopyrrol .....	Iodol
Methylthionine hydrochloride....		Theobrominae sodium acetate ...	Agurine
Methylene blue		Theobromine sodium	
Mercury, colloidal .....	Hyrgol	salicylate.....	Fibrolysin
Mercury nucleinate .....	Mercurol	Thyminic acid .....	Solurol
Mercuric ethylenediamine		Theobromine sodium salicylate..	Diuretin
sulphate .....	Sublamine	Thymol carbonate .....	Thymotal
Methylzanthin sodium		Thymol iodide .....	Aristol
acetate .....	Theocine-sodium acetate	Thymol iodide .....	Annidalin
Methylenhippuric acid .....	Hippol	Thymol iodide .....	Thymotol
Monochloral-antipyrine .....	Hypnal	Tribromphenolbismuth .....	Xeroform
Naphthalol .....	Betol	Urea salicylate .....	Ursal
Naphthol salicylate .....	Betol	Zinc phenolsulphonate..	
Naphthosolol .....	Betol	Zinc sulphocarbonate	

## PHARMACY.

**Pharmaceutical Nomenclature and Classification.**—In every science it is necessary to follow some system of naming the objects under consideration, and if this be done carefully it is a great assistance to its study and avoids much confusion. Common names, being used by persons who possess but slight knowledge of the subject, are likely to be frequently applied and are not sufficiently distinctive. For instance, nitre may mean sodium carbonate or sodium nitrate, as well as potassium nitrate, without the proper chemical title. Milk-weed designates any common plant which yields a milky juice, whereas the name *Asclepias tuberosa* always serves to designate a species of *asclepias*, without confusion or error. Scientific nomenclature is therefore not adopted with the object of making the study of a subject more difficult to the beginner, but really with the view of making its comprehension more easy after he has mastered the details of its technical nomenclature. It is absolutely necessary for the student of materia medica to have a knowledge of botanical and chemical terms. In the consideration of drugs in the present work, every official drug appears under the title of its Latin chemical or botanical name, with the letters U. S. P. or B. P. the common name or synonym is also given. In the case of plants the botanical name and natural order are usually stated, following the United States Pharmacopœia. The scientific, or botanical, title is given in Latin so as to avoid mistakes, as this is the name by which it is generally recognized all over the world, and by which it may easily be identified; whereas, the same common name may be applied to plants of different species having very different physiological actions and medicinal effects. In common language the English name of the remedy is to be used, but in prescriptions the Latin pharmacopœial name should always be employed. Further remarks upon prescription-writing will be found at the end of the section. It is to be understood that throughout these pages the U. S. P. after the name of a drug, preparation, or formula indicates that it is recognized by the United States Pharmacopœia, and is wherever this authority is acknowledged. B. P. similarly indicates that the remedy or preparation is official in the last edition (1898) of the British Pharmacopœia.

The nomenclature of the United States Pharmacopœia is based upon the following rules adopted by the Convention of 1890, through its Committee on Revision, which have also been followed in the more recent edition.

"In the choice of titles of official articles the principle governs that convenience, established custom, and consideration of safety against mistake through similarity or changes in names, should outweigh purely theoretical considerations or scientific preciseness. In the designation of chemical compounds (oxides, salts, etc.), put the basylous or metallic component first; viz.: sodium chloride, silver nitrate, lithium bromide, lead oxide, etc. Instead of writing chloride of sodium, nitrate of silver, bromide of lithium, oxide of lead, etc. In the case of the salts of iron and mercury this el

involves also the use of the respective terms in *ous* and *ic* (ferrous and ferric, mercurous and mercuric) which greatly help to distinguish salts heretofore frequently confounded. As a matter of precaution, however, the distinguishing adjectives, 'corrosive,' 'mild,' 'yellow,' 'red,' etc., have been left in the titles of the respective mercury compounds; for instance, 'Corrosive Mercuric Chloride,' 'Mild Mercurous Chloride,' etc. In the case of complex iron preparations such as the so-called scale salts (*Ferri et Ammonii Citras*, *Ferri et Ammonii Tartras*, etc.), which are not true chemical salts, yet all of which contain the iron in a ferric condition, the word iron was left unchanged, to avoid the impression that they are definite, double salts." These changes in nomenclature were retained in the Eighth Revision. In addition a few synthetic remedies were introduced, such as antipyrine, sulphonal, phenacetin, and formin, under their (condensed) chemical titles. Also a few organic remedies were made official.

### Pharmaceutical Classes of Remedies.

#### ACIDA—ACIDS.

Two degrees of relative concentration are usually recognized, and in one case (acetic acid) there are three. The dilute acids are all of uniform 10-per-cent. strength,—one-tenth acid and nine-tenths water,—except dilute nitrohydrochloric, which contains only 7 per cent., and dilute acetic, 6 per cent., while the aromatic sulphuric acid contains 20 per cent. of the official acid, and dilute hydrocyanic acid contains only 2 per cent. of absolute hydrocyanic acid. The official **Acids** are:—

#### 1. INORGANIC.

##### (a) *Liquid Acids*:—

*Acidum hydrobromicum dilutum.*  
*Acidum hydrochloricum.*  
*Acidum hydrochloricum dilutum.*  
*Acidum hydriodicum dilutum.*  
*Acidum hypophosphorosum.*  
*Acidum hypophosphorosum dilutum.*  
*Acidum nitricum.*  
*Acidum nitricum dilutum.*  
*Acidum nitrohydrochloricum.*

##### (a) *Liquid Acids (continued)*:—

*Acidum nitrohydrochloricum dilutum.*  
*Acidum phosphoricum.*  
*Acidum phosphoricum dilutum.*  
*Acidum sulphuricum.*  
*Acidum sulphuricum dilutum.*  
*Acidum sulphuricum aromaticum.*  
*Acidum sulphurosum.*

##### (b) *Solid Acid*:—

*Acidum boricum.*

#### 2. ORGANIC.

##### (a) *Liquid Acids*:—

*Acidum aceticum glaciale.*  
*Acidum aceticum.*  
*Acidum aceticum dilutum.*  
*Acidum hydrocyanicum dilutum.*  
*Acidum lacticum.*  
*Acidum oleicum.*

##### (b) *Solid Acids*:—

*Acidum benzoicum.*  
*Acidum camphoricum.*  
*Acidum citricum.*  
*Acidum gallicum.*  
*Acidum salicylicum.*  
*Acidum stearicum.*  
*Acidum tannicum.*  
*Acidum tartaricum.*  
*Acidum trichloroaceticum.*

The official **Alkaloids** are:—

Aconitina.	Morphine acetat.
Apomorphinæ hydrochloridum.	Morphinæ hydrochloridum.
Atropina.	Morphinæ sulphas.
Atropinæ sulphas.	Pelletierinæ tannas.
Caffeina.	Physostigminæ salicylas.
Caffeina citrata.	Physostigminæ sulphas.
Caffeina citrata effervescens.	Pilocarpinæ hydrochloridum.
Cinchoninæ sulphas.	Pilocarpinæ nitras.
Cocaina.	Quinina.
Cocainæ hydrochloridum.	Quinina bisulphas.
Codeina.	Quinina hydrobromidum.
Codeinæ phosphas.	Quinina hydrochloridum.
Codeinæ sulphas.	Quinina salicylas.
Colchicina.	Quinina sulphas.
Homatropinæ hydrobromidum.	Scopolaminæ hydrobromidum.
Hydrastina.	Sparteina sulphas.
Hydrastinæ hydrochloridum.	Strychnina.
Hyoscinæ hydrobromidum.	Strychninæ nitras.
Hyoscyaminæ hydrobromidum.	Strychninæ sulphas.
Hyoscyaminæ sulphas.	Veratrina.
Morphina.	

#### NEUTRAL PRINCIPLES.

Chrysarobinum.	Piperinum.
Elaterinum.	Salicinum.
Glycyrrhizinum ammoniatum.	Santoninum.

#### OILS.

##### 1. EXPRESSED OR FIXED OILS.

Oleum adipis.	Oleum olivæ.
Oleum amygdalæ expressum.	Oleum ricini.
Oleum gossypii seminis.	Oleum theobromatis.
Oleum lini.	Oleum tiglii.
Oleum morrhuzæ.	

##### 2. DISTILLED OR VOLATILE OILS.

Oleum amygdalæ amaræ.	Oleum hedeomæ.
Oleum anisi.	Oleum juniperi.
Oleum aurantii corticis.	Oleum lavandulæ florum.
Oleum betulæ volatile.	Oleum limonis.
Oleum cadini.	Oleum menthæ piperitæ.
Oleum cajuputi.	Oleum menthæ viridis.
Oleum cari.	Oleum myristicæ.
Oleum caryophylli.	Oleum picis liquidæ.
Oleum chenopodii.	Oleum pimentæ.
Oleum cinnamomi.	Oleum rosæ.
Oleum copaibæ.	Oleum rosmarini.
Oleum coriandri.	Oleum sabinæ.
Oleum cubebæ.	Oleum santali.
Oleum erigerontis.	Oleum sassafra.
Oleum eucalypti.	Oleum sinapis volatile.
Oleum fœniculi.	Oleum terebinthinæ.
Oleum gaultheriæ.	Oleum terebinthinæ rectificæ.
	Oleum thymi.

## PHARMACOPŒIAL PREPARATIONS.

The U. S. Pharmacopœia presents thirty-six classes of official preparations:—

<i>Latin.</i>		<i>English.</i>
1. Acetum.	(Gen. sing., <i>i</i> Nom. pl., <i>a</i> )	Vinegar.
2. Aqua.	( " " <i>æ</i> " " <i>æ</i> )	Water (aromatic).
3. Cataplasma.	( " " <i>atis</i> " " <i>ata</i> )	Poultice.
4. Ceratum.	( " " <i>i</i> " " <i>a</i> )	Cerate.
5. Charta.	( " " <i>æ</i> " " <i>æ</i> )	Paper.
6. Collodium.	( " " <i>i</i> " " <i>a</i> )	Collodion.
7. Confecto.	( " " <i>i</i> " " <i>a</i> )	Confection.
8. Decoctum.	( not declinable )	Decoction.
9. Elixir.	(Gen. sing., <i>i</i> Nom. pl., <i>a</i> )	Elixir (cordial).
10. Emplastrum.	( " " <i>i</i> " " <i>a</i> )	Plaster.
11. Emulsum.	( " " <i>i</i> " " <i>a</i> )	Emulsion.
12. Extractum.	( " " <i>i</i> " " <i>a</i> )	Extract.
13. Fluidextractum.	( " " <i>i</i> " " <i>a</i> )	Fluid Extract.
14. Glyceritum.	( " " <i>i</i> " " <i>a</i> )	Glycerite.
15. Infusum.	( " " <i>i</i> " " <i>a</i> )	Infusion.
16. Linimentum.	( " " <i>i</i> " " <i>a</i> )	Liniment.
17. Liquor.	( " " <i>oris</i> " " <i>ores</i> )	Solution.
18. Massa.	( " " <i>æ</i> " " <i>æ</i> )	Pill-mass.
19. Mel.	( " " <i>lis</i> " " <i>lita</i> )	Honey.
20. Mistura.	( " " <i>æ</i> " " <i>æ</i> )	Mixture.
21. Mucilago.	( " " <i>inis</i> " " <i>ines</i> )	Mucilage.
22. Oleatum.	( " " <i>i</i> " " <i>a</i> )	Oleate.
23. Oleoresina.	( " " <i>æ</i> " " <i>æ</i> )	Oleoresin.
24. Pilula.	( " " <i>æ</i> " " <i>æ</i> )	Pill.
25. Pulvis.	( " " <i>eris</i> " " <i>eres</i> )	Powder.
26. Resina.	( " " <i>æ</i> " " <i>æ</i> )	Resin.
27. Serum.	( " " <i>i</i> " " <i>a</i> )	Serum.
28. Spiritus.	( " " <i>us</i> " " <i>us</i> )	Spirit.
29. Suppositorium.	( " " <i>i</i> " " <i>a</i> )	Suppository.
30. Syrupus.	( " " <i>i</i> " " <i>i</i> )	Syrup.
31. Tinctura.	( " " <i>æ</i> " " <i>æ</i> )	Tincture.
32. Tinctura herbarum recentium.	( " " <i>æ</i> " " <i>æ</i> )	Tincture of fresh herba.
33. Trituratio.	( " " <i>onis</i> Gen. " <i>ones</i> )	Trituration.
34. Trochiscus.	( " " <i>i</i> " " <i>i</i> )	Troche (lozenge).
35. Unguentum.	( " " <i>i</i> " " <i>a</i> )	Ointment.
36. Vinum.	( " " <i>i</i> " " <i>a</i> )	Wine.

**Aceta, or Vinegars (2).**—Liquid preparations made with dilute acetic acid. Strength, 10 per cent.

Acetum opii.

Acetum scillæ.

**Aque, or Aromatic Waters (18).**—Watery solutions of volatile substances, formerly prepared by distillation, now commonly made by adding the volatile or essential oil to distilled water, with magnesia and filtering. They are generally used as flavoring agents, and the dose is indefinite, except ammonia, chlorine, and creosote waters. Aqua is potable water in its purest attainable form.

Aqua destillata.

Aqua ammoniæ.

Aqua ammoniæ fortior.

Aqua amygdalæ amaræ.

Aqua anisi.

Aqua aurantii florum.

Aqua aurantii florum fortior.

Aqua camphoræ.

Aqua chloroformi.

Aqua cinnamomi.

Aqua creosoti.

Aqua fœniculi.

Aqua hamamelidis.

Aqua hydrogenii dioxidi.

Aqua menthæ piperitæ.

Aqua menthæ viridis.

Aqua rosæ.

Aqua rosæ fortior.

**Cataplasmata, or Poultices (1).**—Moist, semi-solid mixtures of consistency for external application.

*Cataplasma kaolini.*

**Cerata, or Cerates (6).**—Fatty mixtures containing wax, so as to be firmer than ordinary ointments.

*Ceratum.*

*Ceratum cantharidis.*

*Ceratum resine.*

*Ceratum camphoræ.*

*Ceratum plumbi subacetatis.* *Ceratum resine eor*

**Chartæ, or Medicated Papers (1).**—Papers of definite size, with drugs.

*Charta sinapis.*

**Collodia, or Collodions (4).**—Liquid preparations of collodion

*Collodium.*

*Collodium flexile.*

*Collodium cantharidatum.*

*Collodium stypticum.*

**Confectiones, or Confections (2).**—Soft, solid preparations made into a paste with sugar.

*Confectio rosæ.*

*Confectio sennæ.*

**Decocta, or Decoctions.**—Liquid preparations of vegetable drugs obtained by boiling with water. A decoction is directed to be made by placing the drug in a suitable vessel, with a cover, and adding 1000 parts of cold water for each 50 of substance used, covering it and boiling for fifteen minutes. When cool, it is passed through the filter, adding enough cold water to bring up the product to 1000 parts. The strength of decoctions of energetic or powerful drugs should be as prescribed by the physician. In the U. S. Pharmacopœia there are official decoctions; the British Pharmacopœia has three: *Decoctum compositum*, *D. granati radiceis*, and *D. hamatoxyli*.

**Elixiria, or Elixirs (3).**—The popularity of this class of remedies is due to their comparatively pleasant taste and to the fact that they contain alcohol and sugar.

*Elixir adjuvans.*

*Elixir ferri, quinae et strychninae phosphatum.*

*Elixir aromaticum.*

**Emplastra, or Plasters (7).**—Solid substances rendered soft and adhesive by heat, so as to be spread upon leather or muslin, of any size or shape, for application to the surface of the body to which they are intended to adhere. One is an exception to the general rule that plasters are to be applied with heat: the *emplastrum ichthyocollæ*, or fish-plaster (court-plaster) (U. S. P., 1890), is rendered adhesive by means of

*Emplastrum adhæsivum.*

*Emplastrum hydrargyri.*

*Emplastrum plumbi.*

*Emplastrum belladonnæ.*

*Emplastrum opii.*

*Emplastrum saponis.*

*Emplastrum capsici.*

**Emulsa, or Emulsions (3).**—Thick liquid preparations containing insoluble substance (generally an oil or a resin) suspended in a menstruum, by the addition of a viscid material.

*Emulsum olei morrhuæ.* *Emulsum olei morrhuæ cum*

*Emulsum olei terebinthinæ.*

*Emulsum olei terebinthinæ.*

**Extracta, or Extracts (28).**—Preparations of a solid or semisolid consistency, containing the active principles or constituents of drugs, obtained usually by evaporation of alcoholic or watery solutions, the strength being from twice to four times that of the official agent from which they are made. They often contain glycerin, to keep them in a condition to readily make into pills. **Assayed extracts** contain a definite proportion of the active ingredient, determined by chemical analysis. Alcoholic extracts, aqueous extracts, acetic extracts, and ethereal extracts are made with the aid of dilute alcohol, water, acetic acid, or ether. Many so-called active principles, such as leptandrin, macrotin, hydrastin, etc., used by botanic physicians, are simply alcoholic extracts, or impure resins, precipitated from strong tinctures by the addition of water.

Extractum aloës.	Extractum euonymi.	Extractum opii.
Extractum belladonnæ foliorum.	Extractum gentianæ.	Extractum physostigmatis.
Extractum cannabis Indicæ.	Extractum glycyrrhizæ.	Extractum quassia.
Extractum cimicifugæ.	Extractum glycyrrhizæ purum.	Extractum rhamni purshianæ.
Extractum colchici cormi.	Extractum hæmatoxyli.	Extractum rhei.
Extractum co'ocynthidis.	Extractum hyoscyami.	Extractum scopolæ.
Extractum colocynthidis compositum.	Extractum krameria.	Extractum stramonii.
Extractum digitalis.	Extractum leptandræ.	Extractum sumbul.
Extractum ergotæ.	Extractum malti.	Extractum taraxaci.
	Extractum nucis vomicæ.	

**Fluidextracta, or Fluid Extracts (85).**—Liquid preparations representative of organic drugs, usually alcoholic, hydro-alcoholic, or acetic acid, and are equivalent to strong tinctures. The rule followed, with a few exceptions, is to have these preparations of definite strength, as related to the crude drug, so that one thousand cubic centimetres of the fluid extract represents the active principle of one thousand grammes of the drug. The dose, therefore, is the same, as the rule, in minims as that of the dry, powdered drug in grains.

Fluidextractum aconiti.	Fluidextractum eucalypti.
Fluidextractum apocyni.	Fluidextractum euonymi.
Fluidextractum aromaticum.	Fluidextractum eupatorii.
Fluidextractum aurantii amari.	Fluidextractum frangulæ.
Fluidextractum belladonnæ radiceis .	Fluidextractum gelsemii.
Fluidextractum berberidis.	Fluidextractum gentianæ.
Fluidextractum buchu.	Fluidextractum geranii.
Fluidextractum calami.	Fluidextractum glycyrrhizæ.
Fluidextractum calumbæ.	Fluidextractum granati.
Fluidextractum cannabis Indicæ.	Fluidextractum grindelia.
Fluidextractum capsici.	Fluidextractum guaranæ.
Fluidextractum chimaphilæ.	Fluidextractum hamamelidis foliorum.
Fluidextractum chiratæ.	Fluidextractum hydrastis.
Fluidextractum cimicifugæ.	Fluidextractum hyoscyami.
Fluidextractum cinchonæ.	Fluidextractum ipecacuanhæ.
Fluidextractum cocæ.	Fluidextractum krameria.
Fluidextractum colocichii seminis.	Fluidextractum lappæ.
Fluidextractum conii.	Fluidextractum leptandræ.
Fluidextractum convallariæ.	Fluidextractum lobelia.
Fluidextractum cubebæ.	Fluidextractum lupulini.
Fluidextractum cypripedii.	Fluidextractum matico.
Fluidextractum digitalis.	Fluidextractum mezerei.
Fluidextractum ergotæ.	Fluidextractum nucis vomicæ.
Fluidextractum eriodictyi.	Fluidextractum pareira.

Fluidextractum phytolacæ.	Fluidextractum scopulæ.
Fluidextractum pilocarpi.	Fluidextractum scutellariæ.
Fluidextractum podophylli.	Fluidextractum senegæ.
Fluidextractum pruni Virginianæ.	Fluidextractum sennæ.
Fluidextractum quassia.	Fluidextractum serpentariæ.
Fluidextractum quercus.	Fluidextractum spigeliæ.
Fluidextractum quillajæ.	Fluidextractum stavisagria.
Fluidextractum rhamni purshianæ.	Fluidextractum stillingia.
Fluidextractum rhamni purshianæ aromaticum.	Fluidextractum stramonii.
Fluidextractum rhei.	Fluidextractum sumbul.
Fluidextractum rhois glabræ.	Fluidextractum taraxaci.
Fluidextractum rosæ.	Fluidextractum tritici.
Fluidextractum rubi.	Fluidextractum uvæ ursi.
Fluidextractum sabinæ.	Fluidextractum valerianæ.
Fluidextractum sanguinariæ.	Fluidextractum veratri.
Fluidextractum sarsaparillæ.	Fluidextractum viburni opuli.
Fluidextractum sarsaparillæ compositum.	Fluidextractum viburni prunifo.
Fluidextractum scillæ.	Fluidextractum xanthoxyli.
	Fluidextractum zingiberis.

**Glycerita, Glycerites (5).**—In these preparations, the vehicle for cal substances is glycerin, a liquid obtained by the decomposition of vegetable or animal fats, or fixed oils, and containing not less than 95 per cent. pure glycerol, a triatomic alcohol.

Glyceritum.	Strychninæ phosphatum.
Glyceritum acidi tannici.	Glyceritum ferri, quiniæ et
Glyceritum amyli.	strychninæ phosphatum.

**Infusa, or Infusions (3).**—These are usually made by pouring water upon vegetable drugs and letting them stand for half an hour covered vessel in a warm place, and separating the infusion by filtering. When the strength is not otherwise directed by the prescription or by the prescription of a physician, they are to be made of full strength. The infusions of cinchona (U. S. P., 1890), and of Virginia are best made with cold water, by percolation. The officines are not made according to the decimal system.

Infusum digitalis (1½ per cent.).

Infusum pruni Virginianæ (4 per cent.).

Infusum sennæ compositum (6 per cent.).

**Linimenta, or Liniments (8).**—Preparations, oily or alcoholic, containing medicinal substances, and intended for external application to the surface of the body, with friction.

Linimentum ammoniæ.	Linimentum camphoræ.	Linimentum saponis
Linimentum belladonnæ.	Linimentum chloroformi.	Linimentum terebint
Linimentum calci.	Linimentum saponis.	

**Liquores, or Solutions (25).**—Liquid preparations of non-volatile generally chemicals, which are wholly soluble in the menstruum employed.

Liquor acidi arsenosi.	Liquor ferri chloridi.	Liquor magnesi citr.
Liquor ammonii acetatis.	Liquor ferri et ammonii acetatis.	Liquor plumbi subac
Liquor antisepticus.		Liquor plumbi subac
Liquor arseni et hydrargyri iodidi.	Liquor ferri subsulphatis.	dilutus.
Liquor calci.	Liquor ferri tersulphatis.	Liquor potassii hydr
Liquor chlori compositus.	Liquor formaldehydi.	Liquor potassii arser
Liquor cresolis compositus.	Liquor hydrargyri nitratis.	Liquor potassii citra
	Liquor iodi compositus.	Liquor sodii hydroxi

Liquor sodæ chlorinatæ.  
Liquor sodii arsenatis.

Liquor sodii phosphatis  
compositus.

Liquor zinci chloridi.

**Massæ, or Masses (2).**—These are soft, solid mixtures of proper consistency to be made into pills.

Massa ferri carbonatis.

Massa hydrargyri.

**Mellita, or Honeys (3).**—Liquid preparations consisting of honey, or honey as a basis.

Mel.

Mel depuratum.

Mel rosæ.

**Misturæ, or Mixtures (4).**—Preparations consisting of a liquid used as a vehicle, and containing an agent not soluble in the menstruum employed.

Mistura cretæ.

Mistura glycyrrhizæ com-  
posita.

Mistura rhei et sodæ.

Mistura ferri composita.

**Mucilagines, or Mucilages (4).**—These are rather dense, viscid preparations of gum, or mucilaginous substances, dissolved in water. They are used for suspending insoluble powders or emulsifying oily substances.

Mucilago acaciæ.

Mucilago sassafras medullæ.  
Mucilago tragacanthæ.

Mucilago ulmi.

**Oleata, or Oleates (5).**—The official oleates are made by dissolving medicinal bases in oleic acid, and are in the form of a soft solid or ointment. Some of the non-official oleates are in the form of dry powder. The official oleates are:—

Oleatum atropinæ.  
Oleatum cocainæ.

Oleatum hydrargyri.  
Oleatum quiniæ.

Oleatum veratrinæ.

**Oleoresinæ, or Oleoresins (6).**—These are liquid preparations obtained by dissolving oily and resinous matters out of vegetable drugs by means of acetone (except ginger, which is extracted with alcohol). Oleoresins differ from fluid extracts in composition and in strength, being the most concentrated liquid preparations of drugs that are produced. The yield of oleoresin naturally varies, according to the quality of the crude drug, this class of remedies not bearing a uniform relation (of gramme to cubic centimetre), as fluid extracts are required to do.

Oleoresina capsici.  
Oleoresina capsi.

Oleoresina cubebæ.  
Oleoresina lupulini.

Oleoresina piperis.  
Oleoresina zingiberis.

**Pilulæ, or Pills (14).**—Small spherical masses of medicinal substances intended to be swallowed whole; two of the official forms are coated with Tolu (pilulæ ferri iodidi and pilulæ phosphori); the rest are simply treated with dusting-powder. It is the rule among manufacturers also to supply a full line of pills coated with gelatine or with sugar, in order to preserve and render them more pleasant to swallow. Sometimes a coating of keratin is used where it is desired the pills should not be dissolved until reaching the intestinal tract.

Pilulæ aloës.

Pilulæ aloës et ferri.

Pilulæ aloës et mastiches.

Pilulæ aloës et myrrhæ.

Pilulæ asafœtidæ.

Pilulæ catharticæ compos-  
itæ.

Pilulæ catharticæ vegeta-	Pilulæ laxativæ compositæ.	Pilulæ podophylli,
bilæ.	Pilulæ opii.	donnæ, et capsicæ
Pilulæ ferri carbonatis.	Pilulæ phosphori.	Pilulæ rhei compo-
Pilulæ ferri iodidi.		

**Pulveres, or Powders (9).**—Drugs in a dry, finely-divided form, usually compounded or mixed.

Pulvis acetanilidi compos-	Pulvis glycyrrhizæ com-	Pulvis jalapæ com-
itus.	positus.	Pulvis morphinæ
Pulvis aromaticus.	Pulvis ipecacuanhæ et	itus.
Pulvis cretæ compositus.	opii.	Pulvis rhei compo-
Pulvis effervescens com-		
positus.		

**Resinæ, or Resins (4).**—Solid preparations of vegetable origin obtained by extracting with alcohol and precipitating with water, or stilling the volatile oil from an oleoresin.

Resina (from turpentine).	Resina jalapæ.	Resina scammonii.
	Resina podophylli.	

**Sera, or Serums,** are fluids separated from the coagulated blood of a horse, which has been immunized against certain forms of infection; one is official at present.

Serum antidiphtheriticum.

**Spiritus, or Spirits (20).**—Solutions of volatile or aromatic substances in which alcohol is used as the menstruum.

Spiritus ætheris.	Spiritus anisi.	Spiritus glycerylis
Spiritus ætheris compos-	Spiritus aurantii composi-	Spiritus juniperi.
itus.	tus.	Spiritus juniperi com-
Spiritus ætheris nitrosi.	Spiritus camphoræ.	positus.
Spiritus ammoniæ.	Spiritus chloroformi.	Spiritus lavandulæ.
Spiritus ammoniæ aromati-	Spiritus cinnamomi.	Spiritus menthæ pip-
cus.	Spiritus frumenti.	Spiritus menthæ viri-
Spiritus amygdalæ amara.	Spiritus gaultheriæ.	Spiritus vini gallici.

**Suppositoria, or Suppositories (1).**—Only one formula for suppositories is now official, but they are directed to be made extemporaneously by incorporating the medicinal substances with cacao-butter (oleum theobromi) and shaping them with a mold into small, conical masses, weighing grammes each, unless otherwise directed. They are intended to be introduced into the rectum and other cavities of the body, where they melt and the medicament to come into contact with an absorbing surface. Suppositories of soap and glycerin are largely used as laxatives to empty the bowel. Similar preparations of cacao-butter or gelatin, for the urethra, nose, are called buginaria, or bougies.

Suppositoria glycerini.

**Syrupi, or Syrups (29).**—These popular preparations are strong solutions of sugar in water, containing flavoring and medicinal substances. They are usually made with the aid of heat, for convenience; but,

heat would be injurious, they are directed to be made by stirring and filtering, or by percolation.

Syrupus.	Syrupus ferri, quiniæ, et	Syrupus rhei aromaticus.
Syrupus acaciæ.	strychiniæ phosphatum.	Syrupus rosæ.
Syrupus acidii citrici.	Syrupus hypophosphitum.	Syrupus rubi.
Syrupus acidii hydriodici.	Syrupus hypophosphitum	Syrupus sarsaparillæ com-
Syrupus amygdalæ.	compositus.	positus.
Syrupus aurantii.	Syrupus ipecacuanhæ.	Syrupus scillæ.
Syrupus aurantii florum.	Syrupus krameriæ.	Syrupus scillæ compositus.
Syrupus calcii lactophos-	Syrupus lactucarii.	Syrupus senegæ.
phatus.	Syrupus picis liquidæ.	Syrupus sennæ.
Syrupus calcis.	Syrupus pruni Virginianæ.	Syrupus tolutani.
Syrupus ferri idodidi.	Syrupus rhei.	Syrupus zingiberis.

**Tincturæ, or Tinctures (63).**—Liquid preparations of vegetable drugs, as the rule, differing from spirits in not containing volatile substances. To this, tincturæ iodi, lavandulæ compositæ, and moschi are exceptions.

Tinctura aconiti.	Tinctura cinnamomi.	Tinctura moschi.
Tinctura aloës.	Tinctura colchici seminis.	Tinctura myrrhæ.
Tinctura aloës et myrrhæ.	Tinctura digitalis.	Tinctura nucis vomicæ.
Tinctura arnicæ.	Tinctura ferri chloridi.	Tinctura opii.
Tinctura asafœtidæ.	Tinctura gallæ.	Tinctura opii camphorata.
Tinctura aurantii amari.	Tinctura gambir composita.	Tinctura opii deodorati.
Tinctura aurantii dulcis.	Tinctura gelsemii.	Tinctura physostigmatis.
Tinctura belladonnæ folio-	Tinctura gentianæ compos-	Tinctura pyrethri.
rum.	ita.	Tinctura quassia.
Tinctura benzoini.	Tinctura guaiaci.	Tinctura quillajæ.
Tinctura benzoini compos-	Tinctura guaiaci ammoni-	Tinctura rhei.
ita.	ata.	Tinctura rhei aromatica.
Tinctura calendulæ.	Tinctura hydrastis.	Tinctura sanguinaræ.
Tinctura calumbæ.	Tinctura hyoscyami.	Tinctura scillæ.
Tinctura cannabis Indicæ.	Tinctura iodi.	Tinctura serpentariæ.
Tinctura cantharidis.	Tinctura ipecacuanhæ et	Tinctura stramonii.
Tinctura capsici.	opii.	Tinctura strophanthi.
Tinctura cardamomi.	Tinctura kino.	Tinctura tolutana.
Tinctura cardamomi com-	Tinctura krameriæ.	Tinctura valerianæ.
posita.	Tinctura lactucarii.	Tinctura valerianæ ammo-
Tinctura cimicifugæ.	Tinctura lavandulæ com-	niata.
Tinctura cinchonæ.	posita.	Tinctura vanillæ.
Tinctura cinchonæ compos-	Tinctura limonis corticis.	Tinctura veratri.
ita.	Tinctura lobeliæ.	Tinctura zingiberis.

**Tincturæ Herbarum Recentium, or Tinctures of Fresh Herbs,** are directed by the Pharmacopœia to be made of 50 parts of the fresh herb, macerated in 100 parts of alcohol for two weeks, and then filtering the product. No special formulæ are given.

**Triturationes, or Triturations (1).**—This is a newly-recognized class of preparations, which represent one-tenth of the strength of the crude drug, to every 10 parts of which 90 of sugar of milk are added, and the mixture thoroughly incorporated by trituration. The only official representative is

Trituratio elaterini.

**Trochisi, or Troches (8).**—Small, flattened, disk-like, solid masses, usually called lozenges. The basis is generally gum and sugar, or fruit-

paste, making a mass which can be slowly dissolved in the mouth medicating the mucous membrane of the mouth and throat.

Trochisci acidi tannici.	Trochisci glycyrrhizæ et	Trochisci potassii
Trochisci ammonii chloridi.	opii.	Trochisci santonini
Trochisci cubebæ.	Trochisci kramerizæ.	Trochisci sodii bies
Trochisci gambir.		

**Unguenta, or Unguents (24).**—Soft, fatty preparations, modifying the temperature of the body, and suitable for inunction and the administration of remedies by external application and friction.

Unguentum.	Unguentum hydrargyri oxidi fl.
Unguentum acidi borici.	Unguentum hydrargyri oxidi ru
Unguentum acidi tannici.	Unguentum iodi.
Unguentum aquæ rosæ.	Unguentum iodoformi.
Unguentum belladonnæ.	Unguentum phenolis.
Unguentum chrysarobini.	Unguentum picis liquidæ.
Unguentum diachylon.	Unguentum potassii iodidi.
Unguentum gallæ.	Unguentum stramonii.
Unguentum hydrargyri.	Unguentum sulphuris.
Unguentum hydrargyri dilutum.	Unguentum veratrinæ.
Unguentum hydrargyri ammoniati.	Unguentum zinci oxidi.
Unguentum hydrargyri nitratis.	Unguentum zinci stearatis.

**Vina, or Wines (10).**—Alcoholic preparations in which strong wine is the menstruum generally employed.

Vinum album.	Vinum ergotæ.	Vinum ipecacuanhæ
Vinum antimonii.	Vinum ferri.	Vinum opii.
Vinum coçæ.	Vinum ferri citratis.	Vinum rubrum.
Vinum colchici seminis.		

#### IMPORTANT CHANGES IN THE EIGHTH REVISION OF THE PHARMACOPŒIA.

Upon the succeeding few pages will be found, arranged in a convenient form for reference, tables showing the comparative strength of the important pharmacopœial substances and preparations as given in the preceding and the present revision:—

COMPARATIVE TABLE SHOWING THE STRENGTH OF THE MORE IMPORTANT PHARMACOMETAL SUBSTANCES AND PREPARATIONS  
IN THE PRECEDING AND IN THE PRESENT PHARMACOPEIA.

TITLE	CHIEF CONSTITUENT	PHARM. 1890	PHARM. 8th REVISION.
Acidum Sulphuricum Aromaticum.	H <sub>2</sub> SO <sub>4</sub> , by weight.	About 18.5 per cent.	About 20.0 per cent.
Aconitum .....	Aconitine, by weight.	Standard not fixed.	At least 0.5 per cent.
Alcohol .....	Absolute Alcohol, by weight.	About 91.0 per cent.	About 92.3 per cent.
Alcohol Dilutum .....	Absolute Alcohol, by weight.	About 41.0 per cent.	About 41.5 per cent.
Belladonnæ Folia .....	Mydriatic alkaloids, by weight.	Standard not fixed.	At least 0.35 per cent.
Belladonnæ Radix .....	Mydriatic alkaloids, by weight.	Standard not fixed.	At least 0.5 per cent.
Caffeina Citrata Effervescens.	Citrated Caffeine, by weight.	2.0 Gm. in 100 Gm.	4.0 Gm. in 100 Gm.
Calx Chlorinata .....	Available Chlorine, by weight.	At least 35.0 per cent.	At least 30.0 per cent.
Cinchona .....	Alkaloids, by weight.	At least 2.5 per cent. Quinine	At least 4.0 per cent ether-sol- uble alkaloids.
Coca .....	Ether-soluble alkaloids, by weight	Standard not fixed.	At least 0.5 per cent.
Colchici Cormus .....	Colchicine, by weight.	Standard not fixed.	At least 0.35 per cent.
Colchici Semen .....	Colchicine, by weight.	Standard not fixed.	At least 0.55 per cent.
Conium .....	Coniine, by weight.	Standard not fixed.	At least 0.5 per cent.
Emplastrum Belladonnæ .....	Mydriatic alkaloids, by weight.	Standard not fixed.	Not less than 0.38 per cent., not more than 0.42 per cent.
Extractum Belladonnæ .....	Mydriatic alkaloids, by weight.	Standard not fixed.	1.4 per cent.
Extractum Colchici Cormi .....	Colchicine, by weight.	Standard not fixed.	1.4 per cent.
Extractum Hyoscyami .....	Mydriatic Alkaloids, by weight.	Standard not fixed.	0.3 per cent.
Extractum Nucis Vomice .....	Strychnine, by weight.	15.0 per cent. total alkaloids.	5.0 per cent.
Extractum Opii .....	Morphine (cryst.), by weight.	18.0 per cent.	20.0 per cent.
Extractum Physostigmatis .....	Ether-soluble alkaloids, by weight	Standard not fixed.	2.0 per cent.
Extractum Stramonii .....	Mydriatic Alkaloids, by weight.	Standard not fixed.	1.4 per cent.
Fluidextractum Aconiti .....	Aconitine, by weight.	Standard not fixed.	0.4 Gm. in 100 c.cm.
Fluidextractum Belladonnæ Radicis.	Mydriatic alkaloids, by weight.	Standard not fixed.	0.5 Gm. in 100 c.cm.
Fluidextractum Cinchonæ .....	Anhydrous e-s. alkaloids, by wt.	Standard not fixed.	4.0 Gm. in 100 c.cm.
Fluidextractum Cocæ .....	Ether-soluble alkaloids, by weight	Standard not fixed.	0.5 Gm. in 100 c.cm.
Fluidextractum Colechici Seminis.	Colchicine, by weight.	Standard not fixed.	0.5 Gm. in 100 c.cm.
Fluidextractum Conii .....	Coniine, by weight.	Standard not fixed.	0.45 Gm. in 100 c.cm.
Fluidextractum Guarani .....	Alkaloids, by weight.	Standard not fixed.	3.5 Gm. in 100 c.cm.
Fluidextractum Hydrastis .....	Hydrastine, by weight.	Standard not fixed.	2.0 Gm. in 100 c.cm.
Fluidextractum Hyoscyami .....	Mydriatic alkaloids, by weight.	Standard not fixed.	0.075 Gm. in 100 c.cm.
Fluidextractum Ipecacuanhæ .....	Alkaloids, by weight.	Standard not fixed.	1.75 Gm. in 100 c.cm.
Fluidextractum Nucis Vomice.	Strychnine, by weight.	1.5 Gm. t/1 alkaloids in 100 c.cm.	1.0 Gm. in 100 c.cm.

COMPARATIVE TABLE SHOWING THE STRENGTH OF THE MORE IMPORTANT PHARMACOPŒIAL SUBSTANCES AND PREPARATIONS  
IN THE PRECEDING AND IN THE PRESENT PHARMACOPŒIA (continued).

TITLE	CHIEF CONSTITUENT	PHARM. 1890	PHARM. 8th REVISION.
Fluidextractum Pilularum	Alkaloids, by weight.	Standard not fixed.	0.4 gm. in 100 ccm.
Fluidextractum Stramonii	Mydriatic alkaloids, by weight.	Standard not fixed.	0.35 gm. in 100 ccm.
Guarana	Alkaloids, by weight.	Standard not fixed.	At least 3.5 per cent.
Hydrastis	Hydrastine, by weight.	Standard not fixed.	At least 2.5 per cent.
Hyoscyamus	Mydriatic alkaloids, by weight.	Standard not fixed.	At least 0.08 per cent.
Ipecacuanha	Alkaloids, by weight.	Standard not fixed.	At least 2.0 per cent.
Jalap	Alcohol-soluble resin, by weight.	12 per cent.	At least 8.0 per cent.
Liquor Ferri Chloridi	Ether-soluble resin, by weight.	Not more than 1.2 per cent.	Not more than 1.5 per cent.
Liquor Ferri et Ammonii Acetatis	Anhydrous $\text{FeCl}_3$ , by weight.	37.8 per cent.	29.0 per cent.
Liquor Ferri Tersulphatis	Tincture of Ferric Chloride	2 ccm. in 100 ccm.	4 ccm. in 100 ccm.
Lithii Citras Effervescentes	$\text{Fe}_2(\text{SO}_4)_3$ , by weight.	28.7 per cent.	36.0 per cent.
Nux Vomica	Lithium Citrate, by weight.	About 17.0 per cent.	About 5.0 per cent.
Oleatum Hydrargyri	Strychnine, by weight.	Standard not fixed.	At least 1.25 per cent.
Oleum Amygdalæ Amaræ	Yellow Mercuric Oxide, by weight.	20.0 per cent.	25.0 per cent.
Oleum Cajuputi	Benzaldehyde, by weight.	Standard not fixed.	At least 85 per cent.
Oleum Caryophylli	Hydrocyanic Acid, by weight.	Standard not fixed.	2 to 4 per cent.
Oleum Cinnamonii	Cincol, by volume.	Standard not fixed.	At least .55 per cent.
Oleum Fœculis	Eugenol, by volume.	Standard not fixed.	At least 80 per cent.
Oleum Limonis	Cinnamic Aldehyde, by volume.	Standard not fixed.	At least 75 per cent.
Oleum Menthae Piperitæ	Cincol, by volume.	Standard not fixed.	At least 50 per cent.
Oleum Pimentæ	Citral, by weight.	Standard not fixed.	At least 4 per cent.
Oleum Rosmarini	Menthyl Acetate, by weight.	Standard not fixed.	At least 8 per cent.
Oleum Santali	Total Menthyl, by weight.	Standard not fixed.	At least 50 per cent.
Oleum Thymii	Eugenol, by volume.	Standard not fixed.	At least 65 per cent.
Opidi Pulvis	Bornyl Acetate, by weight.	Standard not fixed.	At least 5 per cent.
Opium Deodoratum	Total Bornol, by weight.	Standard not fixed.	At least 15 per cent.
Pancreatinum	Santalol, by weight.	Standard not fixed.	At least 90 per cent.
	Phenols, by volume.	Standard not fixed.	At least 20 per cent.
	Morphine (cryst.), by weight.	13 to 15 per cent.	12 to 12.5 per cent.
	Morphine (cryst.), by weight.	13 to 15 per cent.	12 to 12.5 per cent.

COMPARATIVE TABLE SHOWING THE STRENGTH OF THE MORE IMPORTANT PHARMACEUTICAL SUBSTANCES AND PREPARATIONS  
IN THE PRECEDING AND IN THE PRESENT PHARMACOPOEIA (continued).

TITLE	CHIEF CONSTITUENT	PHARM. 1890	PHARM. 8th REVISION.
Potassii Citras Effervescentes.....	Potassium Citrate, by weight.....	About 48.0 per cent.	About 20.0 per cent.
Spiritus Frumenti.....	Absolute Alcohol, by weight.....	44 to 50 per cent.	37 to 47.5 per cent.
Stramonium.....	Mydriatic alkaloids, by weight.....	Standard not fixed.	At least 0.35 per cent.
Suppositoria Glycerini.....	Glycerin, (half their former size)	6 Gm. each.	3 Gm. each.
Syrupus Ferri Iodidi.....	Ferrous Iodide, by weight.....	About 10 per cent.	About 5 per cent.
Tinctura Aconiti.....	Aconitine, by weight.....	Standard not fixed.	0.045 Gm. in 100 c.cm.
Tinctura Aurantii Dulcis.....	Aconite.....	1 Gm. in 2.85 c.cm.	1 Gm. in 10.0 c.cm.
Tinctura Belladonnæ Foliorum.....	Sweet Orange Peel.....	1 Gm. in 5.0 c.cm.	1 Gm. in 2.0 c.cm.
Tinctura Benzoini Composita.....	Mydriatic alkaloids, by weight.....	Standard not fixed.	0.035 Gm. in 100 c.cm.
Tinctura Calumbæ.....	Belladonna Leaves.....	1 Gm. in 6.67 c.cm.	1 Gm. in 10.0 c.cm.
Tinctura Cannabis Indicæ.....	Benzoin.....	1 Gm. in 8.33 c.cm.	1 Gm. in 10.0 c.cm.
Tinctura Cantharidis.....	Calumba.....	1 Gm. in 10.0 c.cm.	1 Gm. in 5.0 c.cm.
Tinctura Capsici.....	Indian Cannabis.....	1 Gm. in 6.67 c.cm.	1 Gm. in 10.0 c.cm.
Tinctura Cardamomi.....	Cantharides.....	1 Gm. in 20.0 c.cm.	1 Gm. in 10.0 c.cm.
Tinctura Cinnamomi.....	Capsicum.....	1 Gm. in 20.0 c.cm.	1 Gm. in 10.0 c.cm.
Tinctura Colechici Seminis.....	Cardamom.....	1 Gm. in 10.0 c.cm.	1 Gm. in 5.0 c.cm.
Tinctura Digitalis.....	Saigon Cinnamon.....	1 Gm. in 10.0 c.cm.	1 Gm. in 5.0 c.cm.
Tinctura Ferri Chloridi.....	Colechicum Seed.....	1 Gm. in 6.67 c.cm.	1 Gm. in 10.0 c.cm.
Tinctura Gambir Composita.....	Colchicine, by weight.....	Standard not fixed.	0.05 Gm. in 100 c.cm.
Tinctura Gelsemii.....	Digitalis.....	1 Gm. in 6.67 c.cm.	1 Gm. in 10.0 c.cm.
Tinctura Hydrastis.....	Anhydrous FeCl <sub>3</sub> , by weight.....	13.6 per cent., by weight.	13.28 per cent., by weight.
Tinctura Hyoscyami.....	Gambir.....	1 Gm. in 10.0 c.cm.	1 Gm. in 20.0 c.cm.
Tinctura Kino.....	Gelacium.....	1 Gm. in 6.67 c.cm.	1 Gm. in 10.0 c.cm.
Tinctura Lobelii.....	Hydrastine, by weight.....	Standard not fixed.	0.4 Gm. in 100 c.cm.
Tinctura Nucis Vomice.....	Mydriatic alkaloids, by weight.....	Standard not fixed.	0.007 Gm. in 100 c.cm.
Tinctura Opi.....	Hyoscyamus.....	1 Gm. in 6.67 c.cm.	1 Gm. in 10 c.cm.
Tinctura Opi Deodorati.....	Kino.....	1 Gm. in 10.0 c.cm.	1 Gm. in 20.0 c.cm.
Tinctura Physostigmatis.....	Lobelia.....	1 Gm. in 5.0 c.cm.	1 Gm. in 10.0 c.cm.
Tinctura Quassiae.....	Strychnine, by weight.....	0.3 Gm. of alkaloids in 100 c.cm.	0.1 Gm. strychnine in 100 c.cm.
	Morphine (cryst.), by weight.....	1.3 to 1.5 Gm. in 100 c.cm.	1.2 to 1.25 Gm. in 100 c.cm.
	Morphine (cryst.), by weight.....	1.3 to 1.5 Gm. in 100 c.cm.	1.2 to 1.25 Gm. in 100 c.cm.
	Physostigma.....	1 Gm. in 6.67 c.cm.	1 Gm. in 10.0 c.cm.
	Ether-soluble alkaloids, by weight.....	Standard not fixed.	0.014 Gm. in 100 c.cm.
	Quassia.....	1 Gm. in 10.0 c.cm.	1 Gm. in 5.0 c.cm.

COMPARATIVE TABLE SHOWING THE STRENGTH OF THE MORE IMPORTANT PHARMACEUTICAL SUBSTANCES AND PREPARATIONS  
IN THE PRECEDING AND IN THE PRESENT PHARMACOPOEIA (concluded).

TITLE	CHIEF CONSTITUENT	PHARM. 1890	PHARM. 8th REVISION.
Tinctura Rhei	Rhubarb	1 Gm. in 10.0 ccm.	1 Gm. in 5.0 ccm.
Tinctura Sanguinariae	Sanguinaria	1 Gm. in 6.67 ccm.	1 Gm. in 10.0 ccm.
Tinctura Scillae	Scilla	1 Gm. in 6.67 ccm.	1 Gm. in 10.0 ccm.
Tinctura Serpentariae	Serpentaria	1 Gm. in 10.0 ccm.	1 Gm. in 5.0 ccm.
Tinctura Stramonii	Stramonium	1 Gm. in 6.67 ccm.	1 Gm. in 10.0 ccm.
Tinctura Strophanthi	Mydriatic alkaloïds, by weight.	Standard not fixed.	0.03 Gm. in 10.0 ccm.
Tinctura Tolutana	Strophanthus	1 Gm. in 20.0 ccm.	1 Gm. in 10.0 ccm.
Tinctura Veratri	Balsam of Tolu	1 Gm. in 10.0 ccm.	1 Gm. in 5.0 ccm.
Trochisci Cubebe	Veratrum	1 Gm. in 2.5 ccm.	1 Gm. in 10.0 ccm.
Unguentum Chrysarobini	Oleoresin of Cubeb, by weight.	0.25 Gm. in each.	0.125 Gm. in each.
Unguentum Phenolis	Chrysarolin, by weight.	About 5.0 per cent.	About 6.0 per cent.
Unguentum Sulphuris	Phenol, by weight.	About 5.0 per cent.	About 3.0 per cent.
Vinum Album	Washed Sulphur, by weight.	About 30.0 per cent.	About 15.0 per cent.
Vinum Colchici Seminis	Absolute Alcohol, by weight.	10.0 to 14.0 per cent.	7.0 to 12.0 per cent.
	Fluidextract of Colchicum Seed.	1 Gm. Colchicum Seed in 6.67 ccm.	1 ccm. Fluidextract of Colchicum Seed in 10.0 ccm.
Vinum Ergotæ	Fluidextract of Ergot	1 Gm. Ergot in 6.67 ccm.	2 ccm. Fluidextract of Ergot in 10.0 ccm.
Vinum Rubrum	Absolute Alcohol, by weight	10.0 to 14.0 per cent.	7.0 to 12.0 per cent.

NOTE.—The five most important changes are: (1) The reduction in the morphine-strength of "Powdered Opium" from 13 to 15 per cent. to 12 to 12.5 per cent.; (2) the reduction in the strength of "Syrup of Ferrous Iodide" from 10 per cent. to 5 per cent.; (3) the increase in the strength of "Tincture of Strophanthus" from 5 to 10 per cent.; (4) the reduction in strength of "Tincture of Aconite" from 35 per cent. to 10 per cent.; (5) the reduction in strength of "Tincture of Veratrum Viride" (now "Tincture of Veratrum") from 40 per cent. to 10 per cent.

introduced for the alkaloidal drugs, and other drugs and preparations for which reliable processes can be formulated. The strengths of the tinctures have been amended so as to reduce them practically to two classes—10 per cent. for the more powerful preparations, and 20 per cent. for the others. Purity rubrics have been inserted which will tend to define the limits of innocuous foreign substances. Of obsolete drugs and preparations 151 have been omitted, and 117 new preparations have been added. Reliable new synthetics have been introduced and

## PHARMACEUTICAL PROCESSES, OR PHARMACY PROPER.

**Pharmacy** is that department of medical science which is devoted to the collection, identification, manipulation, compounding, and dispensing of drugs. It comprises the various articles and preparations composing the *Materia Medica*, *official* and *non-official*; guards against adulteration and substitution; analyzes the composition and determines the standard proportion of active constituents, besides providing eligible and efficient preparations and indicating the proper procedures in filling prescriptions *secundum artem*. A knowledge of at least the rudiments of pharmacy is absolutely necessary to the practicing physician. It is a great misfortune that so many students are permitted to graduate from our medical schools with such an imperfect acquaintance with practical pharmacy as they ordinarily possess. A very little carelessness or ignorance on the part of the prescriber may cause serious mistakes to be made.

[In practical pharmacy, a number of preparations known as favorite prescriptions or popular remedies, like Squibb's Cholera Mixture, Lafayette Mixture, etc., being in frequent demand, are usually kept on hand in the shops. Some of these, like Brown Mixture, Compound Licorice Lozenges, and Basham's Mixture, have been admitted to the pharmacopœia. Others are less often prescribed, but the pharmacist is expected to have a formula at hand so as to prepare the remedy extemporaneously. Such a collection is known as the "Extra Pharmacopœia," or simply as a Formulary. Some years ago the American Pharmaceutical Association appointed a committee to collect the formulæ for such *unofficial* preparations and to select the best of each class, so as to form a National Formulary. This was done, and the result of the committee's work was fully approved by the American Pharmaceutical Association. The work was issued for the purpose of obtaining uniformity in *unofficial* compounds, and to publish formulæ which represent some proprietary preparations. A "Physicians' Manual of the National Formulary" is published in Chicago, by C. S. Hallberg, at a trifling cost. Every physician will find it useful to have at hand for reference the United States Pharmacopœia, or a good Dispensatory, and also the National Formulary of the American Pharmaceutical Association.]

The principal operations of pharmacy are:—

1. Weighing and Measuring.
2. Determination of Specific Gravity and Temperature.
3. Operations Requiring the Use of Heat.
4. Operations Chiefly Mechanical.
5. Pharmaceutical Testing and Analysis.
6. Extemporaneous Preparations.

**1. Weighing and Measuring.**—Solids are usually weighed and liquids measured; the denser liquids, however, are often, for the sake of accuracy, dispensed by weight, and all liquids might be. Owing, however, to the variation in bulk of liquids, and the necessity of making corrections for specific gravity and temperature, this plan is not employed in prescribing, although parts by weight have been adopted in our pharmacopœia, which in the last edition has largely followed out the metric system. Scales, or balances, of various kinds and varying degrees of accuracy, are employed

in weighing, and care should be taken that scales used in compounding prescriptions are reliable and sufficiently sensitive for the purpose for which they are used.

Weight is the measure or expression of the attraction of gravitation for a given mass of matter at the earth's surface, being dependent principally upon its bulk, density, and physical condition. The comparative bulk of bodies is expressed in terms of dimension or measurement. Standards of weight and measure are established by law in all civilized countries. Those in use in the United States have been adopted by Act of Congress of June 14, 1836, when the Secretary of the Treasury was directed to furnish each State in the Union with a complete set of revised standards based upon those of Great Britain. In 1864 the use of what is known as the metric system was legalized in Great Britain, but was not made compulsory; and in 1866 the United States pursued the same course. It was finally introduced into the Pharmacopœia in the last two revisions. The measures in common use in handling drugs and compounding prescriptions are as follows: Troy and Avoirdupois weights for ascertaining the relative ponderosity of bodies; Wine, or Imperial, measure for quantity of liquids, and the Metric System for both solids and liquids.

Troy, or apothecaries', weight is used for compounding or dispensing drugs; avoirdupois is the standard for commercial purposes, and is used in buying and selling drugs in quantity.

#### *Troy, or Apothecaries', Weight.*

20 grains (symbol gr.)	equal 1 scruple (symbol ℥).
60 grains, or 3 scruples	equal 1 drachm (symbol ℥).
480 grains, or 8 drachms	equal 1 ounce (symbol ℥).
5760 grains, or 12 ounces	equal 1 pound (symbol lb Troy).

#### *Avoirdupois Weight.*

437½ grains	equal 1 ounce (symbol oz.).
7000 grains, or 16 ounces	equal 1 pound (symbol lb Av.).

The British Pharmacopœia is peculiar in using in its formulæ Avoirdupois weight. As will be noticed above, denominations may be represented by symbols. In Troy or Apothecaries' weight, gr. (Lat. *granum*) stands for grain or grains; ℥ (Lat. *scrupulum*) stands for scruple or scruples; ℥ (Lat. *drachma*) for drachm or drachms, and ℥ (Lat. *uncia*) for ounce or ounces. In prescriptions, as well as in dispensing, these symbols are commonly employed; they will be referred to again under the section on "Prescription-writing."

Fluids, as already stated, may be dispensed by weight; but they are usually measured and sold by quantity.

#### *Apothecaries' Measure.*

60 minims (symbol m)	equal 1 fluidrachm (symbol ℥).
480 minims, or 8 fluidrachms	equal 1 fluid ounce (symbol ℥).
7680 minims, or 16 fluidounces	equal 1 pint (symbol ℥).
61440 minims, or 8 pints	equal 1 gallon (symbol C).

An Imperial pint contains twenty fluidounces; there are eight such pints in the Imperial gallon. The latter will contain ten pounds of distilled

water (at 60° F.). The Imperial fluidounce weighs 437.5 grains, which is less by 18.2 grains than the United States Pharmacopœia's ounce of water. This should be remembered in copying prescriptions from English medical publications.

The Metric System of weights and measures is growing in favor, and is employed by nearly all European pharmacopœias, and also by that of the United States. The unit of this system is the metre, which is the ten-millionth part of one-fourth of a meridian, or one forty-millionth of the polar circumference of the earth. This has been found to be a little more than the English yard (3 feet,  $3\frac{3}{4}$  inches), 39.37 inches. From this unit of length the unit of capacity is derived; a thousandth part of a cubic metre is a litre, which contains a little more than two pints ( $2\frac{1}{10}$  pints); it is represented by a cube whose height is one-tenth of a metre. The unit of weight is obtained by weighing a quantity of distilled water required to fill a cube whose sides measure one one-hundredth of a metre; this is called a gramme, and it is equivalent to 15.432 grains. By a system of prefixes the quantities are readily expressed by multiplication or division; thus, *myria* = 10,000 times, *kilo* = 1000 times, *hecto* = 100 times, *deka* = 10 times; whereas *deci* means  $\frac{1}{10}$ , *centi*  $\frac{1}{100}$ , and *milli*  $\frac{1}{1000}$ . This will be readily understood by referring to the following table, in which the relative values of different denominations in the metric and English systems are approximately given:—

*Measures of Length.*

$\frac{1}{1000}$ metre.....	= 1 millimetre (mm.), or	$\frac{1}{25}$ inch.
$\frac{1}{100}$ metre.....	= 1 centimetre (cm.), or	$\frac{4}{10}$ inch.
$\frac{1}{10}$ metre.....	= 1 decimetre (dm.), or	$3\frac{11}{16}$ inches.
1 metre.....	= 1 METRE (M.), or	39.37 inches.
10 metres.....	= 1 Dekametre (Dm.), or	32.81 feet.
100 metres.....	= 1 Hectometre (Hm.), or	328.09 feet.
1000 metres.....	= 1 Kilometre (Km.), or	3280.9 feet.
10000 metres.....	= 1 Myriametre (Mm.), or 32,809 feet, or	$6\frac{1}{4}$ miles.

*Measures of Capacity.*

$\frac{1}{1000}$ litre....	= 1 cubic centimetre (c.cm.), or millilitre (ml.) =	16 minims
$\frac{1}{100}$ litre....	= 1 centilitre (cl.) =	2.705 f3.
$\frac{1}{10}$ litre....	= 1 decilitre (dl.) =	3.381 f3.
1 LITRE (L.) =	$2\frac{1}{10}$ pints (O) =	33.815 f3.
10 litres... = 1	Dekalitre (Dl.) =	2.641 gallons.
100 litres... = 1	Hectolitre (Hl.) =	26.419 gallons.
1000 litres... = 1	Kilolitre (Kl.) =	264.19 gallons.
10000 litres... = 1	Myrialitre (Ml.) =	2641.9 gallons.

*Measures of Weight.*

$\frac{1}{1000}$ gramme, or 1 milligramme (mg.)	.....equal to	$\frac{1}{64}$ grain.
$\frac{1}{100}$ gramme, or 1 centigramme (cg.)	.....equal to	$\frac{1}{4}$ grain.
$\frac{1}{10}$ gramme, or 1 decigramme (dg.)	.....equal to	1.5 grains.
1 gramme (Gm.)	.....equal to	15.432 grains.
10 grammes, or 1 Dekagramme (Dg.)	.....equal to	154.32 grains.
100 grammes, or 1 Hectogramme (Hg.)	.....equal to	3.52 oz. Av.
1000 grammes, or 1 Kilogramme (Kg.)	.....equal to	2.2 lbs Av.

*Relation of Metric Weights and Measures to Apothecaries' Weights and Measures.*

1 grain	equals	0.0647895	gramme.
1 scruple	equals	1.295	grammes.
1 drachm	equals	3.887	grammes.
1 ounce	equals	31.103	grammes.
1 minim	equals	0.061613	cubic centimetre (weighing 0.616 or 0.05 grain.)
1 drachm	equals	3.007	cubic centimetres.
1 ounce	equals	29.57	cubic centimetres.
1 pint	equals	473.11	cubic centimetres.
1 gallon	equals	3785.0	cubic centimetres.

In ordinary use, in prescription-writing, the following table found to be nearly correct, and can be easily memorized:—

mj equals.....	100	c.cm.	gr. j equals.....	1065	grams
fʒj equals.....	4	c.cm.	ʒj equals.....	4	grams
fʒij equals.....	7.50	c.cm.	ʒij equals.....	8	grams
fʒss equals.....	15	c.cm.	ʒss equals.....	15.5	grams
fʒj equals.....	30	c.cm.	ʒj equals.....	31.1	grams

The use of a decimal line greatly reduces the possibility of misreading in reading such prescriptions. As 0.06 (drug) is less than 1 grain, 4.0 and 32.0 (vehicle) are more than the fluidrachm or ounce, there is danger of giving a stronger dose than was intended by using this c.cm. (cubic centimetres), used for Gm. (grammes), causes an error of 5-per-cent. excess.

A teaspoonful is usually 4 to 5 c.cm.; a tablespoonful, 15.0 c.cm. domestic measurements of this kind are so irregular and unreliable that it is best to have the patient take his medicine from a properly graduated or a standard spoon.

Ordinary expressions of weight or measure, therefore, may be aptly and safely reduced to metric terms by the following rule: Multiply grains by 6, and the result will be centigrammes; multiply drachms by 4, or ounces by 32, and the result will be grammes. In the same manner, by dividing centigrammes by 6, we obtain grains; or grammes by 4 or 32, and the result will be the number of drachms or ounces, as the case may be.

Liquids are usually measured, when compounding prescriptions, in convenient glass vessels, which, on account of having their capacity graduated by marks blown or engraved upon them, are known as graduated glass measures. They are usually smaller at the bottom, having a conical shape, or may be cylindrical. The indications of capacity may be according to the ordinary apothecaries' liquid measure or to the metric system. If the quantities are measured in tinned-iron or copper measures, where the metal is not corrosive; for liquids which cannot be measured in metallic vessels, glass or porcelain can be used. Small quantities are measured by minims or by drops. The only accurate method of regulating the dosage of small quantities is by using a small instrument known as a minim-pipette. This is simply a glass tube, with a slightly contracted extremity, so that it can deliver its contents not too rapidly. Upon the side the tube has gradations engraved upon it. A rubber cap may be applied to the upper extremity, by which fluid may be drawn into the tube when its point is placed under the surface. The desired amount may then be expelled by pressing the cap or bulb, and the amount is indicated by the graduated

If the pipette is long enough the rubber bulb can be dispensed with and the mouth applied to produce suction, the liquid afterward being retained by placing the forefinger over its upper end, by which also the flow may be regulated. A little experience with this instrument will enable the operator to transfer small quantities of liquid from one receptacle to another with considerable accuracy and rapidity. A good way to keep the pipette ready for use and clean is to use a perforated cork, passing the pipette through it into a bottle containing alcohol or water. When water or any fluid capable of wetting the glass is used the fluid will creep up the sides of the tube by capillary attraction, and the outer edge of the fluid will therefore be higher than the remainder of the surface. In reading the measure it is customary to take the level of the centre of the liquid, or a plane slightly above it, in order to be accurate.

In spite of the fact that every one knows that a drop is not a unit of measure, and that the size and weight of drops of liquid vary according to temperature, specific gravity, and even the shape of the bottle from which they come, and that the drops of some liquids are much larger than others,—for instance, the drop of deodorized tincture of opium being nearly twice as large as that of the ordinary tincture,—physicians constantly prescribe active medicines by drops when they mean minims, if they mean anything at all definite. This uncertainty with regard to drops is shown in the following table,<sup>1</sup> where every attempt to maintain uniformity was observed:—

<i>Acetum opii</i> . . . . .	90 drops in 3.70 ccm. or 69 minims.
<i>Acetum scillæ</i> . . . . .	68 " " " "
<i>Acetum aceticum</i> . . . . .	108 " " " "
<i>Acidum carbolicum</i> . . . . .	111 " " " "
<i>Acidum hydrocyanicum</i> . . . . .	60 " " " "
<i>Acidum lacticum</i> . . . . .	111 " " " "
<i>Acidum phosphoricum dil.</i> . . . . .	59 " " " "
<i>Acetum sulphuricum aromat.</i> . . . . .	146 " " " "
<i>Acidum sulphuricum dil.</i> . . . . .	60 " " " "
<i>Ether fortior</i> . . . . .	176 " " " "
<i>Assafoetida</i> . . . . .	146 " " " "
<i>Aqua destillata</i> . . . . .	60 " " " "
<i>Hydrogenium</i> . . . . .	250 " " " "
<i>Chloroformum purif.</i> . . . . .	250 " " " "
<i>Chloroaceticum</i> . . . . .	122 " " " "
<i>Extract. belladonnæ radicis</i> . . . . .	156 " " " "
<i>Exract. colechici radicis</i> . . . . .	160 " " " "
<i>Chloricinium</i> . . . . .	67 " " " "
<i>Liquor acidi arsenosi</i> . . . . .	57 " " " "
<i>Liquor arseni et hydrarg. iodidi</i> . . . . .	58 " " " "
<i>Liquor hydrargyri nitratis</i> . . . . .	131 " " " "
<i>Liquor iodi comp.</i> . . . . .	63 " " " "
<i>Liquor potassæ</i> . . . . .	62 " " " "
<i>Liquor potassii arsenitis</i> . . . . .	57 " " " "
<i>Chloroformum aspidii</i> . . . . .	130 " " " "
<i>Chloroformum caryophylli</i> . . . . .	130 " " " "
<i>Chloroformum ricini</i> . . . . .	77 " " " "
<i>Chloroformum tiglii</i> . . . . .	104 " " " "
<i>Spiritus chloroformi</i> . . . . .	150 " " " "
<i>Spiritus</i> . . . . .	65 " " " "
<i>Spiritus scillæ</i> . . . . .	75 " " " "
<i>Spiritus scillæ comp.</i> . . . . .	102 " " " "

<sup>1</sup> From a table prepared by the late Mr. Stephen L. Talbot. The preparations referred to are of the revision of 1870.

Scientific accuracy in prescribing and in dispensing medicines can only be obtained by carefully measuring or weighing the agent in graduates, or scales, of standard accuracy. Where a fraction of a grain, drop, or minim of some powerful remedy is ordered, the division can be made more evenly by diffusing the remedy in a larger quantity of some menstruum in which it is soluble, like alcohol, ether, water, or by mixing it with some inert powder, like gum arabic. Thus, the one one-hundred-and-twentieth of a grain of atropine may be obtained by dissolving one grain in 480 minims of water, of which four minims would represent the desired quantity. Croton-oil and similar agents can be dissolved in alcohol or diffused through some inert powder, like milk-sugar, and thus be accurately divided into parts smaller than the minim or drop.

Most pharmacists are supplied with a full set of metric weights and measures, and can compound prescriptions in accordance therewith; but there are practical objections and difficulties that stand in the way of the general adoption of the French system which will prevent its general use in prescription-writing for many years, or until they are overcome, as pointed out by Prof. Oscar Oldberg. At the same time those physicians who have been trained according to the metric system may find it easier for themselves to continue to employ it in prescription-writing; they owe it to their patients, however, to see that the prescriptions are sent to a pharmacist sufficiently versed in the system not only to avoid making mistakes himself, but also to qualify him to detect any errors that may have been accidentally made by the physician. The maximum dosage of drugs, according to the usual metrology, is usually known to a drug-clerk, but he may not be as familiar with the doses according to the metric system, and therefore the chances of mistakes in compounding are greatly increased. Bottles are now provided by the manufacturers, which contain definite quantities, according to decimal system, in cubic centimetres or millilitres; and pipettes and graduates, marked in metric equivalents, are for sale in all establishments for the sale of scientific apparatus.

**2. Determination of Temperature and Specific Gravity.**—In some pharmaceutical operations it is necessary to take into consideration the temperature or relative degree of heat, both of the room in which the work is going on and of the object manipulated. For instance, the laboratory or room may be below zero or above 90 degrees; it usually is about 65 degrees, or between this and 70 degrees, and, where no temperature is specified, it is supposed to be at this point. When it differs much, either above or below, it should be noted, especially when taking the specific gravity of fluids.

The instruments employed in measuring degrees of heat are called

thermometers; they do not indicate absolute heat, but only its relative intensity. Thus, more heat would be required to raise a gallon than an ounce of water 1 degree, and yet the thermometer would register the same in each case. The quantity of heat is calculated in another way,—according to the laws of physics. Thermometers used to indicate the degree of heat are usually made of glass, pure mercury being preferred as the index because it expands uniformly between the freezing-point of water and its boiling-point. On account of the contraction of the glass, old thermometers generally read too high. Where the temperature is important, the thermometer may be compared with a standard, and its variations noted and allowed for. Thermometers should be three years old before being graduated, in order to allow for the shrinkage of the glass, which usually reaches its limit in this time.

Thermometers in this country are usually marked according to Fahrenheit's scale, which commences at 32 degrees below the melting-point of ice and divides the intervening space between this and the boiling-point of water into 212 equal gradations, making 180 degrees between the point at which ice melts and water boils; the degrees above and below these extremes are established by experiment. This form of thermometer is generally employed in this country for laboratory work, and is given the second place by the U. S. Pharmacopœia. In Réaumur's thermometer, which is in use to some extent on the continent of Europe, the freezing-point is 0 degrees and the boiling-point 80 degrees. The Centigrade, or the thermometer of Celsius, is principally used for scientific work all over the world, and has been adopted in the U. S. Pharmacopœia (1890). The melting-point of ice is zero and the boiling-point of water is 100 degrees, the intervening space being equally divided into degrees Centigrade. The reading in Fahrenheit degrees may be converted into Centigrade by a simple rule. Keeping in mind that the former begins 32 degrees below freezing, which is the zero of the other, and that the space in the former occupying 180 degrees only covers 100 degrees of the latter, we have the following:—

**To convert Fahrenheit degrees into Centigrade,** subtract 32, multiply by 5, and divide by 9,—the result will be degrees Centigrade.

**To convert Centigrade degrees into those of Fahrenheit,** multiply by 9, divide by 5, and add 32.

As both scales are in use in clinical medicine, it is necessary for the student to familiarize himself with this calculation and remember the rules.

All thermometers are not equally sensitive; while some reach their maximum reading in one minute, others require three or four minutes, or more, to get up to the proper degree.

The *Specific Gravity* of any substance is an expression of the relative weight of any quantity of the substance as compared with an equal bulk of distilled water at a temperature of 60° F. and under ordinary conditions of atmospheric pressure as indicated by the barometer. It may be ascertained directly in the case of a liquid by placing it in a bottle which, when filled to the same point with distilled water, would contain just 1000 grains of the latter, and weighing it accurately; in this way, by subtracting the weight of the bottle, we get the weight of a quantity of liquid which exactly fills the space that 1000 grains of water would. The result is the specific gravity of the liquid. An easier, though less direct, method is to use specific-gravity beads, which are small, balloon-shaped, glass globes, of

different sizes and weights, so adjusted that they have different degrees of buoyancy. Figures are scratched upon each one, showing the specific gravity of the medium in which it swims indifferently, neither floating nor sinking. These are known as Levi's beads, and are used in cases where a liquid is to be evaporated until it attains a given specific gravity. They are hydrometers having only one specific gravity. An improvement on this, which is in general use, is the mercurial hydrometer, of which two are used,—one for liquids heavier than water and one for liquids lighter than water. The form in general use is that of Baumé, which consists of a closed glass tube, loaded at the lower end with mercury or shot, and having an expansion, just above the weight, containing air, which causes it to float in an upright position. The original scale of Baumé has been superseded by the specific-gravity scale, which is engraved upon the stem of the instrument. Hydrometers are usually floated in cylindrical glass jars, the instrument sinking to a certain depth in liquids to be tested; the degree marked upon the scale cut by the surface of the fluid indicates the specific gravity at the ordinary temperature (60 degrees). Alcoholmeters, elæometers, and lactometers are used for alcohol, oils, and milk, respectively. The urinometer, used in testing urine, is a specific-gravity hydrometer. The best form for this purpose is that manufactured by Dr. E. R. Squibb, of New York, which is remarkably accurate, as it is graded at 77° (F.), which is nearer the usual room-temperature than is 60° (F.).

3. **Heat** is indispensable in pharmaceutical operations. Any of the ordinary sources of heat may be utilized, but it is found more convenient to use alcohol or illuminating-gas for the majority of the purposes to which heat is essential. The ingenuity of inventors has supplied us with small lamps or stoves, burning alcohol or petroleum, which are most convenient and cleanly. A Bunsen gas-burner, or one of its many modifications, is now an indispensable adjunct to the pharmaceutical laboratory.

The following are the principal procedures requiring heat:—

(a) *High Temperatures*.—Ignition, or burning. Fusion, or melting. Calcination, or driving off volatile substances by heat. Deflagration, or burning with the aid of oxygen or some substance, like nitre or potassium chlorate, capable of yielding oxygen. Carbonization, or heating organic substances without exposure to air; the volatile substances escape, and the residue is of a dark color, like charcoal. Torrefaction, or roasting. Incineration, or reduction to cinders by consuming all the carbon. Sublimation, or separation of a volatile solid substance from another not volatile by heat.

(b) *Temperatures Less High*.—Among these are the water-bath; steam-bath; glycerin-, oil-, or sand-bath. In the water-bath it is not possible to raise the temperature higher than 212° F., but addition of salt increases the density and raises the boiling-point to 227° F. By using steam under pressure the temperature may be still further increased 100 degrees. Vaporization and evaporation are employed to separate volatile substances from fixed bodies. "When vaporization is used to separate a volatile liquid from a less volatile liquid it is called **evaporation**. When the object sought is the volatile liquid it is called **distillation**. When it is used to separate a volatile liquid from a solid it is called **desiccation**, **exsiccation**, or **granulation**. When it is used to separate a volatile solid from another body it is called **sublimation**."

Many of the most useful classes of preparations are made with the aid of heat of moderate degree of intensity. *Infusions* are liquid preparations made by treating vegetable substances with either hot or cold water, but usually the former. The preparation must not be boiled. Cold water is used as a menstruum when the drug contains some volatile substance which may be dissipated by heat, such as in *prunus Virginiana*. The general directions given by the pharmacopœia are to take 5 parts of the substance and boiling water q. s. to make 100 parts. "Put the substance into a suitable vessel provided with a cover, pour upon it the boiling water, cover the vessel tightly, and let it stand for half an hour. Then strain, and pass enough water through the strainer to make the infusion weigh 100 parts." In the three official solutions this system is not followed. The infusion of *betula* is only  $1\frac{1}{2}$  per cent., that of wild cherry is 4, and the compound infusion of senna contains 6 per cent. of senna and 12 each of manna and sulphate of magnesium. The strength of energetic or powerful substances should be specially prescribed by the physician.

*Decoctions* require not only boiling water, but boiling vegetable substances with water. The general official formula for an ordinary decoction, the strength of which is not directed by the physician nor specified by the pharmacopœia, is based upon the same proportion of ingredients as the infusion, but the process differs. Put the substance into a suitable vessel provided with a cover, pour upon it 100 parts of cold water, cover it well, and boil for fifteen minutes; then let it cool to about  $40^{\circ}$  C. ( $104^{\circ}$  F.), express, strain the expressed liquid, and pass enough cold water through the strainer to make the product weigh 100 parts. Of the two official decoctions, that of *ectaria* contains 5 per cent.; that of *sarsaparilla comp.* contains 10 of *sarsaparilla*, with 2 each of *sassafras*, *guaiaec*, and *licorice-root*, and also 1 of *mezereum*.

In making extracts, the heat of the water-bath is utilized in evaporating the extract to a pilular consistency. Heat is also employed in making ointments, cerates, suppositories, solutions, in spreading plasters, and a variety of other pharmaceutical manipulations.

**4. Some operations are chiefly mechanical;** among these are comminution, solution, separation of fluids and solids, filtration, clarification, decantation, precipitation, crystallization, granulation, dialysis, extraction, expression, percolation, maceration, separation of immiscible fluids, decantation, and siphonage.

**Comminution** is the process of breaking a solid into small pieces. In the case of herbs, the agent may be broken up by cutting, slicing, or chopping, or, if it be sufficiently dry, it may be ground in a mill or mortar, or it may be rasped or grated. When it is reduced to fragments by being subjected to a succession of blows, the process is called **contusion**. Drugs are frequently cut or sliced and then contused, preparatory to making pharmaceutical preparations, such as infusions, decoctions, or tinctures. For small quantities, the mortar and pestle are generally used, but larger quantities are ground in a drug-mill. Different degrees of fineness of powder may be attained, being regulated by the fineness of the meshes of sieves through which it is to be passed to separate it from the coarser particles and make it uniform. When reduced to a very minute subdivision it is said to be **extenuable**, because the substance has lost its character of hardness, and is soft and light to the touch. **Very fine** powder passes through a sieve having

eighty or more meshes to the linear inch, and is known as No. 80 powder; **fine** powder passes through a sieve of sixty meshes to the inch and is called No. 60; **moderately fine** powder passes through one having fifty meshes to the inch,—No. 50 powder; **moderately coarse** powder passes through a sieve of forty meshes to the inch,—No. 40 powder; and **coarse** powder is only required to pass through a sieve having twenty meshes to the linear inch,—No. 20 powder. These are the five different degrees of fineness and names to distinguish them adopted by the United States Pharmacopœia. For very fine powders bolting cloth is used, which gives a product as smooth as flour. Levigation is the term applied to a process for reducing solids to a powdered state by adding some liquid in which they are not soluble, the paste thus formed being rubbed up in a shallow mortar or on a glass slab with another piece of glass somewhat bell-shaped, with a solid, flat base, which is known as a muller. When a porphyry slab and muller are used the process is termed porphyzation. Another method is to use an excess of liquid, in which the fine, insoluble powder is suspended, and then decanting the portion of the liquid containing the lighter particles, which is set aside; the fine powder subsequently subsides to the bottom of the receiver, and the supernatant liquid may then be poured off and the powder dried. This is known as **elutriation**; a good illustration is the preparation known as prepared chalk, which is made in this way. By a modification of the latter process the semiliquid, pasty mass, containing the elutriated powder, may be placed in a funnel-shaped receptacle fastened in a wooden frame, having a short leg near its middle, and a handle.

The material having been placed in the receptacle, the apparatus is held in the hand, and the leg tapped slightly upon a table of chalk or other porous substance; the shock of impact causes a small portion to become detached from the rest and to fall in the form of small, conical masses or troches, which, with a little practice, may be made nearly uniform in size. Pastils (**Pastilla**) are small masses of this kind, which are usually made with aromatic substances and used for fumigation. Substances refractory to pulverization, like gold-leaf, may be pulverized by rubbing them into a paste with honey or potassium sulphate, afterward removing the foreign element by washing with water. Camphor is pulverized by the addition of a few drops of alcohol or chloroform, although it may be obtained from the spirit by the addition of water, and elutriation or filtration, and afterward removing the alcohol or water by evaporation. Metallic tin is granulated by agitating melted (fused) tin with chalk-powder, the latter being subsequently removed by washing or by chemical solution with an acid. Phosphorus may be pulverized by heating it in the presence of water until melted and keeping it agitated until cooled. Calomel, calcined magnesia, and sulphur may be sublimed, and by introducing steam an exceptionally fine product is obtained. A coarse powder is produced by evaporating a solution to point of concentration and continuing the evaporation, while stirring the liquid, until all the fluid is evaporated. This process is known as **granulation**. Granular effervescent salts are made by thoroughly mixing the perfectly dry material and moistening the mixture with strong alcohol. The pasty mass is pressed through a sieve, and the granules quickly dried in a hot chamber and packed in hermetically-sealed bottles to exclude the moisture of the air. Pulverization is sometimes preceded by **exsiccation**, by which water of crystallization is driven off; this is usually required for

salts like alum and sulphate of iron, which contain a large proportion of water of crystallization. Some metals, like zinc, are granulated by melting them and pouring them in a fine stream into water. Pepsin and similar adhesive substances are reduced to a powdered state by being dissolved and painted on glass plates, from which, after drying, they are scraped off in fine scales. If a finer powder is needed, a cold mortar, perfectly dry and washed with alcohol, is used. The operation is facilitated by combining some rather hard solid with the powder,—like milk-sugar.

**Solution** is the process whereby a solid or gaseous substance is made to lose its physical identity by the power of some liquid known as a solvent or menstruum. When the liquid has dissolved some, and will take up no more of the substance, it is called a saturated solution. A simple solution is one which contains the original substance chemically unaltered and will yield it again by evaporation. A chemical solution is one in which some chemical action takes place, and the evaporation of the liquid will yield a body having different chemical properties from the original substance. Solution is favored by agitation and usually by the application of heat. Rapid solution is accompanied by change of temperature and abstraction of heat from surrounding bodies, so that the process may be used as a cooling agency. Freezing mixtures are made in this way. On the contrary, where chemical change occurs, there is apt to be a rise of temperature.

A **decimal solution** contains one part of the substance in ten of the menstruum; a 1-per-cent. solution is a **centesimal solution**. The principal solvents employed in pharmacy are the following:—

**Water**, preferably chemically pure, or recently distilled, water (as ordinary spring- or river- water contains more or less earthy and organic matter, in solution or suspension) is used in making liquors, medicated waters, infusions, decoctions, solutions, syrups, etc. **Alcohol** is used very largely, and is next in importance to water. As it has antiseptic qualities, solutions with alcohol are not so liable to fermentation, as watery preparations are. Moreover, alcohol is a solvent for many substances that are insoluble in the former menstruum, such as resins, volatile or fixed oils, alkaloids, glucosides, etc., while gum, albumin, and starch are not affected by it. This affords an opportunity of dissolving out the medicinal qualities or principles, and leaving the inert, woody, and starchy matters. In some of the manipulations dilute alcohol is directed, which contains one-half water, or, more correctly, according to the pharmacopœia, it contains about “41 per cent. by weight, or about 48.6 per cent. by volume, of absolute ethyl-alcohol, and about 59 per cent., by weight, of water.” Alcohol is the basis of the spirits, elixirs, tinctures, medicated wines, and many of the fluid extracts of the pharmacopœia. Ether, benzol, chloroform, carbon disulphide, acetone, acids, and oils are all recognized as solvents in appropriate cases.

Solids may be separated from liquids, or solutions containing them, by filtration, precipitation, decantation, siphonage, evaporation, and crystallization. **Dialysis** is a process by which a crystallizable substance in solution may be separated from non-crystallizable (colloid) substances. Graham, in 1861, brought out this very useful process, which depends upon the diffusability of certain solutions through porous partitions. The usual form is a circular frame, like a sieve, in which the wire meshes are replaced by a diaphragm of parchment or parchment-paper (made by immersing unsized white paper in a cold mixture of two measures of sulphuric acid and

one of water). The dialyzer is floated upon the surface of water in receptacle, and the mixture to be separated is placed within it. A suspended in a glass jar would answer the same purpose. This is used to separate alkaloids from organic mixtures, especially for quantitative testing, crystalloid substances passing out through dialyzer, leaving colloid substances behind. It is particularly adapted to toxicological investigations.

When the object in view is to separate active principles from constituents of drugs, a liquid is employed, termed a *menstruum*, the desired principles are soluble. The principal modes of **extraction** employed by pharmacy, at present, are maceration and expression, percolation, infusion, and decoction. Maceration requires the drug to be a coarse powder, contused or properly comminuted. The usual mode is to place the powder and *menstruum* in a large bottle, until the soluble constituents are all taken up: a process which may be facilitated by occasional shaking during a week or more. This was formerly the process employed in making tinctures, and is still followed by the German Pharmacopœia. In this country it is now superseded by the process of percolation, which is much more expeditious, and, when properly done, equally effective. **Percolation**, or displacement, is the process by which a powder packed in a conical or cylindrical receiver known as a percolator is exhausted of its soluble principles or medicinal qualities by the descent through it of a solvent. **Lixivation** is the name applied to this process when the substance is first incinerated, as in the process of extracting lye from wood-ash. The U. S. Pharmacopœia gives specific directions for percolation, which is largely used in making tinctures and fluid extracts, as follows: "The process of percolation, or displacement, directed in this pharmacopœia, consists in subjecting a substance, or mixture of substances, in powder, contained in a vessel called a percolator, to the solvent action of successive portions of a certain *menstruum* in such a manner that the liquid, as it travels downward through the powder in its descent to the receiver, shall be charged with the soluble principles of it, and pass from the percolator free from insoluble matter.

"When the process is successfully conducted the first portion of liquid, or percolate, passing through the percolator will be nearly saturated with the soluble constituents of the substance treated; and if the quantity of *menstruum* be sufficient for its exhaustion, the last portion of the percolate will be nearly free from color, odor, and taste, other than those of the *menstruum* itself.

"The percolator most suitable for the quantities contemplated by the pharmacopœia should be nearly cylindrical, or slightly conical, with a funnel-shaped termination at the smaller end. The neck of this funnel should be rather short, and should gradually and regularly become narrower toward the orifice, so that a perforated cork, bearing a short glass tube be tightly wedged into it from within until the end of the cork is flush with the outer edge of the orifice. The glass tube, which must not project beyond the inner surface of the cork, should extend from 3 to 4 cm. from the inner surface of the cork, and should be provided with a closely-fitting rubber tube, at least one-fourth longer than the percolator itself, and inserted in another short glass tube, whereby the rubber tube may be so suspended that its orifice shall be above the surface of the *menstruum* in the percolator, a rubber band holding it in position.

"The size of the percolator selected should be in proportion to the quantity of drug extracted. When properly packed in the percolator, the drug should not occupy more than two-thirds of its height.

"The percolator is prepared for percolation by gently pressing a small tuft of cotton into the neck above the cork, a thin layer of clean and dry sand then being poured upon the surface of the cotton to hold it in place.

"The powdered substance to be percolated (which must be uniformly of the fineness directed in the formula, and should be perfectly air-dry before being weighed) is put into a basin, the specified quantity of menstruum is poured on, and it is thoroughly stirred with a spatula, or other suitable instrument, until it appears uniformly moistened. The moist powder is then passed through a coarse sieve—No. 40 powders, and those which are finer, requiring a No. 20 sieve, while No. 30 powders require a No. 15 sieve for this purpose. Powders of a less degree of fineness usually do not require this additional treatment after moistening. The moist powder is now transferred to a sheet of thick paper, and the whole quantity poured from this into the percolator. It is then shaken down lightly and allowed to remain in that condition for a period varying from fifteen minutes to several hours, unless otherwise directed, after which the powder is pressed, by the aid of a plunger of suitable dimensions, more or less firmly, in proportion to the character of the powdered substance and the alcoholic strength of the menstruum, strongly-alcoholic menstrea, as a rule, permitting finer packing of the powder than the weaker. The percolator is now placed in position for percolation, and, the rubber tube having been fastened at a suitable height, the surface of the powder is covered by an accurately-fitting disk of filtering-paper, or other suitable material, and a sufficient quantity of the menstruum poured on through a funnel reaching nearly to the surface of the paper. If these conditions are accurately observed, the menstruum will penetrate the powder equally until it has passed into the rubber tube and has reached, in this, a height corresponding to its level in the percolator, which is now closely covered to prevent evaporation. The apparatus is then allowed to stand at rest for the time specified in the formula.

"To begin percolation, the rubber tube is lowered and its glass end introduced into the neck of a bottle previously marked for the quantity of liquid to be percolated, if the percolate is to be measured, or of a tared bottle if the percolate is to be weighed; and, by raising or lowering this receiver, the rapidity of percolation may be increased or decreased as may be desirable, care being taken, however, that the rate of percolation, unless the quantity of material be largely in excess of the pharmacopoeial quantities, shall not exceed the limit of 10 to 30 drops in a minute. A layer of menstruum must constantly be maintained above the powder, so as to prevent the access of air to its interstices, until all has been added, or the requisite quantity of percolate has been obtained. This is conveniently accomplished, if the space above the powder will admit of it, by inverting a bottle containing the entire quantity of menstruum over the percolator in such a manner that its mouth may dip beneath the surface of the liquid, the bottle being of such shape that its shoulder will serve as a cover for the percolator.

"When the dregs of a tincture, or of a similar preparation, are to be subjected to percolation, after maceration with all or with the greater portion of the menstruum, the liquid should be drained off as completely as

possible, the solid portion packed in a percolator, as before described, the liquid poured on, until all has passed from the surface, when gradually a sufficient quantity of the original menstruum should be added on to displace the absorbed liquid, until the required quantity is obtained.

"Authority is given to employ, in the case of fluid extracts, when it may be applicable, the process of repercolation without change of the menstruum."<sup>1</sup>

Fractional percolation is the same process applied to two successive portions of the powder, the result being identical with repercolation.

**Expression** is the process of forcibly separating liquids from solids. It is a very ancient method, the best-known form being the wine-press. After macerating a crude drug for the desired length of time, the full amount of tincture is obtained by decantation and expression.

**Precipitation** is the process of separating solid particles from a liquid by the action of physical or chemical means. If the precipitate is of a lower specific gravity than the liquid it will float upon its surface; if, as is the case, it is of higher specific gravity it will sink to the bottom of the receptacle. Precipitates may be curdy, granular, flocculent, gelatinous, crystalline, amorphous, etc. A magma is a thick, more or less tenacious precipitate. Substances containing albumin are precipitated by heat. Silver salts precipitate silver salts; but the most frequent method of precipitation is by chemical action. This is resorted to (1) for the purpose of obtaining substances in the form of a powder, (2) as a means of purification, (3) for isolating chemicals, and (4) to isolate chemicals. In assuming the crystalline form some salts take up considerable water, which is known as water of crystallization; the amount varies in different salts, but it is important to bear this in mind with some salts like sulphate of iron or alum, in which water should be expelled by heat before making them into pills or powders. Such salts are liable to deliquesce and become moist or liquid by absorbing more moisture from the air, or in a dry atmosphere they may effloresce from loss of water.

**5. Pharmaceutical testing and analysis** is the method followed in ascertaining the presence of certain constituents and determining the proportion if present. The methods followed are not different from those employed in organic chemistry and in the laboratory. The pharmacopœia supplies a list of standard reagents for the purpose of applying the tests prescribed in the text. As the processes of analysis are not peculiar to pharmacy, space will not be taken here to consider them in detail. In practical pharmacy the microscope is indispensable for the recognition of drug adulterants and for the examination of crystalline deposits and sediments.

**6. The preparation of extemporaneous formulæ** is not different in principle from the official, except that some extemporaneous preparation may be ordered which have no relation to the pharmacopœia. For instance, some preparations of the English, German, or other pharmacopœia are occasionally prescribed, or formulæ which are original with the physician. Unofficial articles, or new remedies, are also often included in the magisterial prescription, but care should be taken that this is not done to excess.

<sup>1</sup> Pharmacopœia of the United States of America, 7th Decennial Revision, *et seq.*

is by no means creditable to a physician to be constantly trying much-vaunted new remedies or proprietary preparations, and neglecting to use the older remedies of established reputation and of standard composition, which have received the sanction of the pharmacopœia. The art of prescribing will now be taken up for consideration.

### PRESCRIPTION-WRITING AND FORMULÆ.

In the progress of the science of medicine it has been found necessary, owing to the accumulation of knowledge, to institute special departments of study, as well as specialties in practice. It having become inexpedient for a physician to collect his own herbs in the fields, to make his own preparations, and to dispense his own prescriptions, these duties have been delegated and entrusted to the trained pharmacist and his assistants, who have special qualifications for the task, to which they devote their whole time and attention. This division of labor is to the advantage of scientific medicine, as the practitioner of medicine is relieved of routine work and has more leisure to devote to the study of pathology, diagnosis, and therapeutics.

**The Prescription.**—The physician usually writes his directions, regarding the medicines which the patient is to take, according to a general form, the writing being called “the prescription” (*præscribo, præscriptum, præscriptio*, in Latin,—something written for, or ordered; in French, *ordonnance*). As a prescription furnishes very tangible evidence of the attainments of a physician, and, being preserved on the prescription-file of the pharmacist as a matter of record, may confront him in the courts of justice, it is of considerable importance that students should be well drilled in prescription-writing before graduating, so that they may be spared mortification and possibly the loss of reputation, caused by blunders or carelessly-written formulæ, to say nothing of the risk to the patient.

The first point to be settled, in composing a prescription, is to determine the therapeutic indication and to decide upon the drug to be employed, and in what form it shall be given,—whether solid or liquid, and whether alone or combined with other remedies. Following this is the question of dosage and the number of doses and length of time during which the remedy is to be given, which determines the quantity to be ordered in the prescription. The body of the prescription, or the formula, may have the quantities written according to the metric system, but, as pharmacists and physicians are more familiar with apothecaries’ weights and measures, it is better—for present purposes, at least—to follow the prevailing method, as a matter of precaution, and to prevent mistakes. It has been found that, by adopting a certain form in writing prescriptions, the work of compounding and dispensing is made easier and more certain, and the task of translation facilitated. In framing a prescription, certain principles should be kept in mind, in order that the product shall be creditable and accomplish the purpose for which it was written. The tendency of the day is toward simplicity, the elegant pharmaceutical preparations at our command having removed the necessity of the resort to **polypharmacy**, as it is called, when a large number of agents are combined in one prescription. As remedies

are modified in their action by association with others, it is oftentimes to make such a combination, and knowledge and experience sometimes displayed to a marked advantage in originating such combinations. Instances of this will be abundantly given in the section to the consideration of drugs. It used to be the rule that a preparation should contain four parts,—(1) the base, (2) the adjuvant, (3) the solvent, and (4) the vehicle; the dose of the first having been decided, quantities of the other ingredients were made to correspond with it, to make the desired quantity of the medicine to be taken at a dose. In the preparations of the pharmacopœia, as a rule, may be prescribed in addition, except with water, or some other convenient diluent, when administered.

The first rule in prescribing should be to make a judicious selection of the active remedy or remedies to constitute the basis of the preparation, always taking a single remedy, unless a distinct advantage can be obtained by using others in conjunction with it. In this connection, it is noted that some drugs can be given in larger doses when thus combined, whereas others must have their doses reduced. As a general rule, agents are from the same therapeutical class they mutually enhance each other's effects, and must be given in smaller doses than when given singly; when they belong to different classes, and especially when they act upon different organs, the dose can often be largely increased with advantage. Having settled upon the main remedy and its associate, and decided upon the desired to be given, the question of eligibility comes up, in deciding the special pharmaceutical form to be employed. There are frequent representatives of the drug in question in several pharmaceutical classes, some in solid form, others liquid,—each having, or supposed to have, some special application or advantage in certain cases, and offering different opportunities for combination. It may be a matter of indifference which form or preparation of the remedy is chosen, but the probabilities are that it is not; and that some are better suited than others. Thus, some preparations of iron are astringent, others acid; others contain alkalies, or are combined with tonics and alteratives; one combination is emetic, another is used as styptic, and rarely given internally; one only as an antidote for arsenical poisoning, and so on.

Having decided upon the principal therapeutic agent, if we choose to give it alone, that will complete the prescription formula, and we only to add the directions to the pharmacist and to the patient (the directions being simply what is desired to be copied upon the label of the medicine-bottle or package). If we wish to combine our remedies, the following objects may govern our selection: First, an addition may be made of some agent which will assist the action of the main ingredient, or more may be selected which mutually aid each other. This aid may be chemical in character, as where dilute sulphuric acid is added to a solution of sulphate to help in its solution, or hydrochloric acid is added to a solution of a mixture containing pepsin; or it may be physiological, and intended to act upon some associated organ, so as to make the effect of the remedy more favorable; or thirdly, to prevent some incidental, disagreeable result. An example of the former is where resin-bearing purgatives, or cholagogue agents, and a sedative like belladonna or hyoscyamus are introduced into a purgative pill; an example of the latter is where hydrobromic acid is

to a cinchona preparation to prevent noises in the ears, or where carminatives are combined with a cathartic remedy, or the unpleasant effects of morphine are prevented by combining with it a small proportion of atropine. The object, not infrequently, may be purely pharmaceutical, as where a dry powder, as an excipient, is added in making pills. The third object of administering remedies in combination is to obtain as pleasant, or at least as unobjectionable, a form as possible.

When a remedy is exhibited in a form that the patient is utterly unable to swallow it, or is so repulsive that each dose causes nausea or vomiting, no matter how correct the prescription may be from the therapeutic standpoint, the patient will pronounce it a failure, and will probably relieve his feelings by uttering maledictions upon the doctor. On the other hand, if the remedy be attractive in appearance and pleasant to the taste, it will be regarded as a signal success, even though of less therapeutical activity. An agent is sometimes given merely for the mental and moral effect, without having any medicinal action directly. Such a combination is called a *placebo*, because it is administered simply to please the patient. Although placebos are rarely resorted to, patients should always be well treated, and with a little care much can be done toward making preparations pleasant. In choosing a physician, the voice of the patient would, in the majority of cases, be given, without hesitation, in favor of the prescriber who orders pleasant medicine, over him who has a special reputation for giving intolerably nasty ones. The young physician can get a hint from this which may greatly contribute to his success in after-life. Hence, a practical acquaintance with the expedients which modern elegant pharmacy offers, for overcoming the objectionable character of remedies, is of the highest service, has no mean intrinsic value from a financial point of view. A few suggestions for prescribing may be given here. Solid medicines may be given in compressed pills, coated with chocolate, in pills sugar- or gelatin-coated, in hard or soft capsules, or in suppositories. Powders can be given in *cachets de pain*, gelatin capsules, or suspended in a dense syrup or other vehicle (such as stewed fruit or currant-jelly). Soluble or fluid agents, if unpleasant, are more difficult to hide, but they may be given in combination with aromatic or orange elixir, some fruit-syrup or in aromatic water. Many illustrations will appear, and formulæ will be given of good forms of combination, in the discussion of individual drugs under each head. A proper understanding and appreciation of this principle of combination will not only make the remedies more effective, but the patient will be less likely to forget to take his medicine, and thus will co-operate with the physician rather than oppose him in every possible way. This is seen to the best advantage in the management of sick children, where the remedies must be palatable or the struggles of the child to escape a nauseous dose may cause the attendant to give up in despair and conclude that the excitement may do the child more harm than the medicine will do him good.

In combining our remedies the question of incompatibility demands consideration. Remedies may be (1) pharmaceutically incompatible, (2) chemically incompatible, or (3) physiologically incompatible. Agents are pharmaceutically incompatible when the proposed combination is either impracticable or extremely undesirable. Thus, the addition of water to a tincture of a resin-bearing drug precipitates the resin, or oleoresin, which floats upon the surface, thus spoiling the appearance of the preparation, and

possibly permitting too large a quantity of the active principle to be given with the first doses from the bottle. As a rule, such tinctures should not be combined with solutions, aromatic waters, or infusions. Preparations of vegetable drugs containing tannic or gallic acid should not be given with iron, as this combination produces an unsightly mixture, and is precipitated in an insoluble form. A survey of the *Materia Medica* affords many instances of the ineligibility of particular remedies in certain forms of combination. Volatile and corrosive substances, or hygroscopic bodies, should not be given with powders; bulky drugs should not be given in pills. In alkaloids of great physiological activity, such as strychnine, delphinine, or aconitine, the pill-form should not be resorted to on account of the danger of unequal mechanical division, and, in solution, it is seen that nothing can be added that would render them insoluble. Therefore, the combinations, inexpedient from a pharmaceutical standpoint, are as follows:—

(a) *Form Explosive Compounds*.—Chlorate of potassium and tannic or gallic acid. Bromide and alcohol. Nitrate of silver and creosote. Vegetable extracts containing glucose. Iodine and solutions of alkalies. Chromic acid and glycerin. Chloride of lime with sulphur. Spirit of ether with certain fluid extracts. Calcium or sodium hypophosphite with dry powders, or when triturated alone.

(b) *Form Unsightly or Undesirable Mixtures*.—Chloral with astringent containing alcohol. Vegetable tinctures containing oils and resinous water. Spirit of nitrous ether with potassium iodide, iron sulphate, or guaiac, antipyrin, mucilage, tannic and gallic acids. Compound infusion of gentian with infusion of wild cherry or of cinchona. Copaiba with watery preparations (unless suspended by acacia or other emulsifying agent). Acids with ammoniated glycyrrhizin.

**Chemical incompatibility** is caused by chemical decomposition or production of a compound (salt) having characters and reaction different from its components. It should be avoided, as the rule, except when expressly intended by the prescriber. A knowledge of chemistry will generally put the physician upon his guard, but there are special illustrations, which must be borne in mind, where the combination is particularly undesirable, and, when ordered in a prescription, will defeat the object of the treatment and bring discredit upon the attendant. The general rules of chemical compatibility are usually stated as follows:—

As a rule, a remedy is not to be ordered in combination with it if it gives a bad taste and chemical tests, especially if the latter depend upon the formation of an insoluble precipitate or a corrosive or poisonous salt. Thus, all preparations are usually precipitated by mercurials and other metals, and may be destroyed by compounds containing free chlorine, caustic alkalies, or potassium permanganate. Tannic and gallic acids usually precipitate the alkaloids in a nearly insoluble form. The alkalies usually cause precipitation when added to solutions of metallic salts. Glucosides are decomposed into free acids or by emulsions.

Special incompatibilities will be studied in connection with individual drugs. Among those that are most likely to give trouble are preparations containing corrosive chloride of mercury, silver nitrate, solutions of iron and iodides, arsenic, lead, quinine, strychnine, and tannic acid, and, as a rule, such combinations should be avoided and the agents given by

selves or simply in some vehicle. Care should be taken in mixing powerful oxidizing agents with easily-combustible bodies. Among the former are chromic acid, concentrated nitric or nitrohydrochloric acid, potassium chlorate or permanganate. Some of the latter are oils, alcohol, ether, glycerin, sulphur, and phosphorus. Mixtures of chromic acid and glycerin or alcohol, as already stated, are explosive; so is silver nitrate with a vegetable extract, or glucose. Compressed tablets of potassium chlorate sometimes explode from slight friction.

**Incompatibilities of Some New Remedies.**<sup>1</sup>—The task of avoiding incompatibilities in the dispensing of the newer remedies of synthetic origin has become correspondingly difficult with their increasing number.

A favorite method nowadays with some physicians is to prescribe a large variety of drugs in wafers. Many remedies, however, are unsuitable for dispensing in wafers, because they attract moisture and soften the wafers. Among these are sodium bromide, calcium chloride, strontium chloride, chloral, the glycerophosphates, piperazine, and the dry vegetable extracts from drugs obtained by desiccation *in vacuo*. Iodides should not be prescribed in wafers, as they decompose or change color.

Some of the pharmaceutical incompatibilities are due to the fact that the mixture of some solids produces a liquid. Thus, camphor mixed with naphthol makes a liquid, while antipyrine and sodium salicylate give rise to a semi-liquid, pasty mass. Antipyrine gives also an oily liquid with chloral, betanaphthol, salol, resorcin, phenol, pyrogallol, thymol, and urethane.

Acetanilide is incompatible with chloral, thymol, resorcin, and menthol.

Betanaphthol should not be mixed with antipyrine, camphor, menthol, phenol, and urethane.

Camphor should not be dispensed with betanaphthol, chloral, exalgine, menthol, phenol, pyrogallol, resorcin, salol, thymol, and urethane.

Camphor monobromide is incompatible with chloral, phenol, salol, and thymol. Chloral is incompatible with acetanilide, camphor, camphor bromide, exalgine, menthol, methacetine, phenacetin, phenol, salol, thymol, and urethane.

Exalgine is incompatible with chloral, naphthol, menthol, phenol, pyrogallol, resorcin, salol, thymol, and salicylic acid.

Menthol cannot be mixed with naphthol, chloral, phenol, pyrogallol, resorcin, salol, thymol, and urethane.

Sodium salicylate should not be dispensed with antipyrine and phenol.

Phenacetin is incompatible with naphthol, chloral, and phenol. Phenol decomposes antipyrine, naphthol, camphor monobromide, camphor, chloral, exalgine, menthol, methacetine, sodium salicylate, pyrogallol, resorcin, salol, thymol, and urethane.

Pyrogallol is incompatible with antipyrine, camphor, exalgine, menthol, and phenol.

Resorcin forms new compounds with acetanilide, camphor monobromide, exalgine, naphthol, menthol, methacetine, phenol, and urethane.

Salol reacts with antipyrine, camphor, camphor bromide, chloral, exalgine, phenacetin, pyrogallol, and thymol.

Thymol is incompatible with acetanilide, antipyrine, camphor, chloral, exalgine, menthol, phenol, salol, and urethane.

Urethane should not be dispensed with antipyrine, naphthol, camphor, chloral, exalgine, phenol, pyrogallol, resorcin, salicylic acid, salol, or thymol.

<sup>1</sup>From the Report of the Committee on New Remedies of the New York State Pharmaceutical Association for 1906. *American Druggist*, 1906, p. 37.

Great care should be taken in preparing mixtures of syrups of acacia with certain phenol derivatives and synthetics. Incompatibilities are apt to occur as the result of the presence of an oxidizing ferment or in the gum, in virtue of which chemical changes take place, either in a precipitation or a change of color. Witness, for example, the combination which occurs in an article by Tanzi, quoted in *Répertoire Thérapeutique*:—

Pyramidon.....	0.20	Gm.
Sodium bromide .....	0.25	Gm.
Syrup of gum acacia .....	130	Gm.

This mixture at once turns a bluish-violet, then violet, then purple after a few hours becomes yellow.

Syrup of acacia gives a blue color with guaiacum resin; a purple turning black with phenol; a violet color, and later a blue precipitate with alphanaphthol; a grayish white opacity with betanaphthol; a yellowish brown color and a garnet precipitate with pyrocatechin; a white precipitate with vanillin; and a deposit of white crystals of oxy-morphine with morphine hydrochloride. Syrup of acacia is also incompatible with adrenalin, syrup of tar, and the liquid preparations of aloes.

**Physiological incompatibility** is based upon the physiological actions of drugs, the rule being that drugs having dissimilar effects upon organs should not be combined in one prescription, especially when the principal action of the drugs is antagonistic. Inasmuch as the effects of individual remedies are not restricted to one organ or set of organs, as it never happens that two drugs will be found exactly opposed in their action throughout their whole range of action, considerable latitude of combination is permitted in prescribing. In fact, there is sometimes an advantage in modifying the activity of a drug by one which is antagonistic to its principal action. For instance, morphine and atropine are opposed in their effects, and atropine is very frequently added to an opiate to diminish the disagreeable effects,—headache, nausea, and constipation,—and heighten the anodyne qualities. Illustrations of such incompatibility are to be found under the antidotes to the toxic effects of drugs, a remedy considered incompatible with its physiological antagonists, as the rule. Some prominent illustrations are the following:—

- Acetanilide: Alcohol, ammonia, caffeine, cardiac stimulants.
- Aconite: Alcohol, ammonia, atropine, amyl nitrite, digitalis, strophanthine, strychnine.
- Agaricus albus: Opium, strychnine, pilocarpine.
- Agaricus muscarius: Atropine, digitalis, stimulants.
- Alcohol: Ammonium, acetate, digitalis, strychnine, caffeine, hyoscyamine.
- Atropine: Aconitine, chloral-hydrate, hydrocyanic acid, jaborandi, morphine, physostigmine (eserine).
- Caffeine: Opium.
- Chloral-hydrate: Ammonium salts, atropine, alcohol, many alkaloids.
- Chloroform: Amyl nitrite, ammonia, digitalis, strychnine.
- Digitalis: Aconite, muscarine, saponin.
- Gelsemium: Opium, atropine, strychnine.
- Hydrocyanic acid: Atropine, hyoscyamine.
- Morphine: Atropine, caffeine, nicotine, physostigmine.
- Muscarius (see *Agaricus muscarius*).
- Opium: Atropine, gelsemium, veratrum viride, potassium permanganate.

**Physostigmine:** Atropine, chloral-hydrate, morphine.

**Saponin:** Digitalis, strophanthus.

**Strychnine:** Amyl nitrite, chloral, potassium bromide, chloroform, etc.

**Veratrum viride:** Opium.

The risks of incompatibility in prescribing can be entirely avoided if due precaution is taken. Whenever a new or unfamiliar combination is ordered, the careful prescriber will, if possible, supervise the preparation of the prescription, and examine the completed product. If an insoluble precipitate be formed, it should be at once investigated and its character determined. Very often a skilled pharmacist will be able to detect an incompatibility in a prescription, owing to his practical acquaintance with the combining of drugs, and in this way point out the fact that such an unintentional incompatibility may exist, and thus show his willingness to work with the physician. It is expected by the general community that a physician should be able to recognize a remedy or preparation by its physical characters alone. In order to do this it will be necessary for him to cultivate a close acquaintance with drugs and the results of combinations which he wishes to order, so that he may pronounce a verdict upon a preparation and decide whether or not it is properly compounded. If he has not such technical knowledge, he should make it his business to acquire it in a laboratory or a pharmacy.

**Form and Language of the Prescription.**—For many reasons formulæ are usually written in the Latin language. However, if any physician choose to write his prescriptions entirely in English he is at liberty to do so; but the demands of accuracy require that he write the official English titles without abbreviation. Such titles as muriate of ammonia, balsam of copaiba, saltpetre or nitre, brown mixture, spirit of turpentine, etc., may be used in conversation, but in prescriptions the correct titles should be given; either **ammonii chloridum** or ammonium chloride; **copaiba** (not balsam); **potassii nitras** or potassium nitrate; **mistura glycyrrhizæ composita** or compound licorice mixture; **oleum terebinthinæ rectificatum** or rectified oil of turpentine, and so on. Many popular titles are very objectionable; thus, oralic acid is sometimes called essential salt of lemons or salt of sorrel, lead acetate is called sugar of lead, while an attempt to trace the vulgar names of plants leads to endless confusion. Sometimes preparations of different strength may be indicated; thus, prussic acid may mean concentrated acid or the official 2-per-cent. dilute acid; oil of almonds may mean oil of sweet almonds or oil of bitter almonds, which differ very much in their properties and effects. The only safe rule, therefore, in writing prescriptions, is to know exactly what is intended to be ordered and to legibly write the scientific name and quantity of the article desired, and if this is done, the language may be left to the choice of the prescriber. As a rule, it will be found that physicians who are competent to do so prefer to write in Latin, and those who cannot write them correctly in the language of the pharmacopœia cannot write them correctly in English either.

As to the *status* of a prescription, although really a communication from a physician to the pharmacist, directing the preparation of the remedy, by tacit consent of all parties it is generally admitted to be the property of the patient, who has the privilege of having it repeated or refilled at his pleasure. When the prescription is marked "not to be repeated," the patient is understood to assume all the responsibility of an injury which he may

experience from disobedience to the physician's directions, the pharmacist generally satisfying his conscience by calling attention to the fact that the physician did not desire the remedy to be continued, declaring that the entire responsibility must rest with the patient, but the prescription just the same. In this way the alcohol habit, the opium habit, the chloral habit, the cocaine habit, the antipyrin or bromide habit are fostered by the resources of modern pharmacy, which prescribes agents in the form of cordials and other attractive preparations; physicians hesitate to prescribe them, for fear of the consequences of patients acquainted with these seductive preparations, as there is no restriction on their sale. It is only just to add that there are honorable pharmacists to whom the above remarks do not apply, and who endeavor to co-operate with the physician and who practice pharmacy as a special department of the practice of medicine.

Besides the formula, the complete prescription contains instructions to the pharmacist concerning the combining or compounding of the ingredients, and directions to the patient as to the dose of, and the manner of taking, the preparation. Finally the document must be signed and dated, and, as a matter of precaution, it is advisable to write upon it the name and address, so that, if the pharmacist should make a mistake and deliver the wrong medicine, he will be able to trace it at once. This is a safeguard against error in administration where more than one patient is under treatment in a family or institution. Many physicians require the formula to be copied upon the label, a plan that is often very useful.

Proceeding to the actual framing of prescriptions, assuming a knowledge of the *Materia Medica* and pharmacopœial titles sufficient to enable the prescriber to determine what remedy he wishes to give and its strength, he writes, as legibly as possible, upon a piece of paper, the formula, taking care to have the case-endings agree with the requirement of the situation. For instance, as the first word is "Recipe," the imperative of the verb "take" requiring the accusative case, it follows that the words which follow referring to quantity should be considered as in the accusative case. Thus, "Recipe, 1 G. or 8 c.cm.," means: "Take one gramme or eight cubic centimetres" of any desired agent. The latter, however, is to be in the genitive case whenever the quantity is expressed; thus, "Recipe, Calcis, 15 c.cm.," means: "Take 15 c.cm. of lime water." On the other hand, when the quantity is not given in any denomination of weight or volume, the subject itself being directly taken, the latter is put in the accusative case; thus:—

"R Vitellum ovi,  
Aque cinnamomi . . . . . q. s. ad 30 c.cm. or 1 fl.ounce."

means: "Take the yolk of an egg, and enough cinnamon-water (with cinnamon) to make thirty c.cm. or one fluidounce," the letters q. s. standing for *quantum sufficiat*, or "as much as may be required to make the amount specified." If the case-endings are known, the proper case may be ascertained by trying to insert the word "of"; where this can be done, the word following it should be written in the genitive case; thus, in the above, of cinnamon, or syrup of orange, the words cinnamon and orange should always be in the genitive case. To students unfamiliar with Latin, the difficulties in the way of correct writing of prescriptions may seem

STANDARD

mountable; but they will disappear after a little attention and practice. One of the best ways of learning the genitive case of pharmacopœial nouns is to study the list of fluid extracts or tinctures in which the remedial agent is in the genitive (fluid extract or tincture of —). Familiarity with the names of the *Materia Medica* will supply the needed information in the majority of drugs regarding the case-endings.

The general form of the prescription is:—

**R** (for recipe, or take)  
*Base.* of A (in the genitive case), a certain quantity (in the accusative case).  
*Adjuvant.* of B (in the genitive case), a certain quantity (in the accusative case).  
*Corrigent.* of C (in the genitive case), a certain quantity (in the accusative case).  
*Vehicle.* of D (in the genitive case), a certain quantity (in the accusative case).  
*Pharmaceutical Directions.* Let such or such preparation be made.  
*Directions for the Patient.* Write (upon the label) the specific directions for dosage, time of taking, alone or with any vehicle, etc.  
*Signature.* Physician's name.  
*Date.*  
*Name and Address of Patient.* For Mr. So-and-so.

It is not at all necessary that the classical arrangement of base, adjuvant, and so on, should always be observed, but it seems natural to write the most important agent first, and follow this with any agent or agents which we desire to combine with it, and, finally, a menstruum or vehicle if any be needed. For illustration, suppose it is desirable to give a patient an expectorant cough mixture. In order to render the secretions more liquid we may use potassium iodide, or a vegetable substance, like ipecacuanha, and, perhaps, may decide to combine them. Associated with them we may give ammonium chloride, which acts beneficially upon the bronchial mucous membrane, causing the development of more healthy epithelium. Finally, a suitable menstruum would make the mixture more palatable. We next decide upon the quantity for each dose, and the prescription now appears in this form:—

**Recipe**  
 Potassii iodidi ..... 20 Gm. or gr. iij.  
 Ammonii chloridi ..... 75 Gm. or gr. xij.  
 Fluidextracti ipecacuanhæ..... 12 c.cm. or mij.  
 Syrupi sarsaparillæ compositi.....q. s. ad 7|50 c.cm. or f3ij.  
 Misce et fiat mistura.

(Or (in English form):—

**Take**  
 of iodide of potassium..... twenty centigrammes, or three grains  
 of ammonium chloride.....seventy-five centigrammes, or twelve grains.  
 of fluid extract of ipecac.....twelve centigrammes, or two minims.  
 of compound syrup of sarsaparilla....enough to make 7.50 cubic centimeteres, or two drachms.  
**Mix.** Let a mixture be made.

Having settled that a dessertspoonful (7.50 c.cm., or 2 drachms) will be a sufficient dose to give, we decide upon the number of doses to be ordered. If twenty be the number selected, the entire prescription will then equal twenty times this quantity, or 150 c.cm., and, when completed, will form a mixture, with directions like the following:—

<b>R</b>	Potassii iodidi .....	4	Gm. or 3j.
	Ammonii chloridi .....	15 5	Gm. or 3iv.
	Fluidextracti ipecacuanhæ.....	2 50	c.cm. or mxl.
	Syrupi sarsaparillæ compositi.....q. s. ad	160	c.cm. or f3v.

Misce et fiat mistura.

Signa: Take a dessertspoonful every four hours for cough, as directed by  
Phila., Sept. 30, 1900.

Dr. X.  
For Mr. A.

Another illustration may be taken:—

<b>R</b>	Quininæ sulphatis .....	3	Gm. or gr. xlvij.
<b>Base.</b>	Acidi sulphurici diluti .....	4	c.cm. or f3j.
<b>Adjuvant.</b>	Tincturæ cardamomi compositæ..	26	c.cm. or f3vij.
<b>Corrigent.</b>	Elixir aromatici .....	90	c.cm. or f3iij.
<b>Vehicle.</b>	Sig.: Take a teaspoonful with water after meals.		
	July 20, 1900.		

Dr. A.  
For Mrs. O.

The principal object of the addition of the sulphuric acid is to increase the activity of the quinine by changing it into the more soluble bisulphate. The compound tincture of cardamom makes the mixture more acceptable to the stomach, and increases the tonic effect, in which the alcohol, both of the tincture and the elixir, will participate. Where the latter is objectionable, the syrup of the red orange may be substituted for the elixir.

There is no essential difference, as regards their form, between prescriptions for internal remedies and those for topical or local use; for instance, we may write as follows:—

<b>R</b>	Olei tiglii .....	4	c.cm. or f3j.
	Olei amygdalæ expressi .....	7 50	c.cm. or f3ij.
<b>M. Sig.:</b>	For external use. Apply with a camel's-hair pencil, once daily, over a space as large as a silver dollar, as directed.		
	Dr. B.		
<b>R</b>	Acidi gallici .....	4	Gm. or 3j.
	Glycerini .....	30	c.cm. or f3j.
<b>M. ft. solutio.</b>			
<b>Sig.:</b>	Apply, night and morning, to the throat as directed.		
	Dr. C.		
<b>R</b>	Potassi chloratis .....	8	Gm. or 3ij.
	Glycerini .....	30	c.cm. or f3j.
	Extracti geranii fluidi.....	15	c.cm. or f3iv.
	Aquæ rosæ .....	q. s. ad 180	c.cm. or f3vj.
<b>M. et ft. mistura.</b>			
<b>Sig.:</b>	Use as a gargle several times daily, diluting with water if necessary.		
	Dr. D.		

**Time and Interval in Relation to Dosage.**—In addition to the question of dosage and the proper form in which to administer remedies, the problem of the frequency of giving the dose must be decided; and the time of the day, the relation to meal-time, all come up for settlement. The old and prevailing three times daily, or *ter in die*, method of ordering medicine to be taken arose from the natural division of time and the custom of eating a morning, noon, and evening meal. Remedies affecting the stomach directly are usually given when the organ is empty,—that is, before meals,—while digestive agents, to assist the assimilation of food, would properly be administered during the period of digestion. Systemic remedies, in a similar manner, are best given a short time after meals, so as to mix with the

food and be absorbed with it and so enter the circulation. Laxative pills may be taken after the principal meal of the day (dinner-pills), or, if they contain cathartics of a slowly-acting character, they are best given upon retiring at night, so that in case they cause griping it will not give so much pain or inconvenience as if it occurred during the day. On the other hand, salines, such as Rochelle or Epsom salts, or natural purgative waters containing them, are more efficient when taken early in the morning, when the stomach and intestinal tract are not occupied in digesting food, and are thus more directly affected. It is sometimes of importance that the bowels should be moved just before retiring at night; for instance, where there are hæmorrhoids, it is found that they are liable to come down during the act of defecation, and afterward to cause pain and irritation during the time the patient is in the erect posture. In such a case a laxative, such as compound licorice powder, or rhubarb, may be given at an hour in the afternoon which a little experience will determine so as to bring about the desired result. Narcotic and sedative remedies are more effective if given just before the patient is accustomed to sleep: just as bitter tonics intended to excite the appetite should be given a little before the times appointed for the meals. Remedies may be given for a temporary purpose, as where alum and molasses, or an ipecac mixture, is ordered for croup, or preparations ordered for headache, or cough, which are to be discontinued as the symptoms are relieved or the object of the treatment is accomplished. In treating a patient for tape-worm it is considered advisable to have the intestinal tract nearly empty, and the action of the remedy is greatly assisted by a preliminary purging to carry off the mucus which is thrown out as a result of the irritation caused by the parasite. For the administration of a purgative or the removal of a tape-worm the medicine is frequently taken on Saturday night, so as to enable the patient to rest the following day in case of overaction of the drug. When it is desired to evacuate the stomach by an emetic, it is advisable that some warm water or gruel shall be swallowed, so as to moderately distend the organ and give the muscles something to contract upon. On the other hand, when vomiting is not desirable, as when ipecac is administered for dysentery and it is not intended to be rejected by the stomach, the patient should abstain from drinking water before or after taking the medicine. Seasons and locality have some effects upon dosage; in hot weather the system usually does not bear strong medication as well as in winter-time. In some localities, where malaria is rife, antiperiodics must be given in larger doses, and are required in almost every disease. The numerous modifying elements that arise from circumstance and place, or the condition of particular organs, will receive due attention in another part of this work.

The **Modes of Administration**, from a pharmaceutical standpoint, have already been referred to, but a few words remain to be said from the therapeutical or physiological point of view. Remedies produce systemic effects because they enter the blood and become a part of the circulating fluid, or they may occasionally produce an impression upon the peripheral nerves, and thus produce local or remote effects, owing to reflex action. It must also be admitted that disturbances of function, similar to those produced by medicines, may be produced by emotion or mental states. In certain very sensitive subjects, usually hysterical, it has been found, in Charcot's clinic, that the effects can be apparently obtained by "suggestion," without

administration of the remedy. This is very similar in principle to the metallotherapy of Burq and to the tractotherapy of Perkins. The latter has just adverted to will be further discussed in the chapter upon "Hemorrhages and Allied States." For the present we are concerned with the actual physiological action of remedies, which may enter the circulation (1) by the mouth and stomach, (2) by the rectum, (3) by the bladder or vagina, (4) by the skin, (5) by the broncho-pulmonary mucous membrane, and (6) by the veins or capillaries upon granulating surfaces.

1. The **mouth** being the natural channel for the introduction of food for sustenance, it seems the most convenient route for the administration of medicines, and is adopted, as a rule. Nature has placed sentinels in the form of the gustatory nerves and papillae, and innumerable examples have been resorted to in order to enable badly-tasting remedies to pass without exciting repugnance or nausea. Patients differ greatly with respect to their ability to take medicines. Some can take castor-oil with pleasure, others enjoy asafoetida as a condiment to their food; some are so sensitive that they are nauseated even by the idea of taking medicine of any kind. The latter often tax the resources of the pharmacist and physician. In some cases some more suitable channel is found for introducing the remedy. The absorption of medicines is largely by means of the capillaries or small veins, but the lymphatics or lacteals also participate. After entering the blood, the remedies are carried by it into the capillaries of the central nervous system and the various organs of the body. After remaining in the blood for a greater or less length of time, and exerting certain characteristic effects upon the functions of the several organs, these agents may enter the circulation, and be excreted from the system by the emunctories. As a rule, the remedy acts as an excitant or stimulant to the organ by which it is separated from the blood. They are subsequently to be found in the various secretions and excretions, either in their original form or as a derivative of it. The absorption of insoluble substances is dependent upon their being transformed into soluble form; this may be done by the action of gastric juice or the alkaline intestinal juice. In some cases of ingested corrosive poisons the individual may perish from shock, or from spasm of the glottis; but, as the rule, there is sufficient time for absorption of the poison from the alimentary canal before death occurs. When a toxic substance has been swallowed it is important to evacuate the stomach and intestine at once, so as to prevent the continued absorption of the poison.

2. Remedies may be introduced by **enema**,—otherwise called injection, lavement, or clyster. In this instance the mucous membrane of the rectum takes the place of the lining membrane of the stomach. There can be no question with regard to the absorption of remedies by the bowel, since it can be so readily demonstrated. Thus, suppositories of opium produce the usual systemic effects of this drug; quinine, introduced into the rectum, stops intermittent fever; nutritive enemata support life for months; and so on. Injections of starch, with laudanum, are especially useful in the treatment of affections of the rectum or the other pelvic organs, and check secretions, diarrhoea or dysentery. When an enema is to be retained it should be more than from 1 to 4 ounces, according to circumstances; as a lavement or clyster, as large an amount as can be borne by the patient without increasing actual pain may be given,—thus, from 2 to 4 pints may be injected in an adult, from one-eighth to one-fourth this quantity for a child, or

2 ounces for an infant. The instrument used for this purpose is called a syringe. It may be the classical form, with a piston and receiver, the latter being furnished with a tube, through which the fluid is forced when the piston is forced down. The best are made out of hard rubber; those made of pewter or glass are very inferior. In addition to these, we have the soft-rubber tube, terminating in a tube of metal or of hard rubber; in the course of this tube there is a rubber bulb, which, expanding after compression, exercises suction, and, by alternate compression and expansion, forces fluids along the tube. This is a great improvement over the old style, as it is easily operated and can be used as a self-injecting apparatus. The fountain-syringe is simply a rubber bag or receiver, of adequate capacity, terminating in a tube, through which the water flows by force of gravity, when the reservoir is elevated. A pneumatic syringe is also made, in which the solution is placed and is afterward forced through the tube by pumping air into the bottle, reversing the aspirator of Dieulafoy. The ordinary injection used for evacuating the bowel consists of warm water containing some Castile soap in solution. In addition to this, we may add 30 to 60 c.cm. of castor-oil or a teaspoonful or more of oil of turpentine, in order to make the injection more stimulating. Glycerin may be used for the same purpose, from 4 to 16 c.cm. (1 to 4 drachms) being generally sufficient to evacuate the lower bowel. When **gaseous enemata** are administered, the gas diffuses rapidly into the blood, and is excreted by the lungs. It was thought that the introduction of sulphuretted hydrogen in this way might benefit tubercular lesions in the lungs (Bergeon's method); but it has not been found to be of much service, clinically. Anæsthesia for surgical operations may be produced by the injection of the vapor of ether into the bowel; but this method is not devoid of danger and has not met with much favor.

3. The **bladder** or **vagina** may be used for the administration of remedies; but, usually, agents here applied are only intended to act locally. A weak solution of silver nitrate, or of some sedative antiseptic,—boric acid or carbolic acid,—is sometimes resorted to, with excellent effect, in cases of inflammation; but remedies are rarely, if ever, introduced by either of these channels into the system.

4. The **skin**, or general surface, may be utilized in several ways for the introduction of medicines. In the first place, the agent may be simply applied to the surface and kept in contact with the skin,—the **enepidermic method**. Friction may be called to our assistance to force the agent through the skin,—the **epidermic method**. The cuticle may be removed by a blister or other means, and the agent applied directly to the derma,—the **endermic method**. Remedies may be introduced beneath the skin and thrown into the areolar tissue,—the **hypodermic method**. With regard to the first three but little need be said. There are in use a large variety of lotions and liniments, some of which are active counter-irritants, which are used principally for a local effect. At the same time, remedies can be thus made to produce a systemic effect, as where mercurials are applied by inunction; or quinine is used in the same way. Occasionally, medicines applied to the surface for a local effect may produce a general one, as where a belladonna ointment or plaster produces dilated pupils, or croton-oil causes a general eruption. Similarly, remedies injected under the skin will produce systemic effects. The last-named, or hypodermic, method will require a more extended notice.

By the subcutaneous or hypodermic method, remedies in a state of

solution are introduced by means of a small syringe, armed with needle, which is made to perforate the skin. This plan was first brought to the notice of the profession by Dr. Alexander Wood, of Edinburgh, being adopted, soon acquired a remarkable popularity. It has some advantages over ordinary methods, in that it admits of greater precise dosage, since the entire dose rapidly enters the circulation; whereas by the mouth, some may escape absorption. It produces prompt effect, influence being observed in from five to fifteen minutes, which makes it valuable in the case of pain. It combines a local with a general effect. According to Dr. Wood, the injection should be administered as near the site of pain as possible. It is clean, it is convenient, and it is cheap; the patient has it given to him. On the other hand, if an overdose accidentally administered the poisoning must be met by physiological means, since it cannot be withdrawn from the circulation after being injected. The needle be not strictly sterilized, or aseptic, it may communicate infection, and instances have been known of pyæmia and tetanus following the use of the hypodermic needle. The greatest objection of all is that, by its use, some patients acquire the morphine habit, they are apt to become addicted to the little instrument and the effects of the punctures, and soon become confirmed morphinomaniacs. It is the latter consideration particularly which has induced physicians to use the hypodermic needle with great caution, and to refrain from its use whenever the remedy can be given by the stomach.

The hypodermic syringe is usually made of glass, of 1.30 c.c. (twenty minims) capacity, the gradations being engraved upon the barrel by the piston-rod. The needles may be of steel or platinum; if the former, they may be gold-plated. Various modifications have been made in the shape, but the form used by Dr. Robert Koch, of Berlin, has an advantage from an antiseptic stand-point, in that it is free from a piston and plunger. The fluid is sucked up by aspiration, by means of a rubber ball attached to the end of the syringe, and, by compression of the ball, is again forced into the needle. The needle is fitted upon the glass barrel by a carefully ground friction, and the whole instrument can readily be taken apart and washed with antiseptic solutions or treated with hot water. The construction of the syringe is readily understood from the foregoing, but a more extended description can be found in the *Medical Bulletin* of February, 1891, by those especially interested in the Koch treatment. There are numerous makes of hypodermic syringes in the market, and those are to be preferred which can most readily be made aseptic and have the smallest needles. Bartholow, who has paid much attention to this method, recommends a silver-plated instrument having a flat side to the piston-rod, upon which is marked the quantity of solution contained in the barrel. He makes the proper suggestion that, when using such an instrument, it should be carefully tested with a standard minimum-glass, in order to see that it is properly graduated. For convenience of sterilization, hypodermic syringes may now be obtained made entirely of glass. Hypodermic syringes of larger size are also supplied for the administration of diphtheria antitoxin. The instrument must be kept hygienically clean; the needles should be small and sharp, and the syringe frequently washed with antiseptic solution, in order to keep the packing of the piston in good order and prevent it from becoming dry. As regards the solution, it should be chemically pure and made with great accuracy.

not too concentrated. It should be fresh, because a fungus often develops in the course of a few days (*penicillium*), which destroys the alkaloid. Where the syringe is not frequently used it is better to rely upon extemporaneously prepared solutions made with recently-boiled water, and powders, compressed tablets, or triturates containing the desired quantity. Distilled water that is not fresh is not so good as recently-boiled water for making the solutions. Chloroform-water, orange-flower water, peppermint-water, or carbolic-acid solutions will keep for a comparatively long time without spoiling.

In administering a hypodermic injection, a part of the skin free from superficial veins should be selected and the surface washed with soap and water and made surgically clean. The previously-sterilized needle is introduced in a plane nearly parallel with the surface of the surrounding skin. If, when the needle is in position, the piston be pulled out slightly and blood is seen to flow into the syringe, the needle should be withdrawn and another spot selected. Profound narcotism (possibly fatal coma) might result from the injection of morphine directly into the circulation by puncture of a vein. The place being selected,—generally in the outer aspect of the arm or forearm, or on the back,—the skin is pinched up into a fold between the forefinger and thumb of the operator's left hand. The needle is then introduced lengthwise into the fold, which is slightly elevated as the desired amount is injected; the needle is withdrawn from the little wound by a twisting motion, and the puncture rubbed gently with the finger. A small tumor or swelling is caused by the injection, which is dispersed into the cellular tissue by rubbing. No further attention to the puncture is necessary, although, if it be painful, the next day it may be washed with carbolized water (1 to 128), as a local sedative as well as antiseptic, or a lead-water-and-laudanum compress be applied. The following are frequently employed for hypodermic medication:—

Alcohol .....	Dose.	60 to 2	c.cm. or <i>mx-xxx</i> .
Ether .....	"	120 to 4	c.cm. or <i>xxx-lx</i> .
Ammonia (aqua) .....	"	60 to 2	c.cm. or <i>mx-xxx</i> .
Apomorphinae hydrochloridum...	"	004	Gm. or gr. $\frac{1}{16}$ .
Arsenicum (Fowler's Solution) ..	"	12 to 30	c.cm. or <i>mii-v</i> .
Acidum carbolicum (liq. phenol.) ..	"	01 to 13	Gm. or gr. $\frac{1}{6}$ -ij.
Amyli nitris .....	"	20 to 30	c.cm. or <i>miii-v</i> .
Atropinae sulphas .....	"	0005 to 0008	Gm. or gr. $\frac{1}{150}$ - $\frac{1}{100}$ .
Atropinae et morphinae sulphas ..	"	0004 to 0005	Gm. or gr. $\frac{1}{100}$ - $\frac{1}{100}$ atropine.
Caffeinae citras .....	"	0004 to 021	Gm. or gr. $\frac{1}{100}$ - $\frac{1}{100}$ morphine.
		065 to 13	Gm. or gr. i-ij.

R Caffeinae citratis ..... 636 Gm. or gr. *xcvj*.

Glycerini,

Aque ..... aa 15 c.cm. or *f3ss*.

M. Twelve centigrammes are contained in 0.6 cubic centimetres (ten minims contain two grains).

Cocaina hydrochloras ..... Dose, 016 to 065 Gm. or gr.  $\frac{1}{6}$ -j.

R Cocaina hydrochloridi ..... 75 Gm. or gr. *xij*.

Aque aurantii florum ..... 15 c.cm. or *f3iv*.

M. Twenty minims contain one grain.

Curare ..... Dose, 003 to 021 Gm. or gr.  $\frac{1}{30}$ - $\frac{1}{2}$ .

Coninae hydrobromidum ..... " 0015 to Gm. or gr.  $\frac{1}{100}$ .

Chloroformum purificatum ..... " 30 to 1 c.cm. or *mv-xv*.

or Spiritus chloroformi ..... " 120 to 250 c.cm. or *xxx-xl*.

Chloral .....	Dose,  65 to 1	Gm. or gr.
Colchicina .....	"  001	Gm. or gr.
Dubosina sulphas, or hydrobromas .....	"  0004 to  001	Gm. or gr.
Ergota .....	"  13 to  20	Gm. or gr.

R Fluidextracti ergotæ.

Glycerini,

Aquæ.....aa 30 c.cm. or f5j.

M. Sig.: Use 1.20 to 2.0 c.cm. (or twenty to thirty minims) by injection

Hyoscina .....Dose, |0006 Gm. or

R Hyoscina hydrobromidi.....|012 Gm. or

Glycerini .....1 20 c.cm. or

Aquæ .....q. s. ad 6 20 c.cm. or

M. Sig.: 0.30 c.cm. (or five minims) contains 0.0006 Gm. (or  $\frac{1}{100}$  grain)

Hyoscyamina .....Dose, |0006 Gm. or

R Hyoscyamina sulphat .....|03 Gm. or

Aquæ chloroformi .....30 c.cm. or

M. Sig.: 0.60 c.cm. (or ten minims) constitute a dose (0.0008 Gm., or gr.

Hydrargyrum (see article "Hydrargyrum," in Part II).

Morphina sulphas .....Dose, |01 to |03 Gm. or g

R Morphina sulphat .....|50 Gm. or g

Phenolis liquefacti .....20 Gm. or f

Aquæ .....30 c.cm. or f

M. Sig.: 0.60 c.cm. (or ten minims) equal 0.01 Gm. (or gr.  $\frac{1}{60}$ ). Powders  
sules may also be used.

R Morphina sulphatis .....25| Gm. or g

M. et divide in chartæ vel capsellæ no. xxiv. Each contain 0.01 Gm. (or  
To be used for making an extemporaneous solution.

Quinina hydrobromidum.....Dose, |065 to |65 Gm. or g

R Quinina hydrobromidi.....1|50 Gm. or g

Aquæ destillatæ .....30 c.cm. or f

M. Sig.: 0.60 c.cm. (or ten minims) contains 0.065 Gm. (or one grain) of q

R Quinina sulphovinatis .....8 Gm. or g

Aquæ chloroformi .....15 c.cm. or f

M. Sig.: 0.60 c.cm. (or ten minims) contains 0.32 Gm. (or five grains).

The quinina bimuriata carbamidata, the double chloride of quinine and r  
soluble in an equal part of water, and is very suitable for hypoderm

Scopolamine (same as Hyoscine).

Strychnina .....Dose, |001 Gm. or gr.

R Strychnina sulphatis .....|015 Gm. or gr.

Acid. acetic, dil., q. s. ad solve.

Aquæ creosoti .....q. s. ad 15 c.cm. or f3i

M. Sig.: 1.20 c.cm. (or twenty minims) contains 0.001 Gm. (or gr.  $\frac{1}{60}$ ) of a  
nine.

Many other instances of eligible forms for the administration of c  
hypodermically will be found, in the following pages, specially ment  
under the drugs concerned.

**Parenchymatous injection** is a form of hypodermic injection in v  
the solution is thrown deeply into the tissues instead of merely under  
skin. It is employed in cases of neuralgia to deposit the remedies cl

in contact with the affected nerve. Bartholow formerly used chloroform in this way, with marked benefit in cases of sciatica. Bichloride of mercury has been injected into the lung-tissue in the treatment of acute and chronic pneumonitis. Liquefied phenol, or tincture of iodine, has been injected into the cavity of the tunica vaginalis testis in the treatment of hydrocele; and acetic acid and ergot have been thrown into the substance of various new growths. Ether has caused the disappearance of sebaceous tumors when injected into their interior, and parenchymatous injections of cocaine are used as a local anæsthetic for small surgical operations. Insoluble preparations of mercury, like grey oil and calomel, are much used in France, in the treatment of syphilis. The injection is made into the gluteal muscles, and is very slowly absorbed.

5. By **inhalation**, remedies may be introduced, through the route of **bronchial mucous membrane**, into the blood. Although rarely employed, except for producing surgical anæsthesia, this method promises, in the future, to play a more important part in therapeutics. The remedies may be in the gaseous form, as where oxygen or nitrous oxide is administered; they may be in a vapor, and inhaled with steam; or made into a spray with the atomizer, and thus inhaled; or they may be used in fumes, as where tar or asthma pastilles are burnt, or sulphur or mercury vaporized. Concerning the extravagant hopes that have lately been raised (especially in the treatment of pulmonary consumption) of the bactericidal effects of inhalations, the results have not been very favorable. When the smaller bronchial tubes and air-cells and their walls are filled with bacteria the only antiseptic that can reach them is the opsonin contained in the blood and more particularly that contained in the healthy white blood-cell. At the same time salicylic acid and other agents are capable of being introduced into the bronchial tubes, and, by liquefying and favoring the expulsion of the secretions and making them less septic, they are capable of affording much relief to the patient and retarding the progress of the disease, if not hastening the cure. Hay fever is much relieved by applications of cocaine and inhalations of weak solutions of quinine; a similar treatment may sometimes be devised for acute and chronic pulmonary affections. For the production of a fine spray by mechanical action, instruments known as atomizers are used. Hand-atomizers consist of bulbs, which, by compression, deliver a blast of air through a tube past a capillary orifice in another tube, the latter being partially immersed in water or other desired solution. The blast of air produces a partial vacuum, and the fluid ascends the tube until, escaping by drops, it is blown into fine spray at right angles to the extremity of the tube. This is a very convenient instrument for small quantities of medicated solutions. When the quantity is larger the hand would become tired, and steam may be resorted to, or we may use compressed air by means of an air-pump. Some very neat and even ornamental forms of the latter have been devised by ingenious instrument-makers, and they may now be met with in the offices of all physicians who pay special attention to treatment of diseases of the throat or lungs.

6. The **intravenous administration** of medicine is the most direct method at our command of obtaining prompt physiological effects from our remedies. The transfusion of blood is an ancient therapeutic device, and it naturally suggested the employment of remedies in the same manner. In the collapse of cholera, intravenous saline injections have saved numerous

lives that were apparently in a hopeless condition. The formula by Hayem is:—

Sodium sulphate .....	25	Gm. or g
Sodium chloride .....	5 30	Gm. or g
Sodium hydrate .....	1	Gm. or g
Water .....	90	c.cm. or f

This should be filtered and brought to the temperature of the blood surface, or not more than 100° F. Of such a solution as much as 1 quart have been used at one operation, but, as a rule, 1 quart will be sufficient. It is important to inject the fluid slowly, so as to imitate the blood-current. Solutions of sodium phosphate and chloride (specific about 1020) have also been employed with success. The late Dr. employed the latter solution in the treatment of diabetic coma with able improvement after 26 ounces (imperial) had been thus used. In case of collapse from hæmorrhage, milk has been employed by a number of authors, with gratifying results. Halford, of Australia, has shown that a wound from a venomous snake, the intravenous injection of aqua ammoniac fortior (1 part) with aqua destillata (2 parts) is well borne and the system in sustaining itself under the effects of the poison, although not be directly antidotal, as was at first supposed. J. T. Eskridge used diluted aqua ammoniac fortior, injected into the vein of the arm, with bad consequences and with recovery of the patient, who had been asphyxiated with hydrogen sulphide. It is also of service in thrombosis of the pulmonary artery, chloroform asphyxia, hydrocyanic poisoning, etc. The danger of admitting air into the vein is not very great and its evil consequences have been greatly exaggerated: however, it may readily be averted with a little care. It is hardly necessary to add that the lancet, and, in fact, the instruments should be surgically clean, and that every antiseptic precaution should be scrupulously observed.

**Transfusion of blood** has been performed many times, and many modifications of instruments have been invented to accomplish it. The trouble is that, when the emergency arises, the instruments are not at hand except in a large general hospital, and the practitioner must extemporize a transfusion apparatus out of a 4- or 6-ounce syringe and a rubber glass tubes. **Immediate transfusion** is where the blood flows from the donor blood-vessel into the recipient's, through a tube which had been previously filled with an antiseptic solution. A syringe may be introduced, so as to measure the amount of blood, as in the instrument of Martin, of London. The instrument of Aveling, of London, is simply a rubber tube with a bulbous enlargement in the middle. The capacity of the bulb is 2 drs. Silver cannulas are placed at the ends of the tube, which is about 12 inches in length. Each cannula is guarded by a stop-cock, and the ends are beveled or rounded, so as to facilitate the insertion. The mode of operation is to carefully cleanse the apparatus by immersion in warm, recently boiled water. The air is entirely expelled, and a warm saline solution used to completely fill the tube. The veins of the donor and recipient being selected generally in front of the elbow,—the incision is made with a scalpel. The tube inserted into each, and held in place by the fingers of an assistant, preference to a ligature. Now, the stop-cocks being turned, the tube

pinched on the side toward the donor, and the fluid is forced onward; the efferent tube is then pinched, and the bulb allowed to slowly refill, when it is again emptied and again refilled, until the proper quantity of blood (6 to 8 ounces usually) has been delivered. The apparatus is then withdrawn, a ligature placed upon the veins, and a proper dressing applied.

In **mediate transfusion** the blood is drawn into a warm bowl, beaten or whipped with sterilized straw to remove the fibrin and prevent subsequent clotting; then the blood is taken up into a previously warmed syringe and slowly injected, through a cannula, into the vein, the median basilic generally being chosen for the purpose. In this way repeated charges may be slowly and gently delivered, but, as Bartholow taught, from 4 to 8 ounces of blood will usually be sufficient to strengthen the heart and avert threatened collapse. The use of lambs' blood was advocated by Gesellius and others, but the transfusion was generally followed by a rigor and sweating, which greatly prostrated the patient, and it is no longer practiced.

Transfusion has been performed in phthisis and other chronic diseases without benefit. It is of greatest service in acute emergencies, such as severe hæmorrhage (traumatic or post-partum), hæmatemesis, intestinal hæmorrhage, epistaxis, etc. In the hæmorrhagic diathesis it has been successfully used by Dr. Buchser, of New York, but it has failed in simple anæmia. In acute poisoning by phosphorus, or carbonic oxide, transfusion has been resorted to successfully by a number of clinicians. A modification of this method has been proposed by Albanese and Hueter in **arterial transfusion**. In this method an artery of one of the extremities is selected and divided (generally the radial or posterior tibial being taken), and the blood is injected just as in mediate transfusion. The advantage sought for is the prevention of clotting and the danger of embolism, and that there is less danger of the introduction of air. Where a large quantity is to be injected, it might be better to employ this expedient, so as to avoid any danger of suddenly overwhelming a weak heart. The effects following the **transfusion of milk** have been found to be very much the same as those from the use of blood, except that albuminuria is more apt to follow. When milk is used it should be taken directly from the cow or goat, and after being carefully strained, without being allowed to cool, it should be gradually introduced into the circulation by means of the syringe and cannula. The results, in some cases, of the treatment after hæmorrhage have been to warrant further trial. At the same time, the report of those who have gone over the entire subject critically is that nothing can be a complete substitute for human blood for the purpose of transfusion. The later plan of injecting a quantity of blood into a large serous sac like the peritoneum, as recommended by Ponfick, has found few followers, and, whereas some good results have been reported, others have occurred in which death resulted from peritonitis.

The introduction of large quantities of water or of normal salt solution into the peritoneal cavity or under the skin has been followed by excellent results in the collapse of cholera and after hæmorrhage. It will be considered fully under the title "Hypodermoclysis."

Medicines may be applied **topically** to wounds and granulating surfaces, or injected into suppurating cavities. The fact that such agents may be absorbed and produce systemic poisoning should lead us to be careful in applying carbolic acid, corrosive sublimate, or other active antiseptics which have powerful toxic effects upon the human organism. By what is called

**galvanic cataphoresis** medical solutions may be made to pass through skin, and directly into the tissues and the blood (see **Electrotherapy**).

**Idiosyncrasy: Individual Peculiarities Affecting the Dosage of Administration of Drugs.**—Personal peculiarities on the part of patient, as regards the effects of remedies, often cause serious error to the prescriber. They are usually attributed to **idiosyncrasy**, but this is merely a term wherewith to hide our ignorance of the real cause. One of the puzzles of experimental therapeutics is the occasional difference in the action of remedial agents in different species of animals.—*e.g.*, man and dog are very slightly affected by opium and are not injured by a quantity which would be fatal in man; a deer can eat tobacco, or a rabbit belladonna without producing toxic effects. Something of a similar character is observed among patients. It is simply impossible to anesthetize some patients with ether, and we are obliged, in such cases, to resort to chloroform when a surgical operation is required. There is also a great difference with regard to susceptibility to the effects of alcohol; some persons are easily overcome by it, and quickly rendered helpless and unconscious; others can take very large amounts, and, while showing its physiological effects by inebriation, are not discommoded by it to the extent of losing control of themselves. Sometimes we encounter individuals who are rendered very uncomfortable by calomel, even a small dose bringing on neuralgia or gouty pains in the joints; others require quite large doses to produce any effects at all. Cinchona and its alkaloids (quinine, cinchonine, quinidine, etc.) sometimes cause disturbance of digestion and eruptions upon the skin, even purpura hæmorrhagica; cases of the latter having been reported by Dr. Woodbury.<sup>1</sup> The objections to taking quinine sometimes encountered, however, are probably due to ignorantly confounding it with other agents, such as mercury. Some patients cannot take colchicum at all; others can use it in large doses with good results. Opium and its alkaloids, morphine especially, are often productive of unpleasant consequences; and, instead of soothing a patient by producing sleep, they occasion excitement, restlessness, headache, irritation of the skin (followed by vomiting and prostration), or an eruption resembling urticaria or erythema. In the same way, potassium iodide, even in small doses, occasions severe coryza in some patients, while in others a vesicular or bullous eruption appears, resembling varicella or variola. The expected prostration and symptoms of poisoning have occasionally followed the administration of ordinary doses of chloral-hydrate, the cases terminating fatally, in spite of everything that could be done. This occurs frequently from chloroform that its use as an anæsthetic has been abandoned by many surgeons, or employed only with great caution. Iodoform, used as a surgical dressing, even, may cause poisoning in certain susceptible persons. The new aromatic compounds—antipyrin, acetanilide, sulphonal, etc.—occasionally excite a peculiar train of toxic effects, for which, as yet, no explanation, except idiosyncrasy, has been given. On the other hand, it is sometimes necessary to give large doses of quinine, opium, calomel, chloral, or potassium iodide, in order to produce a desired, or positive, therapeutic result. When such unpleasant effects forbid the employment of a remedy, it becomes necessary to resort to a substitute, or **succedaneum**, as it is called, but

<sup>1</sup> *Philadelphia Medical Times*, Sept. 18, 1880.

similar therapeutic effects without the objectionable features of the former agent.

From all that has been said in the preceding pages, the explanation is easily given of the reason why the dose of a drug cannot be stated with the same definiteness as its specific gravity, for instance. While we can say that a certain quantity is a customary or usual dose, and that a larger quantity is the maximum dose, which, under ordinary circumstances, it is not well to exceed, at the same time we may find patients who cannot take even the ordinary dose without great discomfort, and others who actually require extraordinarily large doses before obtaining the anticipated therapeutic result. The Committee on Revision has introduced the average or medium therapeutic doses into the Pharmacopœia; but has very wisely avoided the mention of maximum dosage. It is customary, when a very large dose is indicated in a prescription, for the pharmacist to ascertain from the physician if the dose was intended, or was due to a mistake, owing to haste or to misinterpretation while writing it. Physicians can save delay, in a case where a large dose is intentional, by underlining it or putting a star after it, to indicate that notice has already been taken by the author of the prescription, and it is not necessary to call it to his attention again.

**Prescribing for Children.**—If the doses for adults are subject to such variation and uncertainty, it is evident that any calculation by mathematical formula of the dose for a child at any given age, based upon the adult dose, must be unreliable. Several such schemes have been proposed. Thus, Dr. Young's plan was to diminish the dose in the proportion of a fraction whose numerator is a figure representing the child's age and the denominator the age of the child increased by 12. The rule would therefore be: Multiply the adult dose by a figure corresponding to the years of a child's age and divide by the age plus twelve. Thus, if a child's age is 6 years and the adult dose 20 grains, we have the following formula:—

$$20 \times \frac{6}{6+12} \text{ or } \frac{1}{3} = 6\frac{2}{3} \text{ grains.}$$

The fact that the development of children depends upon other factors than age is sufficient to show the fallacy of this scheme, especially if we remember that some children, like adults, are very susceptible to medicines. A somewhat more rational plan than the preceding is based upon the weight of the child, which is taken as the numerator of a fraction whose denominator is 140, which is arbitrarily taken as the average adult weight. Inasmuch as many circumstances besides the age and weight of an individual affect the question of dosage, and as this is even more evident in prescribing for children than among adults, we cannot advocate any such mathematical formula for ascertaining the dose for children. Caution should be observed in prescribing narcotics to very young children; a single drop of laudanum has caused the death of an infant, while, on the other hand, they may bear, without injury, relatively large doses of belladonna, conium, arsenic, and mercury. Ptyalism should never be intentionally set up in children by excessive use of mercury, because it may be followed by inflammation and sloughing of the lips and cheek and other serious lesions. In writing a prescription for a child it is sometimes of advantage for the pharmacist to know the fact, which may be indicated by addressing it "for baby," or "for Willie or Mary," or simply "for Mr. Blank's child."

In concluding this part of the work, the following table will be useful in reading and writing prescriptions:—

LATIN TERMS AND PHRASES EMPLOYED IN PRESCRIPTIONS.

WORD OR PHRASE.	USUAL CONTRACTION.	ENGLISH EQUIV.
A or Ab (prep. with ablative)	A or Ab	From or Out of.
Ad (with accusative)	Ad	To or Up to.
Adde	Add	Add.
Ad duas vices	Ad 2 vic.	In two takings or d
Ad tertiam vicem	Ad 3 vic.	At three takings or
Ad libitum	Ad lib.	At pleasure.
Absente febre	Abs. feb.	Fever being absent.
Adstante febre	Ad. feb.	Fever being present
Adhibendus	Adhib.	To be administered.
Admove	Admov.	Apply.
Aliquot	Aliquot	Several.
Alternis horis	Alt. horis	Every second hour.
Alvo adstricta	Alv. adstrict.	The bowels being b
Ana	aa or aa.	Of each.
Ante cibum	Ante cib.	Before food.
Aqua astricta	Aq. astr.	Ice.
Aqua bulliens	Aq. bull.	Boiling water.
Aqua destillata	Aq. dest.	Distilled water.
Aqua ex flumine	Aq. ex flum.	River water.
Aqua fervens	Aq. ferv.	Hot water.
Aqua fluvialis	Aq. fluv.	River water.
Aqua fontis or fontana	Aq. font.	Spring water.
Aqua pluvialis	Aq. pluv.	Rain water.
Aqua pura	Aq. pur.	Pure water.
Bene	Bene	Well.
Bis in die	Bis die or Bisind.	Twice daily.
Bougia	Boug.	A long suppository o
Bulliat	Bull.	Let it boil.
Capiat	Cap.	Take.
Caute	Caute	Cautiously.
Cibus	Cib.	Food or Meal-time.
Cochleare magnum	Coch. mag.	A tablespoonful.
Cochleare medium	Coch. med.	A dessertspoonful.
Cochleare parvum	Coch. parv.	A teaspoonful.
Cola or Coletur	Col. or Colet.	Strain.
Collyrium	Collyr.	An eye-wash.
Coloretur	Coloret.	Let it be colored.
Compositus	Co. or Comp.	Compound.
Congius	Cong.	A gallon.
Continuantur remedia	Cont. rem.	Continue the medicin
Coque, Coquantur	Coq.	Boil.
Cras, Crastinus	Crast.	To-morrow.
Cras mane sumendus	Cras mane sum.	Take to-morrow mor
Cujus	Cuj.	Of which, of any.
Cujus libet	Cuj. lib.	Of any you please.
Cum (with ablative)	Cum	With.
Cyathus	C. or Cyath.	A glass.
Cynthus vinarius	C. vin.	A wine-glass.
Debita spissitudo	Deb. spiss.	Proper consistence.
Decubitus	Decub.	Lying down (or A be
De die in diem	De d. in di.	From day to day.
Diebus alternis	Dieb. alt.	Every second day.
Diebus tertius	Dieb. tert.	Every third day.
Dilue, Dilutus	Dil.	Dilute, diluted.

WORD OR PHRASE.	USUAL CONTRACTION.	ENGLISH EQUIVALENT.
Dimidius	Dim.	One half.
Divide	Div.	Divide.
Dividatur in partes <sup>æquales</sup>	Div. in par. æq.	Let it be divided into equal portions.
Donec alvus soluta fuerit	Donec alv. sol. ft.	Until bowels are open.
Dosis	D.	Dose.
Drachma	Dr. or ʒ	A drachm.
Durante dolore	Dur. dolor.	During pain.
Eadem	Ead.	The same.
Ejusdem	Ejusd.	Of the same.
E or Ex	E.	Out of, from.
Fac or Fiat	F. or ft.	Make, or let be made.
Fac pilulas duodecim	F. pil. xij.	Make 12 pills.
Fervius	Ferv.	Hot.
Fiant chartulæ duodecim	Ft. chart. xij.	Let 12 papers be made.
Fiant pilulæ duodecim	Ft. pil. xij.	Let 12 pills be made.
Fiat emplastrum	Ft. empl.	Let a plaster be made.
Gargarisma	Garg.	A gargle.
Gradatim	Grad.	By degrees.
Gutta, Guttae	Gtt.	Drop or Drops.
Guttatim	Guttat.	By drops.
Hauftus	Haust.	Draught or Potion.
Horâ decubitus	Hor. Decub.	Bed-hour.
Horâ somni	Hor. som.	Hour of sleeping.
Horæ unius spatio	Hor. 1 spat.	One hour's time.
Idem	Id.	The same.
In dies	Ind.	Daily.
Infrico	Infr.	To rub in.
Infusa	Inf.	Let it infuse or steep.
Intime	Int.	Thoroughly.
Jus	Jus.	A broth (juice).
Linimentum	Lin.	A liniment.
Lotio	Lot.	A lotion.
Macero	Mac.	To macerate.
Magnus	Mag.	Large.
Mane	Mane	In the morning.
Mane primo	Man. prim.	First thing in the morning.
Medicamentum	Med.	A medicine.
Mica panis	Mic. pan.	Crumb of bread.
Minimum	M. or Min.	A minim.
Misce	M.	Mix.
Mitte	Mitt.	Send.
Mitte decem tales	Mitt. x tal.	Send 10 such.
Modicus	Mod.	Moderate-sized.
Modo præscripto	Mod. præsc.	In the manner written.
Mollis	Moll.	Soft.
Morbis	Morb.	A sickness.
More dictu	Mor. dict.	In the manner directed.
More solito	Mor. sol.	As accustomed.
Ne tradas sine nummo	Ne tr. s. num.	Collect on delivery.
Nocte maneq	Noct. maneq.	Night and morning.
Nomen proprium	Nom. prop.	The proper name.
Non repetatur	Non. repetat.	Let it not be repeated.
Octarius	O., Oct.	A pint.
Omni horâ (or Omnis horis)	Omn. hor.	Every hour.
Omnibus alternis horis	Omn. alt. hor.	Every second hour.
Omni bihoris	Omn. bih.	Every two hours.
Omni quadrante horæ	Omn. ¼ h.	Every fifteen minutes.
Omni mane vel nocte	Omn. mane vel noc.	Every morning or night.
Optimus	Opt.	Best.
Partes æquales	P. æq.	Equal parts.
Parvulus	Parv.	Small.

WORD OR PHRASE.	USUAL CONTRACTION.	ENGLISH EQUIVALENT.
Penicillum camelinum	Penicil cam.	Camel-hair pencil.
Per (accusative case)	Per	Through or By.
Phiala prius agitata	P. p. a.	The bottle being first shaken.
Post (accusative)	Post	After.
Pro (ablative)	Pro	For or According to.
Pro ratione ætas	Pro rat. æt.	According to patient's age.
Pro re nata	P. r. n.	As occasion arises.
Quantum libet	Q. lib.	As much as pleases.
Quantum sufficiat	Q. suff.	As much as suffices.
Quaque hora	Qq. hor.	Every hour.
Quoque	Quoq. or Q.	Also.
Quotidie	Quotid.	Daily.
Recipe	R	Take.
Redactus in pulverem	Red. in pulv.	Powdered.
Repetatur	Repetat.	To be repeated.
Scrupulum	Scrup. or ℥	A scruple (20 grains).
Secundum artem	Sec. a.	According to art.
Semi or Semisse	Ss.	A half.
Semihora	Semih.	Half an hour.
Sesqui	Sesqui.	One and a half.
Signa	Sig.	Write.
Simul	Simul	Together.
Sine	Sin.	Without.
Singulorum	Sing.	Of each.
Si opus sit	Si op. sit	If need exists.
Solve	Solv.	Dissolve.
Statim	Stat.	Immediately.
Stet or Stent	St.	Let it (or them) stand.
Subinde	Subind.	Frequently.
Succus	Suc.	Juice.
Sumat talem	Sum. tal.	Take one such.
Sume	Sum.	Take.
Talis	Tal.	Of such.
Tere	Tere	Rub.
Ter in die	T. i. d.	Thrice daily.
Tritura	Trit.	Triturate or Grind.
Tussis	Tus.	Cough.
Ultimus Præscriptus	Ult. præsc.	The last ordered.
Ut dictum	Ut dict.	As directed.
Vel	Vel	Or.
Verus	Ver.	Genuine.
Vesper	Vesp.	The evening.
Vitellus	Vitel.	Yolk of an egg.

### POISONS AND ANTIDOTES.

A general formula for administration in cases of poisoning by an unknown agent is sometimes useful as a sort of universal antidote. Dr. Murrell recommends the following combination:—

℞ Liquor ferri sulphatis (ad saturandum) . . . . .	100
Aquæ . . . . .	800
Magnesiæ . . . . .	88
Carbonis animalis purificatæ . . . . .	40

The iron solution is to be kept separate from the mixture of calcined magnesia and animal charcoal until wanted, and then the ingredients should be put in a bottle and well shaken together. The solution should be drunk

the insoluble ingredients are in a state of suspension. A wineglassful 3 or 4 times, frequently repeated.

The following table is placed here for convenience of reference; for further details of treatment the reader is referred<sup>1</sup> to the paragraphs relating to the effects and antidotes under the individual titles in the section devoted to drugs.

*Poisons.**Treatment.*

Acetonitrile, Aspirin.	{ Diffusible stimulants, hot alcoholic drinks, hot coffee, stimulating enemata, hypodermic injections of atropine, digitalis, or nitroglycerin.
Alkalies:— Soda, Sodium chloric, Potash, Lime, Phosphoric, Sulphuric, Tartaric.	{ Magnesia, chalk, dilute solutions of alkaline carbonates (soap, tooth powder). Demulcents: milk, albumin, oils. (For hydrocyanic acid the treatment is the same as for cyanide of potassium.)
Acids:— Sulphuric potash, Concentrated lye, Soda, Lime, Ammonia, etc.	{ Vinegar, dilute acids, lemon-juice. Demulcents: milk and oil, flour and water, etc. Opium, morphine, and atropine to relieve symptoms.
Analgesics.	{ Finely divided animal charcoal, tannic acid, coffee.
Asphyxiating vapors and gases:— Ammonia, Hydrogen, Chlorine, Sulphur, Carbonic oxide (CO), Carbon dioxide (CO <sub>2</sub> ), Charcoal fumes, Coal gas, Fur-damp, Choke-damp, Marsh gas, Hydrogen sulphide.	{ Fresh air, oxygen inhalations, artificial respiration. Intravenous injections of ammonia. Transfusion of blood.
Antidotes.	{ Diffusible stimulants, tannic acid, coffee or tea infusion, alcohol, ammonia. Hypodermic injections of digitalis, strophanthus, atropine, or amyl nitrite. Hot pack. Faradization.
Antidotes.	{ Coffee, ammonium acetate, strychnine, stimulating enemata, catheterization, stomach-pump.
Antidotes.	{ Artificial respiration, inhalation of ammonia or amyl nitrite, faradization, inversion of the body.
Antidotes.	{ Tannic acid, albumin, milk, and demulcents, with hypodermic injections of morphine and atropine.

For further information concerning poisons and their antidotes the reader will find the individual drugs in Part II. He also will find Dr. Murrell's little book, "What to Do in Case of Poisoning," very convenient for reference.

Apomorphine.	{ Chloroform mixture; digitalis hypodermically. Diluents and stimulants.
Arsenic.	{ Freshly-precipitated hydrated sesquioxide of iron, ferric hydrate in a moist and pulpy state (a table-spoonful to each grain of poison), or hydrated oxide of iron with magnesia, or dialyzed iron. Animal charcoal, magnesia levis, with opium to relieve pain and vomiting or diarrhœa. Demulcents.
Atropine. (Belladonna).	{ Fixed alkalies. Caffeine, or fresh infusion of coffee or tea, artificial respiration. Morphine, cautiously given, physostigmine, muscarine, and pilocarpine are physiological antidotes.
Belladonna.	{ (See atropine.)
Brucine.	{ Same as for strychnine.
Calabar bean. (Physostigmine).	{ Stimulants, fixed alkalies, atropine hypodermically, artificial respiration.
Cannabis Indica.	{ Atropine.
Cantharides.	{ Opium, demulcent drinks, saline cathartics. Avoid oils and fats.
Carbolic acid.	{ Soluble sulphates, saccharated lime, stimulants and anodynes. Alcohol. Glycerin.
Chloral.	{ Hot infusion of tea or coffee, strychnine hypodermically, warmth and exercise.
Cinchona (Quinine, Cinchonine, Quinidine, etc.).	{ Tannic-acid and astringent infusions: iodine forms insoluble compounds with the alkaloids. Morphine and atropine hypodermically.
Codeine.	{ (See opium.)
Colchicum.	{ Opium, stimulants, astringents.
Conium.	{ Alkalies, astringents, strychnine hypodermically.
Copper.	{ Morphine, albumin, demulcents.
Corrosive sublimate.	{ Albumin, atropine, and morphine.
Croton-oil.	{ Opium, stimulants, astringents.
Curare.	{ Strychnine and atropine, oxygen inhalations, artificial respiration.
Cyanide of potassium. (Hydrocyanic acid).	{ Artificial respiration, ammonia inhalations. Cold affusions to the spine, transfusion of blood. Ether hypodermically.

Digitalis.	{ Opium, nitroglycerin solution.
Gelsemium.	{ Atropine, strophanthus, hot alcoholic stimulants, hypodermic injections of ether.
Lead salts.	{ Magnesium sulphate, opium, potassium iodide. Baths.
Lobelia.	{ Morphine, strychnine, strophanthus, stimulants.
Mercurials.	{ (See also corrosive sublimate.) Albumin, demulcent drinks, opium or belladonna.
Muscarine (Mushrooms).	{ Stimulants and cathartic agents, atropine hypodermically, with morphine, if needed.
Nitrites:— Amyl, Sodium, Nitroglycerin.	{ Stimulants, digitalis, atropine, artificial respiration, hot and cold douches, ergot.
Opium (Morphine, Codeine).	{ Emetics or stomach-pump, coffee, exercise, friction or flagellation, caffeine by the rectum, atropine hypodermically, faradization, artificial respiration, warmth, permanganate of potassium.
Phosphorus.	{ Old oil of turpentine; sulphate of copper. Avoid oils and fats. Transfusion of blood.
Picrotoxin.	{ Chloral, bromides, morphine.
Pilocarpine.	{ Atropine and morphine hypodermically, stimulants.
Savin.	{ Soluble sulphates, demulcents, anodynes.
Silver nitrate (Lunar caustic).	{ Table-salt, chlorides, demulcents, potassium iodide.
Snake-venom.	{ Ligature of limb. with application or cupping glass or caustic alkali. Ammonia inhalation, stimulants. Artificial respiration. Heat to surface. Solution of potassium permanganate injected into the wounds. Digitalis or ammonia hypodermically.
Strychnine.	{ Chloral, potassium bromide, chloroform by inhalation, alkalies, tannin, alcoholic stimulants.
Tobacco.	{ Strophanthus, hot applications, and cardiac stimulants; strychnine hypodermically.
Turpentine, oil of.	{ Magnesium sulphate, demulcents, opium.
Veratrine.	{ Diffusible stimulants, caffeine; rest in recumbent posture.
Zinc salts.	{ Sodium carbonate and demulcents; anodynes if needed.

### GENERAL THERAPEUTICS.

**THERAPEUTICS** is the application of knowledge to the treatment of the sick. It comprises in its widest scope everything relating to the prevention, cure, or alleviation of disease. The special pharmaceuticals employed in the treatment of sickness in the human subject, taken together, constitute the *Materia Medica*. Among these are many inorganic elements and their compounds; but by far the larger proportion is made up of organic substances, especially certain vegetable structures. Crude drugs and their derivatives form the principal part of the two main classes of official pharmaceutical preparations. A smaller portion is supplied by animal bodies, such as the organic extracts, antitoxins, diaphoretics, ferments, etc.

The drugs and preparations which constitute the United States Pharmacopœia are, in this country, spoken of as official. All other remedies are unofficial. In the following pages the remedies of the British Pharmacopœia are also systematically considered, but these are only official in the British standard authority governs. The official remedies represent a select class of therapeutic agents, the value of which has been established by careful investigation and clinical experience. The results of the diligent work of the Committee on Revision of the United States Pharmacopœia deserve high appreciation.

The *Materia Medica* does not represent the sum-total of the resources of modern medicine. In addition to his knowledge of the action of drugs, the physician must understand the value of hygienic measures, which greatly to the comfort of the patient and facilitate his recovery. The human body is an assemblage of organs designed collectively as a mechanism for the transformation and evolution of energy. The activity of the vital forces gives the living body recuperative power which, when properly directed, tends to restore disturbed functions to their normal conditions. A knowledge of physiology often enables the physician to anticipate Nature's methods and to place the patient under circumstances most favorable for his recovery.

Modern therapeutics is not based upon mere theory, but upon a scientific foundation of physiologic experiment and clinical experience. Pharmacology is affiliated with the other natural sciences, and its facts, which are determined by true scientific methods, are capable of demonstration in the laboratory and clinically. They also agree with the general experience of mankind. In his early struggles for existence man learned by accident the medicinal qualities of mineral springs and some vegetable substances. In the course of centuries the effects of these drugs became thoroughly established by experience, and their application to bodily disorders better defined. It is to be noted that these actions of drugs upon the human body and its functions are elementary facts and are essential characters of the substances in question. They are supported by the character of evidence as the statement that sugar tastes sweet or quinine is bitter. They are true biochemical phenomena or physiologic reactions.

The influence of the mind upon the body, especially during the action of strong emotions or of subconscious attention, is fully recognized by pathologists and clinical observers, as a cause of disordered function, as aphonia, paralysis of sensation or motion, and various neuroses. It

been shown by experience that, frequently, such cases may be cured by suggestion, or by simply acting on the mind of the patient. The practical lesson to be learned is that the mind is a powerful factor in causing or intensifying disturbances of the body, and, on the other hand, is a very valuable adjunct in therapeutics. The eminent Dr. Rush appreciated this so highly that he always, when giving a remedy to a patient, took particular care to impress upon the individual's mind the effects which he expected to follow its administration. This practice is now followed by many, who are acknowledged to be the most successful exponents of modern medical science.

It has often been observed that among patients of highly developed nervous organization the administration of some almost inert remedy, or even the use of some mysterious agent (such as Perkins's tractors, Haycraft's imitation tractors, the iron ring for rheumatism, the horse-chestnut or potato carried in the pocket for other disorders, amber necklaces for fits, etc.) may be followed by apparently marvelous results. The eminent American surgeon, Joseph Pancoast, in lecturing to his class, pointed out that some patients suffered discomfort or disease, without having any bodily lesion; but he insisted upon the clinical fact that, whether a man be sick in his body or in his mind, he is sick, and appropriate treatment should be administered, physics for the bodily sick; psycho-therapy for the mentally afflicted.

There can be no success in therapeutics without recognizing the importance of the psychological factor in disease. Sometimes a sudden mental shock will restore speech to an aphonic patient, or it may be expectant attention alone that accomplishes the result. Sir Humphry Davy reported an interesting case of a paralytic patient, who remarked, after experiencing the novel sensation of having a clinical thermometer placed under his tongue, that he felt better. Upon repeating the procedure daily he steadily improved, and fully recovered at the end of a fortnight without any other treatment.<sup>1</sup> Patients of neurotic ancestry, without being actually insane, often have delusions, or morbid fears, about their health. In such cases, what is called the moral treatment is of the highest importance. In order to obtain the best results in therapeutics, it is essential that the physician should use every proper means to secure the confidence and co-operation of his patient. Expectant attention is acknowledged to be a powerful therapeutic adjunct. Suggestion undoubtedly has a strong influence, and is a factor in therapeutics to be reckoned with.

Disease is frequently caused or maintained by certain states of the blood.<sup>2</sup> These may be provisionally divided into three classes. 1. Those in which there is a diminution or absence of certain principles in the blood which are necessary for cell-development and metabolism. Thus, a peculiar morbid condition (cachexia strumipriva) has been observed to follow removal, or destruction by disease, of the thyroid gland, apparently because the blood is deprived of some important constituent or internal secretion which this gland elaborates and which is necessary to health. This con-

<sup>1</sup>On Superstitions Connected with the History and Practice of Medicine and Surgery. By Thomas Joseph Pettigrew. Philadelphia, 1844.

<sup>2</sup>Abstracted from an address on "Our Therapeutics," delivered by the author before the Ohio State Medical Society. *Journal of the American Medical Association*, June 3, 1899.

dition has been shown to be amenable to treatment by means of extract obtained from the organs of sheep. When we treat anæm iron, rickets with lime-salts, scurvy with lemon-juice, or neurasthen hypophosphites, this principle is followed of supplying to the blood proximate principles which are needed for healthy metabolism. Since we may supply some substance which the blood needs to enable it to resist infection or throw off the consequences of infection. Thus antitoxin is used in diphtheria and similar bodies in erysipelas, tetanus, typhoid fever, plague, pneumonia, tuberculosis, cholera, and yellow fever. 2. is another class of cases in which certain elements normally present in the blood are in such excess as to cause symptoms of disorder. In diabetes, for example, there is an excess of glucose in the blood, and the result is manifested in glycosuria. In gout and lithæmia, we have evidence of an excess of uric acid, or of other compounds of the xanthin group. In jaundice there is an excess of biliary pigment in the circulating fluid. The object of treatment in such cases is to diminish the quantity of the pathogenic element by administering drugs which reduce production and augment excretion, thus bringing the patient in a condition approaching the normal. 3. In a third class of cases there are present in the blood substances which are not among its normal constituents and which cause disturbance of cell-action (alcohol, nicotine, muscarine, metallic poisons, etc.). There is a large class of substances of bacterial origin which cause symptoms of disease when introduced into the blood. In addition to the group of infectious diseases, which are of this nature, there are also toxins absorbed from the alimentary tract which are productive of symptoms, the origin of which is often overlooked. Eczema may be produced in this manner. A case has been reported in which, after the removal of a Fallopian tube, which was distended with pus, a lupus of the face underwent a spontaneous cure. Albuminuria is likewise occasionally due to toxins. In all these instances it is seen that the active cause of the disease is recognized and removed the symptoms disappear. How drugs may be utilized in bringing about this result will be the object of therapeutics to show, as will be made manifest in the following sections on the uses of drugs.

#### THERAPEUTIC CLASSIFICATION OF REMEDIES.

**Classification** has been found as difficult in *Materia Medica* as in any other branch of natural science. It is impossible to mark out, with exactitude, definite limits to the action of drugs on account of the fact that they often simultaneously influence different organs and functions. If, from one point of view, a medicine be described as a diuretic, from another point of view it might be no less properly placed among the cathartics or diaphoretics. When we seek to understand the mechanism of its action and its influence upon the composition of the urine, we must also study its effect upon the central nervous system, the cardiac nerves and ganglia, the heart-muscle and the muscular coat of the arterial system. The organs concerned in sanguification may likewise be affected, and this result is evidenced by a changed proportion of the urinary constituents. If a drug specially presses the chief nerve-centres, its range of influence must extend more or less powerfully and directly to every important organ. It need not, therefore,

It is almost strange that no classification of remedies has received universal support. In describing the properties and applications of drugs, the alphabetical arrangement is here adopted, as it is the most simple and it facilitates reference.

Different methods of classification of the articles of the *Materia Medica* have been employed for different purposes. Thus, a botanical basis may be adopted, or drugs and preparations may be arranged according to their chemical and pharmaceutical relations; or remedies may be classified according to their most prominent physiological or therapeutical effects. It is generally recognized that drugs affect function because they contain certain proximate principles, or extractives, by virtue of which they produce their physiological action and their therapeutical powers. A cinchona-tree that is grown in a botanical garden, and on this account contains no quinine in its bark, will have no medicinal value, and preparations of such bark will exert no therapeutic effect, except it may be through mental impressions upon the patient who thinks that he has taken an antiperiodic. In passing, it may be mentioned that one of the great sources of fallacy in medical therapeutics exists in the varying quality of drugs and the consequent uncertainty as to their effects. This may be obviated to a large extent by using precautions to obtain only the best quality of drugs and to use what are called standardized preparations, in which the proportion of the active principle is ascertained and guaranteed to be uniform.

It is only proper to state that the therapeutical classification is necessarily only a general one, and many exceptions can be taken. Especially it is to be noted that it is not to be inferred that this classification is exclusive, and that, because the principal action of a remedy under ordinary circumstances is such as to warrant its being placed under a special heading, it might not also be entitled to a place under another heading. This difficulty arises from the multiple action of drugs, and that they often act upon several organs simultaneously. Thus a drug, like quinine, may be an antiseptic and it may also be a stimulant, or an antiperiodic. As an incidental effect it may act as a depressant or cause certain eruptions on the skin. The oil of turpentine is an antiseptic and a stimulant to the digestive organs and the heart, it is also a diuretic; but it is capable in some cases of causing toxic symptoms and general inflammation of the skin, or erysipelas and nephritis, even from small doses. With reference to this peculiar personal susceptibility of individuals to the action of drugs, called idiosyncrasy or idiosyncrasy, no satisfactory explanation can be given. Thus, opium, instead of acting as a narcotic as it generally does, sometimes acts as a stimulant; morphine in some individuals causes wakefulness and burning and annoying itching of the skin. Cannabis Indica may cause delirium and nervous excitement instead of soothing the nervous system. In some cases alcohol acts like a narcotic poison, in others it produces acute mania. In the consideration of the actions of drugs in the next section such examples will be referred to. Enough have been mentioned here to prove the statement that classification of drugs according to their effects on the human body is only tentative and suggestive at the best, and is subject to many corrections as applied to individual cases. The therapeutical physician, aware of the incidental effects of drugs, is constantly on the alert to modify his treatment when they are manifested.

Remedies may be divided into classes (after Garrod):—

The alkalies combine with and neutralize acids. Therefore, they are useful in overcoming hyperacidity of the stomach, whether due to excessive production of hydrochloric acid or to fermentative change in the production of fatty acids. They promote the secretion of acid, and strain that of alkaline, fluids. Hence, when administered immediately before a meal, an alkali excites a flow of gastric juice, and, in this way, it promotes digestion and is serviceable in dyspepsia. On the other hand, if given immediately after a meal, such a remedy, by neutralizing gastric juice, corrects hyperacidity and relieves the symptoms of indigestion. It may, however, embarrass digestion and favor fermentation. It is readily understood, therefore, how the prolonged use of alkalies in dyspepsia at length disorders appetite and aggravates the condition for which they were originally prescribed. A dilute alkaline solution checks the course of acute eczema, which possesses the same reaction: it allays the itching and smarting of this disease, or the burning pain of superficial burns and scalds. Paræsthesia, whether dependent upon constitutional or excited by local causes, is often amenable to the influence of an alkaline lotion. The same preparation is beneficial by neutralizing acid secretions from the bowel, vagina, or the skin, and obviating their effects. Proper administration of an alkaline remedy may be injurious and give rise to emaciation and debility from the accelerated disintegration of nitrogenous substances. These remedies aid in the resolution of inflammatory exudations.

A diminished alkalinity of the blood in rheumatism and gout is caused by the presence, respectively, of lactic or uric acid, with other cementitious substances, in excessive quantity. The alkalies are serviceable in these diseases, combining with the acid and facilitating its elimination. The same result takes place in the urine. The reaction of the fluid being rendered alkaline, uric acid is dissolved or forms soluble combinations, irritation of the urinary tract is quieted, and the precipitation of the uric acid in the kidney or bladder is prevented. Alkalies are useful in uric-acid calculus is present. They may be able to dissolve a small soft stone. At all events, they prevent further deposit and relieve to some extent the irritation, which the foreign body and acid urine have occasioned.

Alkaline remedies consist of: potassium hydrate, potassium carbonate, and bicarbonate, sodium hydrate, sodium carbonate and bicarbonate, lime-water, precipitated calcium carbonate, and prepared chalk. The combinations of potassium, sodium, and lithium with the vegetable acids do not act as such in the stomach, but, being converted into carbonates in the blood, they alkalize the urine as they escape from the system. Finally, an alkali acts as a chemical antidote in poisoning by an acid.

**Acids.**—When given after meals, these supply the acid medium in which pepsin is efficient. They, therefore, improve the appetite and digestion, and are useful in digestive disorders. They promote secretion and allay nausea. Administered before a meal, by reducing the secretion of acid by the peptic glands, and by preventing fermentation, they check the acidity of the stomach. The mineral acids possess astringent properties and are of service in lessening hemorrhages, morbid secretions, and discharges. They are, likewise, usually antiseptic; they disinfect the alimentary canal and restrain deleterious fermentation of its contents. In concentrated form they act as escharotics.

**Irritants** are applied to the skin in order to produce nervous and vascular reaction. According to the degree of their action, they are classed as **rubefacients**, or those which simply redden the surface; **epispastics** (or **vesicants**), those which occasion blisters; and **pustulants**, which excite sufficient inflammation to form pus. The rubefacients most in use are mustard, capsicum, arnica, turpentine, chloroform, ether, and iodine. Among vesicants are ammonia, cantharides, euphorbium, mezereum, and iodine. The principal pustulants are tartar emetic, croton-oil, and silver nitrate. The prolonged application of a rubefacient often gives rise to a blister.

**Escharotics** or **caustics** destroy tissues and lead to the formation of a slough. The principal escharotics are: liquefied phenol, glacial acetic acid, chromic acid, strong mineral acids, caustic potash, caustic soda, and the galvanocautery or actual cautery.

**Local sedatives** diminish nervous and vascular excitement in the part to which they are applied. They consequently relieve local inflammation and pain. Among agents of this group are bismuth, acetate of lead, aconite, cocaine, opium, belladonna, etc.

**Demulcents** are bland substances used to protect, mechanically, the gastro-intestinal tube from contact with irritant poisons, to allay inflammation of the same canal, of the respiratory or genito-urinary passages. Many of them possess some nutritive value. This class embraces acacia, flaxseed, elm, marshmallow, Iceland and Irish moss, starch, gelatin, olive-oil, etc.

**Emollients** are applied to the external surface. They resemble demulcents in being of a bland, soothing character, protect the surface from friction and from air, relieve tension, and diminish pain. Among emollient substances are: lard, olive-oil, spermaceti, glycerin, starch, cacao-butter, etc.

**Local Astringents and Styptics.**—The astringents and acids, which are useful in checking hæmorrhages and morbid discharges when administered internally, usually have the same effect when locally applied.

**Antiparasitics.**—The term **antiparasitic**, or **parasiticide**, is generally restricted to agents which have the power of destroying the animal and vegetable parasites which may infest the exterior of the body. The principal antiparasitic remedies are: sulphur, iodine, salts of mercury, liquefied phenol, and boric acid.

**Hæmatinics** are given internally to influence favorably the composition of the blood. Useless, or even deleterious in health, such a drug tends to improve, in certain diseased states, the quality of the blood, and, consequently, the nutrition of the entire organism. Destruction of its corpuscular elements and drain of its albumin indicate that the nutrient fluid-tissue urgently requires increased and appropriate pabulum. Remedies belonging to this class are, or contain, normal constituents of the body, and are necessary to the maintenance of structure and the performance of function. Prominent among the hæmatinics are preparations of iron, manganese, codliver-oil, other animal and vegetable oils, and a good diet.

**Alkalies.**—When alkalies, in concentrated form, are brought into contact with animal tissues, they enter into chemical combination with the oxygen present, and thus give rise to an active necrosis, or destructive inflammation. Alkalies are, likewise, solvents of albumin. These physical and chemical properties render the caustic alkalies useful in producing powerful counter-irritation. Their escharotic effects have been made use of in chronic synovitis, myelitis, and meningitis, and in the destruction of morbid tissue, whether of neoplastic or inflammatory origin.

Alteratives counteract the effects of various forms of toxæmia, of chronic malaria, syphilis, scrofula, tuberculosis, carcinoma, and mineral poisoning.

The principal agents of this class are: gold and sodium chloridations of arsenic, preparations of mercury, preparations of iodine form, iodol, potassium chlorate, antimony, mezereum, sulphur, sa colchicum, guaiacum, sanguinaria, xanthoxylum, calcium chloride, sarsaparilla, codliver-oil, and phosphorus.

**Exhilarants** determine an active cerebral circulation and stimulate functions of cerebral centres; but if administered for too long a in excessive quantities, a depressing effect is produced. The effect is higher is reflected to the lower centres, the heart strengthened, the action deepened, and muscular vigor promoted. Substances belonging to this class support the system under prolonged and unusual strain, and are useful in the treatment of mental alienation. Among exhilarants ranked the preparations of belladonna, hyoseyamus and stramonium tea, coffee, the primary action of ether, and alcohol.

**Hypnotics and Anodynes.**—Hypnotics cause sleep, anodynes allay pain. Sound sleep obliterates the perception of pain; the relief of pain, on the other hand, permits sleep. A close relationship exists, therefore, between these remedies. An hypnotic will often abolish pain, while an anodyne frequently overcome wakefulness. In some substances, however, the hypnotic, and in others the anodyne, influence is more conspicuous. Sleeplessness depends upon anxiety, mental excitement, or prolonged intellectual effort, the treatment differs from that to be adopted when induced is due to pain. Hypnotics act chiefly by influencing the circulation to the brain, anodynes by their effect upon sensory centres.

The chief remedies belonging to this class are: opium, chloral-hydrate, chloralamid; potassium, sodium, and ammonium bromides, acetone, a paraldehyde, ethyl carbamate, sulphonethylmethane, and sulphonmethane.

**Anæsthetics.**—Agents of this class abolish consciousness and sensibility by inhibiting the functions of the higher cerebral centres. When the influence is continued, the sensory and motor centres of the spinal cord and of the medulla oblongata are, in turn, affected. The first result of inhalation is a stage of intellectual, emotional, and motorial excitement. This is succeeded by a stage of narcosis. Anæsthetics destroy life by paralysis of the centres situated in the medulla oblongata. They are employed for the purpose of relaxing spasm and producing a condition of unconsciousness, during which surgical operations may be painlessly performed.

The chief members of this group are: ether, chloroform, ethyl-bromide, ethyl chloride, and nitrous oxide.

**Spinal Stimulants.**—Agents belonging to this class, when given in medicinal doses, exalt the functions of the cord, invigorate the action of the heart and lungs, and promote secretion and nutrition, by influencing gastric motion and peristalsis.

These remedies are useful in atonic dyspepsia, atony of the bowels, bladder, cardiac weakness, emphysema, neuralgia, spinal neurasthenia, paralysis, and phthisis.

The principal members of this group are: nux vomica and its related species, ignatia, and alcohol and camphor in small doses.

**Spinal Sedatives.**—These are substances which have the property of

regulating the functions of the spinal cord. They may act directly upon the centre, or produce their effect by an influence on the circulation through the cord. Excessive doses cause paralysis. Spinal sedatives are valuable in conditions of irritation, or congestive excitement, of the cord. The chief remedies belonging to the group are: potassium bromide, sodium bromide, iodine, gelsemium, conium, hydrocyanic acid, potassium nitrate, physostigmine salicylate, and tobacco. Magnesium sulphate, when injected into the spinal cord, is a powerful sedative.

**Antispasmodics.**—Antispasmodic drugs allay irregular action of the voluntary or involuntary muscles by a calmative influence upon nerve-centres. They are of use in many disorders characterized by nervous excitement and muscular spasm, such as hysteria, colic, asthma, and intestinal cramps. The principal antispasmodic remedies are: ammoniated valerian, camphor, camphor, musk, castor, and ether.

**Tonics.**—Tonics improve appetite, digestion, assimilation, and secretion, strengthen the circulatory apparatus, improve the composition of the blood, invigorate the muscular system, and promote the nutrition of nerves and fibres. The most powerful members of this class also possess sedative virtues. Tonics are useful in the treatment of digestive disorders, in depressed conditions of the nervous system and nutrition in general, and in diseases characterized by periodicity. The former variety includes: gentian, calumba, chirata, serpentaria, and eucalyptus. The preparations of iron and manganese act as tonics when the quality of the blood is impaired. Certain mineral salts, as zinc oxide, silver oxide, and zinc sulphate, exert a similar influence in nervous affections, as chorea and epilepsy.

**Vascular Stimulants.**—Members of this class strengthen the action of the heart and blood-vessels. They are, therefore, advantageously employed in weakened conditions of the central organ of the circulation, in transudation due to blood-stasis, and in hæmorrhage. Chief among vascular stimulants are: alcohol, preparations of ammonium, caffeine, convallaria, digitalis, ginseng, and scopolamine.

**Vascular Sedatives.**—These remedies render the heart's action more moderate and less forcible. They moderate cardiac excitement, and are of service in febrile and inflammatory affections of a sthenic type. Examples of this class are: aconite, veratrum, gelsemium, antimony, muscarine, pilocarpine, and hydrocyanic acid.

**Sialagogues.**—Sialagogues excite the secretion of saliva, either by an irritant local effect, with a reflex stimulation of the salivary glands, or by a systemic influence upon the glands during their elimination. Examples of the former variety are: capsicum, mustard, ginger, pellitory, and mezereum; of the latter: preparations of iodine and mercury, pilocarpus, muscarine, and physostigma.

**Antisialics** check salivary secretion. This is the action of belladonna, opium, and potassium chloride.

**Emetics.**—Emetics cause vomiting, either by irritating the terminal branches of the gastric nerves or by exciting the nervous centre which presides over the act of emesis. Remedies which act by direct irritation are: mustard, copper sulphate, zinc sulphate, and mercuric subsulphate. The indirect or systemic emetics are: apomorphine, ipecacuanha, tobacco, and strychnine.

**Anti-emetics** allay irritability of the gastric nerves or the vomiting cen-

Alteratives counteract the effects of various forms of toxæmia, of chronic malaria, syphilis, scrofula, tuberculosis, carcinoma, and mineral poisoning.

The principal agents of this class are: gold and sodium chloridations of arsenic, preparations of mercury, preparations of iodine form, iodol, potassium chlorate, antimony, mezereum, sulphur, sa colchicum, guaiacum, sanguinaria, xanthoxylum, calcium chloride, sarsaparilla, codliver-oil, and phosphorus.

**Exhilarants** determine an active cerebral circulation and stimulate functions of cerebral centres; but if administered for too long a in excessive quantities, a depressing effect is produced. The effect is higher is reflected to the lower centres, the heart strengthened, the tion deepened, and muscular vigor promoted. Substances belonging class support the system under prolonged and unusual strain, and are useful in the treatment of mental alienation. Among exhilarants ranked the preparations of belladonna, hyoseyamus and stramonium tea, coffee, the primary action of ether, and alcohol.

**Hypnotics and Anodynes.**—Hypnotics cause sleep, anodynes allay sound sleep obliterates the perception of pain; the relief of pain, other hand, permits sleep. A close relationship exists, therefore, between these remedies. An hypnotic will often abolish pain, while an anodyne frequently overcome wakefulness. In some substances, however, the notic, and in others the anodyne, influence is more conspicuous. sleeplessness depends upon anxiety, mental excitement, or prolonged lectual effort, the treatment differs from that to be adopted when it is due to pain. Hypnotics act chiefly by influencing the circulation of the brain, anodynes by their effect upon sensory centres.

The chief remedies belonging to this class are: opium, chloral-hy chloralamid; potassium, sodium, and ammonium bromides, acetone, a paraldehyde, ethyl carbamate, sulphonethylmethane, and sulphonme

**Anæsthetics.**—Agents of this class abolish consciousness and serve by inhibiting the functions of the higher cerebral centres. When the fluence is continued, the sensory and motor centres of the spinal cord of the medulla oblongata are, in turn, affected. The first result of inhalation is a stage of intellectual, emotional, and motorial excitement. This is succeeded by a stage of narcosis. Anæsthetics destroy life by ysis of the centres situated in the medulla oblongata. They are employed for the purpose of relaxing spasm and producing a condition of unconsciousness, during which surgical operations may be painlessly performed.

The chief members of this group are: ether, chloroform, ethyl-bromide, ethyl chloride, and nitrous oxide.

**Spinal Stimulants.**—Agents belonging to this class, when given in medicinal doses, exalt the functions of the cord, invigorate the action of the heart and lungs, and promote secretion and nutrition, by influencing gastric motion and peristalsis.

These remedies are useful in atonic dyspepsia, atony of the bowels, bladder, cardiac weakness, emphysema, neuralgia, spinal neurasthenia, paralysis, and phthisis.

The principal members of this group are: nux vomica and its related species, ignatia, and alcohol and camphor in small doses.

**Spinal Sedatives.**—These are substances which have the proper

reducing the functions of the spinal cord. They may act directly upon the nerve-cells or produce their effect by an influence on the circulation through the cord. Excessive doses cause paralysis. Spinal sedatives are valuable in conditions of irritation, or congestive excitement, of the cord. The chief remedies belonging to the group are: potassium bromide, sodium bromide, lobelia, gelsemium, conium, hydrocyanic acid, potassium nitrate, physostigmine salicylate, and tobacco. Magnesium sulphate, when injected into the spinal cord, is a powerful sedative.

**Antispasmodics.**—Antispasmodic drugs allay irregular action of the voluntary or involuntary muscles by a calmative influence upon nerve-centres. They are of use in many disorders characterized by nervous excitement and muscular spasm, such as hysteria, colic, asthma, and intestinal colic. The principal antispasmodic remedies are: ammoniated valerian, asafoetida, camphor, musk, castor, and ether.

**Tonics.**—Tonics improve appetite, digestion, assimilation, and secretion, strengthen the circulatory apparatus, improve the composition of the blood, invigorate the muscular system, and promote the nutrition of nerve-centres and fibres. The most powerful members of this class also possess antiperiodic virtues. Tonics are useful in the treatment of digestive disorders, in depressed conditions of the nervous system and nutrition in general, and in diseases characterized by periodicity. The former variety includes: gentian, calumba, chirata, serpentaria, and eucalyptus. The preparations of iron and manganese act as tonics when the quality of the blood is impaired. Certain mineral salts, as zinc oxide, silver oxide, and zinc sulphate, exert a similar influence in nervous affections, as chorea and epilepsy.

**Vascular Stimulants.**—Members of this class strengthen the action of the heart and blood-vessels. They are, therefore, advantageously employed in weakened conditions of the central organ of the circulation, in transudation due to blood-stasis, and in hæmorrhage. Chief among vascular stimulants are: alcohol, preparations of ammonium, caffeine, convallaria, digitalis, strophanthus, and scoparius.

**Vascular Sedatives.**—These remedies render the heart's action more slow and less forcible. They moderate cardiac excitement, and are of service in febrile and inflammatory affections of a sthenic type. Examples of this class are: aconite, veratrum, gelsemium, antimony, muscarine, pilocarpine, and hydrocyanic acid.

**Sialagogues.**—Sialagogues excite the secretion of saliva, either by an irritant local effect, with a reflex stimulation of the salivary glands, or by a specific influence upon the glands during their elimination. Examples of the former variety are: capsicum, mustard, ginger, pellitory, and mezereum; of the latter: preparations of iodine and mercury, pilocarpus, muscarine, and physostigma.

**Antisialics** check salivary secretion. This is the action of belladonna, opium, and potassium chlorate.

**Emetics.**—Emetics cause vomiting, either by irritating the terminal filaments of the gastric nerves or by exciting the nervous centre which presides over the act of emesis. Remedies which act by direct irritation are: alum, mustard, copper sulphate, zinc sulphate, and mercuric subsulphate. General or systemic emetics are: apomorphine, ipecacuanha, tobacco, and tartar emetic.

**Anti-emetics** allay irritability of the gastric nerves or the vomiting cen-

tre. Bismuth, cerium oxalate, creosote, carbolic acid, chloroform calomel, and silver nitrate soothe gastric irritation. Opium, hydrochloric acid, bromides, and chloral-hydrate quiet the excitement of this nerve.

**Purgatives** produce evacuation of the intestinal canal by increased secretion, or transudation, along the tract and by exciting peristaltic movements. According to the intensity of their action, purgatives or cathartics are subdivided into several varieties: 1. Laxatives cause slight increase in secretion and peristalsis, resulting in softened stools. Among laxatives ranked manna, sulphur, figs, prunes, olive-oil, rhamnus purshiana, eumylus, soap, etc. 2. Simple purgatives, or purgatives proper, are decidedly stimulant, and occasion semiliquid motions. Belonging to this class are: senna, aloes, rhubarb, castor-oil, and calomel. 3. Drastic cathartics are strongly irritant to the intestinal mucous membrane, and occasion transudation from its vessels and almost fluid stools. The action of these is often accompanied by considerable griping pain. Examples of drastics are jalap, colocynth, gamboge, scammony, elaterium, podophyllum, and croton-oil. Excessive doses of simple purgatives have a very similar effect. Hydragogue purgatives remove abundant serum from the intestinal vessels and produce large, watery motions. Elaterium, cream of tartar, and croton-oil are illustrations. An analogous action is exerted by the saline cathartics of the alkalies and alkaline earths. Large doses of the cathartics have the effect of hydragogues. The principal saline purgatives are sodium sulphate, magnesium sulphate, magnesium citrate, potassium bitartrate and bitartrate, and potassium and sodium tartrate. 5. Cholagogues stimulate, either directly or indirectly, the liver, cause increased flow of bile, quicken the peristaltic movements, and produce bilious, liquid evacuations. Among the cholagogues are included some preparations of mercury, aloes, euonymin, iridin, rhubarb, leptandra, and podophyllum.

**Anthelmintics** cause destruction or expulsion of intestinal worms. Those agents which destroy are termed vermicides; those which expel are known as vermifuge remedies. Tape-worms are killed or removed by the use of aspidium, kamala, kousso, pomegranate (or pelletierine), pumpkin seed oil, turpentine, and chloroform. Remedies which act against round-worms are santonin, spigelia, chenopodium, and azedarach. Seat-worms are destroyed by enemata containing table-salt, tannic acid, quassia, eucalyptol, etc.

**Stomachics.**—Stomachics stimulate the gastric mucous membrane, increase appetite, promote the secretion of gastric juice, and assist digestion. Carminatives restrain abnormal fermentation and dispel intestinal gas. Among stomachics are: capsicum, piper, cardamom, cloves, mustard, and ginger.

**Hepatic Stimulants.**—These are medicines which excite the liver to increased functional activity. They occasion an augmented formation of bile, and thus promote the normal elaboration of nitrogenous aliment. Increased quantity of bile is not always accompanied by a corresponding increase in the characteristic bile-salts.

The principal substances which increase production of bile are: hydrochloric acid, ipecacuanha, sodium phosphate, mercuric chloride, aloes, podophyllum, rhubarb, colocynth, euonymin, iridin, etc. The quantity of urea is increased by ammonium chloride, arsenic, antimony, phosphorus, and iron. The glycogenic function is stimulated by nitrohydrochloric acid, amyl nitrite, and sodium bicarbonate.

**Hepatic Depressants.**—Agents belonging to this class reduce

tional activity of the liver, diminishing the formation of bile, urea, and glycogen. Those which lessen the secretion of bile are: opium, lead acetate, alcohol, and quinine. The amount of urea is decreased by opium, alcohol, quinine, and colchicum. Glycogenesis is diminished by opium, phosphorus, arsenic, and antimony.

**Expectorants.**—Expectorant remedies modify the character of the bronchial secretions and facilitate their expulsion. Small or nauseating doses of emetic substances increase and liquefy the secretions of the mucous membranes. Larger doses, by causing vomiting, mechanically aid the expulsion of mucus from the air-passages. The term "stimulating expectorants" is given to a group of drugs eliminated by the bronchial mucous membrane, which they stimulate, and the secretion of which they at the same time alter and improve. Certain substances, when dissolved in the mouth, aid expectoration by a stimulating influence upon the cilia of the trachea and bronchi. These are called ciliary excitants. The nauseating expectorants are: antimony, ipecacuanha, apomorphine, lobelia, pilocarpus, etc. Among the stimulating expectorants are: ammonium chloride, balsams of Peru and Tolu, senega, squill, sulphur, and terpin hydrate. Ciliary excitants are: ammonium chloride, potassium and sodium chlorate, gum acacia, etc.

**Pulmonary sedatives** relieve cough by allaying irritability of the respiratory centre, or the terminal fibres of the nerves distributed to the bronchi and lungs. Examples of this class are: opium, belladonna, stramonium, hyoscyamus, hydrocyanic acid, etc.

**Anhydrotics** check excessive sweating; among them are atropine or belladonna, camphoric acid, mineral acids, especially aromatic sulphuric acid, also agaricin and adrenalin.

**Diaphoretics** increase perspiration by stimulating the sudoriparous glands in the course of their removal, as sulphur, guaiacum, sarsaparilla, serpentaria, mezereum, and camphor. Other agents produce the same effect by causing relaxation of the cutaneous capillaries. In this subdivision are found the nauseants and emetics, as tartar emetic, ipecacuanha, lobelia, and Dover's powder, as well as opium, ether, and alcohol. A third group of remedies excites diaphoresis by an influence upon the sweat-centres, as pilocarpus, veratrum, and salts of potassium.

**Diuretics.**—The quantity of urine excreted is increased by remedies which raise general or local arterial tension, and by those which stimulate the secreting cells of the kidney. The free ingestion of water assists the action of diuretic drugs, and is mechanically serviceable by irrigating the renal tubules. Among the stimulant diuretics are found cantharides, copaiba, cubeb, turpentine, colchicum, squill, broom, juniper, potassium acetate, and calomel. The principal agents which act by elevating blood-pressure are: digitalis, belladonna, nux vomica, and alcohol.

**Lithontriptics.**—This name has been given to a class of remedies which increase the flow of urine, and at the same time, by modifying its chemical reaction, dissolve and prevent the deposition in the urinary passages of uric, phosphoric, or oxalic acid, or insoluble salts of those acids. If precipitation has taken place, they are given with a view to dissolve or remove gravel or calculi. Potassium carbonate, bicarbonate, and citrate, and lithium carbonate and citrate are the principal solvents for uric acid. The agents which are given for the purpose of acting upon phosphoric calculi are: benzoic acid, ammonium benzoate, and diluted nitric acid.

**Hæmostatics.**—Agents for checking pulmonary hæmorrhage, or ing excessive menstrual flow, or hæmorrhage from the uterus at other than the monthly periods are frequently demanded. They may act through the nervous system, as when atropine is injected hypodermically or oil of erigeron administered, or they may act through contraction of muscular fibres, as when ergot or stypticin is given. Cold causes vasoconstriction, as when ice is applied to hæmorrhoids, or introduced into the vagina or rectum.

**Ecbolics.**—These remedies, also known as oxytocics, stimulate the pregnant womb to contraction. They may thus lead to abortion, if prematurely given, but, administered during labor, are often of valuable assistance in invigorating the organ. It is surmised that ecbolics may act either by direct irritation of the muscular structure of the womb, or exerting their action through an influence upon the uterine centre in the cord. The principal ecbolics are: ergot, cotton-root bark, ustilago, quinine, and

**Emmenagogues.**—Emmenagogues excite the menstrual flux either by a direct stimulant effect upon the uterus or indirectly by improving the quality of the blood and nutrition in general. Small doses of ecbolics are usually emmenagogue. Direct emmenagogues are: ergot, cantharis, rue, myrrh, etc. Indirect emmenagogues are: preparations of iron and manganese, nux vomica, codliver-oil, etc.

**Aphrodisiacs** excite the sexual appetite and the genital functions. The object they accomplish by stimulation, either direct or reflex, of the nerves which govern the genital organs. Whatever promotes nutrition of the genital organs indirectly to invigorate the sexual apparatus. The chief aphrodisiacs are: cantharis, phosphorus, alcohol, camphor, and cannabis Indica.

**Anaphrodisiacs** diminish sexual desire and power. They allay the excitability of the genital centres and diminish irritation or hyperæmia of the generative organs. Among anaphrodisiacs are included potassium, or ammonium bromide; potassium iodide; large doses of camphor, opium; tobacco, gelsemium, etc. Whatever depresses general systemics has likewise an indirect anaphrodisiac effect.

**Mydriatics** produce dilatation of the pupil by stimulation of the organs of the sympathetic, with contraction of the radiating fibres of the iris as a result, and by paralysis of the third nerve, causing relaxation of the circular fibres. The principal mydriatics are: atropine, cocaine, hyoscyamine, daturine, duboisine, and hyoscyamine.

**Myotics** cause the pupil to contract by stimulating the circular muscles of the iris. Eserine, or physostigmine, thus acts when locally applied, and is used by ophthalmologists for this purpose. Other drugs which contract the pupil, though not administered for that purpose, are opium, pilocarpine, muscarine.

**Antiseptics** act upon pathogenetic micro-organisms, prevent their growth and multiplication, and thus protect the system against infection. The most valuable antiseptics are: mercuric chloride and iodide, creosote, salicylic acid, chlorine, naphthol, quinine, thymol, sulphuric acid, iodine, iodoform, resorcin, etc.

**Disinfectants** are used for the purpose of destroying the organic matter of disease, as they may exist in the atmosphere, clothing, water, pathological discharges, etc. Substances which accomplish this purpose are: Formaldehyde, sulphurous-acid gas, chlorine, bromine, zinc chloride, mercuric iodide, etc. A high degree of heat is also a disinfectant.

**Dosage.**—By the dosage of a remedy is meant the definite quantity of the agent required to produce a desired therapeutical result. Naturally a considerable margin exists, owing to different degrees of vigor in patients, and to the amount of impression we desire to make upon the bodily functions. It is evident, then, that, even among patients of the same age, some will require larger doses than others in order to produce a particular effect. Thus arises the distinction between the **minimum** and **maximum** doses, the former being the smallest dose capable of physiological or therapeutical effect, the latter being the largest dose which it is considered safe to give. The toxic dose rapidly develops the physiological action of the drug in a high degree, giving rise to the characteristic symptoms of poisonous action of the remedy. **Broken** or **fractional** doses are merely doses much smaller than those usually given, and intended to develop the physiological effects by degrees, being the reverse of toxic doses in the sense that they singly produce no marked disturbance, and are within perfectly safe limits. In the following pages reference may be found to a **full** or **single dose**, the **interrupted dose**, and the **continued dose**. The **full dose** is the maximum amount which the patient will require to produce the physiological action of the remedy, and it is usually not intended to be repeated. For instance, an ounce of magnesium sulphate, or several cathartic pills, may be ordered to accomplish a certain therapeutical result, and, this being obtained, there is no need to give any more. Where the symptoms tend to recur, as where purgative remedies are required in chronic constipation, or amyl nitrite for angina pectoris, it becomes necessary to repeat the administration of the remedy from time to time, the system having opportunity to recover fully from the effects of one dose before another is administered. The **interrupted dose** is generally smaller than the full dose, although exceptionally it occurs that by the frequent repetition of a remedy the system becomes accustomed to it, and larger doses are required to produce the same effect. The **continued dose** is where each succeeding dose is given before the effects of the preceding have passed away, so that when the intervals are short a **cumulative action** of the remedy is seen. The latter obviously depends upon the rate of elimination of the agent; some drugs, like alcohol or ether, are excreted very quickly, and exert a cumulative action only when the intervals are very short; others, like arsenic, mercury, and digitalis, are excreted slowly, and may show a cumulative effect after awhile, even when only one or two doses are given daily. The alternating administration of drugs by **rotation**, as a practical principle of treatment, is designed to overcome the tendency to toleration of drugs by the system. Rotation has been advocated by Ewart<sup>1</sup> on these grounds: 1. Some drugs—and these are chiefly the stimulants and the sedatives—lose more and more of their effect the longer they are continued. 2. Other drugs, being slowly eliminated or distinctly cumulative, acquire through prolonged administration an increased activity, and in some instances a modified, and sometimes a dangerous, action. 3. The most active dose, in the case of any stimulant or sedative, and in that of many tonics, is (putting aside summation of doses or of their effects) the first dose. These considerations led Ewart to the adoption of a principle which may be regarded as novel, that of a systematic “rotation of drugs,” which, not unlike the farmer’s “rotation of crops,” rests as well as fertilizes.

<sup>1</sup> *British Medical Journal*, Oct. 1, 1898, p. 938.

## PART II.

### PHARMACEUTICAL THERAPEUTIC AGENTS, OR DRUGS.

IN this section will be considered, systematically and in alphabetical order, the remedial agents or drugs in present use in the treatment of disease. All of the drugs and preparations made official by the United States and British Pharmacopœias receive notice and consideration in proportion to their importance. Some of the most valuable of the new remedies which are coming largely into use by the profession have also been introduced, these being distinguished from the official agents by the absence after them of the letters U. S. P. or B. P.

Each drug will be considered individually and from three different points of view: (1) the botanical or chemical definition and physical characters of the remedy, with the strength and dosage of its various preparations; (2) its physiological actions, including toxicology and antidotes, with special effects, if any, upon individual organs and tissues; and (3) the therapeutical indications, with illustrative formulæ, comments, and suggestions as to eligible forms of administration, or cautions concerning its use. This arrangement is the one which has been found by experience to be the most convenient to facilitate reference and study.

**ABRUS.**—Jequirity, Wild Licorice, or *Abrus precatorius* (Leguminosæ).

**Pharmacology and Toxicology.**—*Abrus* is a native of India, but grows elsewhere in the tropics. The part used in medicine is the seed, or bean. These are small, nearly round, of a bright-red color, with a black spot at the hilum. The poisonous constituents are a globulin, and an albumose, the action of which closely resembles that of toxins of bacterial origin. These bodies, of similar chemical composition, are both extremely toxic, and their systemic effects have been likened to those produced by the venom of the snake. The temperature is lowered and the blood remains fluid after death (Martin and Wolfenden). The seeds do not contain an alkaloid. The root contains glycyrrhizin (15 per cent.) and an acrid resin (8 per cent.). The leaves contain 10 per cent. of glycyrrhizin.

**Therapy.**—The infusion is made by triturating three seeds in a mortar with an ounce of cold water, to which is added an ounce of hot water. When cold, the solution is filtered; the resulting filtrate, containing the globulin and albumose, if introduced into the eye, is highly irritating, and sets up a purulent inflammation. It has accordingly been successfully used in ophthalmological practice in the treatment of granular lids, or trachoma. It is applied three times the first day and repeated on the second and third days, if necessary. This powerful application should be made with care, since Dr. T. E. Murrell describes three cases of stricture of the nasal duct that had resulted from its careless use or too frequent application. Hypodermic injections produce local gangrene.

The cases in which jequirity is apt to prove most serviceable are the later stages of trachoma or the fibrous state of the conjunctiva following trachoma. Good results also follow its cautious use in vascular keratitis produced by a burn. The powdered drug may be applied by means of a

camel's-hair brush to the everted lid, a very small quantity being used first, in order to avoid an excessive reaction. Jequirity has been employed in chronic suppurative otitis, and also in chronic metritis. So should be recently made, as they rapidly undergo decomposition.

Abrus is not used internally. Injection of the infusion in circulation of the lower animals causes death by cardiac depression.

**ABSINTHIUM.**—**European Wormwood:** consists of the leaves and stems of *Artemisia Absinthium* (Compositæ).

**Preparations.**—Wormwood has no official preparations.

**Pharmacology.**—An herb, bitter and aromatic to the taste, indigenous to Europe, but naturalized in this country, and common along waysides. It contains the glucoside **Absinthin** and a very bitter resin; the former of which is soluble in water, alcohol, and ether. Wormwood also contains an essential volatile oil, more in the dried plant than in the fresh state. The oil consists largely of **Thujone**, or **absinthol**, with a blue coloring principle. A liqueur flavored with aromatics, called **Absinthe**, is used to a large extent as a tonic and stimulant in France, where its pernicious effects have attracted the attention of sanitarians. The constant use of absinthe produces profound depression of the nervous system, epileptiform convulsions, and renders the subject a physical wreck. These effects are similar to those produced by the volatile oil of wormwood upon the lower animals, in which it acts as a depressant of nervous energy, followed by stupor, clonic muscular spasms, and fatal termination. According to the experiments of Cadéac and Albin Meunier upon man, the oil of wormwood, in small and large doses, possesses decided antispasmodic properties. The oil is frequently adulterated with oil of turpentine.

**Toxicology.**—Poisonous effects may be counteracted by cold affusion, followed by friction of the skin and sinapisms, with careful administration of ammonia by inhalation, or by the mouth, or by injection under the skin into a vein. Evacuation of the contents of the stomach should be obtained by stimulating emetics; or, if these fail, by the stomach-pump. The treatment of **absinthism** calls for hygienic and restorative measures, particularly nerve-tonics, in addition to the usual treatment of alcoholism. The use of absinthe as a stimulant should be discouraged on account of the aggravation of the condition, moral and physical, which it produces.

**Therapy.**—Wormwood has been used medicinally in the form of an infusion (4 to 8 Gm. to 473 c.cm., or 3i-ij to Oj), a wineglassful being the dose, as a tonic or as an anthelmintic, for children. The infusion is likewise employed as an enema for the destruction of thread-worms.

Hiccough due to flatulent distension may be checked by the administration of a few drops of the volatile oil. The dose of the powdered leaves is 1.30 to 2.60 Gm. (or gr. xx-xl), or, of the oil, 0.06 to 0.18 c.cm. (or m. ss).

It is a domestic remedy for flatulent dyspepsia and weak digestion. Externally, it has been used as a stimulant application to indolent ulcers. According to Dr. J. L. Corning, the volatile oil of wormwood is a valuable local anæsthetic, and may be serviceably applied for the purpose of relieving rheumatic pains. A wine slightly tintured with wormwood, known as **Vermouth**, is sometimes given to increase appetite and hasten convalescence. Absinthin has been employed recently as a bitter tonic in doses of 0.015 (or gr.  $\frac{1}{4}$ ) before meals. The German Pharmacopœia recognizes the extract and a tincture of absinthium.

**ACACIA (U. S. P.).—Acacia (Gum Arabic, Gum Senegal).** The dried, gummy exudation from *Acacia Senegal*, *Willdenow*, or from other species of *Abrus* (*Leguminosæ*).

**ACACIÆ GUMMI (B. P.).—Gum Acacia.** A gummy exudation from the stem and branches of *Acacia Senegal* and of other species of *Acacia*.

#### Preparations.

**Syrupus Acaciæ (U. S. P.).—Syrup of Acacia** (acacia, 100 parts, with sugar, 800, and distilled water to make 1000 parts). Dose, 2 to 7.5 c.cm. (or fʒss-ij).

**Pulvis Cretæ Compositus (U. S. P.).—Compound Chalk Powder** (prepared chalk, 30; acacia, 20; sugar, 50). For making chalk mixture. Dose, 1.67 to 4 Gm. (or gr. xx-3j).

**Mucilago Acaciæ (U. S. P., B. P.).—Mucilage of Acacia** (U. S. P. contains 34 parts, with lime-water 33, and plain water enough to make 100 parts by weight). Dose, 2 to 7.5 c.cm. (or fʒss-ij).

These are the only official preparations of acacia, and are simply used as vehicles. The density of the solution of gum arabic enables it to be used to suspend insoluble powders or oils; in the latter case the resulting mixture forms an *emulsion*.

**Pharmacology.**—Gum arabic comes in white, or nearly colorless, translucent, irregular lumps, which are brittle, odorless, and almost tasteless. Its solution is valued for its adhesive qualities. *Acacia* also possesses some nutritive properties, and in the East it is eaten as food. It is soluble in water, but insoluble in alcohol. It has a faint odor and a mucilaginous, insipid taste. *Acacia* consists of a peculiar principle called *arabin*, or *arabic acid*, united with calcium, potassium, and magnesium. *Arabin* is described as an amorphous, glassy, and transparent substance when dry and of a milk-white color when moist. The solutions of acacia readily undergo acetous fermentation, unless some antiseptic is added to preserve them. As a rule, they should be freshly made.

**Therapy.**—In bowel disorders and fevers, a thin mucilage, flavored with lemon and sweetened, makes a nourishing, bland drink which relieves thirst. Irritation in the throat is relieved by gum-arabic troches. *Coryza* is relieved by a snuff of acacia and bismuth subnitrate, to which a little morphine may be added, as in Ferrier's snuff:—

R Morphinæ sulphatis .....	32	Gm. or gr. v.
Pulveris acaciæ .....	8	Gm. or ʒij.
Bismuthi subnitratæ .....	23	32 Gm. or ʒvj.

M. et ft. pulvis.

Sig.: A few grains to be snuffed into the nostrils, as directed.

For sore nipples, a good combination is as follows:—

R Pulveris acaciæ .....	15	5 Gm. or ʒiv.
Pulveris sodii boratis .....	4	Gm. or ʒj.
Pulveris camphoræ .....	32	Gm. or gr. v.
Pulveris marantæ .....	8	Gm. or ʒij.

M. Sig.: Dust over the surface.

Another serviceable application, in some diseases of the skin, is:—

R Pulveris acaciæ .....	12	Gm. or ʒiij.
Pulveris zinci oleatis .....	2	Gm. or ʒss.
Adipis lænæ hydrosi .....	15	5 Gm. or ʒss.

M. Sig.: Ointment for sore nipples, intertrigo, or acute dermatitis.

Powdered gum arabic may be used to check bleeding from leech. The mucilage acts as a protective to slight burns and excoriations.

The emulsion may likewise be employed as a demulcent vehicle in chitis, and in irritation of the genito-urinary passages.

Gum arabic is chiefly employed for pharmaceutical purposes, preparation of emulsions, pills, etc.

**ACETANILIDUM** (U. S. P., B. P.).—**Acetanilide**, or **Phenyl-acetanilide** (B. P.). Also known by trade name of **Antifebrin**.

**Dose**, 0.06 to 0.30 Gm. (or gr. j-v). B. P., 0.065 to 0.2 Gm. (or gr.

*Preparation.*

**Pulvis Acetanilidi Compositus** (U. S. P.).—Compound Acetanilide Powder (Acetanilide, 70; caffeine, 10; and sodium bicarbonate, 20 parts.) **Dose**, 0.10 Gm. (or gr. ij-x).

**Pharmacology.**—Acetanilide is an acetal derivative of aniline. A white powder, of neutral reaction, slightly pungent, without odor, slightly soluble in water and freely soluble in ether and in alcoholic solutions. Not changed by acids or alkalies.

**Physiological Action.**—In ordinary dose, the action of acetanilide is much less marked upon a person in health than when fever is present. Its most evident action is to reduce temperature, possibly by converting oxyhæmoglobin into methæmoglobin in the red blood-corpuscle and interfering with oxidation. The effect does not depend upon sweating, since it occurs when no perspiration is produced. Acetanilide, which at first introduced as an antipyretic, has been found to possess remarkable analgesic power. It is the chief constituent of popular headache remedies, to take the place of which the compound acetanilide powder was introduced into the pharmacopœia. When a toxic quantity has been absorbed the patient becomes prostrated, the lips and finger-nails are dark colored, the pulse rapid and compressible, and the skin pale and moist; the fluidity of the blood is lessened, many red corpuscles destroyed, hæmoglobin is liberated and eventually appears in the urine, which becomes dark brown in color. The quantity of uric acid and urea in the urine is increased. Peptonuria may be produced. The drug is eliminated by the kidneys. Large doses cause diastolic arrest of the heart, preceded by tremors, convulsions, depressed temperature, coma, and motor and sensory paralysis. In smaller doses, the action of the skin and kidneys is increased; the blood pressure is at first elevated, but soon falls, and the heart's action decreased. In some cases, however, whether owing to peculiar susceptibility, or to impurity in the drug, symptoms of poisoning—cyanosis and collapse—resulted even from small doses. Vomiting or profuse sweating have followed moderate doses of acetanilide. Toxic symptoms are especially apt to occur when acetotoluid is present as a contamination. The effects of the drug must be counteracted by use of external heat, and vigorous alcoholic stimulation, together with the hypodermic use of ether, atropine, and strychnine, in order to support the respiration and circulation. In patients suffering with fatty or dilated heart, acetanilide should be used with great caution, if at all. Owing to its action upon the blood-cells, it should not be used repeatedly or in large doses, in the low fevers. The prolonged administration of acetanilide gives

rise to congestion of the liver, spleen, and kidneys. In animals poisoned by acetanilide the heart, liver, kidneys, and other organs have been found affected by fatty degeneration. When used as a dusting-powder, combined with an equal quantity of starch or zinc stearate, in the treatment of intertrigo of infants, it has caused death from absorption of the drug, in several cases (*Journal of the American Medical Association*, Feb. 1, 1896, p. 239).

**Therapy.**—Acetanilide possesses antiseptic properties and may be advantageously used as a local remedy. It is an efficacious local application to chancroids and ulcerated chancres, used as a dusting-powder. In the form of an ointment containing 1.30 Gm. (or gr. xx) to 31 Gm. (or ̄j) it is of service in obstinate and irritable ulcers, erysipelas, eczema, herpes, urticaria, and other diseases associated with considerable irritation. Combined with a mercurial it exercises a beneficial influence upon the lesions of psoriasis. A gargle, containing 0.25 Gm. (or gr. iv) of acetanilide to 30 c.cm. (or f̄j) of water, may be beneficially employed in pharyngitis. Finely-powdered acetanilide and boric acid constitute an excellent dressing to burns, scalds, and small lacerated wounds. In many cases it has been found to prevent the production of pus. It has a beneficial influence upon ulcers and has been applied with success to mucous patches.

Given in fever (0.20 Gm., or gr. iij, or less) every hour, it usually is followed by prompt reduction of the temperature to the normal. It is also antispasmodic, and has been used in small doses in epilepsy, asthma, and whooping-cough. In whooping-cough it is given in the dose of 0.03 to 0.32 Gm. (or gr. ss-v), according to the age and condition of the child. Improvement has taken place in chorea, also, in consequence of its administration. For the relief of pain it has been employed in nervous affections, and relieves attacks of facial neuralgia, locomotor ataxia, sciatica, etc., in doses of 0.06 to 0.30 Gm. (or gr. i-v). In migraine, or neuralgic headache, it is also an efficient remedy. Acetanilide is highly esteemed in the treatment of dysmenorrhœa, especially of young girls. In doses of 0.20 to 0.32 Gm. (or gr. iij-v) thrice daily it is of value in relieving seasickness. Acetanilide may be used with lupulin for the affections just named:—

R Acetanilid.,  
Lupulini ..... aa 6½0 Gm. or gr. c.

M. et ft. capsulæ no. xx.

Sig.: One or two capsules every two or three hours.

It may be employed with camphor, as—

R Camphoræ ..... 3½25 Gm. or gr. 1.  
Acetanilid. .... 6½50 Gm. or gr. c.  
Olei theobromatis, q. s.

M. et ft. suppositoria no. x.

Sig.: Insert one into the bowel every two or three hours, for the relief of neuralgia.

In traumatic tetanus, doses of 0.25 to 0.38 Gm. (or gr. iv-vj) of acetanilide every third or fourth hour, in conjunction with hypodermic injections of carbolic acid, have been used with success.

A combination of value in the treatment of neuralgia, headaches, muscular and acute articular rheumatism, dysmenorrhœa, influenza, and various febrile affections is thus given by Dr. W. Blair Stewart:—

<b>R</b> Acetanilid.,		
Quinine bisulphat.....	aa	005 Gm. or gr. j.
Cocainæ hydrochloridi.....		004 Gm. or gr. $\frac{1}{4}$ .

The ingredients are compressed into the form of a tablet triturate; one tablet can be administered every three or four hours, according to effect and the nature of the case.

Acetanilide is said to be of value in the treatment of obstinate vomiting especially when due to nervous disturbance or extreme irritability of stomach. It has also been employed with success in order to relieve vomiting which follows surgical operations or the use of an anæsthetic.

Dr. Hollopeter recommends, in simple fevers of children, the following combination:—

<b>R</b> Acetanilid. ....	1/20	Gm. or gr. x
Hydrarg. chlor. mitis.....		005 Gm. or gr. j.
Sodii bicarb. ....	75	Gm. or gr. x
Sacch. lact. ....	1	Gm. or gr. x

**M.** et **ft.** chart. no. xij.

**Sig.:** One every two hours until three are taken.

**ACETONUM** (U. S. P.).—Pyroacetic Spirit, or Ether ( $C_2H_4O$  or  $COCH_3$ ).

**Dose,** 1 to 1.3 c.cm. (or *mxv-xx*), dissolved in spirit of nitrous ether.

Acetone is a liquid containing not less than 99 per cent. by weight of absolute acetone (dimethylketone). It should be kept in well-stoppered vessels in a cool place, remote from lights or fire.

**Therapy.**—Pyroacetic spirit has a peculiar ethereal, faintly mint-like odor, and a pungent, sweetish taste. It has been used as an antipyretic, or febrifuge, and as a sedative for cough, especially in pulmonary tuberculosis. It has also been used to relieve flatulence and pain in colic, and in diarrhoea or dysentery. It checks vomiting. When inhaled, it has an anæsthetic effect, but causes bronchial irritation. It is a mild hypnotic, analgesic, and has been used in rheumatism and gout. Acetone is a constituent of the urine in diabetes, and occasionally in that of healthy individuals while on a proteid diet.

**ACETPHENETIDIN** (U. S. P.).—(See Phenacetine.)

**ACIDUM ACETICUM** (U. S. P., B. P.).—Acetic Acid, composed of 3 per cent., by weight, of absolute acetic acid, U. S. P.; 33 parts of hydrous acetic acid, B. P.

**ACIDUM ACETICUM GLACIALE** (U. S. P., B. P.).—Glacial Acetic Acid, nearly or quite absolute acetic acid (contains 99 per cent. of  $C_2H_4O_2$ ).

#### Preparations.

**Acidum Aceticum Dilutum** (U. S. P., B. P.).—Diluted Acetic Acid contains 5 per cent., by weight, of absolute acetic acid, U. S. P.; 4.27 parts of hydrous acetic acid, B. P. The German dilute acetic acid is 30 per cent.

**Linimentum Terebinthinæ Aceticum** (B. P.).—Liniment of Turpentine and Acetic Acid (composed of oil of turpentine, glacial acetic acid, and liniment of camphor). Dilute acetic acid is the basis of the Acetic Acid, or official vinegars, except **Acidum Cantharidis** (B. P.), which contains glacial acetic acid.

**Pharmacology and Toxicology.**—Acetic acid is a clear, colorless liquid, having a strong vinegar-like odor, with acid taste and reaction. It mixes

water or alcohol in all proportions. Glacial, or absolute, acetic acid is a crystalline solid at 59° F.; it attracts moisture from the atmosphere, and should therefore be kept in well-stoppered bottles. Acetic acid in the strongest form acts as an escharotic to the tissues; and, if taken internally, is a violent corrosive poison, causing vomiting of sour-smelling liquid, also intense pain, followed by convulsions and fatal coma. If the case is prolonged, gastro-enteritis is produced by the acid. It has some antiseptic qualities, and, if swallowed, slightly increases the acidity of the urine.

**Acetum**, or vinegar, which contains from 6.3 to 7 per cent. of acetic acid, is not official in either the United States Pharmacopœia, or British Pharmacopœia, as dilute acetic acid takes its place. The use of a 60-per-cent. acetic acid is recommended by good authority as a menstruum for extracting the active principles of drugs, with which it seems, in many instances, to form soluble compounds.

**Pyroligneous acid**, or crude acetic acid, a dark-brown fluid having a smoky odor, obtained from the destructive distillation of wood, may be used with advantage as a disinfectant. Glacial acetic acid is partially eliminated by the intestinal canal, but chiefly by the kidneys. In cases of poisoning, milk or flour and water should be freely given, and vomiting encouraged. Weak alkaline solutions should be administered as chemical antidotes.

**Therapy.**—Glacial acid is used successfully as an application to lupus, epithelioma, ulcers, papillomata (or warts), and nasal hypertrophies, and also as an application to ringworm and other forms of tinea. A mixture of 30 parts of acetic acid and 2 parts of salicylic acid is esteemed an efficacious application to venereal warts. Vinegar (not official), or dilute acetic acid, has been given internally to check night-sweats and to relieve diarrhœa. After constipation has been overcome vinegar has been employed with good effect in the treatment of lead colic. Vinegar is a convenient antidote for poisoning by caustic alkalies. It is also used externally for the relief of headache, and the entire surface of the body may be sponged several times a day with vinegar and water to reduce high temperature and acid sweating. It will also prevent the formation of bed-sores. The vapor of vinegar diffused through the sick-room is, according to Dr. S. J. Bumstead, of Decatur, Ill., beneficial in cases of catarrhal, membranous, and diphtheritic croup. Engelmann claims that the direct application of vinegar answers a good purpose in diphtheria. Warholm recommends the use of vinegar for the purpose of relieving or preventing nausea, vomiting, and headache following the inhalation of chloroform. A compress saturated with the liquid is placed over the nose and kept in that position until consciousness has returned.

The following liniment is useful in chronic rheumatism of the joints. It is Stokes's or St. John Long's liniment, the *Linimentum Terebinthinæ Aceticum* of the National Formulary:—

R. Ol. terebinth. ....	100	c.cm. or fʒiiss.
Ovum recent.,		
Ol. limonis .....	4	c.cm. or fʒj.
Acid. acetic. ....	20	c.cm. or fʒv.
Aquæ rosæ .....	85	c.cm. or fʒiiss.
M. et ft. linimentum.		

Properly diluted, acetic acid is sometimes able to mitigate the intense pruritus of urticaria. It is capable also of checking moderate bleeding, as from leech-bites, superficial wounds, and epistaxis. In post-partum hæmorrhage, weakened acetic acid, or vinegar and water, expressed from a mop

or sponge into the cavity of the womb, will cause that organ to contract and prevent the loss of more blood. Acetic acid may be of service in bleeding from the stomach. Dr. E. Maguire reports good results in acute gonorrhea from the use of injections, consisting of 1 part acetic acid to 4 of

**ACIDUM ARSENIOSUM (B. P.).—Arsenious Anhydride.**

Dose, 0.001 to 0.004 Gm. (or gr.  $\frac{1}{60}$ - $\frac{1}{12}$ ).

**ARSENI TRIOXIDUM (U. S. P.).—White Arsenic ( $As_2O_3$ ).**

**ACIDUM ARSENOSUM (U. S. P., 1890).**

Dose, 0.002 to 0.005 Gm. (or gr.  $\frac{1}{30}$ - $\frac{1}{12}$ ).

*U. S. P. Preparations.*

**Arseni Iodidum.**—Arsenic Iodide. Dose, 0.0027 to 0.008 Gm. (or gr.  $\frac{1}{30}$ ).

**Sodii Arsenas.**—Sodium Arsenate. Dose, 0.0027 to 0.005 Gm. (or gr.  $\frac{1}{30}$ ).

**Sodii Arsenas Exsiccatus.**—Dried Arsenate of Sodium. Dose, two-thirds of the dose of the preceding.

**Liquor Acidi Arsenosi.**—Solution of Arsenous Acid (1 per cent.). Dose, 0.60 c.cm. (or mi-x).

**Liquor Potassii Arsenitis.**—Solution of Potassium Arsenite (equal to 1 per cent. of arsenic trioxide). Fowler's solution. Dose, 0.06 to 0.60 c.cm. (or mi-x).

**Liquor Sodii Arsenatis.**—Solution of Sodium Arsenate (1 per cent. of arsenate of sodium). Dose, 0.06 to 0.60 c.cm. (or mi-x).

**Liquor Arseni et Hydrargyri Iodidi.**—Solution of Arsenic and Mercuric Iodide (1 per cent. each of arsenic iodide and red mercuric iodide). Donovan's Solution. Dose, 0.06 to 0.60 c.cm. (or mi-x).

*B. P. Preparations.*

**Ferri Arsenas.**—Iron Arsenate. Dose, 0.004 to 0.015 (or gr.  $\frac{1}{10}$ - $\frac{1}{6}$ ).

**Arsenii Iodidum.**—Arsenious Iodide. Dose, 0.003 to 0.013 Gm. (or gr.  $\frac{1}{30}$ - $\frac{1}{6}$ ).

**Sodii Arsenas.**—Dose, 0.0016 to 0.006 Gm. (or gr.  $\frac{1}{60}$ - $\frac{1}{10}$ ).

**Liquor Arsenicalis.**—Arsenical Solution, Fowler's Solution (1 per cent.). Dose, 0.06 to 0.60 c.cm. (or mi-viii).

**Liquor Sodii Arsenatis.**—Solution of Sodium Arsenate (1 per cent.). Dose, 0.06 to 0.60 c.cm. (or mi-viii).

**Liquor Arsenii et Hydrargyri Iodidi.**—Solution of Arsenious and Mercuric Iodides. (Same strength and dose as U. S. P. preparation.)

**Liquor Arsenici Hydrochloricus.**—Hydrochloric Solution of Arsenic (100 contain 1 Gm. of arsenious anhydride). Dose, 0.12 to 0.50 c.cm. (or mii-viii).

**Pharmacology.**—A white, almost tasteless, heavy powder, contains not less than 99.8 per cent. of pure arsenic trioxide. It is soluble in 30 of cold water or 15 of boiling water; also in glycerin and in hydrochloric acid solution. When thrown upon burning charcoal it volatilizes, the white fumes being very poisonous. It is recognized by **Marsh's test**: by the generation of hydrogen in the presence of a solution containing arsenureted hydrogen is produced, which leaves a dark ring on a cold surface held in its flame; this also is extremely poisonous if inhaled. **Reinsch's test** consists in adding a few drops of hydrochloric acid to the suspected solution and immersing in it a polished plate of copper; the solution being heated, the metallic arsenic is deposited upon the copper. Arsenic possesses antiseptic qualities, and preserves bodies from decay; when death occurs from arsenic effects, it, therefore, remains for a long time in the stomach, liver, and

<sup>1</sup> "Annual of the Universal Medical Sciences," 1890, vol. v.

organs. Owing to its tastelessness and want of color, arsenous acid is frequently given with homicidal intent, but it is the most easily recognized by its tests of all the mineral poisons. **Paris green**, or **Scheele's green**, is an impure copper arsenite, used for killing potato-bugs, and as a pigment in wall-papers, and is a frequent cause of poisoning.

**Clemens's solution of arsenic bromide** is made by boiling powdered arsenous acid and potassium carbonate (of each, 4.74 Gm., or gr. lxxij) in distilled water (60 c.cm., or f̄ij), and the resulting solution cooled. Add 295 c.cm. (or f̄3x) of water, then bromine, 7.7 Gm. (or gr. 117), and afterward enough water to make 473 c.cm. (or Oj). The fluid is kept four weeks, being frequently shaken during the first week, or until it forms a permanently-clear solution. The dose is 0.06 to 0.30 c.cm. (or *mi-v*) daily, freely diluted and given after meals.

**Cacodyle**, or **kakodylic acid** (see **Acidum Cacodylicum**), is a white crystalline powder, soluble in water.

**Physiological Action.**—To the surface of the skin, if moistened, arsenic acts as an irritant, and produces inflammation and sloughing. Arsenic is readily absorbed, and is supposed to enter into combination with the red blood-corpuscles. It diminishes the elimination of carbonic acid and probably of urea.

Taken in small doses, arsenic exerts a tonic effect upon the nervous system, stimulates the circulation, and permits an increased amount of exercise to be taken without fatigue or short breathing. Large doses depress the action of the heart and diminish blood-pressure. The respiratory centre is stimulated by small and depressed by large quantities. Medicinal doses decrease, and excessive amounts increase, the metamorphosis of nitrogenous tissue. When administered for a long time, the system becomes habituated to its use and much larger doses may, in some cases, be taken without serious consequences. The arsenic-eaters of Styria can take 0.50 to 0.65 Gm. (or gr. viii-x) at a dose. It is said that but few can tolerate such large doses, and they are careful not to drink water afterward; so that absorption probably goes on very slowly, at the same time that it is eliminated rapidly by the kidneys. It is possible that the tolerance may be partly explained by heredity, as imitators of the arsenic-eaters, sooner or later, experience the toxic effects of the drug. Inflammation of the stomach is one of the results of poisoning by arsenic, even when introduced per enema or absorbed through the general surface. The urine becomes scanty, albuminous, or bloody. The skin is affected by arsenic; superficial oedema, especially of the face, appears, and may be followed by eczema, urticaria, herpes zoster, bronzing in patches, or exfoliation of the epidermis. The hair and nails may fall and conjunctivitis may occur. If the remedy is not discontinued at this time the puffiness of the eyelids and face may increase until a general anasarca is the result. Cases of idiosyncrasy have occasionally been observed in which the prolonged administration of arsenic in medicinal doses has given rise to urethritis, which gradually abated when the use of the drug was abandoned. The digestive organs are stimulated by small doses, but large ones cause gastro-enteritis, with burning pain in the epigastric region, vomiting, purging, and collapse resembling Asiatic cholera. In fact, when symptoms of this kind appear in the absence of an epidemic of cholera, they are very likely caused by arsenical poisoning, and should always excite suspicion of the administration of arsenic. Arsenical poisoning is occasionally

accompanied by paralysis of one or more extremities. According to the observation of Dr. Thomas Buzzard, the continued use of arsenic will occasionally give rise to multiple neuritis. Arsenic is eliminated from the system by the kidneys, and can be readily detected in the urine, when re-ingested. Knecht and Dearden<sup>1</sup> have shown that in small part arsenic escapes from the system through the hair. Their method employed was only one of detection, but also estimation, and obtained as high a proportion of arsenic as 1 to 10,000. There is also at the present time abundant evidence to show that the fate of arsenic in the body is partly in the hair; this fact cannot but be of the utmost importance in medicine, especially in toxicology.

The neuritis and paralysis so often observed in alcoholics may at first be due, not to alcohol, but to a contamination of arsenic in the beverages. The attention of the profession has recently been called to this important subject by Dr. E. S. Reynolds, of Manchester, England, who announced at the meeting of the Manchester Medical Society on November 1900, that the epidemic of multiple neuritis then existing in that city was caused by arsenic in the beer drunk by those so affected; he found that the arsenical contamination was due to the use of sulphuric acid employed in the preparation of glucose being made from arsenic pyrites, the acid being contaminated with arsenous acid to the extent, in some instances, of 1.5 per cent. of its weight, the arsenized glucose carrying with it as high as 1 Gm. (or gr. ij) of arsenous oxide to the gallon of beer. This deplorable occurrence, it is hoped, will serve as a warning to brewers of the danger of substituting cheap and impure products for the proper ingredients. The general appearance of the patients was described<sup>2</sup> as frequently, but not always, that of persons suffering with alcoholism. Usually the patients walked with difficulty, in an ataxic manner; pigmentation of the skin in various parts of the body was observed in almost every case, especially of exposed parts and of the axillæ, the groins, the areolæ of the breasts and the region surrounding the umbilicus. In many cases there was hyperæmia, erythema, or an eruption of papules; cramps and pains resembling those of tabes dorsalis were common; and the soles of the feet were exceedingly tender, so that walking, besides being ataxic, was exquisitely painful. Other symptoms noted were tremors, exaggerated reflexes, diminution or absence of knee-jerk, and a condition resembling erythromelalgia; nausea and vomiting were often complained of, but in many cases there was no vomiting. The exact number of cases poisoned in Manchester alone is not definitely known, though at one time more than three hundred cases had been under observation.

The vagina also has been used as a route for the introduction of arsenic into the system, and a number of cases have been reported in which it has thus administered criminally, either in solution or in crystals. In the 17th century a peasant in Hungary, as reported by Mangar, poisoned three victims by introducing arsenic into the vagina after coitus. Haberdar<sup>3</sup> reports a case of a young woman who apparently had committed suicide in this way; at the autopsy there was found acute inflammation of the surrounding organs, and a paper package containing arsenic crystals was found in the vag-

<sup>1</sup> *Lancet*, March 23, 1901.

<sup>2</sup> *New York Medical Journal*, December 15, 1900.

<sup>3</sup> *Centralblatt für Gynäkologie*, No. 50, 1896.

vault, imbedded in thick fibrinous exudations. The patient died with symptoms of peritonitis.

In exceptional cases of poisoning by arsenic the gastro-intestinal symptoms are not prominent, but profound collapse or stupor may be the chief manifestation and herald a speedy death. After recovery from the immediate effects of overdoses of arsenic various disorders, especially of the alimentary canal and nervous system, may occur as a result. Myelitis, peripheral neuritis, motor paralysis, hyperæsthesia, or anæsthesia are among the after-effects of this drug. A case fell under the observation of Dr. Roget in which epilepsy occurred as one of the secondary effects of the poison. Chronic arsenical poisoning is not uncommon among workmen on account of the extensive employment of this substance in the arts. A summary of the most typical manifestations of this form of toxæmia is thus given by the late Professor Taylor: "Dryness and irritation of the throat, irritation of the mucous membranes of the eyes and nostrils, dry cough, languor, headache, loss of appetite, nausea, colicky pains, numbness, cramps, irritability of the bowels attended with mucous discharges, great prostration of strength, a feverish condition, and wasting of the body."

In workmen employed in making arsenical dyes local affections are produced by constantly handling the substance. Among these effects are ulcers about the roots of the nails, papular and eczematous eruptions, and erysipelas. To these local difficulties the constitutional symptoms of chronic intoxication may subsequently be added. After death from arsenic, fatty degeneration of the heart, liver, kidneys, and other organs has been found. The temperature is depressed by toxic doses. Fly-poison, or cobalt, an impure arsenical oxide, is sometimes swallowed by mistake; so is rat-poison, made by mixing arsenic and meal ("rough-on-rats" contains 50 per cent.). Arsenic is excreted from the body by the kidneys and intestinal canal. It also escapes by way of the skin, and it has been found in different secretions, as the saliva, tears, and milk of nursing women to whom it had been administered.

As arsenical intoxication is occasionally due to wall-paper, the following test is of easy application in suspicious cases: A small piece of the paper placed in strong ammonia-water will give rise to a bluish color if arsenite of copper be present. A yellowish deposit upon a crystal of silver nitrate, moistened with a drop of the fluid, points to the presence of arsenic. Death has been caused by the ingestion of 0.13 Gm. (or gr. ij) of white arsenic. On the other hand, considerable amounts have been taken without fatal consequences, the immunity being, in all probability, due to prompt emesis and the form in which the poison was taken. Death from arsenic usually occurs within from eighteen hours to three days, but it has taken place in twenty minutes, while, on the contrary, the patient has lingered until the sixteenth to twentieth day.

**Antidotes.**—The antidotes to arsenous acid are the freshly-precipitated sesquioxide of iron, or the official *ferri hydroxidum cum magnesiæ oxido*, of which about 1.30 Gm. (or gr. xx) must be given for each grain of arsenic swallowed. The solution of dialyzed iron is also a convenient preparation for this purpose. Calcined magnesia and milk may be freely administered, and the stomach emptied by the stomach-pump, or by free vomiting. Oleaginous or mucilaginous drinks are also serviceable. If purging has not occurred, the bowels should be emptied by magnesium sulphate or Rochelle

salt. The case subsequently may require treatment for resulting inflammation. The autopsy reveals lesions of the œsophagus and stomach with erosions and ecchymoses, congestion of the lungs, and fatty degeneration of different organs. The arsenic may be detected not only in the contents of the stomach, but also in the urine and in the tissues, especially liver and great nerve-centres. The antidotes to Fowler's solution are ferric salts, especially the official solution of ferric acetate, to which ammonia should be added to neutralize the free acid.

**Therapy.**—When administered internally, arsenic has occasionally shown considerable power over morbid growths, and is the only remedy we have at our command that has any effect upon the development of the viscera. In epithelial cancer and other superficial growths an arsenical paste has been employed (cinnabar, 70; dragon's blood, 22; arsenous acid, 8), but, as previously stated, it is a very painful treatment, and may be applied to a small area at a time on account of the danger of producing toxic effects. The excessive use of an arsenical paste or powder has caused death by absorption of the poison.

Dr. Wight regards arsenic bromide as the most efficacious agent in preventing the dissemination and extension of malignant growth. In sarcoma he recommends a combination of this preparation with calcium carbide.

In ague and chronic malarial disorders, and also as a prophylactic against malarial poisoning, arsenic is used very effectually in small doses, and may be combined with quinine and iron:—

R. Liq. potassii arsenitis..... 18 to 30 c.cm. or minims.  
Tr. cinchona comp. .... 7 50 c.cm. or f3ij.

M. Pro dosi.

R. Sodii arsenatis ..... 1065 Gm. or gr. j.  
Mass. ferri carbonatis..... 13 Gm. or gr. x  
Quinina sulph. .... 13 Gm. or gr. x

M. et ft. pil. no. xx.

Sig.: One three times a day.

Dr. C. F. Bryan believes that arsenic acts as a prophylactic against intermittent fever and, perhaps, against diphtheria and influenza. The use of arsenic in pulmonary tuberculosis is advocated by Dr. Karl Hochhalt, who states that in fifty cases the appetite improved, the weight increased, and the fever diminished, while Fowler's solution was being administered. In neuritis arsenic frequently exercises a very happy effect, especially when given in the form of the solution of sodium arsenate. Larger doses are required for cases of chorea, but the effect is very marked. According to Dr. W. J. Murray, of Newcastle-on-Tyne, the most effectual method of treating chorea is by the administration of large doses of Fowler's solution. He begins giving 1 or 1.20 c.cm. (or *mxv-xx*) three times a day, in the middle of the meal. He claims that these heroic doses may be given for a few days without disturbing the stomach, and that it cures chorea within a week. A better method is to begin with a small dose, and increase each day until the maximum is reached; then stop for a few days, and begin again.

A course of arsenic has a valuable tonic influence in organic heart disease, and under its use dyspnoea, palpitation, and oedema improve. It also corrects intermittency of the pulse. This remedy is of service in certain forms of chronic albuminuria. Dr. Phillips has employed it with advantage for many years in albuminuria following scarlatina. Arsenic will not infrequently succeed in relieving hæmorrhoids.

It may be administered with advantage thus:—

- R Liq. sodii arsenatis,  
 Fluidext. nucis vomicæ..... aa 4| c.cm. or f3j.  
 Elix. gentianæ .....150| c.cm. or f3v.  
 M. Sig. One teaspoonful in water after meals. Used in neuralgia and chorea.

Sawyer<sup>1</sup> highly extols arsenic in gastralgia, where pain exists when the stomach is empty and is relieved by taking food. He gives 0.0027 Gm. (or gr.  $\frac{1}{24}$ ), in pill with some vegetable extract, three times daily, half-way between meals.

A pill highly extolled in the treatment of neuralgia is:—

- R Arseni iodid. .... |065 Gm. or gr. j.  
 Ext. belladonnæ fol.  
 Morphin. valerianat. .... aa |50 Gm. or gr. viij.  
 Pulv. ext. gentianæ ..... |32 Gm. or gr. v.  
 Pulv. ext. aconiti..... |32 Gm. or gr. v.  
 M. et ft. pil. no. lx.  
 Sig: One to three pills during the day.

Some spasmodic disorders of respiration, asthma, hay fever, and chronic catarrhal bronchitis are controlled by arsenic, and, if there is no acute inflammation, it may be used with the atomizer. Arsenic is of service in catarrhal pneumonia. Cases of periodical sneezing, dependent upon reflex action, have been cured by the use of this remedy.

In irritative dyspepsia, with morning vomiting and clean, red tongue, arsenic is of service; also in the diarrhoea coming on immediately after eating. In skin diseases arsenic is valuable in proportion to the absence of irritation or acute inflammation. In all chronic processes, especially when accompanied by desquamation or infiltration of the skin, such as psoriasis, the persistent use of small doses is often curative; also in the dry form of eczema and impetigo, as well as in pemphigus and lichen. In the vesicular or bullous eruptions of children small and repeated doses of arsenic are usually followed by speedy improvement. It is contra-indicated in the early stage of each of these affections except psoriasis. Sawyer<sup>2</sup> recommends arsenous acid for gastralgia given in pill form with gentian or other vegetable extract.

Prof. O. Lassar<sup>3</sup> gives an account of three cases of cancrroid in which the internal use of arsenic was followed by a disappearance of these growths; in one case sections were made of the growth before treatment, which upon examination gave the appearance of a beginning epithelioma; the arsenic was administered in pills containing 1 milligramme, increasing the dose to the physiological limit and continuing treatment for several months. In

<sup>1</sup> *Lancet*, July 4, 1896.

<sup>2</sup> *Lancet*, July 4, 1896.

<sup>3</sup> *Berliner Klinische Wochenschrift*, March 11, 1901.

one patient there had not been a recurrence of the growth at the eight years.

Dermatitis herpetiformis and recurrent herpes are benefited by administration of arsenic. It is generally of service also in the treatment of chronic urticaria. The internal administration of arsenic will probably benefit in chronic scaly affections. The persistent administration of small doses of arsenic is usually of service in the small pustular and papular eruptions of acne, especially in cases dependent upon debility or anæmia.

The following are serviceable formulæ in the diseases referred to

R. Liq. potassii arsenitis.....	4	c.cm. or f3j.

Arseni trioxidi.....	065	Gm. or gr. j.
M. et ft. capsulæ no. xx.		
Sig.: One after meals.		

In diabetes mellitus, the solution of arsenic bromide (not official), in Vichy water after each meal, has produced remarkable results in the case of Clemens, probably owing to its action upon the liver.

Quinquaud has experimentally demonstrated that, in animals fed with arsenic, diabetes cannot be produced by lesion of the bulb. In disease of the liver or kidneys, especially the early stages of cirrhosis, arsenic sometimes has a very decided effect. In vomiting and diarrhoea, especially in infants, copper arsenite in infinitesimal doses (0.0005 Gm., or gr.  $\frac{1}{128}$ , to water c.cm., or f3iv, a teaspoonful being given every hour or less) has been followed by good results; but the older method of using Fowler's solution in the same way is probably better, because less poisonous than the copper arsenite, the effect being largely due to the antiseptic action of the arsenic which acts more efficiently in the soluble form.

The vomiting of pregnancy is often remarkably relieved by the administration of a drop of Fowler's solution immediately before each meal. The same preparation is valuable in chronic gastritis (especially when it has been produced by alcohol), in chronic gastric ulcer, and cancer of the stomach. Arsenic is sometimes beneficial in chronic rheumatism. In rheumatoid arthritis Phillips testifies that under the continued use of this drug he has known the joints to return to their natural size. In angina pectoris Aitken asserted that arsenic was of decided service in mitigating the severity of the attacks, especially in anæmic patients suffering from overwork and anxiety. Syphilitic affections are sometimes better treated by the combination of arsenic with mercury than by mercury alone. Donovan's solution is especially useful in old syphilitic skin lesions.

Dr. H. Smith has reported a case of secondary syphilis, in which arsenic produced a rapid improvement, after mercury and iodide of potassium had failed. An isolated case of trichinosis was successfully treated by Dr. M. M. by means of Fowler's solution in doses of 0.30 c.cm. (or *mv*) thrice a day, gradually increased until constitutional effects were produced. Prior to its administration the patient was steadily growing worse. Donovan's solution in doses of 0.60 c.cm. (or *mx*) three times a day is said to do good in gleet. Finally, in chlorosis and anæmia the tonic effects of arsenic

well be combined with those of quinine and of iron. The usual dose of arsenous acid is 0.0027 Gm. (or gr.  $\frac{1}{24}$ ), to be cautiously increased. The best method of administration is in solution. Arsenic iodide has been found extremely effective by R. St. Philippe in cases of chronic eczema, inflammation of the eyes, intestinal catarrh, and other manifestations of scrofula. From 0.30 to 1.20 c.cm. (or *mv-xx*) a day, of a 1-per-cent. solution, in cold water, of arsenic iodide were administered, with no local treatment except sterilized water. Recently he has confirmed this, after an experience of over 300 cases.

In a case of leukæmia which Dr. Drew treated by means of an arsenical solution, in ascending doses until the physiological limit was reached, the spleen, which had been greatly enlarged, became, in the course of three months, diminished in size, the proportion of white blood-corpuscles was decreased, and the number of red corpuscles was augmented. When amenorrhœa is caused by congestion of the uterus, anæmia, or chlorosis, the administration of arsenic will usually be followed by a return of the catamenial flow. Professor Renaut, of Lyons, advocates the administration of arsenic by the rectum. Three injections may be given daily, of a solution containing a third of a milligramme (gr.  $\frac{1}{180}$ ) in 5 c.cm. (*mlxxv*). The treatment may be continued for months. Should any rectal irritation be caused, the addition of a few drops of laudanum will obviate it. This treatment is highly recommended by Renaut in the early stage of tuberculosis; also in diabetes mellitus, and in exophthalmic goitre.<sup>1</sup>

Radcliffe was the first to use arsenic hypodermically for the relief of chorea, in 1866, and since then it has been frequently used in scaly skin diseases, lymphadenomata, and nervous disorders. This method is also of advantage in the treatment of obstinate cases of malaria which have resisted the action of quinine. Very marked hypertrophy of the liver and spleen due to malaria may be reduced by the injection of Fowler's solution. Dr. Hué, of Rouen,<sup>2</sup> used hypodermic injections of 1 to 1000 solution of arsenous acid in inoperable cancer. In a case of epithelioma of the cheek he claims to have effected a complete cure. Planel obtained the same result in a case of cancer of the breast. This agent has also been used in several cases of recurrence of cancer; in some the progress of the disease has been distinctly retarded, in others the treatment had no effect. Hué used the following:—

R Arseni trioxidi .....	20	Gm. or gr. iiij.
Cocaine hydrochloridi .....	1	Gm. or gr. xv.
Aque destillatæ .....	90	c.cm. or ℥iij.

Of this, 1.20 to 2.50 c.cm. (or *mxx-xl*) were injected into the substance of the tumor, at intervals varying from two to eight days. In the successful case of epithelioma above mentioned Hué gave daily injections during several months.

The ointment of oleate<sup>3</sup> of arsenic is also a useful application in the treatment of old ulcers, epithelioma, and lupus. The following combination will be found of service in the diseases just named:—

<sup>1</sup> *Nouveaux Remèdes*, April 24, 1898.

<sup>2</sup> *Semaine Médicale*, Nov. 6, 1896.

<sup>3</sup> See "Ointments and Oleates, especially in Skin Diseases," by the author. F. A. Davis, 1890.

R Morphine sulphatis .....	13 Gm. or gr. i
Zinci chloridi .....	32 Gm. or gr. v
Pulveris marante .....	4 Gm. or 3j.
Ungt. arseni oleatis .....	15 1/2 Gm. or 3ss.

M. Sig.: Apply on old muslin for several hours.

Arsenic iodide (0.25 or 0.32 Gm. to 4 Gm., or gr. iv or v-5j) ointment is a valuable stimulating application in old dry eczema.

In warts, Unna advises the application of mercurial ointment containing from 5 to 10 per cent. of arsenic. E. Mansel Sympson declares that internal administration of small doses of arsenic has a curative effect on warts. After a week or two of this treatment the growths begin to disappear.

The cacodylate of guaiacol is a white salt, very soluble in alcohol and glycerin, but in water only 5 parts in 100. The addition of 1 part of free guaiacol makes the watery solution more permanent, and acts as a local anæsthetic when the solution is used hypodermically. Introduced into medicine by Dr. Barbary, of Nice, in 1900, Dr. Burlureau<sup>1</sup> has advocated its use in tuberculosis and in la grippe. One or two injections of 5 centigrammes reduces temperature, and ameliorates all the symptoms.

#### ACIDUM BENZOICUM (U. S. P., B. P.).—Benzoic Acid ( $\text{HC}_6\text{H}_5\text{O}_2$ ).

An organic acid usually obtained from benzoin by sublimation, or prepared artificially, chiefly from toluol. (See *Benzoinum*.)

#### ACIDUM BORICUM (U. S. P., B. P.).—Boric Acid ( $\text{H}_3\text{BO}_3$ ). For Boracic Acid.

Dose, 0.32 to 2 Gm. (or gr. v-xxx). B. P., 0.32 to 1 Gm. (or gr. v-xxx).

##### Preparations.

Glyceritum Boroglycerini (U. S. P.).—Glycerite of Boroglycerin. Gly Acidum Borici (B. P.).—Solution of Boroglyceride. (Contains 50 per cent. by weight of boroglycerin.) For external use.

Sodii Boras (U. S. P.).—Sodium Borate. Borax. Dose, 0.32 to 2 Gm. (or gr. v-xxx).

Unguentum Acidi Borici (U. S. P., B. P.).—Boric-Acid Ointment (10 parts of boric acid to 90 parts of paraffin ointment).

Borax (B. P.).—Borax, Sodium Biborate. Dose, 0.32 to 2 Gm. (or gr. v-xxx). Glycerinum Boracis (B. P.).—Glycerin of Borax (1 to 6).

Mel Boracis (B. P.).—Borax Honey (borax, 50; glycerin, 25; clarified honey, 400 Gm.).

Liquor Antisepticus (U. S. P.).—Antiseptic Solution (boric acid, 20 Gm.; glyceric acid, 1 Gm.; thymol, 1 Gm.; with eucalyptus, 0.25; peppermint oil, 0.50 Gm.; gaultheria, 0.25 Gm.; oil of thyme, 0.10 Gm.; alcohol, 250 c.c.m.; with sufficient water to make 1000 c.c.m.). Used as a dentifrice and as an antiseptic spray for the throat. May be taken internally in doses of 2 to 8 c.c.m. (or f5ss-ij).

**Pharmacology.**—Boric acid is in transparent, colorless, six-sided crystals, soluble in 25 parts of water or 15 parts of alcohol, and in 3 parts of boiling water or 5 of boiling alcohol. The alcoholic solution gives a green color. Borax is soluble in 16 parts of cold water, but not in alcohol. The solubility of boric acid is greatly increased by the addition of borax. When a mixture of equal parts of boric acid, borax, and water are heated together a crystalline salt is obtained known as the tetraborate of sodium, which is apparently neutral, as it is of neutral reaction. Sodium tetraborate is a white, un-

<sup>1</sup> *Bulletin Gen. de Thérapeutique*, January 23, 1906.

water, readily soluble in water and free from caustic or toxic properties. Boric acid has a feebly-acid taste and borax a sweetish, alkaline taste and no reaction. **Boroglycerin** is a combination of boric acid (62 per cent) and glycerin. An equal quantity of glycerin added to this makes the saturated solution of boroglycerin. Lister's antiseptic ointment for dressing wounds is made by adding 1 part each of boric acid and white wax, to 2 parts each of paraffin and almond-oil. Borated lint or borated cotton-wool (borated cotton) is made by steeping the substance in a saturated solution of boric acid and allowing it to dry. **Boral**, a trade preparation, consists of equal parts of boric acid and acetanilide, in fine powder.

**Physiological Action and Therapy.**—Boric acid is antiseptic. The presence of borax in food notably retards the action of saliva upon starch, as shown by experiments made by C. T. Fox, under the direction of Professor Henshaw, of Columbus, Ohio.

Chittenden and Gies<sup>1</sup> found that moderate doses of boric acid (up to 3 Gm. or gr. xlv, daily) are practically without influence on proteid metabolism or upon general nutrition. The same is true of borax, up to daily doses of 10 Gm. (or gr. lxxv). Larger doses of borax from 5 to 10 Gm. (or 5i $\frac{1}{4}$ -iiss) have a direct stimulating effect upon proteid metabolism, and lead to increased excretion of nitrogen; also of sulphuric and phosphoric acids. They retard the assimilation of proteid and fatty foods. With very large doses there is a tendency to diarrhœa from increased secretion of mucus. Borax decreases the volume of urine, gives it an alkaline reaction, and, owing to its excretion by this channel, raises the specific gravity. Neither borax nor boric acid has any influence upon the putrefactive processes of the intestine. They are rapidly eliminated from the body (twenty-four to thirty-six hours).

Boric acid is rapidly eliminated in the urine and is said by Max Grüber to increase the elimination of urea and the quantity of urine passed. Accidents from its use are rare; but a few cases have been observed in which boric acid excited cutaneous eruptions. The eruptions which may be excited by the internal use of boric acid assume a number of forms. Erythema, papules, blebs, generalized urticaria, and confluent rubeola-like rashes have been observed. Disturbances of the nervous system have also been caused. The symptoms have been attributed to non-elimination of the acid by the kidneys. Suppuration of the ear, or running from the ear, is cured by cleaning the canal and insufflating finely-powdered boric acid. In the treatment of aural suppurations and wounds Dr. Jaenicke, of Görlitz, recommends sodium tetraborate, which is also considered as a valuable application in conjunctivitis and keratitis and is said to restrain the formation of pus. Dr. J. Harris Pierpont suggests that finely-powdered boric acid is a ready means of diagnosing small perforations of the membrana tympani. After the external ear has been cleansed and dried the powder is blown into the canal until the membrane is completely coated. When an examination is made, a few hours subsequently, the perforation, if present, will appear as a dark or discolored spot upon a white field, the discharge, in passing through the opening, having partially or wholly dissolved the acid. Finely-powdered boric acid is regarded by McCandliss<sup>2</sup> as an excellent application

<sup>1</sup>American Journal of Physiology, Jan., 1898.

<sup>2</sup>China Medical Missionary Journal, Dec., 1890.

to leg ulcers. It is entirely unirritating when applied to the skin, and been used as a dressing for wounds in powder or ointment.

R. B. Wild,<sup>1</sup> after citing a number of cases, including some of his, distinguishes two forms of intoxication from boric acid—one in which a large quantity of the drug is rapidly absorbed from the alimentary tract from a serous or other cavity, or from an extensive raw surface; in such cases vomiting and diarrhœa, general depression, and partial paralysis of the nervous and muscular systems occur, and may cause death. A rash is present in many instances, especially when the patient recovered or lived some time after the absorption of the drug. The other class of cases results from the administration of boric acid or borax in comparatively small doses for long periods, and the symptoms appear at a variable time after the commencement of the drug. In some of these cases it is mentioned that the kidneys were diseased, and the author gives, as a possible reason for the immunity to the injurious effects of boric acid, its very rapid elimination by healthy kidneys.<sup>2</sup> Furthermore, it is possible that cases of intoxication occur more frequently than is at present recognized. Boric acid may unwittingly be taken in food and cause a toxic skin-eruption which may be mistaken for eczema, psoriasis, or exfoliative dermatitis. It may be noted that a 1 per cent. solution corresponds to 1.13 Gm. (or gr. xviiss) per pint of the acid, a large dose for an infant on milk diet and one likely in some cases to produce disturbance of the alimentary canal. It should also be ascertained whether the milk ordered in cases of kidney disease is free from excess of boric acid or borax. The use of boric acid or the borates in surgery and their internal administration ought to be carefully guarded in patients with diseased kidneys, and immediately discontinued on the appearance of dermatitis or other toxic symptoms. In suspected cases examination of the urine may afford a valuable evidence of the presence of the drug.

A solution of boric acid is an agreeable application in conjunctivitis and is very efficient in the treatment of burns, applied upon lint or absorbent cotton. The saturated solution is used in various chronic, scaly, and pruritic skin eruptions, and is the best remedy for bromidrosis of the feet and fetid perspiration. Among the beneficial combinations are:—

R. Acidi borici .....	2℥	Gm. or 3ss.
Glycerini, .....		
Tinct. opii .....	aa 15℥	c.cm. or f℥ss.
Aq. camphor. ....	30℥	c.cm. or f℥j.

M. Sig.: Ten drops to be instilled into the ear for earache. (Dr. Prout.)

R. Acidi borici, .....		
Bismuthi subnit. ....	aa 12℥	Gm. or 3iij.

M. Sig.: For running from the ear and in excessive and fetid perspiration.

R. Acidi borici .....	8℥	Gm. or 3ij.
Pulv. zinci carb. imp. ....	15℥5	Gm. or 3ss.

M. Sig.: In acute eczema and erythema.

R. Acidi borici .....	4℥	Gm. or 3j.
Aquæ hamamelidis dest. ....	120℥	c.cm. or f℥iv.

M. Sig.: Use in fetid perspiration and in an oily state of the skin.

<sup>1</sup> *Lancet*, No. 3032, p. 23.

<sup>2</sup> *Merk's Archives*, Jan., 1890.

In pharyngitis Dr. Capart prescribes the following combination:—

R Sodii boratis .....	4	Gm. or 3j.
Sodii salicylatis .....	2	Gm. or 3ss.
Decoctionis althææ .....	180	c.cm. or f5vj.

M. Sig.: To be given in divided portions through the day.

Whitla, Keegan, and others have employed boric acid in typhoid fever with good results. The temperature was lowered and the diarrhoea checked. Dr. Tortchinsky<sup>1</sup> has used this remedy in 240 consecutive cases of typhoid fever, and reports very favorably of its action. It is stated that the course of the disease was considerably shortened and that complications were very rare. The effect of the boric acid was enhanced, in the late stages accompanied by cerebral symptoms and in relapses, by a combination with quinine. The same writer has obtained equally satisfactory results from the use of boric acid in the summer diarrhoea of children.

Good results have been obtained in erysipelas, even of the phlegmonous form, by the application of lotions containing this remedy.

Borax in substance, mixed with white sugar, is applied to aphthous sore mouth in infants. Aufrecht recommends the internal administration of borax in the stomatitis of elderly and debilitated persons in whom the disease extends to the œsophagus and stomach, causing dysphagia and defective nutrition. A piece of borax of about 0.13 to 0.20 Gm. (or gr. ii or iij) placed in the mouth is said to be useful to speakers and singers by producing salivation and relieving hoarseness; its solution is a cooling application to superficial inflammations of the skin, and for pityriasis versicolor and seborrhœa of the scalp, or dandruff.

The late Dujardin-Beaumetz used the following as a favorite prescription for a dentifrice:—

R Acid. borici .....	25	Gm. or 3vi¼.
Phenolis liquefacti .....	1	Gm. or gr. xv.
Thymol. ....	25	Gm. or gr. iv.
Aquæ .....	828	c.cm. or Oi¾.

M. et adde:—

Sp. menthæ. ....	60	c.cm. or mx.
Sp. anisi. ....	9	25 c.cm. or f3iiss.
Cocci. ....	q. s.	ad colorand.
Sp. vini rect. ....	90	c.cm. or f3iij.—M.

The above author lays stress upon the importance of attention to the mouth, in many diseases, but especially in diabetes mellitus, in order to avoid lesions of the mucous membrane, gums, and teeth.

A lotion containing borax may be used in order to allay the itching of urticaria and paræsthesia. Internally, borax, in 1.30 Gm. (or gr. xx) doses, relieves irritable bladder and reduces the acidity of the urine. It has, in some instances, given encouraging results in epilepsy. The general tendency of borax is to diminish the number of attacks. It will sometimes succeed in cases which potassium bromide has failed to relieve. A combination of the two drugs has disappointed expectation. It is recommended to begin with doses of 0.50 to 1 Gm. (or gr. viiss-xv) and rapidly increase the amount until the limit of tolerance or a decided effect upon the disease is produced. Professor Mairet, of Montpellier, states that when daily doses of 8 Gm. (or 5ij) are insufficient to hold the attacks in check it is to be feared that larger

<sup>1</sup> *British Medical Journal*, Jan. 14, 1893.

doses will prove no more successful. When the paroxysms have been restrained, he advises the reduction of the amount to about 4 Gm. (or 3 *diem*. Among the disadvantages of the prolonged administration of are salivation, impairment of appetite and digestion, diarrhoea, emaciation, swelling of the face, œdema of the lower extremities, cutaneous rashes, conjunctivitis, fissures of the lips, fall of the hair, and alterations in the

According to Dr. G. Lemoine, a blue line, resembling that of lead poisoning, may form upon the gums after the prolonged use of borax.

Gowers has, when administering borax in epilepsy, seen psoriasis develop in several instances, and is disposed to attribute the disease of the to the influence of the drug. Both psoriasis and eczema have been attributed by other writers to the ingestion of borax. Borax is said to be better when administered in glycerin instead of aqueous solution, or when internal antisepsis is conjoined. Dr. Ch. Féré, after an experience of six with borax in epilepsy, regards it as distinctly inferior to the bromide efficacy. The renal trouble excited by prolonged use of the drug does always subside on suspension, and one case is mentioned which terminated fatally from uræmic coma. When the epileptic attacks are nocturnal, a tion of the drug should be given during the night. In order to cover the taste of borax M. Gay recommends solution in an infusion of licorice the addition of a little glycerin; in sweetened milk and strong coffee; syrup of orange-peel with julep. Syrup of orange is said to be the vehicle. Professor Lashkevich considers the borate of ammonium of service in phthisis. It is said to reduce the expectoration and, in some cases fever. He combines it with conium, hyoscyamus, or some other sedative. Dr. Golding-Bird asserts that borax cannot be employed with impunity in women, as it has a stimulant action upon the uterus, and states that in instances he has seen it produce abortion. Some have employed borax for the purpose of exciting uterine contractions in protracted cases of labour. It has also been administered in amenorrhœa and dysmenorrhœa.

Dr. Sacaze, of Montpellier, reports an excellent result from the use of borax in a case of paralysis agitans. It was first given in 0.25 Gm. (or gr. doses three times a day. After a few days the dose was gradually increased to double that quantity. Improvement was rapid.

Several cases of poisoning, some of them fatal, have been reported apparently due to the local application of boric acid or its solutions to external cavities: the vagina or stomach. The symptoms were reduction of temperature, depression of spirits, sickness of the stomach, feeble pulse, and in some instances, hiccough and ecchymoses. The mind usually remained clear, but coma sometimes occurred.

Solution of boroglyceride (50 per cent.) is a pleasant and efficient application for conjunctivitis, pharyngitis, and as a dressing for wounds and granulating surfaces, having the important advantage of not being poisonous. It is especially recommended for the local treatment of diphtheria. Boroglyceride ointment, made by adding to it unguentum aquæ rosæ, is a pleasant application for sunburn, pruritus, and other skin affections. Boric acid ointment (in lanolin or zinc ointment, 1 to 6) is used as a dressing for wounds and ulcers. The solution of boroglyceride is a valuable application in chronic eczema of the palms of the hands and the soles of the feet. It is also useful in subacute and chronic eczema of the genital organs, especially when the scrotum is invaded. It can be prescribed with witch-hazel.

The addition of borax is said to increase the laxative effect of glycerin suppositories.

**ACIDUM CACODYLICUM.**—Cacodylic, or Dimethalarсенic, Acid is a white crystalline powder, odorless, soluble in water, and containing 54.4 per cent. of metallic arsenic, which is equivalent to 71.4 per cent. of arsenic oxide. Cacodylic acid and sodium cacodylate have lately been occupying the attention of Continental investigators as substitutes for the usual preparations of arsenic on account of being less toxic in their effects. The cacodylates of potassium, magnesium, lithium, quinine, iron, guaiacol, and mercury have also been introduced.

Dr. Danlos,<sup>1</sup> of Paris, France, made a second report of his investigations with the use of the sodium cacodylate before the Paris Medical Society on June 16, 1900. He has treated some sixty cases of psoriasis, with good results, although he has to note a tendency to relapse, the method of administration being by hypodermic injections. Internally this author has used cacodylic acid with good results in lupus erythematosus, and in tuberculosis of the skin.

Dr. M. H. Billet,<sup>2</sup> attached to the military hospital at Constantine, Algeria, reports thirteen cases of malarial cachexia more or less pronounced that had been treated with cacodylate of sodium. This drug following immediately upon treatment by quinine, had restored the red blood-cells from about 3,500,000 per millimetre to normal, in the space of from fifteen to twenty days. The number of injections was from four to six, at intervals of three or four days, the dose employed being 0.23 Gm. (or gr. iii  $\frac{3}{4}$ ) for each injection. The hæmoglobin proportion had been raised simultaneously with the increase of red blood-corpuscles. It has also been noted that the offensive garlic smell of the breath, when given internally, is obviated by hypodermic administration.

Dr. William Murrell, of London, reports toxic neuritis and other bad results, from doses of 0.6 Gm. (or gr. j) three times a day. He considers it a dangerous drug.

**ACIDUM CAMPHORICUM** (U. S. P.)—(See Camphora.)

**ACIDUM CARBOLICUM** (B. P.).—Carbolic Acid. **PHENOL** (U. S. P.). ( $C_6H_5OH$ ).

Dose, 0.03 to 0.13 Gm. (or gr. ss-ij).

A constituent of coal-tar, obtained by fractional distillation, and subsequently purified.

**ACIDUM CARBOLICUM LIQUEFACTUM** (B. P.).—Liquefied Carbolic Acid.

Contains 10 parts of water to 100 parts, by weight, of phenol.

**PHENOL LIQUEFACTUM** (U. S. P.).—Liquefied Phenol.

Contains 90 per cent. phenol, with 10 per cent. water.

#### Preparations.

Glyceritum Phenolis (U. S. P.).—Glycerite of Phenol (20 per cent.).

Glycerinum Acidi Carbolici (B.P.).—Glycerin of Carbolic Acid (20 per cent.).

<sup>1</sup> "Bulletins et Mémoires," vol. xvi, p. 588.

<sup>2</sup> New York Medical Journal, Aug. 25, 1900.

*Sodii Phenolsulphonas* (U. S. P.).—Sodium phenolsulphonate. *Sodii S carbolus* (B. P.). Dose, 0.32 to 2 Gm. (or gr. v-xxx).

*Unguentum Phenolis* (U. S. P.), *Unguentum Acidi Carbolici* (B. P.).—Oil of Phenol (U. S. P., 5 per cent.). *Carbolic Acid Ointment* (B. P., 4 per cent.).

*Trochiscus Acidi Carbolici* (B. P.).—Phenol Lozenge (0.005 Gm., or gr. j Tolu basis).

*Suppositoria Acidi Carbolici* (B. P.).—Phenol Suppositories. Each co 0.065 Gm. (or gr. j) with white bees-wax and cacao-butter.

*Zinci Phenolsulphonas* (U. S. P.), *Sulphocarbolate* (B. P.).—Phenolsulp of zinc. Dose, 0.06 to 0.30 Gm. (or gr. i-v).

**Pharmacology.**—Liquefied phenol is a liquid obtained during the stillation of coal-tar between the temperatures of 180° and 190° C. (35 374° F.). What is called crude carbolic acid is distilled at a somewhat temperature, and contains also cresylic acid and other substances v render it unfit for medicinal use, except as a disinfectant for drains, et mixture of coal-tar constituents has, under the name of saprol, been posed as a cheap disinfectant. **Saprol** is a dark-brown, oily substance floats upon the surface of water, which extracts from it carbolic acid, c and other soluble products of coal-tar. In 1-per-cent. solution, saprol energetic agent, and is well adapted to the disinfection of dejecta in barr prisons, and schools. It must be borne in mind when using this fluid tl is of an inflammable nature.

Pure carbolic acid is crystalline at ordinary temperatures, and at is colorless, but reddens after exposure to the air. It has a characte odor and pungent taste; it is very soluble in all the usual menstrua, ha the peculiarity of being liquefied by 5 per cent. of water; but the fu addition of water produces turbidity until the proportions are reverse to 20), when it remains permanently clear and is not affected by fu dilution. It resembles creosote in its disinfectant properties, but differs : it by being converted into picric acid when nitric acid is added to it; whe with creosote, nitric acid forms oxalic acid. Resorcin is also of a sir character, but is in the form of a powder. Both creosote and resorcin be considered separately.

The following unofficial preparations are sometimes used:—

#### *Unofficial Preparations.*

*Aqua Acidi Carbolici* (8 Gm. in 473 c.cm. of water, or 3ij in Oj). Dose, 4 to c.cm. (or f3i-ij); also as a wash, gargle, or spray.

*Carbasus Acidi Carbolici* (gauze, containing carbolic acid, 1; resin, 5; par 7 parts).

*Oleum Acidi Carbolici* (1 in 20 of olive- or cotton-seed- oil).

*Carbolic-Acid Camphor*.—Dissolve 9 parts acid in 1 of alcohol, and mix wit parts camphor, forming a clear, oily solution.

*Liquor Sodii Carbolatus* (N. F.).—Solution of Carbolate of Soda (carbolic 12.60 Gm., or gr. clxxxvii; caustic soda, 2 Gm., or gr. xxx); water, 120 c.cm., or f. For external use, properly diluted. *Phénol-sodique*.

*Liquor Sodii Boratis Compositus* (N. F.).—Dobell's Solution (borax and sod bicarbonate, each, 8 Gm., or 3ij; carbolic acid, 1.55 Gm., or gr. xxiv, in water; c.cm., or Oj). For external use in spray for nose and throat.

*Tribromophenol*.—A compound of Bromine with Carbolic Acid with strong mine odor. In the form of soft, white needles; used as an antiseptic externally internally. Dose, 0.20 Gm. (or gr. iij).

*Parachlorphenol*. As an antiseptic.

*Calcium Carbolatum*.—Carbolated Lime. For disinfecting purposes.

**Physiological Action.**—Carbolic acid and its preparations are dis- guished by their destructive action upon the lower forms of life, but, ow

to their tarry smell and toxic effects, they cannot be used for preserving food, and are not popular in the household. When applied to the skin, carbolic acid causes irritation, and sometimes sloughing. Gangrene sometimes follows the use of carbolic acid as a surgical dressing. According to the observations of Dr. E. T. Reichert, this result is most apt to be caused by the use of moist applications and occurs especially in weak subjects, women and children. According to some reported cases, the presence of chronic alcoholism or diabetes seems to favor the occurrence of this accident. Carbolic acid is a local anæsthetic. It is also readily absorbed through the skin, and toxic effects have been produced in this way, although much more frequently by the absorption through the raw surface of a recent wound. Two cases of coma due to the application for a variable time of a 5-per-cent. solution have been reported by R. Clement Lucas and W. Arbuthnot Lane. The urine is diminished in quantity, and on standing acquires an olive-green color; this is generally the earliest symptom of intoxication. We also notice loss of appetite, nausea, vomiting, frothy salivation, difficulty in swallowing, and nervous symptoms. The pupils are contracted and the functions of the brain and spinal cord are affected, suspended reflexes and impaired sensibility and motility being observed. Large doses exert a depressant influence upon the circulation, and after lethal amounts the heart stops in diastole. Death occurs from respiratory paralysis; the temperature is at first increased, but afterward is reduced. In severe cases there is shock, great pallor, and sudden death. At the autopsy the drug may be recognized by its penetrating odor; evidences of corrosive action may be seen if taken in concentrated form, but even in small quantities it produces gastritis. As elimination takes place principally by the urine, the kidneys may be congested or inflamed; the blood is dark and imperfectly coagulated.

According to the observation of Dr. W. J. Wilkinson, the number of red blood-corpuscles is reduced, but the percentage of hæmoglobin remains unaltered. Zwaardemaker has shown that rats and cats are particularly susceptible to the action of carbolic acid. After a poisonous dose death sometimes comes on with great rapidity. In rare cases it is delayed for several hours or days. The fatal dose varies within wide limits, the minimum being rather more than 4 Gm. (or 3j).

**Treatment of Poisoning.**—When carbolic acid has been swallowed prompt treatment is required. The soluble sulphates (soda or magnesia) are the best antidotes, but the liquor calcis saccharatus, or syrup of lime, is also useful, if at hand. Alkalies, soap, albumin, flour and water may be given, and the stomach washed out with the stomach-pump. Oils should not be given, as they favor absorption. The bowels should be freely opened with magnesium, or sodium, sulphate. Collapse is relieved by hypodermic injections of atropine, by hot applications, arterial stimulants, and friction. The soluble sulphates should be administered in small doses for several days, in order to remove the carbolic acid from the system. Professor Carleton, of New York, states that vinegar is an excellent antidote to phenol. When applied to a cutaneous or mucous surface which has been burnt by the acid the characteristic whitish appearance produced by the caustic at once disappears and subsequent scarring is to a large extent prevented. Vinegar is also said to be equally good as an antidote when the acid has been taken into the stomach, and it is recommended that the patient should as soon as possible drink some vinegar mixed with an equal part of water, after which other

measures may be taken to more fully counteract the poison. Drs. F and Powell state that alcohol is an absolutely safe and sure specific against the escharotic action of concentrated carbolic acid. Dr. Gross, of Wayne, further suggests the use of alcohol internally as an antidote for carbolic-acid poisoning. Cases successfully treated by alcohol given freely, by the mouth and hypodermically, have been reported by Dr. Kel Brooklyn, and Dr. Hair, of Bridgeport, Conn.<sup>1</sup> As cases of poisoning by agent are becoming quite common, it has been suggested that every physician should keep on hand sulphate of soda, which is a prompt and safe antidote.

**Therapy.**—The antizymotic and antiseptic qualities of liquefied phenol have been largely utilized in surgery, although it has now been nearly superseded by the solutions of mercury, which have no offensive odor. Formerly the spray of carbolic water was considered an indispensable feature of the Listerian method, but this has been found to be unnecessary and has been abandoned, as asepsis can be secured without it. The solution is still used as a detergent and as an application upon dressings. In the treatment of carbuncle or malignant pustule, after incision and scraping, the application of pure carbolic acid not only acts as an antiseptic, but also as a local anesthetic, relieving pain.

Dr. Oscar H. Allis, of Philadelphia, and Dr. B. F. Gardner, of Bloomsburg, Pa., apply undiluted carbolic acid in the treatment of wounds and burns. The tissues turn white immediately after its application and are cleansed by douching with sterilized water. They have witnessed from its use in this manner neither shock nor systemic absorption. It also exerts a hemostatic effect, especially upon the capillary vessels.<sup>2</sup> Czerny<sup>3</sup> reports three cases in which carbolic-acid solution was applied to the fingers and gangrene resulted. In two of the cases, a 3-per-cent. solution was applied but it was kept on for several days. The duration of the application is more important than the concentration. Dr. Housell<sup>4</sup> has collected forty-two cases of carbolic-acid gangrene and calls attention to the fact that it has been caused by solutions as weak as 1 or 2 per cent. He warns physicians to discard its use as a dressing for the extremities in all strengths. Carbolic acid camphor, being free from offensive odor, may be used as a substitute for the pure acid. In weak solutions carbolic acid has been used as a parasiticide in various forms of tinea; and it has also been used topically for the prevention of pitting from small-pox. An ointment containing carbolic acid and camphor has proved of service also in mitigating the pruritus accompanying variola. In the treatment of burns, in the form of an especially carbolized oil, it is much employed. In acute vesicular eczema, erythema and in dermatitis, especially from various poisonous substances, the acid has been employed this combination with great service:—

R Phenolis liquefacti . . . . .	38 Gm. or gr. vj.
Pulveris zinci carb. imp. . . . .	31   Gm. or 3j.
Liq. calcei, . . . . .	
Glycerini . . . . .	aa 90   c.cm. or f3iij.

M. Sig.: Shake well, and mop frequently over the surface.

<sup>1</sup> *The Medical Bulletin*, Feb., 1900, p. 57.

<sup>2</sup> See paper by Dr. Oscar H. Allis, on "Carbolic Acid Used in Full Strength in Surgery," in *Medical Bulletin*, Jan., 1894, p. 4.

<sup>3</sup> *München medicinische Wochenschrift*, April 20, 1897.

<sup>4</sup> *Beiträge zur klinische Chirurgie*, B. 19, H. 3.

An ointment containing carbolic acid, sulphur, and camphor is most effective in many pruritic diseases of the skin, especially papular eczema, psoriasis, lichen, and urticaria (or nettle-rash):—

R Phenolis liquefacti .....	32	Gm. or gr. v.
Sulphuris subl. ....	2	Gm. or ʒss.
Camphoræ .....	65	Gm. or gr. x.
Ungt. zinci oxidi.....	31	Gm. or ʒj.

M. Sig.: Apply frequently to the irritable surface.

Lotions containing carbolic acid also allay the itching which accompanies jaundice.

In the vulvitis or leucorrhœa of young girls lotions or injections of carbolic acid in the strength of 5 parts to 1000 of water are beneficial, pads of lint saturated in the same solution being used to separate the inflamed parts in the intervals. The gonorrhœa of females has also been successfully managed by the application once or twice a day of tampons moistened with the following mixture:—

R Phenolis liquefacti .....	1	Gm. or gr. xv.
Alcohol. vel sp. odorat.....	30	c.cm. or fʒj.
Aquæ .....	75	c.cm. or fʒiiss.—M.

Scabies has been cured by friction with a 1-to-15 carbolized oil.

Internally, carbolic acid, sometimes, rather unexpectedly produces symptoms of poisoning, which fact restricts its use. In fermentation accompanying flatulent dyspepsia and in dilated stomach; carbolic acid will check the process and relieve the symptoms. It is useful in irritable vomiting, given frequently in broken doses. The author suggests the following prescriptions in the variety of dyspepsia referred to:—

R Phenolis liquefacti .....	25	Gm. or gr. iv.
Pulv. aromatici .....	75	Gm. or gr. xij.

M. et ft. pil. no. xij. In capsulæ duris.

Sig.: One before meals.

R Phenolis liquefacti .....	32	Gm. or gr. v.
Syrupi acaciæ,		
Aquæ cinnamomi .....	aa 45	c.cm. or fʒiiss.

M. Sig.: One teaspoonful before meals.

Carbolic acid is also of service in the treatment of diarrhœa. It has been used in pill form in the treatment of tape-worm. It is part of the so-called specific treatment of typhoid fever in extemporaneous combination with tincture of iodine (1 to 2 of iodine) in doses of 0.12 to 0.18 c.cm. (or miiij) every three or four hours, given in mint-water. The acid has been given in typhoid fever unassociated with iodine. Surgeon R. H. Quill, of the British army, has used in typhoid fever a combination of carbolic acid and chloroform (the proportion of acid to spirit of chloroform being as 3 to 10), and gives the most favorable reports of this method. In puerperal septicæmia, alone or alternated with quinine, it has been thought to answer a good purpose. Carbolic acid has been recommended by some writers as a valuable prophylactic against scarlet fever. In offensive breath, the cause may be in the mouth, throat, or bronchi, and in any of these cases the use of the steam-atomizer with a 5-per-cent. solution of carbolic acid will often relieve the patient very promptly. Caries of the teeth may be relieved by a

mouth-wash containing carbolic acid or phénol-sodique, well diluted. The same applied with a brush or atomizer has been used in diphtheria and other forms of sore throat. Weak solutions are used in hay fever, chronic catarrh, coryza, and influenza, and afford marked relief; the one known as Dobell's solution is widely used for the purpose, and for cleansing the trills. It is the liquor sodii boratis comp. of the National Formulary.

Subcutaneous injections of a 2-per-cent. solution have been made for checking the progress of erysipelas, and parenchymatous injections into the lungs in pulmonary phthisis. In the early stage of furuncle, and in enlarged lymphatic glands, the parenchymatous injection of the same solution often proves effectual in preventing the formation of pus. The same method has been employed with success in the treatment of chronic synovitis, and it has proved of service in certain forms of functional spasm, accompanied by localized pain, the injection being made at the painful spots. Cases of tetanus have been successfully treated by the subcutaneous injection, joined with warm baths and enemata containing chloral and potassium bromide.

Dr. F. E. Place has treated successfully tetanus in horses by hypodermic injections of pure carbolic acid. His method is to inject in the neighborhood of the neck and shoulders 4 Gm. (or 5j) every two hours, for the first two hours of treatment, and less frequently later. A large swelling appears at the site of the injections, but disappears in about fourteen days. Sometimes there is a loss of hair over the spots, but it is not permanent. He has never administered less than 64 Gm. (or 5xviiss) in a successful case.<sup>1</sup> Nilsson and Amyx<sup>2</sup> have reported 4 cases of tetanus in the human subject treated by injections of 2-per-cent. solution of carbolic acid under the skin in the neighborhood of the wound. The patient who received the largest quantity was the only one to recover. In each case chloral-hydrate and potassium bromide were given simultaneously in large doses. The case which recovered received 17.20 Gm. (or gr. cclxvij) in eight days, of which 6.5 Gm. (or gr. c) were given in the first twenty-four hours, without untoward effect of any kind.

Dr. Flavel Woods,<sup>3</sup> of Philadelphia, reported recently a satisfactory recovery from tetanus by means of large doses of carbolic acid. This method was introduced by Baccelli. Babès<sup>4</sup> speaks of it in very high terms, and says that the statistics of the antitoxin treatment do not show any better results. Babès injected 0.50 Gm. (or gr. viiiss) of a 1/2-per-cent. solution at the spinal column every two hours. Arcoli injected a 2- or 3-per-cent. solution in small doses, the patient receiving 0.32 Gm. (or gr. v) a day. The Accademia Medica, of Rome, published these statistics: One death in 11 cases with Baccelli's treatment; 8 deaths in 40 with Tizzoni's serum; 4 in 11 cases with Behring's serum No. 1; 2 in 9 cases with Behring's serum No. 2. Lieutenant-Colonel W. G. H. Henderson<sup>5</sup> reports success with the carbolic acid treatment of tetanus in both man and animals. Of 20 patients treated three times a day with injections of 0.13 Gm. (or gr. ij) of carbolic acid in 1.20 c.cm. (or mxx) of water, 7 recovered. Kitasato has demonstrated that

<sup>1</sup> *Lancet*, Feb. 24, 1900.

<sup>2</sup> *St. Louis Medical Review*, Dec., 1899.

<sup>3</sup> Editorial in *Medical Record*, Oct. 21, 1899.

<sup>4</sup> "Twentieth Century Practice of Medicine."

<sup>5</sup> *Lancet*, June 3, 1899.

carbolic acid acts as an anæsthetic, then as an antiseptic, and as an antidote to the toxin of tetanus.

J. M. Atkinson recommends large doses of carbolic acid hypodermically in treating the bubonic plague, and reports a successful instance of its use.<sup>1</sup>

Subcutaneous injections of carbolic acid were found very effective by SkultECKI in 2 cases of severe erysipelas and 1 of septic puerperal fever; all recovered promptly, and he recommends the treatment as strongly as it has already been lauded for tetanus and anthrax. The erysipelas patients received seventy-two to eighty-four injections, a total of 1.44 to 1.68 Gm. phenic acid (or gr. xxi<sup>2</sup>/<sub>4</sub>-xxvj), in a 2-per-cent. solution, 1 c.cm. (or *mxv*) every four hours. The puerperal fever was treated with 0.38 Gm. (or gr. *vj*) of phenic acid every three hours, the first day, and afterward with 0.30 Gm. (or gr. *ivss*) every four hours, for a week, when the cure was complete.<sup>2</sup>

A. Strubell reports a severe case of gangrenous and necrotic anthrax spreading from the tip of the nose, with chills, fever, etc., completely cured with scarcely a scar, by frequent injections of a 3-per-cent. solution of carbolic acid, a total of 400 Pravaz syringefuls in eighteen days, combined with copious stimulants, warm baths, and hot cataplasms at a temperature of 50° to 55° C., applied locally every ten minutes, night and day. The growth of the anthrax bacillus is checked at 40° and permanently arrested at 42°. Cultures from the nose were very virulent, but no bacilli were found in the blood.<sup>3</sup>

Ziemssen recommends in tonsillitis the injection into the substance of the gland of 0.50 c.cm. (or *mvijj*) of a 2-per-cent. solution. Relief is rapid, often after only a single injection has been made. As a prophylaxis against frequent recurrent attacks of tonsillitis, gargling the throat with a carbolyzed alcoholic solution has been advised. The pure acid (1 to 1.30 Gm., or gr. *xv-xx*) has been used by Levis as an injection into the tunica vaginalis, in cases of hydrocele, with successful results. In hæmorrhoids, carbolic acid, either pure or diluted with oil, has been employed with satisfactory results; but there have been some accidents. It has also been recommended in weak solution for the treatment of ascarides by enema, but the danger of absorption is too great for its use in this way; it may, however, be applied externally, as it is an excellent antipruritic.

The vapor of carbolic acid may be inhaled for whooping-cough or phthisis, in the place of the spray, by placing a few drops upon some absorbent cotton in an inhaler.

Dr. H. Ernest Schmid relies entirely, in every stage of whooping-cough, upon the use of a spray composed as follows:—

R Phenolis liquefacti .....	38	Gm. or gr. <i>vj</i> .
Menthol (4-per-cent. sol.) .....	15	c.cm. or <i>f3iv</i> .
Cocain. hydrochlor. (3-per-cent. sol.).....	11	c.cm. or <i>f3iij</i> .
Glycerin. ....	4	c.cm. or <i>f3j</i> .
Aq. laurocerasi .....	q. s. ad 30	c.cm. or <i>f3j</i> .—M.

The solution is used by means of an atomizer every third hour, the nozzle of the instrument being directed as far as possible into the mouth

<sup>1</sup> *Lancet*, Dec. 9, 1899. See also article on the "Bubo Plague," by author, in revised edition of "Reference Hand-book on the Medical Sciences." William Wood & Co., New York, 1900.

<sup>2</sup> *Semaine Médicale*, May 25, 1898.

<sup>3</sup> *Münchener medicinische Wochenschrift*, Nov. 29,

of the patient. The use of a weak solution of carbolic acid by atomizer combined with its internal administration, is of service in pulmonary disease. In the septic diseases,—small-pox, septicæmia, puerperal fever, the phenolsulphonates have been used with asserted success. In typhoid fever Dr. Waugh has had good results from zinc phenolsulphonate, in doses of 0.13 to 0.20 Gm. (or gr. ii-ij), four or five times a day. It has the advantage, over the carbolic acid and iodine treatment, of being less depleting to the heart and less injurious to the kidneys.

Prof. M. Charteris, of Glasgow, believes that pure carbolic acid gives good results in the treatment of typhoid fever. He gives it in the form of a pill containing 0.16 Gm. (or gr. iiss) of pure acid made up with some innocuous powder and covered with keratin, for the purpose of delaying its action until it has passed into the bowel. He is also of the opinion that it may be useful as a prophylactic and therapeutic agent in cholera, and it might, with advantage, be tried in diphtheria in doses of 0.13 Gm. (or gr. iij) every two hours.

Magnesium phenolsulphonate is said by Dr. G. Tarozzi to be an efficacious laxative and intestinal antiseptic in doses of 1 to 2 Gm. (or gr. xxx).

**Parachlorophenol**—obtained by the action of chlorine on phenol—by Girard, of Beine, to be more stable, energetic, and constant in action than other drugs and its toxicity is much less than mercury, cresol, or picric acid. Subcutaneous injections of 1 Gm. (or gr. xv) per kilogramme of body-weight are required to form a toxic dose for a dog or rabbit. A 2-per-cent. solution kills the spores of anthrax in an hour, whereas a 5-per-cent. solution of phenol requires twenty days. It forms a valuable antiseptic dressing for wounds or for cleansing surgical instruments.

**Phenosalyl.**—Combinations of antiseptic substances have often been proposed for the purpose of securing increased action, lessened toxicity, greater solubility, etc. Dr. J. de Christmas, of the Pasteur Institute, Paris, has devised a mixture which he terms **Phenosalyl**, the formula of which is as follows:—

Phenol.....	90 parts.
Lactic acid.....	20 parts.
Salicylic acid.....	10 parts.
Menthol.....	1 part.

This forms a clear, syrupy liquid, which partially crystallizes at low temperatures, but upon the addition of a small quantity of glycerin, a clear solution results. This will not again crystallize and readily dissolves in water, alcohol, and ether. In cold water it is soluble to the extent of 1 per cent. Experiments have shown that phenosalyl is considerably less poisonous than carbolic acid. It has been used in 1-per-cent. solution for the disinfection of hands and instruments, for irrigations, etc. A solution of the same strength proved rapidly curative in a case of impetigo, while 5-per-cent. phenosalyl pencils were beneficial in endometritis and urethritis. Phenosalyl has been advantageously used as an antiseptic in obstetric operations. A 2-per-cent. solution injected into the bladder was productive of excellent results in purulent cystitis. An ointment of 1 part of phenosalyl to 100 parts of vaselin was successfully employed by Dr. Berger in blepharitis and a 0.2- to 0.4-per-cent. aqueous solution in different forms of conjunctivitis. Scheurlen and Bechmen, a few years ago, published the

sults of experiments proving that the germicidal action of carbolic acid is decidedly increased by the addition of sodium chloride. A solution of 1 per cent. of carbolic acid with 24 per cent. of common salt gave better results than 6 per cent. solution of carbolic acid in plain water.

**ACIDUM CHROMICUM** (B. P.).—Chromic Acid ( $\text{CrO}_3$ )

**CHROMII TRIOXIDUM** (U. S. P.).—Chromic Trioxide.

It should contain not less than 90 per cent. of chromic anhydride.

*Preparations.*

Potassii Dichromas (U. S. P., B. P.).—Potassium Dichromate. Dose, 0.006 to 0.012 Gm. (or gr.  $\frac{1}{100}$  to  $\frac{1}{80}$ ).

Liquor Acidi Chromici (B. P.).—Solution of Chromic Acid (25 per cent. of  $\text{CrO}_3$ ).

**Pharmacology.**—Chromic acid occurs in the form of small, crimson, needle-shaped crystals, deliquescent and very soluble in water. They should not be added to alcohol, as mutual decomposition takes place, sometimes explosively. An explosion results instantly from a mixture of 1 part of chromic acid with 2 parts of glycerin. For the same reason chromic acid should never be combined with spirit of nitrous ether.

**Physiological Action and Toxicology.**—On account of its marked affinity for water and its contained oxygen, chromic acid rapidly destroys tissues, forming an eschar, and it is a powerful antiseptic. In solution (from 5 to 20 per cent.) it acts as a caustic. When swallowed it is a corrosive poison, and requires prompt treatment by demulcents and alkalies, with irrigation of the stomach. If death does not occur at once from shock, it may result from inflammation and sphacelation of the mucous coats of the stomach. Workmen in factories where chromic acid is used are liable to have perforation of the nasal septum from the local action of the acid applied accidentally upon the fingers. Eczema of the hands is liable to occur in those engaged in making the bichromate solution used for dyeing purposes. Cloth dyed with this material is apt to produce ulceration of the integument. The electropoion fluid (Liquor Electropoeicus, N. F.), or battery-fluid, contains potassium dichromate in powder, 186 Gm. (or  $\text{℥vi}$ ); commercial sulphuric acid, 180 c.cm. (or  $\text{℥vj}$ ); cold water, 1419 c.cm. (or  $\text{℥xlviij}$ ). Being of an attractive red color, and in such common use among physicians, it may be swallowed by mistake, and instances of poisoning in this way are not uncommon. In such cases, soap-suds and milk may be given at once, and the stomach carefully washed out with a soft tube, as vomiting may rupture the stomach. Arterial stimulants and external counter-irritation and hot applications may be required. Chrome yellow, or lead chromate, has been used by bakers in order to give a rich color to cakes. The symptoms are principally indicative of lead poisoning.

**Therapy.**—The solution of chromic acid is an excellent remedy for warts, syphilitic mucous patches, and enlarged tonsils (0.65 to 30 c.cm. of water, or gr.  $\text{x}$  ad aq.  $\text{℥j}$ ), applied with cotton or a camel's-hair brush once or twice a day. It has also been used in gynecological practice in uterine hæmorrhage and endocervicitis, and has been injected into hæmorrhoids, and applied to hypertrophies of the nasal chambers, and also to some malignant growths. Sweating of the feet (hyperidrosis) is relieved by sponging the feet daily with a weak solution. Parasitic skin diseases, sycosis, lupus, tinea circinata, and condylomata require a stronger solution (6.50 to 30 c.cm., or gr. c

to f3j). As the caustic action tends to spread, it should be used with care, covering the neighboring surface with petrolatum, or some other protective ointment, and promptly removing excess of acid with an alkaline wash.

In favus, after the crusts have been removed, an ointment composed as follows has proved serviceable:—

R Potass. dichromat .....	1	Gm. or gr. xv.
Adipis .....	31	Gm. or 3j.

M. ft. ungt.

A 1-per-cent. solution of chromic acid in water has been found by Professor Kaufman, of Alfort, to be an excellent remedy in cases of bites. As an application to chronic ulcers the following combination is recommended:—

R Chromii trioxidi .....	2	Gm. or gr. xx
Acid. tannic. ....	1	30 Gm. or gr. xx
Morphinæ sulph. ....		32 Gm. or gr. v.
Chlorali hydrati. ....	23	32 Gm. or 3vj.
Aquæ .....	473	c.cm. or Oj.

M. Sig.: Apply frequently with camel's-hair brush.

Chromic acid has been successfully used by Dr. W. R. H. Stewart in the treatment of ranula and cystic goitre. After the tumors had been opened, their contents washed out, and after hæmorrhage had ceased, a saturated solution of trioxide of chromium was applied to several points of the cyst. Chromic acid is not used internally; but the potassium dichromate has been administered in doses of 0.006 to 0.012 Gm. (or gr.  $\frac{1}{10}$ – $\frac{1}{8}$ ); it acts as an emetic in doses of 0.048 Gm. (or gr.  $\frac{3}{4}$ ). It has been used in chronic syphilis and syphilis, made into pill with some vegetable bitter, but its doubtful utility in these conditions.

**Potassium Dichromate.**—Dr. Joseph H. Hunt, of Brooklyn, praises the action of potassium dichromate as an expectorant in catarrhal conditions of the respiratory tract. To children of a year old, he is accustomed to give in 0.0032 Gm. (or gr.  $\frac{1}{20}$ ) doses. When the respiration is seriously embarrassed, he repeats the dose every fifteen or thirty minutes until the symptoms are ameliorated, when he diminishes the frequency to hourly intervals.

Following the suggestion of Vulpian, Professor Fraser, of Edinburgh, has, with advantage, made use of potassium dichromate in numerous cases of aggravated dyspepsia,<sup>1</sup> some of which were associated with distinct symptoms of gastric ulcer. The remedy was generally given in the dose of 0.005 Gm. (or gr.  $\frac{1}{12}$ ), sometimes increased to 0.01 Gm. (or gr.  $\frac{1}{6}$ ), three times a day. Professor Fraser advises that the remedy be given during fasting, while the stomach is, as far as possible, empty. He states that potassium dichromate is capable of relieving, and often in a short time of removing the entire group of symptoms, except constipation and anæmia, encountered in dyspepsia. It is particularly useful in alleviating pain, nausea, and vomiting. In gastric ulcer it did not succeed in checking hæmorrhage. In obstinate vomiting, gelatin capsules, each containing 0.006 Gm. (or gr.  $\frac{1}{20}$ ), have been given every hour or two, with good results. In gastralgia they have been successfully given, 1 three times a day, on an empty stomach, by Bradbury, of London.<sup>2</sup> Professor Fraser, of Edinburgh, read a paper

<sup>1</sup> *Lancet*, April 14, 1894. <sup>2</sup> *Lancet*, Sept. 14, 1895.

before the International Medical Congress at Rome on the use of this salt, recommending it in certain affections of the stomach.<sup>1</sup>

Potassium dichromate has likewise been administered with asserted benefit in locomotor ataxia. Dr. Diago reports very favorable results from the exclusive administration of this remedy in seven cases of hæmatochyluria, three of which depended upon the presence of filariæ. It was given in the dose of 0.02 to 0.03 Gm. (or gr.  $\frac{1}{3}$ -ss) in half a pint of water. He regards the salt as of value in the treatment of pernicious malarial anæmia. In cases of poisoning by potassium dichromate the same means are employed as in arsenical poisoning. At the present day it is rarely prescribed internally.

**ACIDUM CITRICUM** (U. S. P., B. P.).—**Citric Acid** ( $\text{H}_3\text{C}_6\text{H}_5\text{O}_7 + \text{H}_2\text{O}$ ).  
Dose, 0.65 to 2 Gm. (or gr. x-3ss). B. P., 0.32 to 1.30 Gm. (or gr. v-xx).

*Preparation.*

**Syrupus Acidi Citrici** (U. S. P.).—One per cent. Dose, 7.50 to 30 c.cm. (or gr. ℥j).

**Pharmacology.**—Citric acid is an organic acid, usually prepared from lemon-juice; it occurs in the form of colorless crystals soluble in less than their own weight of water. Citric acid is soluble likewise in alcohol and ether. It is not infrequently adulterated with tartaric acid, which may be detected in the form of bitartrate by the addition of a strong neutral solution of carbonate of potassium. It has a sour taste, not unpleasant in weak solutions. In substance it is irritating to the gastro-intestinal mucous membrane, and may thus act as a poison. It renders the urine acid. It is eliminated to some extent by the bowels, but principally by the kidneys.

**Therapy.**—In the proportion of 37 Gm. (or gr. ℥xx) to 473 c.cm. (or ℥j) of distilled water it forms a solution of the average acidity of lemon-juice, which may be further diluted and sweetened as a refrigerant drink for fever. It has been used also as a substitute for fresh lemon-juice in the treatment of scurvy, but is less efficient.

Citric acid has likewise been employed for the purpose of relieving intensity of the liver and catarrhal jaundice. A 1-per-cent. aqueous solution of citric acid is said to be useful as an injection in gonorrhœa.

Citric acid has the power of sterilizing polluted water.

**ACIDUM FORMICUM.**—**Formic Acid** ( $\text{CH}_2\text{O}_2$ ).

**Pharmacology.**—Many species of ants contain formic acid in its own juice. The red ant, *Formica Rufa*, indeed, contains about half its weight of this peculiar constituent, the name of formic acid having been derived from the fact. These ants possess no stings; but they can inflict very irritating wounds upon the human body by biting through the skin with their strong mandibles and injecting formic acid into the flesh. The powerful irritation set up was at one time utilized in therapeutics by taking rheumatic joints near to an ants' nest, and making the insects angry so that they would bite the exposed surface around the affected joints. Recently, this has been revived in scientific medicine by substituting the hypodermic needle for the living insect for the introduction of the formic acid. Nearly three centuries ago (in 1670) two physicians, Wray and Fischer, obtained formic

<sup>1</sup>*Lancet*, April 14, 1894.

acid by distilling ants with water-vapor. They introduced the solution of formic acid into medical practice, principally for external use as a rubefacient, and, to a limited extent, for internal use, as a general stimulant and aphrodisiac. It has been only lately discovered that formic acid, being a methane derivative, can be produced in different ways, notably by the oxidation of methyl-alcohol, or by breaking up oxalic acid in the presence of glycerin. The latter, devised by Berthelot, is the method now generally adopted.

Formic acid readily combines with bases to form a series of salts known as formates, which offer special advantages for the internal administration of this active agent. It has been demonstrated that the alkali formates, notably the sodium and calcium formates, have a very stimulating effect upon the muscular elements, both striated and non-striated. Huchard of Paris, in a communication to the Academy of Medicine (March 14, 1891), reported, as the results of extensive laboratory investigation, that "the acid salts increase the work performed by the muscular tissues, three or four-fold, without fatigue." He regards them as superior in their effects to caffeine, kola, strychnine, or spermine. Dr. Garrigues, also, as the result of his personal observations, reported to the Academy (March 28, 1891), that the administration of the formates induces not only an increase in muscular strength, but also stimulates the appetite. This statement has been confirmed by Clement, of Lyons, and others. The conditions in which the formates of calcium and of sodium have been administered successfully were certain forms of constipation, incontinence of urine, defective nutrition, and poor circulation, especially in phthisis, general asthenia, neurasthenia, and anemia. The doses of the formates vary according to circumstances. In Huchard's physiological experiments upon himself and patients, they took from 2 to 3 grammes per day (15 grains, two or three times a day) with very decided benefits, as shown by the ergograph, and, he claims, without any deleterious after-effects. In phthisical patients, the urination was increased from 20 to 52 grammes. Other observers have concluded that the more lasting results can be obtained by giving small doses, three or four times a day (0.06 to 0.30 Gm., or gr. j-v) for a prolonged period. The glycerophosphates are synergistic with the formates, and they may be used in combination with strychnine or other cardiac tonic.

Pure formic acid ( $\text{HCO}_2\text{OH}$ , molecular weight 45.67) has the peculiar property of acting both as an aldehyde and as an acid. It is crystalline, but, at a temperature above  $8.3^\circ \text{C}$ ., it is a colorless liquid, having a pungent odor and burning taste. It is caustic and destructive to the tissues when applied in full strength.

**Therapy.**—In modern therapeutics, formic acid is coming into use as a counter-irritant, in a 50-per-cent. solution; and in more dilute form, to 3 per cent. For internal administration the German Pharmacopoeia provides *spiritus formicarum*, or spirit of ants, which is composed of 2 parts formic acid, 35 parts alcohol, and 13 parts water. This solution may be given in doses of from 20 to 30 minims, as a general stimulant, acting much like ammonia. The 50-per-cent. solution has been applied locally with success, as a counter-irritant, in treating neuralgia and rheumatism. It has also been used to prevent bed-sores. The 2 1/2-per-cent. solution is used in acute rheumatic arthritis. It has recently been used hypodermically with remarkably beneficial results, by Dr. Louis B. Crouch (*Medical Record*, June 24, 1905).

**ACIDUM GALLICUM** (U. S. P., B. P.).—Gallic Acid ( $\text{HC}_7\text{H}_5\text{O}_6 + \text{H}_2\text{O}$ ).

**Dose**, 0.13 to 0.65 Gm. (or gr. ii-x). B. P., 0.32 to 1 Gm. (or gr. v-xv).

An organic acid usually prepared from tannic acid (U. S. P.). A trihydroxybenzoic acid. It may be prepared by the action of diluted sulphuric acid on tannic acid (B. P.).

**Pharmacology**.—Galls are lumps or nodes upon the oak-tree, caused by insects. They contain about 50 per cent. of tannic acid, which, chemically, is an anhydride of gallic acid, and, in fact, is convertible into gallic acid by acids or simply by immersion in water. Its solutions strike a black color in the presence of iron, and they should not be prescribed in combination with chalybeates. Gallic acid is in the form of long needles, nearly colorless, slightly acid, though less astringent than tannin; it is soluble in 100 parts of cold water,  $4\frac{1}{2}$  parts of alcohol, or 3 parts of boiled water.

**Therapy**.—Like tannin, gallic acid has the effect of restraining secretion, reducing swelling, and hardening tissues. It is eliminated by the kidneys under its own form. In solution, as the glycerite (1 part to 8 of glycerin) it forms a favorite application to sore throat or tonsillitis; and the ointment of gallic acid is a good application to hæmorrhoids, being an improvement upon the ointment made of powdered galls. The alcoholic solution is useful as a local application to the membranes in diphtheria.

Internally, gallic acid is given in hæmorrhage (1.30 Gm., or gr. xx, at a dose) from the alimentary canal, kidneys, or lungs; also in menorrhagia, but here it is inferior to ergot.

In hæmoptysis, ulcer of the stomach, hæmorrhage from the bowel, especially in typhoid fever, the following formulæ can be used:—

R Acid. gallic. ....	8	Gm. or 3ij.
Acid. sulphuric. arom. ....	4	c.cm. or f3j.
Morphine sulph. ....	0.065	Gm. or gr. j.
Tinct. cardamom. co. ....	30	c.cm. or f3j.
Aque rose ....	60	c.cm. or f5ij.

M. Sig.: One teaspoonful in water every hour or two.

R Acid. gallic. ....	8	Gm. or 3ij.
Glycerini ....	90	c.cm. or f3iij.

M. Sig.: One teaspoonful every half-hour or hour until relieved.

This combination is a useful application to subacute pharyngitis or tonsillitis.

It has also been used to reduce the quantity of albumin in Bright's disease. On account of its astringent effects gallic acid is useful in a number of disorders attended by excessive secretion or transudation, as chronic bronchitis, cystitis, chronic diarrhoea, dysentery, and the night-sweats of phthisis. It is likewise serviceable in purpura hæmorrhagica. It retards the progress of pyelitis or pyelonephritis, and diminishes suppuration. Combined with opium, it has been found beneficial in diabetes insipidus.

**ACIDUM HYDRIODICUM DILUTUM** (U. S. P.).—Diluted Hydriodic Acid.

Contains not less than 10 per cent. of absolute acid and about 90 per cent. of water. **Dose**, 0.30 to 2.50 c.cm. (or mv-xl).

#### Preparation.

**Syrupus Acidi Hydriodici** (U. S. P.).—Syrup of Hydriodic Acid (contains about 1 per cent., by weight, of absolute acid). **Dose**, 2 to 15 c.cm. (or mxxx-f3ss).

**Pharmacology.**—Hydriodic acid is a gas which may be prepared by the action of iodine upon phosphorus in the presence of water, with the gentle heat. It is colorless, but produces white fumes in air; it can be liquefied or even rendered solid by strong pressure and a low temperature. A solution of hydriodic acid in water, if exposed to the air, soon becomes colored, and after a time deposits crystals of iodine. The solution is official, but the U. S. P. recognizes a syrup.

**Therapy.**—The syrup of hydriodic acid is a valuable means of introducing iodine into the system. When administered in this way the iodine is liberated in the body, and is peculiarly active in its nascent form, and is especially adapted for administration to scrofulous subjects and cases of catarrh of the lungs, pneumonia of the chronic type. In some skin diseases of the same character the syrup of hydriodic acid, when properly made, has proved of great value. It is very efficacious in spasmodic asthma, especially of that variety which is linked with the gouty diathesis.

The syrup of hydriodic acid is an efficient remedy in tertiary syphilis, acute and chronic rheumatism, lumbago, rheumatoid arthritis, chronic lead poisoning, bronchitis, exophthalmic goitre, and other affections in which iodine is indicated.

Dr. James Craig, of Jersey City, speaks very highly of the syrup of hydriodic acid in acute rheumatism. He gives from 7.5 to 11 c.cm. (or f3j to f3ss) in a wineglassful of water every two or three hours until relief is experienced, afterward reducing the dose and continuing the remedy for several days as required. The pain and fever are reduced within forty-eight hours, and he believes that this treatment exerts an important influence in preventing diphtheritic complications. Its power over serous exudation and fibrous adhesions is well illustrated in pleurisy with large effusion, or in pleurisy with adhesions. As the latter is a prominent predisposing cause of phthisis, it is important that it should receive attention early and be removed by the administration of iodine, especially in the form of syrup of hydriodic acid. Wile has used this preparation with success in various cases of lead poisoning.

**ACIDUM HYDROBROMICUM DILUTUM (U. S. P., B. P.).**—Diluted Hydrobromic Acid ( $\text{HBr}_2 + [\text{H}_2\text{O}]_n$ ).

**Dose,** 2 to 7.50 c.cm. (or mxxx-f3ij). B. P., 1 to 4 c.cm. (or mxv-f3ss).

**Pharmacology.**—Hydrobromic acid resembles hydrochloric acid in its action, being official only in solution, each being a gaseous substance. Diluted hydrobromic acid contains 10 per cent., by weight, of absolute hydrobromic acid (hydrogen bromide, B. P.). It is a clear, colorless solution with an acid taste, and can be given in lemon-syrup or simple elixir.

**Therapy.**—Hydrobromic acid should be an excellent antiseptic dressing wounds, being sedative, non-poisonous, and bactericidal in action. It was introduced as a substitute for the bromides, but it has not fulfilled the expectations of its projectors, although it has some anodyne and hypnotic effects. It is more pleasant to take than the bromides, is not apt to produce an eruption or physical depression, but it is more irritating to the stomach. In some cases of nervous cough, neuralgia, headache, nervousness it has a good effect, but is ordinarily given in too small doses. Its action in epilepsy may be compared to that of the bromides, but the gastric irritability which it excites is a bar to its continued use.

Schewitz has found it useful in headache due to eyestrain. In cases of annoying tinnitus after taking quinine it is said to give prompt relief, although it often fails in relieving tinnitus from other causes. Two fluidrachms (7.50 c.cm.) are equivalent to 18 grains (1.16 Gm.) of potassium bromide.

To relieve irritative cough in phthisis:—

R Codonæ .....	1065	Gm. or gr. j.
Acidi hydrobromici dil. ....	30	c.cm. or fʒj.
Syr. aurantii .....	60	c.cm. or fʒij.
M Dose, 1 or 2 teaspoonfuls.		

**ACIDUM HYDROCHLORICUM** (U. S. P., B. P.).—**Hydrochloric Acid**, formerly **Muriatic Acid** (contains 31.9 per cent. by weight of absolute hydrochloric acid, with water, 68.1 per cent.; B. P., 31.79 per cent., by weight, of hydrogen chloride). ( $\text{HCl} + [\text{H}_2\text{O}]$ .)

#### Preparation.

**Acidum Hydrochloricum Dilutum** (U. S. P., B. P.).—Diluted Hydrochloric Acid contains 10 per cent. of absolute hydrochloric acid in water; B. P. contains 10.58 parts of hydrogen chloride in 100 parts of water). Dose, 0.60 to 2 c.cm. (or *mx-xxx*).

**Pharmacology.**—The acid itself is an irritating, irrespirable gas. Its solutions are clear, colorless, and decidedly acid. When applied to the skin they are antiseptic and astringent; in some persons with delicate skin hydrochloric acid is irritating and slightly caustic. The salts of hydrochloric acid are collectively termed hydrochlorides. Prominent among them are apomorphine, cocaine, hydrastinine, morphine, pilocarpine, and quinine hydrochlorides.

**Physiological Action and Toxicology.**—When taken internally in poisonous doses, it acts as a violent irritant, causing burning pain, a strong acid taste in the mouth, red and swollen tongue, and discoloration of the face. Vomiting occurs at once, and may be accompanied by bleeding. The patient is at first feverish, but soon falls into collapse, and dies of shock or exhaustion. Violent gastric inflammation is found after death, and the esophagus and mouth show the effects of a corrosive poison. The vapor of ammonia escaping near the vomited matters produces a white cloud of ammonium chloride. The treatment is the same as for other corrosive mineral acids.—demulcent drinks, flour or soap and water, milk, oil, or eggs. The carbonates may be given cautiously, for fear of rupturing the stomach by the escaping carbonic-acid gas. The stomach being softened by the acid, it should be evacuated by the tube rather than by emetics, if vomiting does not occur spontaneously. There is, moreover, danger that, in the act of vomiting, a portion of the acid may find its way into the air-passages and thus still further extend the mischief. Subsequently, the patient must be treated for the resulting lesions, which are not limited to the intestinal tract, since congestion of the kidneys and lungs may also occur. Medicinal doses stimulate the appetite and promote digestion.

**Therapy.**—Topically, hydrochloric acid is applied to septic wounds, discharging wounds, or bites of rabid animals. It has also been used, mixed with an equal proportion of honey, as an application to the throat in diphtheria. It is important that this application should be made only to the diseased

surface. It is a good addition to baths in cases of skin disease, as pityriasis versicolor or tinea, and in full strength it is used to destroy warts on the hands of children. The undiluted acid has been successfully used as a counter-irritant in sciatica. Dr. Gennatas, of Montpelier, applies three or four coats by means of a small brush, along the affected nerve, and wraps up the part in cotton. The application may be repeated in twenty-four or forty-eight hours.<sup>1</sup>

Dr. Morris, of New York, has, in some cases, utilized hydrochloric acid for the removal of carious and necrotic bone. Through a sinus or incision a 2- or 3-per-cent. solution of hydrochloric acid in distilled water is injected every two hours, or at bed-time, according to the circumstances of the case. The exposed portion of bone is rapidly decalcified, after which there is injected every second day an acid-pepsin solution made by adding 1 c.c. (or *mxv*) of hydrochloric acid and 2 Gm. (or *3ss*) of pepsin to 120 c.c.m. (*f3iv*) of distilled water. The decalcified bone with caseous or fatty matter is digested out within a few hours, leaving exposed clean dead bone, which can be attacked in the same manner.

When hydrochloric acid is given well diluted, it is acceptable to the stomach, being one of the constituents of the gastric juice. When fermentation of the food takes place, causing flatulence, or "windy dyspepsia," it may be due to a deficiency of this element. At all events, cases of weak digestion and dyspepsia are sometimes much benefited by 0.60 to 1.20 c.c.m. (or *mx* to *xx*) of the diluted acid with half the quantity of tincture of nux vomica, after each meal. Where acid stomach is caused by the presence of bacteria, antiseptic action is best obtained by administering the hydrochloric acid when the stomach is empty, shortly before eating. It is also held that excessive secretion of hydrochloric acid (which forms one variety of peptic ulcer of the stomach) may be prevented by administering an acid solution just before eating, on the rule that acids check acid secretions. Hydrochloric acid sometimes affords great relief in nausea. In intestinal indigestion with diarrhea this agent is also very effective, given one or two hours after meals. Temporary administration of pepsin in combination with the acid is of great value in cases of this kind, but the pepsin should not be continued too long, or the peptic glands may lose their functions.

A digestive mixture which is very beneficial is:—

R Acid. hydrochlor. dil. ....	15	c.cm. or <i>f3iv</i> .
Pepsin. pur. ....	15	Gm. or <i>3iv</i> .
Glycerini ....	90	c.cm. or <i>f3iij</i> .
M. Sig.: One teaspoonful in water after meals.		

In fevers, where the secretions are very much diminished and hydrochloric acid is not secreted, its administration is of great service in assisting digestion. In typhoid fever, dilute hydrochloric acid is very useful (0.60 to 1.20 c.c.m., or *mx-xx*, every three hours), and it exercises an important influence upon the contents of the bowels, being slightly astringent and preventing the multiplication of bacilli. Relapse is less frequent under this treatment because autoinfection is less likely to occur. In other infectious zymotic diseases—as scarlet fever, small-pox, or diphtheria—hydrochloric acid, or compound chlorine solution, may be administered in the same way.

<sup>1</sup> *Lancet*, Nov. 20, 1897.

It is serviceably combined with the tincture of iron in the treatment of diphtheria, and the mixture may be used both internally and as a local application. The presence of a mineral acid has been shown to diminish the virulence of the toxins of diphtheria.

In phthisis it is serviceable in disinfecting to some extent the alimentary canal, checking excessive sweating, or watery discharges from the bowels, and promoting constructive metamorphosis.

A very beneficial combination for phthisis is:—

R Acid. hydrochlor. dil.,		
Tinct. nucis vomicæ .....	aa 12	30 c.cm. or mce.
Tinct. capsici .....	4	c.cm. or f3j.
Tinct. cinchonæ .....	150	c.cm. or f3v.

M. Sig.: Two teaspoonfuls in water after meals.

The liquor pepsini (N. F.), or liquid pepsin, contains saccharated pepsin, 40 parts; hydrochloric acid, 12 parts; glycerin, 400 parts; and water, to make 1000 parts. It is practically an artificial gastric juice, and can be used locally to cleanse wounds, or injected into the bladder to dissolve blood-clots. The usual dose for indigestion is a tablespoonful after eating.

Chlorine, for bleaching or disinfecting purposes, can be obtained by pouring hydrochloric acid upon manganese binoxide. It is a greenish-colored, intensely-irritating gas. (See Chlorum.)

**ACIDUM HYDROCYANICUM DILUTUM** (U. S. P., B. P.). — Diluted Hydrocyanic Acid (Prussic Acid). ( $\text{HCN} + [\text{H}_2\text{O}]$ .)

Dose, 0.06 to 0.30 c.cm. (or *mi-v*).

**Pharmacology.**—A liquid composed of 2 per cent., by weight, of absolute hydrocyanic acid (hydrogen cyanide, B. P.) and 98 per cent. of water. It is colorless, faintly acid, with taste and odor of peach-kernels, rapidly loses the volatile acid when exposed to the air and light, and deteriorates if kept too long; so that the dose is variable. We should always commence with the minimum dose and cautiously increase, because of the different degrees of activity of this preparation. Cherry-laurel water (*Aqua lauro-cerasi*) is official in the British Pharmacopœia, but not in U. S. P.; it is also of very variable strength, but is used in considerably larger doses (2 to 8 c.cm., or *xxx-3ij*). Diluted hydrocyanic acid is also present in the compound tincture of chloroform and morphine (B. P.). The cyanides of potassium and of silver are official (U. S. P.). By the addition of an acid to either of these salts, it will be decomposed and hydrocyanic acid set free, as in the following prescription:—

R Potassii cyanidi .....	65	Gm. or gr. j.
Acid. citric. ....	32	Gm. or gr. v.
Syr. Tolutani .....	60   vel 90	c.cm. or f3ii vel iij. .

M. Sig.: A teaspoonful as a dose for an irritable cough.

**Physiological Action and Toxicology.**—Hydrocyanic acid is very poisonous as a gas, and given in the ordinary solution, in sufficient quantities to cause death, it is almost immediately fatal. In cases where it does not cause death at once, there is great prostration of bodily powers; weak, fluttering pulse; cold extremities, and impending collapse. Atropine, hypo-

dermically, is the physiological antidote. The chemical antidote is potassium carb. 1.30 Gm. (or gr. xx) in water, 120 c.cm. (or  $\mathfrak{z}\text{iv}$ ), followed by:—

R Ferri sulphate .....	65 Gm. or gr. x
Tinet. ferri chlor. ....	3.88 Gm. or 3j.
Aqua .....	124 1/4 Gm. or $\mathfrak{z}\text{iv}$ .

M

According to Dr. Johann Antal, cobalt nitrate is an efficacious chemical antidote, but no time should be lost before emptying the stomach with aid of stimulating emetics. Cold affusions to the spine, with frictions faradism to the surface, and hot applications are also efficient. The peculiar bitter-almond odor of the ejecta indicates the character of the poison. Death generally occurs by suffocation, from paralysis of respiration. Elimination as well as absorption, of hydrocyanic acid is very rapid. Ringer states that if life can be supported for half an hour recovery will usually occur. Professor Kobert advocates the use of hydrogen dioxide as an antidote to hydrocyanic acid. He uses a 3-per-cent. solution hypodermically and a 30-per-cent. solution for washing out the stomach. Vomiting is to be encouraged and artificial respiration practiced. Where poisoning has occurred by inhalation, it will not be necessary to wash out the stomach. Kobert's method of treatment has been used for several years in English mining and smelting works, where a great deal of cyanide is used. He recommends a cabinet containing both solutions in hermetically sealed flasks with hypodermic syringe, also a stomach-tube and funnel, to be kept constantly ready for immediate use in chemical laboratories, photographic studios, gold-beating establishments, where the acid or cyanides are used.

Locally, hydrocyanic acid at first slightly irritates the skin, but afterward acts as a sedative. It should not be used in skin diseases when the skin is broken, for fear of absorption. It has some action upon the brain, causing vertigo and hebétude; the respiratory centre is enfeebled and the motor nerves paralyzed, producing great muscular feebleness. The conductive power of the sensory nerves is diminished. It is a decided cardiac sedative, the pulse becoming slow, with lowered arterial tension. The poison acts upon the respiratory function of the red blood-corpuscles, and prevents them from carrying sufficient oxygen to the tissues.

**Therapy.**—Hydrocyanic acid has been used as an antispasmodic in various forms of reflex vomiting, such as the vomiting of pregnancy and that of phthisis. It has also been employed in nervous cough, in irritative heart, and asthma. Whooping-cough, acute mania, and melancholia may also be relieved by the administration of hydrocyanic acid. As it is rapidly eliminated from the system, the dose should be repeated at short intervals. Its sedative effect upon the gastric mucous membrane renders it valuable in painful affections of that organ, such as gastralgia, ulcer, and cancer. The same benefit is obtained from its use in enteralgia. For external use it may be added to rose-water (7.50 to 240 c.cm., or  $\mathfrak{f}\mathfrak{ss}$ – $\mathfrak{f}\mathfrak{v}\mathfrak{i}\mathfrak{i}\mathfrak{j}$ ) with a little glycerine to be applied in cases of troublesome pruritus.

**ACIDUM HYPOPHOSPHOROSUM** (U. S. P.).—**Hypophosphoric Acid.** (See *Acidum Phosphoricum*.)

<sup>1</sup> *Merck's Archives*, March, 1900, p. 94.

**ACIDUM HYPOPHOSPHOROSUM DILUTUM** (U. S. P.).—Dilute Hypophosphorous Acid. (See Acidum Phosphoricum.)

**ACIDUM LACTICUM** (U. S. P., B. P.).—Lactic Acid ( $\text{HC}_3\text{H}_5\text{O}_3$ ).

An organic acid, usually obtained by subjecting milk-sugar, or grape-sugar, to lactic fermentation; composed of 75 per cent., by weight, of absolute lactic acid (hydrogen lactate, B. P.) and 25 per cent. of water.

#### *Preparations.*

**Syrupus Calcii Lactophosphatis** (U. S. P.).—Syrup of Calcium Lactophosphate. Dose, 2 to 7.50 c.cm. (or fʒss-ij).

**Ferri Lactas.**—Ferrous Lactate. Dose, 0.13 to 0.32 Gm. (or gr. ii-v).

**Pharmacology.**—A colorless, odorless, syrupy liquid, with an acid taste. On account of carelessness in manufacture it may contain hydrochloric, sulphuric, or sarcosolactic acid and traces of metallic impurities. It is soluble in water and alcoholic solutions. The ordinary dose is from 1.20 to 2 c.cm. (or mʒv-fʒss), diluted and sweetened.

**Physiological Action.**—Lactic acid is present in the stomach during the digestion of carbohydrates, especially during the first stage of gastric digestion. When in excess, it forms one variety of sour stomach, and causes pain in different parts of the body, headache, etc. It has been asserted that scurvy is due to an excess of this acid in the system, and the fact that scurvy symptoms sometimes develop after partaking of sour milk or other acid seems to lend support to this view. Such patients are benefited by the use of alkaline treatment. Large amounts act as depressors to the nervous system and decrease the normal alkalinity of the blood, thus favoring migraine and neuralgic attacks.

**Therapy.**—Locally, lactic acid, diluted with water and glycerin, has been used in tuberculosis of the throat and larynx and in diphtheria and as a solvent of false membrane. In lupus or tubercular ulceration of the tongue it has been found very useful, as well as in lupus of the face, treated (15 to 30 per cent.).

A solution of lactic acid varying in strength from 10 to 30 per cent. is also a beneficial application to many laryngeal tumors. In a 20- to 40-per-cent. solution it has been employed with good result in suppurative lesions and ulcers of the nasal fossæ. Mosetig-Moorhof has used concentrated acid locally in caries, lupus, and epithelioma.

In the external lesions of tuberculosis, Dr. Zippel, of Hamburg, prefers the application of gauze tampons soaked in lactic acid. In the treatment of tuberculous fistulæ the same writer recommends the introduction of rods composed of a paste made by gently heating 50 grammes (ʒiʒv) each of lactic acid, and water, and then adding 30 grammes (ʒj) of menthol. The rods made of the congealed paste are covered with a layer of vasoline.

In dyspepsia, with deficient secretion, pepsin may be combined with lactic acid and given after meals. Lactic acid is useful in lithæmia and phosphæmia. In the green diarrhoea of infancy, attributed by Hayem to a ferment, this agent well diluted (4 c.cm., or fʒj, in a tumblerful of recently-boiled water, sweetened with white sugar, of which solution a teaspoonful may be given every half-hour or hour, according to the case) is a very effi-

**R. P.** The solutions of ferric and of mercuric nitrate are official in the U. S. P., and solution of ferric nitrate and acid solution of mercuric nitrate in the B. P.

**Physiological Action and Toxicology.**—Diluted nitric acid when applied to the skin produces a yellowish discoloration. Stronger applications occasion a bullous eruption resembling pemphigus.

Introduced into the stomach in a concentrated solution, nitric acid is a violent corrosive poison, and produces vomiting, pain, and distress, at once, followed by inflammation and sloughing of the mucous membrane of mouth and oesophagus. Alkalies, demulcents, and milk diet constitute the treatment. Fatal accidents occasionally happen from inhaling the fumes of nitric, or other mineral, acids. In small doses nitric acid stimulates the internal glands.

When its use has been too-long continued, nitric acid causes salivation, sore and bleeding gums, with loosening of the teeth, foulness of the breath, dyspepsia, colic, headache, and debility. These untoward effects soon disappear when the remedy is suspended.

**Therapy.**—Nitric acid is an oxidizing agent in the laboratory, and when diluted in strong solution it has a decidedly caustic action, staining the skin yellow. It is the preferred caustic for venereal sores, warts, poisoned wounds, ulcers, and phagedena. In uterine ulceration, prolapse of bowel, and hemorrhoids, nitric acid is a useful application. Nitric acid has been successfully employed in the form of a lotion or foot-bath in the treatment of gonorrhea. Introduced into the system in small doses, well diluted, it acts as astringent tonic, especially useful in cases of atonic dyspepsia, in uric acid diathesis and oxaluria. Small doses of nitric acid are serviceable in gonorrhea. In broken-down syphilitic subjects, or in chronic liver disease, nitric acid is a useful restorative.

A very valuable prescription, especially for the treatment of chronic gonorrhea, is as follows:—

<b>R.</b> Acid. nitrici dil. ....	12 30 c.cm. or <i>mcc.</i>
Pondextracti lappe ....	90  c.cm. or <i>f3iij.</i>
Pondextracti xanthoxyli ..	60  c.cm. or <i>f3ij.</i>
<b>M. Sig.:</b> One or two teaspoonfuls in water three times a day.	

In dilute solution (0.60 or 1.20 to 30 c.cm., or *mx-xx* to *f3j*) it has been used, in cases of phosphatic calculi, to wash out the bladder, and it may be used for injection into sinuses connected with dead bone. A few drops of nitric acid to 30 c.cm. (or *f3j*) of water is an excellent stimulant application to indolent ulcers. In whooping-cough, or bronchial catarrh, it has been inhaled, and in hoarseness of public speakers a few drops in a glass of water afford relief. It is inadvisable to continue too long the administration of nitric acid, as, in that case, it excites gastro-intestinal catarrh. The same remark applies to the other mineral acids.

In many skin diseases, such as impetigo, lepra, acne, the addition of nitric acid to the bath has been found useful in addition to its internal administration.

**Mistura Camphora Acida (N. F.).**—Antidysenteric mixture, or Hope's mixture.

<b>R</b> <i>Acidi nitrici</i> <sup>1</sup> .....	175	c.cm. or <i>mxvii</i>
<i>Tincturæ opii</i> .....	120	c.cm. or <i>mxix</i> .
<i>Aquæ camphoræ</i> .....	100	c.cm. or <i>f̄iiss</i> .

M. Dose, a tablespoonful every hour or two, according to symptoms. for diarrhœas of relaxation, especially in elderly persons.

Diluted nitric acid will often relieve chronic diarrhœa, and its eff may be increased by the addition of witch-hazel, thus:—

<b>R</b> <i>Acidi nitrici dil.</i> .....	10	c.cm. or <i>mlx</i> .
<i>Fluidext. hamamelidis</i> .....	11	c.cm. or <i>f̄iij</i> .
<i>Syrup. aurantii</i> .....	120	c.cm. or <i>f̄iiv</i> .

M. Sig.: From one to two teaspoonfuls in water three or four times a da

In the daily dose of 4 to 15 c.cm. (or *f̄iiv*–*iv*) dilute nitric acid has s times proved successful in diabetes insipidus, and it is said to allay the t of saccharine diabetes.

Full doses of well-diluted nitric acid, every fourth or sixth hour useful in intermittent fever. After the paroxysm has been broken u quinine, nitric acid may be serviceably given, in order to relieve inact of the liver and intestinal glands. Small doses of nitric acid are bene in aphthæ and ulcerative stomatitis.

Nitric acid reddens morphine, and probably decomposes it; and, th fore, should not be prescribed in solutions with this agent, as the rule. nitrites have a decided lowering influence upon the temperature and culation; they will be considered in connection with amyl nitrite.

**ACIDUM NITROHYDROCHLORICUM (U. S. P.).—Nitrohydrochl Acid, Nitromuriatic Acid** (nitric acid, 18 parts; hydrochloric acid, 82 pa

#### *Preparation.*

**Acidum Nitrohydrochloricum Dilutum (U. S. P., B. P.).—Diluted Nitrohy chloric Acid (Diluted Nitromuriatic Acid)** (contains 4 parts of nitric acid, 1 hydrochloric acid, and 78 parts of distilled water). Dose, 0.30 to 1.20 c.cm. *mv–xx*).

The B. P. preparation is considerably stronger (Nitric Acid *f̄iij*; hydrochl acid *f̄iiv*; distilled water *f̄xxxv*.)

Symptoms of poisoning and methods of treatment same as given u **Acidum Hydrochloricum**.

**Pharmacology and Therapy.**—The strong combination of nitric hydrochloric acids is official only in the U. S. P. It should be allowe stand for two weeks after mixing, and kept in a cool place. The con trated solution readily dissolves gold leaf when immersed in it. For med purposes, it should be greatly diluted. It is supposed to have a special act upon the hepatic functions, and is a good tonic and astringent. It has b applied upon compresses in chronic liver disorders, in a solution (15 c.c. or *f̄jss*, to 473 c.cm., or *Oj.* of water).

Internally, the dilute acid is given in plenty of water, and gener through a glass tube, in torpidity of the liver, the chronic hepatitis of tropics, and in the early stage of hepatic cirrhosis. It is of service in chro diarrhœa and dysenteric diarrhœa. This acid has been occasionally kno to produce salivation.

<sup>1</sup> The original formula for this preparation called for nitrous acid, but as c merical nitric acid usually contains some nitrous, it may be used as above.

**ACIDUM OLEICUM** (U. S. P., B. P.).—**Oleic Acid** ( $\text{HC}_{18}\text{H}_{33}\text{O}_2$ ).

An organic acid, prepared in a sufficiently-pure condition, by cooling commercial oleic acid to about  $5^{\circ}\text{C}$ . ( $41^{\circ}\text{F}$ .), then separating and preserving the liquid portion.

*Preparations.*

**Oleatum Atropinæ** (U. S. P.).—Oleate of Atropine (2 per cent.).

**Oleatum Cocainæ** (U. S. P.).—Oleate of Cocaine (5 per cent.).

**Oleatum Quininae**.—Oleate of Quinine (25 per cent.).

**Oleatum Veratrinæ** (U. S. P.).—Oleate of Veratrine (2 per cent.).

**Oleatum Hydrargyri** (U. S. P., B. P.).—Oleate of Mercury (U. S. P. preparation contains 88.35 per cent. with oleic acid, representing 25 per cent. mercuric oxide).

**Unguentum Hydrargyri Oleatis** (B. P.).—Mercuric-Oleate Ointment (1 to 3 of medicated lard).

**Unguentum Zinci Oleatis** (B. P.).—Zinc-Oleate Ointment (50 per cent.).

**Pharmacology.**—Oleic acid is an oily, yellowish, tasteless liquid, gradually becoming brown, rancid, and acid when exposed to the air. It is insoluble in water, but soluble in alcohol, ether, etc.

Oleic acid, freshly prepared, is a bland and unirritating application to the skin, and was brought forward as an addition to ointments and liniments to increase their penetrating power, but lanolin has now largely taken its place for this purpose. Lately, greatly through the influence of the writings of the author, it has been much used in the manufacture of oleates, which are now produced in the form of true chemical compounds, instead of simple mixtures, as heretofore.

The following is a summary of the action of the oleates, from "Ointments and Oleates, especially in Diseases of the Skin":—

*The Oleates.*

**Acetiline Oleate.**—Not very active. Can be used in neuralgia.

**Aluminum Oleate.**—Diluted one-half with lard or some fatty substance, it forms the ointment of the oleate of aluminum, which is decidedly astringent. It is useful in checking the muco-purulent discharges of dermatitis and eczema, and in chafing, especially in infants and young children. In hyperidrosis and in bromidrosis it is very effective. This ointment is also a useful dressing to burns, foul ulcers, catarrhs and sinuses.

**Arsenum Oleate.**—A valuable alterative and escharotic, but it must be used with caution. The oleate, when melted with lard or ointment base (1 to 4 or 1 to 9), forms the ointment of arsenum oleate. This has little action upon a healthy skin, but when the epidermis has been removed, or on granulating surfaces, it produces necrosis and destroys the vitality of the tissues to a considerable depth. When diluted, it exerts a most excellent alterative impression upon the integument; and also in ulcerating epithelioma, in lupus (after scraping), and in old scrofulous ulcers, this is of great utility. In syphilis, seborrhœa, and chronic eczema it is likewise of service. After scraping or puncturing the affected area, it can be used to remove warts, corns, horns, condylomata, old granulations, and nævi. It may be advantageously combined with opium, belladonna, hyoscyamus, arnica, arrow-root, etc. For formula, see author's book on "Oleates."

**Atropine Oleate.**—Not very active. Constitutional effects not produced except on large surfaces are anointed.

**Bismuth Oleate.**—Emollient and slightly astringent. In all pustular eruptions, it relieves the itching and often aborts the pustules. It allays irritation of the eyelids and sunburn. In acne rosacea, it relieves the inflammation, and, in connection with scarification of the surface, is curative. In acute eczema, this oleate is considered indispensable in arresting the progress of the malady. Cracked and sore

nipples are usually healed by the oleate-of-bismuth ointment (1 part of bismuth to 7 parts of ung. aquæ rosæ).

Cadmium Oleate is stimulating and irritating. It has been used in eczema with great infiltration, exuberant granulations, and enlarged gland strength of the ointment being adapted to each case.

Cocaine Oleate (U. S. P.) contains 5 per cent. of the alkaloid. It can be combined with equal parts of ointment or lanolin. It has not answered expectation as a local anodyne or anæsthetic, but has been used with some benefit in pruritus pudendi and ani, or eczema marginatum.

Copper Oleate, in the form of 10- or 20-per-cent. ointment, has no visible action upon the healthy skin, but penetrates deeply into the follicles, where it exerts stimulating and antiseptic action. It is decidedly astringent to the broken and raw surface, reducing exuberant granulations, checking hæmorrhage from irritable sores and old ulcers. Owing to its parasiticide action, it is the best remedy for various forms of ringworm. In tinea versicolor, even in favus, it is equally effective in destroying the parasite without epilation. Copper oleate, melted and spread in a plaster, will very often cure warts, corns, bunions, and thickened conditions of the epidermis. The ointment above referred to is also useful in freckles and other colorations of the skin. It is essential that the salt should be made from pure copper acid, as otherwise the application may be accompanied by irritation or inflammation of the skin. The weaker ointment (0.32 to 0.65 Gm., to 31.1 Gm., or gr. v-x) should be first tried and the strength gradually increased.

Iron Oleate is a valuable styptic and astringent. The use of a weak ointment in the inflammatory form of eczema, in which the surface is raw and bleeding, followed by good results; also in pustular eczema, sycosis, furuncles, and in serous sores. Mixed with the oil of ergot or any bland oil, the iron oleate is of great advantage in dry seborrhœa and in patches of alopecia. The early stages of acne rosacea are often entirely relieved by the weak application of ointment of iron. In ulcers caused by arsenical poisoning, this has given better results than any other remedy in the hands of the writer, especially with the addition of 1 per cent. carbolic acid.

Lead Oleate, melted with equal parts of lard-oil, or lard, forms a cream-colored semisolid ointment, which is superior to Goulard's cerate or Hebra's litharge ointment. It allays irritation in papular or pustular eczema, and also in fissured eczema of the hands or feet. In hard and indurated papules, as in acne of the face, neck, and chest, it is excellent in its effects. Thymol, naphthol, carbolic acid, oil of chamomile, or cade may be combined with it, according to the case.

Manganese Oleate has been used (a 10- to 20-per-cent. solution in ointment) as a remedy in amenorrhœa and other uterine affections, applied with friction to the abdomen. Probably its asserted good effects are to be attributed to the mercury rather than to any constitutional effect from the manganese, as there is no evidence of its absorption.

Mercuric Oleate (U. S. P., B. P.).—The ointment of mercuric oleate is a yellowish substance of fatty consistence. It is stimulating to the skin, and has a deobstruent action upon the glandular structures. In old eczema, with thickening of the skin, this twofold action is very beneficial; also in papular and tubercular lesion infiltration attendant upon abscesses. In inflammation of the hair-follicles, syphilis, and scrofuloderma it is quickly curative. Its bactericidal action makes it valuable in all cases of parasitic invasion of the skin; and, in the treatment of lousiness, the addition of picrotoxin ( $\frac{1}{2}$  per cent., or gr. i-5j) is advisable, in order to destroy the vitality of the nits. If it is desired to produce a constitutional impression, it may be added, or mercurous oleate substituted. In fact, mercuric oleate is absorbed only very slowly. Large quantities have been applied to the surface without producing constitutional effects.

Mercurous Oleate.—This ointment contains a higher percentage of mercury than the preceding (41.6 per cent.); it is substituted when it is desired to make a profound impression upon the structures of the skin, or to practice the inunction treatment of syphilitic affections, and for this is far superior to either the ordinary blue ointment or the mercuric oleate. In old spots of psoriasis and chronic palmar and palmar eczema it can be used alone, or combined with some form of tannin or naphthol.

Morphine Oleate has only a feeble action upon the integument, and has no special advantage.

Nickel Oleate, in the form of ointment with some fatty base, has a very decided astringent action upon abraded surfaces. In the proportion of from 5 to 20 grains to the ounce of lard it acts well in epithelial ulcerations, old callous ulcers, or chronic eczemas.

Quinine Oleate (U. S. P.), 25 per cent. alkaloid, has some antiseptic action, but has no special advantages.

Silver Oleate coagulates albumin, and, when sprinkled over sores, coats the surface and excludes the air; at the same time it stimulates granulations and cleans off the surface. Dissolved in oleic acid and mixed with lard (5 to 60 grains to the ounce), it forms a dark-brown, pliable ointment, which may be applied in cases of erysipelas to keep the inflammation from spreading. In superficial lupus it sometimes lessens cell-infiltration and reduces active inflammation. In boils, carbuncles, eczema around the genitals or on the buttocks, especially if attended by irritation or itching, marked relief follows the application, either alone or combined with opium, belladonna, or hyoscyamus.

Strychnine Oleate has no special value as an ointment.

Tin Oleate.—The ointment (0.65 to 4 Gm., or gr. x to lx-3j) is a grayish-brown ointment, possessing some astringent and tonic action. It is of especial service in diseases of the nails and in irritation of skin around the nails (agnail, etc.).

Veratrine Oleate (U. S. P.) is official in 2-per-cent. solution in ointment. It has decided counter-irritant and benumbing effects upon the skin, making it useful in some cases of neuralgia or tender spots.

Zinc Oleate (U. S. P., B. P.), is a fine, pearl-colored powder, soft and soap-like to the touch, is astringent in its effects, and can be used as a dusting-powder in hyperidrosis and bromidrosis. In local sweating of the axillæ, genitalia, hands, or feet, especially when attended by maceration of the epidermis, this agent is very useful. Murrell, of London, has also used it in the sweating of phthisis, combined with thymol (1 to 500). Salicylic acid (3 per cent.) or French chalk may be added to it, for the treatment of local affections, such as comedo and acute vesicular eczema. In all such acute inflammatory affections it can be used with advantage, where greasy applications cannot be borne. It has also been used in gynecology as an application to cancerous ulceration of the cervix uteri. Here it may be combined with iodoform (zinc oleate, 1; iodoform, 2 parts).

### ACIDUM OXALICUM.—Oxalic Acid ( $\text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ ).

**Pharmacology and Therapy.**—Oxalic acid is an irritant poison, and is sometimes taken by mistake for Epsom salts. Its antidote is lime, chalk, calcium carbonate, or whitewash.

Dr. F. J. L. Hart<sup>1</sup> reports two cases of poisoning by oxalic acid: One instance was a boy, aged 15 years, who had taken about 12 Gm. (or 3iij) of the acid; he had several convulsive seizures, his pupils were dilated, lower jaw fixed in a tetanic spasm, froth exuding between the teeth, and pulse could not be felt—stomach-washing and the hypodermic injection of apomorphine, 0.006 Gm. (or gr.  $\frac{1}{10}$ ), were resorted to as well as brandy, strychnine, and digitalis. The patient in a few days made a good recovery. In the second case the quantity taken was unknown, the patient dying within one hour.

Dr. Talbot Jones, of St. Paul, has reported four cases in which acute articular rheumatism was apparently produced by prolonged contact with a solution containing oxalic acid. The patients, engaged in making bluing, were accustomed to keep the hands and forearms immersed while stirring the solution.

According to Taylor, 4 Gm. (or 3j) is the smallest quantity of oxalic acid which has been known to destroy life at the age of sixteen years, death occurring in eight hours. Under three minutes is given as the shortest-

<sup>1</sup> *Lancet*, Oct. 1, 1898.

known period of survival after an unknown quantity of this poison been taken.

Oxalic acid has, at the suggestion of Dr. F. Poulet, been employed as an emmenagogue. Dr. A. W. Marsh has found it useful in amenorrhea. He remarks that the remedy is not unpalatable, and, in medicinal doses, is unirritant to the stomach. Dr. Marsh also recommends oxalic acid in the treatment of acute cystitis from whatever cause. He is accustomed to prescribe:—

R Acidi oxalici .....	1℥	Gm. or gr. xv.
Syr. aurant. cort. ....	3℥	c.cm. or f℥j.
Aqua .....	9℥	c.cm. or f℥ij.

M. et ft. sol.

Sig.: Teaspoonful every four hours.

Poulet has found oxalic acid useful, likewise, as an expectorant in asthma, capillary bronchitis, and tuberculous bronchitis. He recommends the following formula:—

R Acidi oxalici .....	2℥	Gm. or 3ss.
Infus. camelliae .....	18℥	c.cm. or f℥vj.
Syr. aurant. cort. ....	6℥	c.cm. or f℥ij.

M. et ft. sol.

Sig.: A teaspoonful every hour.

In some cases where oxalic acid was given in 0.032 Gm. (or gr.  $\frac{1}{15}$ ) doses, Dr. F. W. Talley, of Philadelphia, observed that the remedy caused nausea, gastralgia, and an eruption resembling urticaria. When administered in solution the acid must be dissolved in either rain or distilled water in order to avoid the deposition of oxalate of calcium of hard water.

#### ACIDUM PHOSPHORICUM (U. S. P.).—Phosphoric Acid.

ACIDUM PHOSPHORICUM CONCENTRATUM (B. P.).—Concentrated Phosphoric Acid.

ACIDUM HYPOPHOSPHOROSUM (U. S. P.).—Hypophosphoric Acid (30 per cent. absolute acid).

#### Preparations.

Acidum Phosphoricum Dilutum (U. S. P., B. P.).—Diluted Phosphoric Acid (10 per cent., by weight, of orthophosphoric acid; B. P. contains 13.8 parts of hydrogen orthophosphate). Dose, 0.12 to 1.20 c.cm. (or mii-xx).

Acidum Hypophosphorosum Dilutum (U. S. P.).—Diluted Hypophosphoric Acid (contains 10 per cent. by weight of absolute acid, with 90 of water). Dose, 0.12 to 2 c.cm. (or mx-xxx).

Syrupus Hypophosphitum Compositum (U. S. P.).—Compound Syrup of Ferrous Phosphites. Dose, 4 to 8 c.cm. (or 3i-ij).

**Pharmacology.**—Phosphoric acid in the solid form, glacial phosphoric acid, is not official. The official phosphoric acid is a colorless, odorless, syrupy liquid, containing not less than 85 per cent., by weight, of absolute orthophosphoric acid and not more than 15 per cent. of water. The British concentrated phosphoric acid contains only 66.3 per cent. of hydrogen orthophosphate. The diluted acid contains 10 per cent., by weight, of absolute orthophosphoric acid and 90 of water (13.8 parts of hydrogen orthophosphate in B. P.). The dose of phosphoric acid is 0.13 to 0.5 c.cm. (mij-v).

**Physiological Action.**—Phosphoric acid, locally, is an irritant, and exerts some escharotic effect. When taken internally, well diluted, it aids nutrition and growth, as it is an essential element in all bony and vascular structures in the form of phosphates. It is also, like nitric acid, a stimulant to oxidation. It improves the appetite and the digestion, increases excretion, and is synergistic with the vegetable bitters. Phosphoric acid has been known to give rise to an eruption resembling that of pemphigus.

**Therapy.**—In all debilitated conditions of the system, in anæmia, in the exhaustion of prolonged lactation, in bronchial catarrh of the aged, phosphoric acid is an excellent tonic; it is also useful in struma and wasting diseases. Its action being different from phosphorus in substance, it is less efficient in the treatment of neuralgic conditions.

Phosphoric acid is especially valuable as a tonic in the following forms:—

R. Acidi phosphorici dil. ....	15	c.cm. or fʒss.
Tract. nucis vomicæ ....	12 30	c.cm. or mēc.
Tinct. ferri chloridi ....	60	c.cm. or fʒij.
Syr. pruni Virg. ....	75	c.cm. or fʒiiss.

M. Sig.: From one-half to one teaspoonful in a wineglass of water, taken through a tube, after meals.

R. Acidi phosphorici dil. ....	12	c.cm. or fʒiij.
Styracinae sulph. ....	03	Gm. or gr. ss.
Glycerini ....	34	c.cm. or fʒix.
Syr. aurantii ....	105	c.cm. or fʒiiss.

M. Sig.: One teaspoonful in wineglass of water, taken through a tube after meals.

Under the name of liquor acidi phosphorici compositus (N. F.) an excellent tonic is furnished, composed of the following ingredients:—

Bone ash .....	1000 parts.
Sulphuric acid (free from arsenic) .....	780 parts.
Water .....	4000 parts.

which is approximated by the following formula:—

LIQUOR PHOSPHATUM ACIDUS—ACID SOLUTION OF PHOSPHATES.

R. Calcis phosphatis .....	25	Gm. or gr. 384.
Magnesiæ phosphatis .....	4 25	Gm. or gr. 64.
Natrii phosphatis .....	2 10	Gm. or gr. 32.
Ferri phosphatis .....	4 25	Gm. or gr. 64.
Acidi phosphorici (sp. gr. 1.710) .....	50	c.cm. or m 808.
Aque .....	q. s. ad 473	c.cm. or fʒxvj.

M. Sig.: This preparation may be given in teaspoonful doses, well diluted with water.

Given before meals, phosphoric acid is beneficial in hyperacidity of the stomach, whether due to increased production of hydrochloric acid or the want of fermentative changes in the food. Phosphoric may reasonably be added to the other mineral acids in the treatment of typhoid fever when the predominant symptoms denote great nervous prostration. In diabetes mellitus phosphoric-acid lemonade answers a useful purpose by assuaging thirst. It has been employed in rickets.

The diluted solution may be applied as a stimulant to indolent ulcers, and it has been proposed to inject it into enlarged glands.

The compound syrup of the hypophosphites is a popular and agreeable tonic. (See formula given under **Calcium**.)

**Dose**, 4 to 8 c.cm. (or 5i-ij), given in water, three times a day.

#### **ACIDUM PICRICUM.—Picric Acid.**

**Pharmacology.**—Picric, or carbazotic, acid (trinitrophenol) is in the form of pale-yellow scales, soluble in water, and has a very bitter taste. Owing to its power of coagulating albumin, its watery solution forms a convenient test for albumin in the urine; it is also a test for peptones. Large doses cause vomiting, purging, and collapse. Internal dose from 0.1 to 0.13 Gm. (or gr. ss-ij); of the ammonium salt, 0.03 Gm. (or gr. ss.)

**Therapy.**—The application, five to ten times daily, of a 6-per cent. solution of picric acid has been found useful in erysipelas. Picric acid constitutes also a good dressing to superficial burns, and has been used for several years for this purpose in the Charity Hospital of Paris. A 1-per cent. solution (about 0.5 per cent.) of picric acid is applied upon the affected surfaces. It exerts an analgesic effect upon the surface. It usually does not rise to no irritation, and the only disadvantage of the method is that the solution communicates a yellow stain to the tissues with which it comes in contact. Dr. Charles Willems, of Ghent,<sup>1</sup> speaks favorably of its use in burns of the first and second degrees; he uses it in the form of an ointment in the strength of 1 to 2 per cent.; he has never observed any bad symptoms from its use, and the only inconvenience has been a yellow coloration of the skin, which may be got rid of by alcohol washing or by a watery solution of carbonate of lithium. The late Dr. Quinquaud recommended picric acid as a local remedy in epithelioma. In chronic eczema, Calvelli claims good results from the application, several times a day, of a solution of 1 1/2 parts of picric acid in 250 parts of distilled water.

The ammonium salt has been highly praised in the treatment of whooping-cough and malaria, the average dose being 0.032 Gm. (or gr. ss) four or five times daily. Dr. Marten Clark asserts that this salt has proved efficient in malarial neuralgia. Picric acid should be used, either internally or externally, with caution, since it is apt to excite urticaria and other symptoms of systemic intoxication.

Shoes lined with leather dyed yellow by picric acid have been known to excite violent dermatitis, the feet becoming swollen and being covered by innumerable vesicles, which coalesced and became filled with purulent serum. Constitutional reaction was also observed.

#### **ACIDUM SALICYLICUM (U. S. P., B. P.).—Salicylic Acid (HC<sub>7</sub>H<sub>5</sub>O<sub>2</sub>)** **Dose**, 0.32 to 1.20 Gm. (or gr. v-xx).

##### *Preparations.*

**Ammonii Salicylas (U. S. P.).—Ammonium Salicylate.** Dose, 0.12 to 0.60 Gm. (or gr. ii-x).

**Bismuthi Subsali-cylas (U. S. P.), Bismuth salicylate (B. P.).—Dose**, 0.1 to 1.3 Gm. (or gr. ii-xx).

**Quinine Salicylas (U. S. P.).—Quinine Salicylate.** Dose, 0.13 to 0.60 Gm. (or gr. ii-x).

<sup>1</sup> *Annales de la Société Belge de Chirurgie*, May 15, 1898.

**Strontii Salicylas** (U. S. P.).—Strontium Salicylate. Dose, 0.30 to 2 Gm.

**Lithii Salicylas** (U. S. P.).—Lithium Salicylate. Dose, 0.32 to 2 Gm. (or gr.

**Phenyl Salicylas** (U. S. P.).—Phenyl Salicylate. (See Salol.)

**Natrii Salicylas** (U. S. P., B. P.).—Sodium Salicylate. Dose, 0.65 to 2 Gm. (or

**Unguentum Acidi Salicylici** (B. P.).—Salicylic-Acid Ointment (2 per cent.).

**Aspirin**.—Acetyl-salicylic Acid. Dose, same as Salicylic Acid.

**Pharmacology**.—Salicylic acid is an organic acid existing naturally in combination in various plants, but most largely prepared synthetically from carbonic acid. It occurs as fine, white, needle-shaped crystals, soluble in 10 parts of cold or 14 parts of hot water; and in alcoholic solutions in 10 parts of chloroform, 60 parts of glycerin, and in 2 parts of olive-oil (by aid of heat). Thirty c.cm. (or  $\text{f}\text{ssj}$ ) of sweet spirit of nitre will dissolve 1.04 gm. (or gr. xvj) of salicylic acid. The solution remains clear even upon the addition of water. Crystallized salicylic acid is pure and without odor; precipitated acid has a rather peculiar, disagreeable taste; the sublimed acid is then pink colored, and smells of phenol. Dialyzed salicylic acid is prepared. It is claimed that the natural acid made from the oil of gaultheria is the best and purest form in which to prescribe it.

**Physiological Action**.—Salicylic acid is an antiseptic and antiferment, and prevents souring of beer, cider, or milk, or the putrefaction of urine. It arrests the action of saliva upon starchy food. It is injurious only when used constantly and in relatively large doses. It is very irritating to mucous surfaces, and is not to be administered in pill, powder, or capsule, but always in solution, and preferably with ammonium or potassium acetate, potassium citrate, or ammonium phosphate, which increases its solubility in water, or it may be given in some syrup or elixir of orange.

Taken internally, it reduces abnormally high temperature. In health its action is not observed, although some observers assert that a slight reaction is produced. Sometimes headache, giddiness, and ringing in the ears have been noticed, but usually no marked effect is seen upon either pulse or respiration. According to Vanden Corput, salicylic acid diminishes the normal activity of the testes, although it is asserted to cause congestion of the uterus and ovaries. It may produce abortion and, therefore, should be cautiously given in pregnancy, especially when a tendency to abortion or premature confinement exists. Toxic doses cause slowing of the breathing. Convulsions, nausea, burning in the throat, vomiting, and gastric irritability have also been observed to occur, followed occasionally by hematuria, hæmaturia, or almost complete stoppage of urine. This is a deviation from the normal action, for in ordinary cases it acts as a diuretic, and might increase of elimination of the urates and urea. Piccinini states that after the administration of sodium salicylate, peptone is to be found in the urine. Salicylic acid is absorbed with rapidity, but slowly eliminated. In acute nephritis it diminishes the quantity of the urine and increases the proportion of albumin. It is stated that deleterious effects are particularly apt to occur in drunkards from the use of salicylic acid.

The treatment of intoxication by this agent is that for an irritant poison: the stomach should be washed out with warm water, decoction of coffee administered, and the patient treated symptomatically. The effects rapidly pass off as the acid is carried out from the system by the urine, principally

without change, partly also as salicin and salicyluric acid. Probably also escapes in the sweat and saliva. After excessive doses the urine becomes olive-green in color, from the presence of indican and pyrocatechin. These substances result from the action of the pancreatic juice upon salicylic acid or it may indicate the presence of phenol in the salicylic acid. A solution of chloride of iron strikes a violet color with urine which contains salicylic acid. In the body, the acid combines with glycocol in the liver and elsewhere, and becomes converted into salicyluric acid. The ingestion of salicylic acid, or sodium salicylate, may be followed by the development of various cutaneous lesions. Erythema with oedema, intolerable itching and swelling of the skin, and fever have been caused by large doses of the sodium salt. Other effects which have been observed are vesicles, pustules, patches of ecchymosis.

**Therapy.**—For external use salicylic acid may be combined with borax as a dentifrice. A similar mixture may be used for the relief of fetid perspiration (feet or axilla), or with talc or corn- or rice- flour. In gangrenous sloughing cancer, it may be applied, but causes burning pain. Dressing should be saturated with an alcoholic solution and subsequently dried. It is not so powerful as carbolic acid, yet it has the great advantages of being odorless and freer from danger of toxic symptoms following absorption. It is used in solution as a substitute for carbolic acid in the details of the most common antiseptic method. (A solution can be made by adding 8 parts of borax to 100 parts of boiling water, and, when dissolved, adding 10 parts of salicylic acid, and filtering when cool. On account of its irritant action it is not a good application for diphtheria or croup.) A saturated solution of salicylic acid, in collodion, is a very effective application to corns and warts. Tincture of cannabis Indica is often added, but it produces an unsightly stain without conferring any additional advantage. The solution of salicylic acid in iodine is likewise asserted to be an efficacious application in scabies, the skin having previously been cleansed by means of a hot alkaline bath. An ointment containing this substance is sometimes of benefit, especially in chronic eczema and in ulcerated lupus vulgaris. A similar application is efficacious in lupus erythematosus of the face and eyelids. A powder composed of 10 parts of salicylic acid, 15 parts of zinc oxide, and 30 parts of powdered starch may be employed to relieve the itching of urticaria and in eczema. From 0.32 to 4 Gm. to each 31 Gm. (or gr. v-lx to 3j) of lard, lanolin, or other excipient will sometimes remove freckles. On account of its germicidal virtue, it may be advantageously used in the treatment of tinea circinata.

It has been found useful as a topical application in thrush and catarrh of the stomatitis, in which conditions it acts as a local anodyne. It allays the burning pain of the erosions left after the vesicles have ruptured. The solution is made by dissolving 1 part of acid in sufficient alcohol and adding 250 parts of water. Salicylic-acid solutions have likewise proved of value in irrigation of the large intestine for dysentery. Acute intestinal catarrh has been treated in the same manner with very successful results. In the last case the internal use of the remedy may be conjoined.

Salicylic acid may also be employed in fetid bronchitis as an inhalant with a steam-atomizer, using 15.5 Gm. (or 3ss) of borax in 503 c.cm. (f3xvij) of boiling water, to which 15.5 Gm. (or 3ss) of salicylic acid is to be added. The same solution can be used in catarrhal pneumonia, in phthisis, etc.

The following formulæ will be serviceable as local applications:—

R Acidi salicylici .....	8	Gm. or 3ij.
Bismuth. subnitrat. ....	15	Gm. or ʒss.
Pulv. zinci oleatis .....	8	Gm. or 3ij.

M. Sig.: Dust over the surface. Useful in excessive or fetid sweating and in seborrhœa oleosa.

R Acidi salicylici .....	2	vel	4	Gm. or ʒss vel 3j.
Ungt. hydrarg. nit. ....	12			Gm. or ʒiij.
Betanaphthol. ....			65	Gm. or gr. x.
Ungt. zinci oxidi .....	19		5	Gm. or ʒv.

M. Sig.: Rub well into the surface several times a day. For fissured eczema of the palms of the hands and soles of the feet.

Lassar's paste is an excellent application for dry eczematous patches:—

R Acidi salicylici .....		65	Gm. or gr. x.—M.
Zinci oxidi,			
Amyli .....	aa	8	Gm. or 3ij.
Petrolati .....	16		Gm. or ʒss.—M.

M ft. unguentum.

Internally, the use of salicylic acid in acute rheumatism (0.65 to 1.30 Gm., or gr. x-xx, doses every hour until 4 to 8 Gm., or 3i-ij, have been taken) for two days is generally followed by prompt relief. On account of its comparative insolubility, salicylic acid is now less used than sodium salicylate, which is given in the same doses. It is believed that the soda salt is rapidly converted into the original acid by the carbonic acid of the blood.

Salicylic acid approaches the character of a specific remedy in acute rheumatism. Its most marked effects are reduction of the articular swellings, the pain, and the fever. But it is not able to prevent the occurrence of heart trouble or of relapse. It is a good practice, and perhaps shortens the absolute duration of the case, to reduce or abandon the salicylic acid after it has produced its most notable results, and to replace or combine it with an alkali. It does not prevent hyperpyrexia, since that condition has been known to occur while this remedy was being administered. It will sometimes give rise to delirium when administered for a considerable period in the treatment of rheumatism. The virtue of the salicylic treatment is much less decided in chronic rheumatism, though stiffness and pain are relieved in a certain proportion of cases. In subjects who are much debilitated quinine salicylate may be employed, or, if anæmia be marked, the salicylate of iron. In muscular rheumatism salicylic acid will sometimes afford relief, and will often fail. The pain and swelling of rheumatoid arthritis are sometimes relieved and the progress of the disease arrested by sodium salicylate. The same salt is, in some instances, serviceable in gonorrhœal rheumatism. In acute articular gout and in irregular gouty manifestations good results have likewise attended the use of salicylic acid or the sodium salicylate.

It has been found that the local application of salicylic acid is beneficial in acute articular rheumatism. The drug acts by absorption, as it may be detected in the urine within half an hour after the application has been made. Dr. Bourget, who has long relied upon the external use of salicylic acid, regards the following as the best formula:—

R Acidi salicylici,			
Adipis lænæ hydrosi .....	aa	10	Gm. or ʒiiss.
Olci terebinthinæ rectificat. ....		9	25 c.cm. or fʒiiss.
Adipis .....		77	5 Gm. or ʒiiss.

Ft. unguent.

It must be noted, however, that cases of intoxication have occurred as a result of the excessive local use of the remedy.

When the salicylate causes gastric disturbance, it may be given by rectum, which should be previously washed out by means of a cathartic enema. It is well to combine laudanum with the salicylate in order to prevent irritation of the bowel. Labceeb has witnessed benefit from the use of salicylic acid in sprains, irrespective of the presence of the rheumatic diathesis.

Salicylic acid, or its sodium salt, has been found useful in those affections so often associated with or dependent upon the rheumatic diathesis as the various forms of neuralgia, especially migraine, trifacial neuralgia and sciatica, chorea, tonsillitis, urticaria, and erythema nodosum. Sodium salicylate is serviceable also in erythema multiforme, especially when, frequently the case, the disease is dependent upon a rheumatic diathesis. The remedy suppresses the eruption and relieves the articular pains. In sciatica, Ringer prefers it to any other remedy. Rheumatic iritis may yield to its influence.

Gay has successfully employed this remedy in Ménière's disease, giving 0.20 Gm. (or gr. iij) three times a day. The attacks of vertigo, which were very frequent, rapidly diminished in number and severity. As improvement progressed, the remedy was suspended during considerable intervals.

In the experience of Dr. Strizower, salicylic acid is an excellent remedy in the treatment of gall-stones. He is accustomed to give it in 0.65 Gm. (gr. x) doses three or four times a day in the intervals between attacks of colic, and states that it prevents the formation of concretions and hastens their expulsion.

Salicylic acid has been successfully used as an anthelmintic. The sodium has been removed by five hourly doses of 0.50 Gm. (or gr. viij) each, preceded and followed by a dose of castor-oil. Round-worms and seat-worms are destroyed by the same agent, the latter by the local effect of an injection of the former by the internal use of the drug.

Salicylic acid may be given in 0.32 Gm. (or gr. v) doses in order to purify the foul breath sometimes present in phthisis. Improvement has sometimes followed the administration of salicylic acid, or its combination with sodium in diabetes. An antidiabetic powder employed by Dr. Monin is composed as follows:—

R. Sodii bicarbonat. ....	62	Gm. or ʒij.
Sodii benzoat. ....	39	Gm. or ʒx.
Sodii salicylat. ....	19½	Gm. or ʒv.
Lithii carbonat. ....	15½	Gm. or ʒss.

M. Sig.: Teaspoonful at each meal.

The same remedy is of service in diabetic neuralgia. It is also employed for its antipyretic effect in typhoid fever, pneumonia, erysipelas, phthisis, but it is regarded as especially serviceable in blood-poisoning, sepsæmia, pyæmia, etc., and the eruptive fevers of children. Dr. de Ruyter attributes prophylactic virtues to this substance in case of exposure to scarlet fever. Dr. C. A. Bryce esteems salicylic acid as of decided efficacy in the treatment of small-pox. He states that it reduces temperature, relieves pain and limits the development of pustules. In relapsing fever it is said to render the relapse shorter and of less severity. It promptly checks the yeasty vomiting dependent upon the growth of *Sarcina ventriculi*. So-

These serious disturbances of the circulation occur from medicinal doses in cases of fever. It is very probable that in some of these cases the results are attributable to impurities in the salicylic acid. Urticaria, erythema, and similar cutaneous symptoms have been noticed after its administration. Desquamation has sometimes followed the erythema. In exceptional cases the exhibition of salicylic acid is followed by hæmorrhage, usually from the gums or nose. The soda salt is believed to be free from this objection.

Bernheim makes use of hypodermic injections of salicylic acid in order to relieve the night-sweats of phthisis. The solution which he employs contains 0.5 Gm. (or ʒiiss) of the acid in 30 c.cm. (or fʒj) distilled water, to which is added 11 c.cm. (or fʒiij) of glycerin and 15 c.cm. (or fʒss) of alcohol. He repeats 2 c.cm. (or mxxx) of the solution on four or five successive evenings. The same writer has reported five cases of inoperable cancer of the cervix in which the injection of salicylic acid into the growth was followed by the disappearance of the hæmorrhages and offensive discharge, with diminution in the size of the tumor. Sodium salicylate in 0.65 Gm. (or gr. x) doses will sometimes assuage the pain of carcinoma.

De Becker has treated a number of cases of acute pneumonia with salicylic acid. He gave to a child of four years 0.10 Gm. (or gr. iss) every hour with successful result. In adults he gives 0.50 Gm. (or gr. viij) every two or three hours. As soon as the expectoration is free, he diminishes the dose. Hot water, coffee, tea, chocolate, and milk are good vehicles for the medicine. He believes that if salicylic acid is given early (on first or second day) it will be found a true abortive of pneumonia. He treated twelve cases, with one death; the fatal result was due to meningitis. The others rapidly recovered.

The granular effervescent form is a good one in which to administer salicylates, or they may be given in effervescent draughts, or in combination like this:—

R Sodii salicylatis .....	8	Gm. or ʒij.
Tinct. lavandulæ comp. ....	15	c.cm. or fʒiv.
Syrup. aurantii .....	105	c.cm. or fʒiiiss.

M. Sig.: Give a tablespoonful every three (or four) hours for acute rheumatism.

The following prescriptions may likewise be recommended as beneficial combinations in acute rheumatism, gout, and neuralgia:—

R Acidi salicylici .....	8	Gm. or ʒij.
Spt. ætheris nitrosi .....	120	c.cm. or fʒiv.
Tinct. cardamom. co. ....	30	c.cm. or fʒj.

M. Sig.: Two teaspoonfuls in water every two hours.

R Acidi salicylici .....	13	Gm. or gr. cc.
Sol. ammon. acetatis,		
Aqua camphoræ .....	aa 19/50	c.cm. or fʒv.
Spt. ætheris nitrosi .....	q. s. ad 60	c.cm. or fʒij.

M. Sig.: A teaspoonful in water every two or three hours.

The appended formula is serviceable in chronic rheumatism and gout:—

R Acidi salicylici .....	12	Gm. or ʒij.
Fluidextract. rhum. purshianæ .....	8	c.cm. or fʒij.
Fluid. aromat. (N. F.) .....	120	c.cm. or fʒj.

M. Sig.: A tablespoonful in water two or three times a day.

On account of its influence upon the utero-ovarian circulation, the drug may be advantageously given in cases of amenorrhœa and dysmenorrhœa. Sodium salicylate has been used with excellent effect in chronic pleurisy. It promotes absorption of the effusion by a powerful diaphoretic action, comparable to that which it exerts in rheumatism.

Since the use of salicylic acid has sometimes been followed by anæmia, Professor Peabody, of New York, combined it with iron, as follows:—

R. Acid. salicylic. ....	1 30 Gm.	or gr. xx.
Ferri pyrophosph. ....	32 Gm.	or gr. v.
Sodii phosphat. ....	3 25 Gm.	or gr. l.
Aque ..... 15	c.cm.	or fʒss.

M. Sig.: To be taken at a dose.

#### ACIDUM STEARICUM (U. S. P.).—Stearic Acid ( $\text{HC}_{18}\text{H}_{35}\text{O}_2$ ).

Stearic acid is an organic acid which, in its commercial, more or less impure, form, is usually obtained from the more solid fats, chiefly tallow. It is a hard, white, somewhat glossy, solid; odorless and tasteless, and permanent in the air. Insoluble in water, it dissolves in about 45 parts of alcohol at 15° C. (59° F.); it is readily soluble in boiling alcohol and in ether.

Stearic acid has no physiological action upon man and is employed in medicine only in the manufacture of glycerin suppositories. The fixed fatty oils, of either animal or vegetable origin, consist mainly of a mixture of three fatty principles,—olein, palmitin, and stearin,—which are glycerides of the corresponding acids. Immanuel Munk has shown that fatty acids alone are competent to produce the nutritive effects of fat, the glycerine being unnecessary and sometimes injurious. Senator has advocated, in cases that cannot tolerate codliver-oil, the administration of the fatty acids which can be given in keratinized pills so as to pass through the stomach unchanged. He regards the saponified fat acids, or soda-soaps, as preferable either to fats or pure fat-acids. Being already in a soluble and absorbable condition, they make no demands upon the digestive capacity of the intestines.

#### ACIDUM SULPHORICINICUM.—Sulphoricinic Acid.

**Pharmacology.**—This derivative of castor-oil is only slightly irritant to the skin, though rapidly fatal to animals when injected into the veins, pleura, or peritoneum. The sulphoricinate of sodium is made by exactly neutralizing sulphoricinic acid with soda.

**Physiological Action.**—The salt is antiseptic and deodorizing and adheres well to the skin. Berlioz found that a 10-per-cent. solution entirely destroyed the odor of five or six times its weight of very fetid pus.

**Therapy.**—The sodium salt has been used as a topical remedy in ozæna, diphtheria, and laryngeal tuberculosis. Several antiseptic compounds have been prepared with the sulphoricinate of sodium. Sulphoricinated naphthol forms an emulsion which has been used in ozæna. Sulphoricinated creosote is used pure, or made into an emulsion with water in laryngeal tuberculosis. Sulphoricinated salol has been employed either in its own form or diluted, as an application to ulcers. Sulphoricinated phenol is made by dissolving, with a little heat, 40 Gm. (or ʒi 1/4) of phenol in carboic acid with 100 c.cm. (or fʒiiifʒij) of sulphoricinate of sodium.

solution of one-fourth of this strength is used in some of the hospitals of Paris in diphtheria. The mixture adheres well to the surface and does not irritate or cause pain. It is applied upon pledgets of cotton, and is not washed off by gargles or irrigations. A combination of 10 parts of acid, 2 parts of creosote or terpin hydrate, and 80 parts of sulphorinate of sodium is also serviceable as a topical application in diphtheria.

**ACIDUM SULPHURICUM (U. S. P., B. P.).—Sulphuric Acid**  
( $H_2SO_4$ ).

*Preparations.*

**Acidum Sulphuricum Dilutum (U. S. P., B. P.).—Diluted Sulphuric Acid** (U. S. P. contains 10 per cent., by weight, of absolute sulphuric acid; B. P., 13.65 per cent. of hydrogen sulphate). Dose, 0.30 to 1 c.cm. (or *mv-xv*).

**Acidum Sulphuricum Aromaticum (U. S. P., B. P.).—Aromatic Sulphuric Acid,** Ess. of Vitriol (U. S. P. contains sulphuric acid, 100 c.cm.; with tincture of ginger, 5 c.cm.; oil of cinnamon, 1 c.cm.; and alcohol, q. s. to make 1000 c.cm.). Dose, 1 to 1.29 c.cm. (or *mx-xx*).

**Pharmacology.**—The official U. S. P. acid contains not less than 92.5 per cent., by weight, of absolute sulphuric acid and not more than 7.5 per cent. of water. The B. P. acid contains 98 per cent., by weight, of hydrogen sulphate. It must be colorless, without odor, and of an oily consistence. It is very caustic and corrosive, and should be kept in glass-stoppered bottles. The commercial acid (oil of vitriol) contains various impurities,—arsenic, lead, nitric acid, etc.

**Physiological Action and Toxicology.**—Sulphuric acid, in full strength, dissolves animal substances and has a strong affinity for water. Applied to the skin it acts as a caustic, redissolving the coagulum formed and penetrating deeply, turning the surface black. When taken internally, the lips and other parts of the mouth are blackened, and symptoms of corrosive poisoning are produced; there is intense pain, with efforts at vomiting. Collapse and death are rapidly ensue from the intense congestion of the œsophagus and stomach, or it may occur secondarily from the resulting gastric ulceration and strictures of the œsophagus.

Renal lesions have been found by Drs. Eugene Fränkel and F. Reiche in three cases of poisoning from sulphuric acid, one of which caused death in five hours, while the other two cases were fatal in from two to four months. The appearance of the organs was much the same in the three cases. In the first, coagulation-necrosis was present and was more extensive in the first than in the succeeding cases, in which the lesion was limited to small patches.

The stomach-pump, if employed, should be used with extreme care on account of the danger of tearing the softened mucous membrane or of rupturing the stomach. Alkalies should be given, with milk or soap-water, or morphine hypodermically to relieve pain, combined with atropine as a sedative stimulant. Oil, white of eggs, and magnesia are also appropriate. Local agents and appropriate treatment for the succeeding inflammation will be needed. Sulphuric acid is sometimes maliciously thrown upon a person, especially in the face. In such a case soapy water is to be used to wash off the excess of acid, and an alkaline wash applied; to relieve pain, opium internally will be needed. The subsequent treatment is that of an ordinary

Sulphuric acid is eliminated to a small extent by the kidneys and probably also by the lower bowel and skin.

**Therapy.**—On account of the pain following its application, sulphuric acid is not much used as a caustic, although it is an efficient destroyer of tissue. Velpeau used it in cancer, and Ricord for chancres, the acid being mixed with some absorbing substance like sawdust or charcoal. In cancer and necrosis, and suppurating cavities or sinuses, it may either be applied upon a glass rod or on lint, diluted with 4 to 6 parts of water.

Internally, dilute sulphuric acid acts as an astringent and antiseptic. The elixir of vitriol is the preferred form for checking the night-sweats in phthisis, and in some cases of diarrhœa. Sulphuric acid, with water, sweetened so as to make a pleasant drink, is a valuable prophylactic against lead poisoning, often used by operatives in lead works. It also has been found to be a preventive of attacks of Asiatic cholera, when taken regularly during the prevalence of an epidemic.

R Acid. sulphurici diluti .....	9	25 c.cm. or f3iiss.
Tr. opii deodorati .....	4	c.cm. or f3j.
Elixir aromatici .....	30	c.cm. or f3j.
Aquæ .....	q. s. ad 120	c.cm. or f3iv.

M. Sig.: Take a tablespoonful for catarrhal dysentery every hour or Watch with care the action of the opium.

Sulphuric acid has been given as an astringent in typhoid fever. It may be preferred to hydrochloric acid when the diarrhœa is excessive. Lead colic is relieved by the use of sulphuric acid, and the constipation of lead poisoning is effectually treated by a combination of diluted sulphuric acid, quin sulphate, and magnesia sulphate. On account of its astringent property it is beneficial in hæmorrhage from the uterus, stomach, or intestinal canal and in purpura. The following prescriptions have been found beneficial

R Acid. sulph. aromat. ....	7	50 c.cm. or f3ij.
Fluidextracti hamamelidis,		
Fluidextracti ergotæ .....	aa 60	c.cm. or f3ij.

M. Sig.: Two teaspoonfuls in water every two or three hours. Use especially in hæmorrhage from lungs, stomach, or womb.

R Acid. sulph. aromat. ....	15	c.cm. or f3ss.
Magnesiæ sulph. ....	62	Gm. or 3ij.
Spt. chloroformi .....	11	c.cm. or f3iij.
Inf. rosæ gallicæ .....	q. s. ad 240	c.cm. or f3viij.

M. Sig.: A tablespoonful every three hours. Useful in hæmorrhage from rectum and constipation.

R Acid. sulph. dil. ....	15	c.cm. or f3ss.
Quiniinæ sulph. ....	75	Gm. or gr. xij.
Tinct. opii .....	7	50 c.cm. or f3ij.
Syrupi et aquæ .....	q. s. ad 90	c.cm. or f3iij.

M. Sig.: A teaspoonful in water every four hours in enteric fever with tendency to diarrhœa and sweating. Also useful in sweating of phthisis.

**Liquor Acidi Sulphurici Halleri** (Haller's acid drops)—not official—a mixture of equal parts, by weight, of acid and alcohol, gradually added with constant stirring, taking care that the temperature of the mixture does not get so high as to vaporize the alcohol. It contains ether, alcohol, sulphuric acid, and sulpho-ethylic acid, and is used for the same purpose

the aromatic acid, in about half the dose, on account of the larger amount of acid.

**Acidum Sulphovinicum**, or ethyl-sulphuric acid, is prepared by adding sulphuric acid to alcohol in combining proportion. It is freely soluble in alcohol, and mixes with water (1 or 2 parts) without losing its oily character. It is a yellowish liquid, with slightly astringent taste, and is neutral in reaction. The ethyl sulphates are crystallizable and soluble in water. The ethyl-sulphate (or sulphovinate) of sodium has been used as a saline cathartic. Ethyl-sulphuric acid is an example of an acid ether, and is a solvent for camphor (25 per cent.), iodoform (3 per cent.), sulphur, naphthalin, chrysanthemum, etc., and can be used as a vehicle for these remedies in the treatment of skin diseases.

**ACIDUM SULPHUROSUM** (U. S. P., B. P.).—**Sulphurous Acid** ( $\text{H}_2\text{SO}_3$ ).

**Dose**, 0.30 to 4 c.cm. (or *mv-f5j*), well diluted.

**Preparations**.—In combination with a base, sulphurous acid makes sulphites. Of its combinations, the following are official in the U. S. P.: sodium sulphite, sodium bisulphite, and sodium thiosulphite.

**Pharmacology**.—Sulphurous-acid gas (sulphur dioxide,  $\text{SO}_2$ ) is produced by burning sulphur in the open air; when combined with water, it forms the official acid. It has a sour, sulphurous, somewhat astringent taste, and contains 6.4 per cent., by weight, of the gas, and not more than 93.6 per cent. of water. The B. P. acid contains the equivalent of 5 per cent., by weight, of sulphurous anhydride, or dry sulphur dioxide.

**Physiological Action**.—This acid and its salts are very destructive to the forms of animal and vegetable life, owing to their affinity for oxygen. It is not well borne by the stomach, and should be given freely diluted with water, as its taste and odor are very unpleasant. Locally, it does not excite much irritation in medicinal doses, but inhalation of air containing from 1 to 2 parts of sulphurous acid per 1000 produces in animals intense inflammation of the respiratory passages and lungs. Injection of a 5-per-cent. solution into the stomach was found by Dr. L. Pfeiffer to excite severe gastritis. Animals not killed by the acid recover very rapidly from the immediate effects, though they may subsequently perish from inflammation. Pfeiffer has demonstrated that 96.5 per cent. of sodium sulphite is eliminated in the urine as sulphate, the remainder only as sulphite. Nearly all the large quantity of sulphite administered was eliminated in five hours.

**Therapy**.—As a local antiseptic or bactericide, sulphurous acid is highly useful in those forms of skin disease caused by parasitic invasion, such as *scab*, *scabies*, and *tinea versicolor*. It may be effectively used in *tinea* by the simple device of Dr. Schuster. A net of strings is stretched over the lower third of a card-board box made to fit the head. A saucer containing burning sulphur is laid upon the net of strings and the box covered. The patient must sit still for half an hour. An abundance of sulphurous-acid gas is generated, the sulphur ceasing to burn, of course, as soon as all the oxygen is exhausted. In various forms of sore throat it is useful, but particularly in diphtheria, where it can be used topically and taken internally.

It is beneficially applied to unhealthy or sloughing wounds or ulcers. Use 7.5 c.cm. (or *f5i-ij*) of the official acid to 30 c.cm. (or *f3j*) of water,

or water and glycerin, is of service in chilblains and chapped hands. sulphurous acid, as Ringer points out, may be used in such a manner as to scabies with the utmost rapidity. This method consists in exposing patient, his head excepted, to the influence of sulphurous-acid gas, generated by burning 46.7 Gm. (or 5xij) of sulphur in a suitable closed apparatus. clothes should be, at the same time, put in boiling water. Dr. Dewar recommends equal parts of sulphurous acid and of water as an efficient dressing in erysipelas.

In fermentation of food in the stomach, flatulent dyspepsia with stomach, pyrosis, dilated stomach, etc., sulphurous acid, properly diluted has been recommended. In typhoid fever it has also been used, and, asserted, with success, and may be tried in measles, scarlatina, and smallpox. In some bronchial affections—catarrh, whooping-cough, dilated bronchial tubes—it may be inhaled with a steam-atomizer. It is also of great service in many skin affections, such as urticaria and purpura, after other methods have failed.

The author would recommend the following formulæ for the diseases just referred to:—

- R. Acidi sulphurosi,  
Syrup. zingiberis ..... aa 60| c.cm. or f5ij.  
M. Sig.: From one to two teaspoonfuls in water three times a day.
- R. Acidi sulphurosi,  
Fluidext. ergotæ,  
Syrup. aurantii ..... aa 30| c.cm. or f3j.  
M. Sig.: Two teaspoonfuls in water three or four times a day.

The sulphites and hyposulphites are employed to fulfill the same indications. The administration of the sulphites in pyæmia was advocated Polli, but later clinical observers have not been able to obtain the good results that he reported. (The sulphides will be considered under the head Sulphur.)

#### **ACIDUM TANNICUM (U. S. P., B. P.).—Tannic Acid (Tannin).**

**Dose,** 0.065 to 1.30 Gm. (or gr. i-xx). B. P., 0.13 to 0.32 Gm. (or ii-v).

#### *Preparations.*

Collodium Stypticum (U. S. P.).—Styptic Collodion (consists of 20 parts tannic acid, 5 of alcohol, 25 of ether, and 50 of collodion). For external use as astringent.

Unguentum Acidi Tannici (U. S. P.).—Ointment of Tannic Acid (contains 10 per cent. of tannic acid).

Glyceritum Acidi Tannici (U. S. P.).—Glycerin and Tannic Acid (20 per cent.).

Trochisci Acidi Tannici (U. S. P., B. P.).—Troches of Tannic Acid (each 0.1 Gm., or gr. j; B. P., 0.03 Gm., or gr. ss).

Glycerinum Acidi Tannici (B. P.).—Glycerin of Tannic Acid (20 per cent.).

Suppositoria Acidi Tannici (B. P.).—Tannic-Acid Suppositories (0.20 Gm., or iiij, of tannic acid).

Tannalbin.—Tannic Acid and Albumin. Dose, 2 to 8 Gm. (or 3ss-ij). Tannalbin.

**Pharmacology.**—Tannic acid is a common constituent of vegetable organisms, especially those noted for astringency, such as oak-bark. Galls contain about 50 per cent. of tannic acid, which can be obtained by exposing powdered galls to dampness and afterward dissolving out the tannic acid with

acid of ether. It occurs in light-yellowish scales, soluble in 16 parts of cold water, and slightly soluble in alcohol. It is likewise soluble in glycerin. It precipitates albumin and gelatin, and strikes a black color with preparations containing iron. Solutions containing tannic acid (decoctions of black tea or coffee) are antidotes for poisoning by some metallic salts, and especially by strychnine or tartar emetic, and the alkaloids.

**Physiological Action.**—Tannic acid, when locally applied, has an astringent action upon the tissues, owing to its affinity for albumin. Internally, it acts as a weak acid upon the digestive tract, but when its chemical affinities are satisfied by combination with a base or neutralizing it with alkali, it is no longer capable of precipitating albumin, and therefore no longer exercises an astringent action upon the parts with which it comes in contact. Hence, according to Stockman, it can exert little, if any, action upon the vascular system, and, as it is not excreted by the bronchial mucous membrane, very little, or none, upon the flow of the bronchial secretions. As regards its action upon the kidneys, as it is excreted principally by the channel, it is conceivable that it may have some influence in diminishing hæmaturia, although even this he regards as doubtful. Lewin, however, recommends the administration of tannic acid in the form of an albuminate, and is free from irritation and is more readily absorbed (tannic acid, 2 grs., water, 90; mix well, and add white of egg, 10 parts). The external or internal use of tannic acid may occasion erythema or urticaria.

**Therapy.**—As a local astringent, tannic acid heads the list. A combination of iodoform and tannic acid (2 to 1), finely powdered, is a good dressing-powder for moist eruptions, some forms of eczema, and for insufflation into the nose to reduce secretion in catarrh. After the severity of the inflammation has somewhat subsided, the glycerite of tannin is a good application in acute eczema. It may be applied twice daily, and allays the stinging pain and itching. A solution of tannic acid and camphor has been found to give good results as a topical application in erysipelas and lymphangitis. The glycerite of tannic acid is a good topical application to tonsillitis or pharyngitis. It may also be used as a spray, properly diluted, in hæmoptysis. A stronger solution (50 per cent.) has been recommended by Capullano<sup>1</sup> as dressing for burns of all degrees. For disorders of the lower bowel, ulcers, fissures, hæmorrhoids, prolapsus, and to expel thread-worms, a solution may be injected, or suppositories used, each containing 3 to 5 grains, with cacao-butter or starch.

Leibersohn has obtained good results in severe acute dysentery from enemata of hot enemata of tannic and boric acids. The injections were given every three hours and consisted of a 4-per-cent. solution of boric acid, in which 65 Gm. (or gr. x) of tannin were dissolved. A few drops of laudanum were added to each enema. The effect was to arrest hæmorrhage, diminish tenesmus, and materially abridge the course of the disease. A plan of treatment introduced by Cantani has been used with advantage in the management of cholera. Large enemata of tannic acid are thrown into the small and large intestine beyond the ileo-cæcal valve. From 6 to 19.5 Gm. (or ʒiiss-v) of tannic acid dissolved in 2 litres (or Oiv) of water, with the addition of 2 c.cm. (or ʒi) of laudanum and 46.5 Gm. (or ʒiiss) of powdered gum arabic, are injected at suitable intervals.

A solution of tannic acid is useful in cases of leucorrhœa. The glycerite or iodoform-tannin, is an excellent application for catarrhal inflammation of the cervix uteri. Even in carcinoma uteri the glycerite of tannic acid is efficient in moderating discharge and allaying odor. Its virtue may be assisted by combining it with a small proportion of liquefied phenol.

The odor of ozæna and other affections attended by fetor may, according to Dr. B. W. Richardson, be overcome by the application of cotton-wool previously moistened in a saturated watery solution of tannin and dried.

In gonorrhœa, after the acute stage has passed off, tannic acid is a useful medicament. In men it may be administered, dissolved in water, by urethral injection. Dr. Hanika, of Munich, has treated gonorrhœa by introducing the urethra with a powder consisting of equal parts of tannin, iodoform and thallin sulphate. The powder is introduced through a metal tube or twice daily immediately after the patient has emptied his bladder. In women a watery solution may be used as a vaginal injection, or the vagina may be packed with gauze covered with tannin. Solutions of tannic acid may also be employed for the purpose of hardening tender nipples and teats. A concentrated solution of tannin may answer a useful purpose as a palliative remedy in ingrown nail. A lotion of tannic acid is frequently of service in herpes. It is useful in phagedenic ulcers and alopecia circumscripta. Made into a pomade, it has been found of benefit in dandruff. Ringer recommends the glycerite of tannic acid in otorrhœa, not, however, during the acute stage, but after this has been relieved and but a moderate discharge is left. The remedy is more beneficial when the membrana tympani is intact. The canal is filled with the solution, which is retained by cotton-wool.

With alkaloids tannic acid generally forms insoluble compounds and should not, therefore, be prescribed with preparations containing salts of quinine, strychnine, etc.

Notwithstanding the chemical arguments urged by Dr. Stock, tannic acid has long been successfully administered as an astringent remedy. As, however, it enters the blood under the form of gallic acid, its real effects are, in reality, due to the latter acid. Tannic acid is preferably employed as a local application, gallic acid as a systemic remedy. The therapeutic uses of gallic acid have been already described, and need not be repeated.

Tannic acid has been used in tuberculosis under the theory that it is able to destroy the bacillus of the disease. M. Arthaud has detailed the results obtained in two thousand cases from this method of treatment. He claims that the effect of tannin is superior to that of creosote.

**ACIDUM TARTARICUM** (U. S. P., B. P.).—Tartaric Acid ( $\text{H}_4\text{O}_6$ ).

**Dose.** 0.32 to 1.30 Gm. (or gr. v-xx).

**Preparations.**—The U. S. P. official salts are antimony and potassium tartrate (tartar emetic), iron and ammonium tartrate, iron and potassium tartrate, potassium tartrate, potassium and sodium tartrate (Rochelle salt) and potassium bitartrate (cream of tartar). Seidlitz powder, or **pulvis effervescens compositus** (U. S. P.), **pulvis sodæ tartaratz effervescens** (B. P.) is dispensed in two small papers, a blue one containing 8 Gm. (or 3ij) of potassium and sodium tartrate, with 2.60 Gm. (or gr. xl) of sodium bicarbonate.

trate, and a white one containing 2.25 Gm. (or gr. xxxv) of tartaric acid. When administered these are separately dissolved, each in about 60 c.cm. (or ℥ij) of water, and the two solutions mixed and drunk while effervescing. A slice of lemon improves the flavor of the dose.

**Pharmacology and Physiological Action.**—Tartaric acid is obtained by the decomposition of cream of tartar (potassium bitartrate) found in old wines. It is laxative and slightly diuretic. It reduces the alkalinity of the blood and makes the urine acid. In larger doses it is an irritant; indeed, in its effects it resembles oxalic acid, and the morbid appearances are also very much the same. In excessive amounts tartaric acid retards and weakens the movements of the heart. Its saturated solutions are irritant even to the skin. In a few instances death has resulted from the ingestion of this substance. The symptoms are best relieved by demulcents, the alkalies, magnesium, chalk, soap, milk, etc.

**Therapy.**—Certain of the tartrates are used as laxatives, magnesium tartrate affording a good substitute for the citrate. Rochelle salt, in 15.5 Gm. or 5ss doses, before breakfast, is a good remedy for habitual constipation. Potassium bitartrate (in doses of 0.65 to 1.30 Gm., or gr. x-xx) exerts a decided diuretic action, and in combination with washed sulphur (1 to 2) it forms an excellent laxative remedy for hæmorrhoids.

The combination of diuretic and cathartic virtues renders potassium tartrate very useful in the treatment of chronic Bright's disease. It reduces oedema and delays the manifestation of uræmia. For a similar reason it is useful in ascites. Potassium tartrate, or Rochelle salt, proves of utility in uricæmic indigestion accompanied by an excess of uric acid in the urine.

Lithium bitartrate also is useful in lithemia and chronic rheumatism.

#### ACIDUM TRICHLORACETICUM (U. S. P.).—Trichloroacetic Acid (C<sub>2</sub>Cl<sub>3</sub>CO<sub>2</sub>H).

**Pharmacology and Therapy.**—This acid, a crystalline and deliquescent substance, readily soluble in water, is an efficacious caustic and astringent. It has been successfully employed in the removal of enlarged tonsils, hypertrophied follicles of the pharynx, and polypoid excrescences. Its use can be more strictly limited than that of some other caustics, but it is too slow for use when large masses of tissue are to be destroyed. It may be applied to the pharynx without any previous anæsthetization. In the larynx, however, the surface should first be touched with a 10-per-cent. solution of the larynx with a 20-per-cent. solution of cocaine. It is notable for the dryness of the eschar which it produces. Trichloroacetic acid is a valuable application to warts, vascular nævi, pigment patches, and incontinent ulcers.

As an astringent, the following combination is recommended:—

R. Iodine	15½	Gm. or 3ss.
Potassium iodid	19.4	Gm. or 3v.
Acidum trichloroaceticum	15½ to 31	Gm. or 3ss-j.
Glycerinum	60	c.cm. or ℥ij.

M. Sig. Apply to the affected surface on a pledget of cotton.

Dr. Adolph Bronner employs trichloroacetic acid in the treatment of the nose. He makes use of a 10- to 15-per-cent. aqueous solution and applies it to the mucous membrane covering the septum and turbinated bones.

The operation is repeated two or three times a week for several weeks. Cozzolino recommends the use of trichloroacetic acid in epistaxis, touch the bleeding-point with a piece of cotton saturated in a solution of 1 (or gr. xv) of trichloroacetic acid to 30 c.cm. (or ℥j) of water.

**ACONITINA** (U. S. P., B. P.).—**Aconitine**.

Average dose, 0.00015 Gm. (or gr.  $\frac{1}{400}$ ).

**ACONITUM** (U. S. P.).—**Aconite**. (Monk's-hood.)

**ACONITI RADIX** (B. P.).—**Aconite Root**.

### *Preparations.*

**Fluidextractum Aconiti** (U. S. P.).—**Fluid Extract of Aconite**. (100 c.cm. tains 0.4 Gm. of Aconitine.) Dose, 0.006 to 0.06 c.cm. (or  $m\frac{1}{10}$  to  $j$ ).

**Tinctura Aconiti** (U. S. P., B. P.).—**Tincture of Aconite** (10 per cent.: assayed to contain in each 100 c.cm., 0.045 Gm. of aconitine U. S. P.). Dose, 0.06 to 0.30 c.cm. (or  $m\frac{1}{2}$  to  $v$ ). B. P., 0.30 to 1.20 c.cm. (or  $mv$  to  $xx$ ); if frequently repeated, 0.12 to 0.6 c.cm. (or  $mii$  to  $x$ ). (The U. S. P. formula is nearly twice the strength of that of B. P.).

**Unguentum Aconitinæ** (B. P.).—**Aconitine Ointment** (2 per cent.).

**Linimentum Aconiti** (B. P.).—**Liniment of Aconite** (500 Gm. in 750 c.cm.). external use, with caution.

**Pharmacology.**—The dried tuberous root of *Aconitum Napellus* (Ranunculaceæ), collected in autumn, yielding, when assayed by U. S. process, not less than 0.5 per cent. of aconitine. The British Pharmacopoeia requires that the roots shall be collected from plants cultivated in Great Britain. Monkshood is a perennial plant indigenous to Europe, but sometimes cultivated here in gardens for its ornamental spike of blue flowers. All parts of the plant are poisonous, but the active principle, an alkaloid, **Aconitine**, exists in greater proportion in the root, associated with **pyracetidine** and **aconine**. (Napelline is probably identical with aconine.) Aconitine crystallizes in rhombic or hexagonal plates; is soluble in alcohol, ether, and chloroform, and in 3200 parts of water.

Dunstan and Cash have found that different samples of aconitine differ extremely as regards toxic properties. What has been termed "amorphous aconitine" contains but a very small proportion of true, or crystalline, aconitine, which is the official form. When aconitine is heated at its melting point there is obtained a new alkaloid, which they proposed calling **pyracetidine**. This substance readily dissolves in acids, forming salts which can be crystallized. The solutions of these salts have a bitter taste, and are toxic in small doses. When heated with diluted acids, or with water in a closed tube, pyracetidine and its salts are converted into benzoic acid and an alkaloid, which has been named **pyracetidine**. Pyracetidine is soluble in water and ether. It combines with acids to form crystalline salts.

All the species of *aconitum* are, as a rule, virulently active, but *napellus* is the only official one. The root of aconite in winter-time has been dug up in the garden and eaten in mistake for horse-radish, with fatal consequences. It is only necessary to be aware of this liability in order to effectually guard against the error. The aconite-root is perennating, and not tapering throughout its length, as the root of *armoracia* is; it is also

a brown color, and when scraped has a disagreeable odor, and does not give out the irritating vapor that is so characteristic of the latter.

**Physiological Action.**—The effects of aconite are those of its active principle, aconitine. Many researches have been made, but the results have differed so widely that it is evident the various investigators have worked with impure or different substances. In the physiologic investigation by Professors Cash and Dunstan,<sup>1</sup> the greatest care has been taken to insure the alkaloids used being chemically pure. They found that aconitine kills mammals by its action on the respiratory centre; diacetyl-aconitine has much the same action, but is not so powerful, while benzaconine and aconine are much weaker. On the heart, all have finally a depressing effect, but aconine, compared with the others, proved to be relatively harmless. It was found that atropine and digitalis exercised a certain amount of antagonistic effect to aconitine. The addition of the two diacetyl groups to aconitine slightly weakens its action, but produces no radical change. The removal of an acetyl group from aconitine, to form benzaconine, greatly reduces its toxic power and greatly alters many of its minor effects, although in a general way its depressing action on the respiration and temperature resembles that of aconitine; but it is no longer a strong heart-poison. Aconine is very much less poisonous, it has a curare-like action, and actually strengthens the heart and opposes the aserquence and inco-ordination which aconitine produces. The introduction into its molecule of benzoyl, and still more of acetyl, to form the other alkaloids, heightens its lethal effects and modifies its action to a very remarkable degree. The authors also found that there is a certain antagonism in action between aconine and benzaconine, on the one hand, and aconitine, on the other. It should be mentioned here, in explanation of the difference in effect from different specimens of aconite, that the alkaloidal strength and the physiological activity of the plant are much affected by circumstances of its growth, the wild varieties being more poisonous than the cultivated. In this way the well-known differences in the activity of different specimens of the drug are explained. Murrell has called attention to the fact that English aconitine is seventeen times stronger than the German, while the French is variable, but generally between these. The crystalline variety (Duquesnel's or Merck's aconitine) is to be preferred when prescribing, on account of its uniform strength. Aconite reduces cardiac action and blood-pressure, diminishes excitability of cerebral centres, the sensory tract of the cord, and the peripheral terminations of sensory nerves. It also promotes the action of the skin and kidneys. The external application of preparations containing aconite has sometimes been attended by redness and the development of vesicles, pustules, and blebs. The internal use of aconite will occasionally produce profuse diaphoresis together with vesiculation and more or less itching.

**Toxic Effects.**—Theodore Cash<sup>2</sup> thinks that the uncertainty of aconitine is due to the mixture with the other alkaloids of aconite, which differ to a great extent in potency and physiological action. The difference in the lethal dose is shown by the following table:—

<sup>1</sup> *British Medical Journal*, Nov. 11, 1899, p. 1365, from *Philosophical Transactions*.

<sup>2</sup> *British Medical Journal*, Oct. 8, 1898.

	RABBIT.	FROG.
Aconitine .....	0.00012 Gm.	{ 0.000586 Gm. March 0.0014 Gm. July.
Benzaconine .....	0.0272 Gm.	0.284 Gm.
Aconine .....	probably 0.28 Gm.	1.055 to 1.75 Gm.

per kilogramme of body-weight. Aconitine is about 200 times as toxic as benzaconine, and 2000 times as toxic as aconine. The aconitine, in doses, slows and steadies the pulse, with a slight decrease of pressure; benzaconine has a like effect, in a much more marked degree, while aconine has this property. The first produces the characteristic tingling of the membrane and impairs sensation, generally by its action on the peripheral sensory nerves. The other two have no such action. They all have a bitter taste, but the last is not so marked. Death from aconitine is primarily due to respiratory failure, although in small doses it at first stimulates the respiratory centre, then finally depresses it by paralyzing the sensory fibres of the pulmonary vagi. Benzaconine acts much like the above, except that it has very little effect upon the sensory nerves, while it depresses the motor group and also the muscle-fibres. It also lacks the antipyretic action of aconitine. Aconine is not such a cardiac depressant as are the two others, but, as above stated, actually strengthens the heart and opposes the bradycardia and inco-ordination which aconite produces; upon the motor system it is a decided depressant and acts like curare.

Applied to the skin or mucous surface, aconite first is slightly irritating, but this is soon followed by numbness, which may be accompanied by tingling sensations. If a bottle containing aconitine be held to the nose, perirrhine irritation of nose and eyes results. In relatively large doses death occurs very promptly, and, if given hypodermically, the fatal result may follow in less than a minute, according to Wood. It is destructive to all forms of animal and vegetable life; sometimes very small doses produce extremely severe symptoms. A case of decidedly marked impression from a quantity of 0.18 c.cm. (or *milij*) of the tincture has been reported by Woodbury, which vomited; loss of power of extremities, with paresthesia and numbness; loss of sight, mild delirium, weak pulse, and threatened stupor. Collapse occurred, life being saved apparently only by very prompt and energetic treatment. The first symptom observed in a case of poisoning is tingling or tingling in the mouth and throat, soon extending to the extremities and sometimes over the whole body. The surface of the extremities is cold and clammy and numb, but at the same time the patients complain that they feel as if the limbs were flayed. Sight may be lost and hearing dulled, but ordinarily the intellect remains clear. Convulsions occur occasionally. The pulse becomes weak and variable; slight exertion may bring on a fatal collapse. The muscular strength is early affected, so that the patient is unable to stand. Owing to the lowering of the blood-pressure and the dilatation of the arterioles caused by the aconite, the heat of the body is at first lowered, with the increased blood-flow, to the surface, and there the blood loses heat by radiation and the temperature of the interior of the body is quickly lowered. The depression is accompanied by increase of perspiration, with

<sup>1</sup> "Proceedings of the College of Physicians of Philadelphia," third series x. p. 450.

still further reduces temperature. This occurs more obviously when there is pyrexia present than when the temperature is normal to begin with. Death results from failure of respiration generally, but it may occur suddenly from syncope, as already stated. Aconite, applied locally, first paralyzes the sensory nerves, beginning with the end-organs and ascending the trunk to the centre. The motor nerves are next affected. The reflex function of the cord is impaired. Uncertainty still exists, however, concerning the mode and order in which aconite affects the different portions of the nervous system. Ringer concludes, upon the basis of his and Dr. Murrell's experiments, that aconitine paralyzes all nitrogenous tissues, abolishing the functions, first, of the sensori-perceptive centre, acting next upon the nerves, and, finally, upon the muscles. Similarly, first the ganglia of the heart are attacked, next its nerves, and lastly its muscular structure. After a fatal dose has been taken the symptoms usually make their appearance very rapidly, and death may result in half an hour. The average time required to produce death is rather more than three hours, the longest case on record being five and a half hours.

**Antidotes.**—The antidotes to aconite are tannic acid, astringent infusions, alcohol, and ammonia. Digitalis appears to be the physiological antagonist to counteract the depressant effect upon the heart, or tincture of *strophanthus* may be substituted. The hypodermic injection of atropine also acts in the same manner. Inhalations of amyl nitrite, administered freely, appeared to save life in Dr. Elliott's case. The patient should be kept in a recumbent position, with his head lower than his feet, and be kept warm. The stomach-pump, artificial respirations, ether or alcohol, and tincture of digitalis or strychnine hypodermically, a hot pack, even faradization over the epigastrium and cardiac region, are each useful.

**Therapy.**—Locally, the benumbing effects of aconite have been utilized in the treatment of neuralgia, the best combination, probably, being the Baltimore liniment, or the *linimentum aconiti et chloroformi* (N. F.):—

R Tr. aconiti,  
Chloroformi ..... aa 12½ c.cm. or f3iij, mviij  
Liniment. saponis ..... 75] c.cm. or f3iiss.

M. Sig.: POISON. For external use. To be applied, with friction, along the course of the affected nerve.

The oleate of aconitine (2 per cent.) has also been used with asserted good results for neuralgia. An ointment of aconitine is official in the British Pharmacopœia. This preparation contains 0.65 Gm. (or gr. x) to 26 Gm. (or gr. ccccx) of lard, the aconitine being dissolved in 5.20 Gm. (or gr. lxxx) of oleic acid before being rubbed up with the fat. Aconitine ointment will often assuage the pain of chronic rheumatism, gout, and myalgia. It serves the same purpose, also, in herpes zoster, but care must be taken, in this affection, not to apply it to the abrasions produced by rupture of the vesicles. The same ointment also affords relief in neuralgia of the skin, paræsthesia or pruritus, papular eczema, and prurigo. It must never be placed upon a raw surface.

Its control over the circulation places aconite in the first rank in the treatment of the fever process; in many cases we may get the best results if given in fractional doses (every ten, fifteen, or twenty minutes, give a teaspoonful of water from a tumbler in which 0.60 to 1 c.cm. (or *mx-xv*), of

the tincture has been dropped). This is invaluable in the treatment of the ephemeral fevers of childhood and hyperpyrexia attendant upon exanthemata. In adults the results are also very positive; so that aconite almost entirely taken the place of the lancet in the antiphlogistic treatment. Aconite, however, should be avoided in typhoid fever or other diseases of an asthenic character.

In the early stage of inflammatory processes—pneumonia, pleurisy, carditis, peritonitis, erysipelas, rheumatism, meningitis—and in childhood diseases, it modifies materially the severity of the symptoms, reduces temperature, and moistens the skin.

In the treatment of rheumatic iritis Dr. Jonathan Hutchinson recommends the tincture of aconite in 0.60-c.cm. (or *mx*) doses<sup>1</sup> three times a day (equivalent to tinctura aconiti, U. S. P., 0.30 c.cm., or *mv*), given in combination with alkalies and the iodide of potassium. He looks upon aconite as of service in mitigating the pain of carcinoma. It also serves a useful purpose in acute congestion of the brain. In spasmodic croup aconite relieves the dyspnoea within a few hours. Aconite has been recommended as a sedative in relieving the vomiting of pregnancy. It is asserted that aconite is an antidote to the sting of the scorpion.

Asthma, especially in children, and preceded by coryza, is generally benefited by the use of this remedy. Ringer states that a drop of the tincture every hour, is useful in acute gonorrhoea. In coryza and quinsy, or tonsillitis, it is highly prized for its influence in shortening the course of the disease; and it has also been given to abort or prevent urethral discharges after the use of instruments. It affords prompt relief in congestive dysuria; and in amenorrhoea, produced by exposure to cold, it is often efficacious in re-establishing the flow. In facial neuralgia the extract may be given internally, in combination with quinine and a carminative, viz.:

R	Fluidextracti aconiti .....	25 Gm. or gr. iv.
	Quininae bisulphat. ....	4 Gm. or 3j.
	Piperin. ....	32 Gm. or gr. v.

Div. in pil. no. xx.

Sig.: Give one every two hours until relieved, and then one every four hours as long as needed.

In migraine, or sick headache, it may be combined with camphor. Indica:—

R	Tr. aconiti .....	12 c.cm. or mij.
	Tr. cannabis Indicae .....	1 c.cm. or mxv.
	Tr. cardamom. co. ....	q. s. ad 4 c.cm. or f3j.

M. For one dose, to be repeated every hour, or two hours, until patient relieved.

Tincture of aconite will relieve the pain of epididymitis and of congested glandular structures, commencing with 0.32 c.cm. (or *mv*), to be followed by 0.13 c.cm. (or *mij*) every half-hour until pain is relieved or the patient shows its effects by lowered rate and diminished arterial tension. In nervous palpitation and overaction of a heart somewhat hypertrophied, and in tobacco-heart, aconite, when cautiously used, gives much relief.

<sup>1</sup>The tincture of aconite of the British Pharmacopœia is only one-half of the strength of the tinctura aconiti of the United States Pharmacopœia.

**Aconitine** should never be given, even in the smallest dose, where there is a weak or fatty heart. It was used by Gubler in the treatment of facial neuralgia, and Seguin also advocated the crystallized aconitine in trigeminal neuralgia, in doses of 0.0002 to 0.00024 Gm. (or gr.  $\frac{1}{300}$  or  $\frac{1}{250}$ ), to begin with, repeated cautiously, and gradually increased until numbness is felt through all the body, with chilliness and, in some instances, even nausea and vomiting. Napelline has also been used in facial neuralgia in doses of 0.03 Gm. (or gr. ss), repeated every two hours until the pain has disappeared.

Tyson has employed the crystallized aconitine nitrate in the treatment of facial erysipelas, and reports that it almost invariably diminishes the duration of the disease and prevents the occurrence of complications. It is a very energetic salt, but it can be readily administered and regulated as regards dose by dissolving it in a mixture of distilled water, glycerin, and alcohol, having exactly the density of distilled water, so that 3.10 c.cm. (or cc.) contain 0.001 Gm. (or gr.  $\frac{1}{100}$ ). It may, therefore, be used in the dose of 0.0002 Gm. (or gr.  $\frac{1}{500}$ ): 1 minim of the solution. He usually adds 0.001 Gm. (or gr.  $\frac{1}{100}$ ) of aconitine nitrate to a mixture, and gives it, in divided doses, in the course of twenty-four hours.

Aconitine cannot be regarded otherwise than as a dangerous remedy. It has been found that the toxic dose and the susceptibility both vary greatly in different subjects.

#### ADEPS (U. S. P., B. P.).—Lard.

##### Preparations.

**Oleum Adipis** (U. S. P.).—Lard-oil.

**Adeps Benzoïnatus** (U. S. P.).—Benzoinated Lard (benzoin, 2 per cent. During hot weather 5 per cent., or more, of the lard should be replaced by white wax).

**Adeps Benzoatus** (B. P.).—Benzoated Lard (benzoin, 3 per cent.).

**Pharmacology.**—Lard is the prepared internal fat of the abdomen of the swine, Linné (class, Mammalia; order, Pachydermata), purified by washing with water, melting, and straining. The specific gravity of lard is about 0.92. It is entirely soluble in ether, benzin, and disulphide of carbon. It melts at or near 95° F. to a clear, colorless liquid. It consists chemically of 62 per cent. of olein, or fluid fat, and 38 per cent. of the hard fats, myristin and stearin. The olein may be separated by pressure, or by the use of boiling alcohol. The salt with which it is frequently impregnated may be removed by boiling the lard with twice its weight of water. The tendency to rancidity is obviated by the addition of benzoin; it may also be prevented by digesting the lard with betanaphthol, or poplar-buds. As a constituent animal fat, lard is largely used in pharmacy as the basis of ointments and cerates; and in domestic practice it is universally employed as a lubricant. By the addition of benzoin it is prevented, not only from becoming rancid, but an agreeable odor is also imparted to it; dehydrated lard is prepared where the presence of water is considered objectionable. Lard-oil is sometimes used for illuminating purposes. It can be administered, in cases of opium poisoning, as an antidote, except where phosphorus or carbolic acid has been swallowed. Lard is an article of food, or, more correctly, is employed in preparing other articles of food.

**Therapy.**—Lard has more penetrating power than petrolatum or vaselin, and its bland agents (such as mercury or the alkaloids) can be combined with

it for administration by inunction. Washed lard, beaten up with an equal quantity of lime-water, and a few drops of oil of bitter almonds, thymol or carbolic acid added, makes an elegant substitute for caron-oil as a dressing for burns, or for some acute inflammations of the skin. Stiffened with a little yellow wax, it forms the simple ointment of the U. S. P. This preparation is well adapted to fulfill the general indications of a fat, and to serve as an excipient for more active ingredients. When the secretory functions of the skin are suppressed, inunction with lard serves as a partial substitute for the natural secretion, softens the hard tissue, and reduces heat. It sheaths the surface, and prevents the contact of the atmosphere with its floating germs. It lessens or prevents the effect of irritant charges. Lard softens and removes scabs. The free application of simple ointment relieves the intense heat of the skin and itching in scarlatina, and at the same time it assists in reducing the pulse-rate and temperature of the body. Inunction is likewise of value in measles. It has been claimed that it is useful as an antidote to strychnine, and that a dog which has had a poisonous dose of strychnine will recover if given lard freely.

**ADEPS LANÆ** (U. S. P., B. P.).—Purified cholesterin-fat of sheep wool.

**ADEPS LANÆ HYDROSUS** (U. S. P., B. P.).—Hydrous Wool-fat.

This is the purified fat of the wool of the sheep, mixed with not more than 30 per cent. of water. (Lanolin is a trade name for *Adeps lanæ*.)

**Pharmacology.**—In the washings of wool is found a variety of fat which, owing to the presence of cholesterin, combines readily with more than its own weight of water; it does not become rancid, and resists saponification. It is neutral and is a good vehicle for remedies to be used by inunction, it passes readily through the skin; it is not adapted as a protective dressing for this reason. The sheepy smell of the fat is removed by repeated washing, and pure lanolin is now obtainable that is nearly odorless.

Lanolin used as a medicament contains from 25 to 30 per cent. of water which is not, however, chemically combined, and is readily separated by heat. Anhydrous lanolin is completely soluble in ether, benzol, and chloroform; sparingly soluble in stronger alcohol; and insoluble in water. Purified lanolin is of an unctuous, tenacious consistence and whitish color. L. A. Gottstein, of Berlin, has demonstrated that lanolin is indestructible and impermeable by micro-organisms. Its employment may, therefore, be regarded as an aseptic measure.

**Physiological Action.**—Lanolin has a soothing action on a delicate and irritable skin. It is not used internally, but only as an unguent.

**Therapy.**—Lanolin is a serviceable dressing in cases of burns, scalp-erysipelas, frost-bites, erythema, and dermatitis. Its property of absorbing water, its blandness and aseptic nature, render it an excellent medicament or base in acute eczema. In chronic eczema with infiltration and in psoriasis lanolin softens the skin and favors the action of remedies with which it may be combined. Lassar highly recommends it in the treatment of impetigo contagiosa. When suitably diluted and perfumed, it is an admirable toilet pomade. It rapidly heals chapped hands and lips, and may be spread upon the face before retiring at night in order to soften the skin after exposure to cold and wind. Lanolin, in conjunction with appropriate internal remedies, restores the lustre or gloss of the hair when it has been lost in consequence

systemic disease. It is valuable in the treatment of atrophy of the hair, and counteracts that dry, harsh condition of the hair which is natural to some individuals. Senile atrophy of the skin may be benefited by the persistent and systematic use of lanolin. Inunction with this substance is one of the best means at our disposal for the obliteration of wrinkles. Lanolin favors the proper performance of the glandular functions of the skin, and is efficacious in anidrosis and comedones. In ichthyosis and scleroderma it softens the surface of the integument. It is an excellent vehicle for the paraffinoides made use of in tinea versicolor, tinea favus, and the varieties of tinea trichophytina. It is admirably adapted to serve as an ointment basis for the oleate of mercury or copper in the treatment of the affections specified. On account of the ready miscibility of lanolin with mercury and its anodyne power, it is peculiarly serviceable in the inunction treatment of gonorrhea. In affections of the nasal and genito-urinary tracts, lanolin is of great advantage combined with cocaine hydrochlorate.

It is a good vehicle for the anodynes—atropine, cocaine, morphine, etc.—in cases of neuralgia or rheumatic joints. As an ointment alone for the eye, lanolin is too thick, tenacious, and sticky, and to remedy these defects a combination of 1 part of benzoinated lard to 3 parts of lanolin has been preferred; this makes a fine, smooth ointment, which has been found a good vehicle for eye ointments, and, even alone, is often used simply at night to the eyelids in conjunctivitis and almost all external inflammations. Lanolin containing a large proportion of water is efficient in soothing the itching which accompanies measles, scarlet fever, and chicken-pox. The gradual evaporation of the water produces a cooling effect upon the skin. In these affections Dr. Klein adds to 31 Gm. (or 5j) of pure anhydrous lanolin 12 Gm. (or 3iij) of vaselin and 18.5 c.cm. (or f5v) of distilled water. Liebreich recommends the injection of a lanolin cream into the rectum for the relief of inflammation and erosions of the rectum and hæmorrhoids. Lanolin seems to heighten the efficacy of many of the drugs for which it is employed as an ointment-base. This is especially the case as regards chrysarobin. Applied upon a bougie it has been found of advantage in the treatment of gonorrhœa.

**ADHATODA JUSTICIA.**<sup>1</sup> — *Adhatoda vasica*, *A. gendarussa*, or *A. verticillata*.

**Pharmacology and Physiological Action.**—The leaves of this plant, belonging to the Acanthaceæ, indigenous to India and neighboring countries, have been used with asserted benefit in pulmonary and catarrhal affections. It contains an alkaloid, **Vasicine**, combined with adhatodic acid. Hooper found it poisonous, when used in infusion, to flies, frogs, and the smaller organisms, but harmless to large animals.

**Therapy.**—In asthma, 0.65 Gm. (or gr. x) doses of the powdered leaves given three times daily, afford great relief, the patient being also permitted to smoke the leaves in a pipe, or to inhale the smoke. On account of its bactericidal properties, Dr. H. H. Rusby has recommended the use of *adhatoda* infusion in diphtheria, and it has been suggested that it might also be efficient in typhoid fever, and by inhalation of the spray from the atomizer in cases of phthisis and fetid bronchitis. It is prob-

<sup>1</sup>"Annual of the Universal Medical Sciences," 1890, vol. v, p. A-7.

able that it might also be useful in infectious dyspepsia due to the abnormal fermentation of food in the stomach.

**ADONIS VERNALIS.**—False Hellebore, or Pheasant's Eye, perennial herb (belonging to the Ranunculaceæ), indigenous to Europe, having bright, showy flowers. There are two annual species, the *A. vernalis* flowering in May, and the *A. autumnalis*, flowering in September; former has orange, the latter red, flowers; hence the common name of chamomile.

**Physiological Action.**—The active principle, **Adonidin**, appears to be a mixture, consisting of yellow **adonidoquercitrin**, **adonidodulcit**, **adonidic acid**, with a brown glucoside, and a bitter, poisonous glucoside, **pieradonin**, according to the analysis of Podwissotzki. Adonidin is a yellowish-white hygroscopic, bitter powder, devoid of odor, soluble in water and alcohol, insoluble in ether, chloroform, and benzin. Merck has isolated a crystalline principle termed **Adonite**, which has been shown to be a pentahydric alcohol, converted into a sugar by oxidation. Adonite is very soluble in water and has a slightly-sweet taste, but, according to Kobert, has no decided physiological action.

Whether used, as the peasants of Russia are said to be in the habit of doing, as an infusion, as the fluid extract, or in the form of adonidin, adonis acts upon the heart as a stimulant or cardiac tonic, resembling its action digitalis or strophanthus. Adonis is said to increase the arterial tension and in large doses causes diastolic arrest of the heart. In large doses the first rise is succeeded by a decided fall of arterial pressure, and paralysis both of the heart and blood-vessels.

It is claimed that, in moderate doses, adonidin is devoid of danger from cumulative effect, and that it agrees well with the digestive organs. Huchard, however, found in some cases, that it caused vomiting or diarrhœa. In a case in which 0.20 Gm. (or gr. iij) of adonidin was taken by mistake, vomiting and diarrhœa were prominent symptoms. The action of this drug is very promptly manifested. In accordance with the observation that it increases arterial pressure, there is an increased flow of urine, but adonidin exerts no effect upon the secreting structure of the kidneys.

**Therapy.**—Internally in cases of mitral or aortic regurgitation it is claimed to be of great value. In functional irregularity of the heart J. Da Costa found much benefit from adonidin (in doses of 0.003 to 0.006 Gm., or gr.  $\frac{1}{20}$ - $\frac{1}{10}$ , thrice daily). In cardiac asthma it also affords relief to the dyspnoea. The fluid extract (normal) is a good preparation in doses of 0.06 to 0.12 c.cm. (or *m-iij*) cautiously increased.

Professor Bekhtereff has observed a favorable influence from the addition of adonis vernalis to a bromide solution in the treatment of epilepsy. The combination which he has for several years employed is

R Potass. bromid. ....	8j to 12j	Gm. or 3ii-iiij.
Tinct. adonidis .....	4	c.cm. or f3j.
Codeine sulph. ....	20	Gm. or gr. iij.
Aque ..... 240		c.cm. or f3viij.

M. et ft. sol.

Sig.: Tablespoonful from four to eight times a day.

The tincture of adonis vernalis, an allied species, in 0.60 c.cm. (or

three times a day, is reported to be efficient in removing fatty tissues from the heart and relieving the dyspnoea which accompanies obesity.

**ADRENALINUM.**—Adrenalin, Epinephrin. (See *Glandulæ Suprarenales*.)

**ÆSCULUS HIPPOCASTANUM.**—Hippocastanum, Horse-chestnut.

**Pharmacology and Therapy.**—The horse-chestnut, *Æsculus hippocastanum* (Hippocastanæ), is a large tree cultivated in Europe and North America as a shade-tree; its original habitat was India. The bark contains tannic acid and two neutral bitter principles—*Æsculin* and *Fraxin*. Their effects are those of the vegetable bitters; the bark also has some antiperiodic powers. A fluid extract, with dilute alcohol, is the best preparation. The fluid extract has been administered in malarial disorders and in neuralgic affections in doses of 1.20 to 4 c.cm. (or *mxx-f3j*). *Æsculin* occurs in the form of brilliant, white crystals and is soluble in hot water. It is said to have been given with good result as a substitute for quinine in malarial fevers, especially of the remittent form.

**ÆTHER** (U. S. P., B. P.).—Ether (*Æther Fortior.*, U. S. P. 1880).

**ÆTHER PURIFICATUS** (B. P.).—Purified Ether [ $(C_2H_5)_2O$ ].

**Dose**, 0.60 to 2 c.cm. (or *mx-xxx*) for repeated administration; for a single administration, 2.40 to 4 c.cm. (or *mxl-lx*).

#### Preparations.

**Oleum Æthereum** (U. S. P.).—Ethereal Oil. Equal volumes of ether and heavy oil of wine.

**Spiritus Ætheris** (U. S. P., B. P.).—Spirit of Ether. Dose, 0.30 to 2 c.cm. (or *ss-lss*).

**Spiritus Ætheris Compositus** (U. S. P., B. P.).—Compound Spirit of Ether, or *Sedman's Anodyne* (U. S. P., composed of ether, 325 c.cm.; alcohol, 650 c.cm.; and *Chloroformum*, 25 c.cm.). Dose, 0.30 to 2 c.cm. (or *mv-xxx*).

**Spiritus Ætheris Nitrosi** (U. S. P., B. P.).—Spirit of Nitrous Ether, or Sweet Spirit of Nitre. Dose, 2 to 4 c.cm. (or *f3ss-j*).

**Pharmacology.**—Ether is a liquid composed of about 96 per cent., by weight, of absolute ether, or ethyl-oxide, and about 4 per cent. of alcohol, retaining a little water. "A volatile liquid prepared from ethylic alcohol by interaction with sulphuric acid. It contains not less than 92 per cent. by volume of ethyl-oxide. It was formerly termed sulphuric ether" (B. P.). Purified ether is: "ether from which most of the ethylic alcohol has been removed by washing with distilled water and most of the water by subsequent distillation in the presence of calcium chloride and recently-prepared lime" (B. P.). It is a thin, very diffusive, clear and colorless liquid, with a refreshing, characteristic odor, a burning and sweetish taste, afterwards slightly bitter, with a neutral reaction. It is soluble in all proportions in alcohol, chloroform, benzol, benzin, fixed and volatile oils; dissolves in about ten times its volume of water at 59° F., and it boils at 98.6° F. It is inflammable, and its vapor, mixed with air and ignited, explodes violently. The vapor is slightly irritating to the conjunctivæ, and at first to the bronchial mucous membrane.

**Physiological Action.**—When ether is poured over the skin it evaporates so quickly that a sensation of cold is experienced, and when its application is continued, as with the atomizer, the temperature of the part is lowered and it may be frozen, which is announced by sudden blanching of the skin. When the escape of the vapor is prevented ether acts as a counter-irritant causing reddening; even vesication may be produced.

When taken internally, ether is a diffusible stimulant, resembling alcohol in its effects, which, although manifested earlier after ether, are more transitory. When introduced into the circulation, by absorption from the stomach or the rectum, by inhalation, or hypodermically, it is found temporarily to increase arterial tension and acts as a cardiac stimulant, the heart continuing to beat after failure of respiration. In these respects it is antagonistic to chloroform, which lowers arterial pressure and is a cardiac sedative. Ether-vapor is inhaled pure, while chloroform-vapor must be combined with 95 to 97 parts of atmospheric air. Upon the nerve-centres ether acts very much like alcohol, affecting (1) the cerebrum; (2) the sensory, and later the motor, functions of the spinal cord; (3) the sensory centres in the medulla oblongata; and (4) finally the motor centres in the medulla. Kemp<sup>1</sup> found a decided increase in the amount of indican excreted after ether, and by the use of the oncometer demonstrated a special contraction of the arteriole of the kidney, and damage to the secretory cells. Therefore the presence of albuminuria or pulmonary oedema is usually regarded as a sufficient contra-indication to its use.

**The State of Anæsthesia.**—Anæsthesia produced by the inhalation of ether-vapor, when complete, nearly approximates the state of coma. It approaches by well-defined stages, the first being one of excitement or exhilaration; the second is narcosis; the third is abolition of sensibility and reflexes, and, carried further, it ends in paralysis and death from failure of respiration, owing to paralysis of the centres in the medulla oblongata. The nerve-centres are affected in the following order: The higher centres in the brain, the motor and sensory centres in the medulla spinalis, and, ultimately, the sensory and motor centres of the medulla oblongata. The vapor of ether is at the beginning of the inhalation irritating to the air-passages and may cause strangling sensations to the patient, but this soon passes away as anæsthesia becomes established; it may be necessary, at the outset, to allow some admixture of air, so as not to frighten the patient, but as soon as may be possible the pure ether-vapor is to be administered, so as to prevent efforts at vomiting. Owing to this irritation of the bronchial mucous membrane, there may be produced congestion or oedema of the lungs, especially when the patient is not kept warm during the operation, or pneumonia may follow.

The presence of bronchitis contra-indicates the use of ether. According to the observation of Poppert, oedema of the lungs is the frequent immediate cause of death from ether, and is due to the toxic influence of the anæsthetic. Senger draws attention to the danger of cerebral hæmorrhage during ether-narcosis, in patients suffering from arteriosclerosis. During operations upon the mouth, and particularly in the extraction of teeth, the blood running down the throat may cause asphyxia. A few "don't's" should be borne in mind when administering ether:—

<sup>1</sup> *New York Medical Journal*, Nov., 1899.

1. Don't give it to a patient whose kidneys are diseased.
2. Don't give it when the stomach contains undigested food; the patient should be fasting for at least four hours, if possible.
3. Don't give it without removing artificial teeth from the mouth, which are liable to fall into the throat.
4. Don't give it unless the clothing is so loose as to allow freedom of respiration.
5. Don't give it when the pleural cavity is full of fluid.
6. Don't give any anæsthetic to women, especially young women, except in the presence of witnesses, who can testify as to your actions during the period of unconsciousness of the patient, as under such circumstances women sometimes acquire fixed delusions which can only be met by testimony absolutely proving their falsity.
7. Don't forget that ether-vapor and air make an inflammable and explosive mixture, and that ether may take fire from the actual cautery as well as from a candle.
8. Don't forget that there are different qualities of ether, and that the proper kind for surgical purposes is the official ether of the best make.
9. Don't forget that ether, like alcohol, lowers temperature, and that the patient should not be too much exposed to cold during operation.
10. Don't forget that ether causes death by respiratory failure, and that the color of the lips and ears is a better guide to the state of the blood than the radial pulse.
11. Don't forget that the anæsthetic state is a state of danger, and the patient is not safe until the effects of the ether have entirely passed off.
12. Don't forget that ether is eliminated rather slowly by the lungs and the kidneys; so the patient should be watched for several hours after the administration.

**The Choice of Anæsthetics.**—The anæsthetic agent should be suited to the operation and to the circumstances of each case. For many trivial operations, or those which are rapidly performed, pure nitrous-oxide gas is sufficient and much safer than the others. In young children chloroform-vapor is easier of administration than ether, and comparatively free from danger when properly administered. It also is preferred where the actual cautery is to be used, or where lights are required near the patient. In midwifery practice it also is the preferred anæsthetic. For all ordinary cases ether is safer than chloroform, and is by far the most frequently used.

A valuable paper has been published by Dr. Julliard,<sup>1</sup> of Geneva, upon the relative safety of ether and chloroform. From the records of several hundred thousand administrations of ether and chloroform it was shown that the mortality from the latter is from four to five times greater than from ether. Methylene bichloride has been tried in England to some extent, but as ordinarily sold it appears to be merely an alcoholic solution of chloroform. Ethyl-bromide is of more recent introduction, and when pure is very well for short operations, but does not have decided advantages over the best ether, except in having a slightly more agreeable odor. For a lengthy operation it is well to precede the anæsthetic by the administration of from 60 to 120 ccm. (or fʒii-iv) of whisky. In a similar manner an hypodermic injection of morphine 0.015 Gm. (or gr.  $\frac{1}{4}$ ) and atropine 0.0005 Gm.

<sup>1</sup>*Revue Médicale de la Suisse Romande*, Feb., 1891.

(or gr.  $\frac{1}{120}$ ) may be given before operating (Nussbaum's method). Various mixtures of anæsthetics have been proposed, the best known being the A. & E. mixture of the London hospitals, containing alcohol, 1; chloroform, 2; and ether, 3 parts; but, owing to the different density and varying rates of diffusion, it is impossible to tell just how much of each is being given; therefore, these mixtures are not recommended. Gurlt finds that when a mixture of agents was used the proportion of accidents from asphyxia was greater than when chloroform alone was employed. By the use of an inhaler, ether-vapor mixed with oxygen can be administered, the gas passing through a wash-bottle containing the ether; by this method asphyxia is avoided and greater safety secured.

Where a patient dislikes ether, or takes it badly, the administration may commence with nitrous oxide and ether substituted later, or it may be preceded by a few whiffs of chloroform. Dr. A. Diaz de Lianó has invented an apparatus by means of which ether can be administered at a temperature of 88° F., and claims that by his method the disadvantages both of cold ether and chloroform are obviated. It is claimed by some clinicians that the preliminary application of cocaine solution to the nasal mucous membrane prevents irritation, and the unpleasant after-effects are, to a large extent, prevented.

The production of surgical anæsthesia by absorption of ether-vapor from the mucosa of the rectum was advocated by Pirogoff in 1847, and was prominently called to the attention of the profession by Axel Iversen, of Copenhagen, and Daniel Mollière, of Lyons. More recently, Stedman,<sup>1</sup> of the Sheffield Hospital, made a plea for this method. It is accomplished by attaching to a rectal tube a rubber pipe connected with a bottle, partly filled with ether, which is placed in a bucket containing warm water. The absence of irritation of air-passages, struggling, and vomiting by this method suggests its adoption in suitable cases. On the other hand, it is slow in action, requiring from five to thirty-five minutes, and it may be necessary to supplement it by ordinary inhalation. At least two deaths have been caused by rectal etherization. In another case, death resulted from rupture of the intestine at the site of an old cicatrix from an ulcer which yielded under pressure of the vapor. Calderon<sup>2</sup> believes ether-narcosis by the rectum to be of special service for surgical operations about the head, and reports a mastoid operation done successfully upon a child with its aid.

What is called "primary anæsthesia" occurs early in the administration of the ether, at the time when narcosis begins. During this stage, which is very brief, small operations, incisions, punctures, etc., may be done without waiting for complete anæsthesia. In order to ascertain when it occurs the patient is directed to extend one of his arms perpendicularly upward and to hold it up as long as he can. At the moment when narcosis occurs the arm falls, which is the signal for the operator to cut and for the administration of ether to cease. The patient regains consciousness at once, and generally there is no vomiting or other ill effects.

**Treatment for Toxic Effects.**—When a patient appears asphyxiated, rhythmical traction upon the tongue by Laborde's method, artificial respiration, inhalation of ammonia, slapping the exposed surface of the chest with wet towels, and the application of the faradic current to the epigastric

<sup>1</sup> *Quarterly Medical Journal*, Sheffield, Jan. 18, 1895.

<sup>2</sup> *Pacific Medical Journal*, March, 1900.

will usually restore him. Rubbing the body so as to keep up the circulation, or the use of stimulating enemata, is also of service. Oxygen might be administered, or a mixture of oxygen and nitrogen monoxide (2 to 1), or pure nitrous oxide cautiously inhaled so as to flush the brain and medullary centres of blood. Nitroglycerin, 0.0006 Gm. (or gr.  $\frac{1}{100}$ ), may be given hypodermically.

**Its Effects of Ether.**—The unpleasant results which sometimes follow the administration of ether, such as nausea and vomiting, may be overcome by giving the patient a cup or two of either strong, hot coffee or tea. After dental operations, where it is especially important to prevent vomiting, nurses now prohibit the administration of any food, medicine, or water by mouth, for a period of 12 to 24 hours, or longer. Thirst can be relieved by injections of water into the rectum, and strength sustained by saline enemata. Suppositories or small hypodermic injections of morphia may be given to relieve pain. For dental operations, ether is preferred to chloroform, on account of greater safety. In the event of nausea, retching, or even wakefulness supervening after extracting teeth, Dr. Dorr administers about 1.60 Gm. (or gr. xxv) of potassium bromide in strong wine, or from a few minims to 4 c.cm. (or f5j) of compound spirit of ether.

The author can also commend sodium bromide (1 to 1.30 Gm., or gr. i-ii, in soda-water, soda-mint-water, or cinnamon-water), camphor-water, aromatic spirit of ammonia, caffeine citrate or hydrobromate (0.065 to 0.130 Gm., or gr. i-iv, at a dose), tincture of capsicum (0.60 to 1.20 c.cm., or min. at a dose), or the effervescent salts of sodium or caffeine bromide, all being especially suitable for the treatment of the ill effects following the administration of ether. In order to control hiccough and vomiting after anaesthesia, Dr. Bernard Joos is in the habit of making digital compression of the phrenic and vagus nerves against the sternal end of the clavicle. He states that, as a rule, vomiting immediately ceases. The pressure is continued for a few moments in order to prevent a return of the sickness. Frederick Silk's conclusions on "ether pneumonia" are: 1. Ether inhalation is only one of the minor exciting causes of croupous pneumonia. The stimulating properties of the vapor may even help to ward off an attack. 2. Tonsillar conditions of the mucous membrane of the air-passages are universal under ether, and their tendency is to subside on withdrawing the vapor. In a small proportion of cases, however, an inflammatory condition is decided, and the patient's life is in jeopardy. Other concomitant causes which generally be found at work: *e.g.*, cold and exposure. 3. To limit this tendency, careful precautions will usually suffice, especially in the direction of avoiding exposure, cold, and draughts.

**Therapy.**—Ether may be used locally for its refrigerating or detergent properties before a surgical operation. It dissolves fat from the skin, and is used in disinfecting the hands by surgeons, in connection with antiseptics. The ether-spray may be used to benumb a part of the skin before making an incision; and, in chorea, ether-spray has been applied to the spine with good results. The ether-spray is also often very serviceable in allaying the pain of neuralgia, especially when seated in a superficial structure. The ether is directed immediately upon the course of the aching nerve. Sir

James Sawyer points out that ether is the best menstruum for the solution of many remedies to be used upon the skin; ether being a good solvent of active principles of many drugs and also of sebaceous matter. It may be used as a menstruum for making ethereal tinctures or liniments. In strangulated hernia, 30 to 60 c.cm. (or fʒi-ij) of ether may be sprayed upon the tumor, as successfully employed by Finklestein<sup>1</sup> and Gusenbauer, or allowed to fall upon the surface drop by drop.

Dr. Charles E. Hughes, of St. Louis, has had good effect from lavage with ether for the relief of pain; thus, in severe headache he has poured ether on the scalp freely with prompt cure.

A case in which a fistula remained after an operation for cholecystomy has recently been described by Dr. John W. Walker. Seven months later a stone again entered the duct and was dissolved by a mixture of equal parts of ether and glycerin placed in a small glass tube attached to a syringe; the tube pressed directly upon the stone and the ether-glycerin injected drop by drop.

Ethereal preparations may be used internally for hysteria, colic, and passage of biliary or renal calculi. Durand's remedy for gall-stones is equal parts of ether and turpentine-oil, given a teaspoonful at a dose.

Ether is a diffusible stimulant, and can be used hypodermically in case of failure (1.20 to 2 c.cm., or mxx-xxx). Taken with water or syrup (2 to 4 c.cm., or fʒss-j), it affords relief in flatulence, spasmodic asthma, or colic. It has similar effects to those of alcohol, and a habit of ether-drinking<sup>2</sup> in like manner been established in some persons (although the odor of breath plainly announces to others the fact that it has been taken), but effects are more transitory than those of alcohol.

The internal administration of ether is capable of relieving mild attacks of angina pectoris. It is a good plan to combine 0.60 to 1.20 c.cm. (mx-xx) of ether with codliver-oil when the latter substance is not well borne. Ether facilitates the digestion and absorption of the oil, probably by increasing the secretion of pancreatic fluid. Hoffmann's anodyne in 2 c.cm. (fʒss) doses is useful in sick headache. The hypodermic injection of from 1 to 2 c.cm. (or mxv-fʒss) of ether in the neighborhood of the affected nerve has proved of value in sciatica, gastralgia, and various forms of rheumatic neuralgia. Barth obtained very excellent results in typhoid pneumonia from these subcutaneous injections of ether. The injections were given from 1 to four times daily, and were followed by notable increase in the strength and volume of the pulse. Castel reports favorably of the same method in small-pox. After puerperal, pulmonary, or other severe hæmorrhage if thrown under the skin stimulates the heart and may avert fatal syncope.

The following combinations of ether will be found serviceable:—

R Spt. ætheris comp. ....	60	c.cm. or fʒij.
Tinct. capsici .....	4	c.cm. or fʒi.
Spt. ammon. aromatic. ....	12	25 c.cm. or mcc.
Mist. sodæ et menthæ (N.F.) .....	60	c.cm. or fʒij.

M. Sig.: A teaspoonful in water every few minutes until relieved. This description is especially useful in the treatment of syncope, flatulence, and nervous hysterical paroxysms.

 Tinct. extracti lupulini,  
 Tinct. valerianæ ammoniatæ. . . . . aa 30| c.cm. or fʒj.

**M** Sig.: Two teaspoonfuls in water every fifteen or twenty minutes. For hysteria and nervous sick headache, neurasthenia, angina pectoris, and spasmodic asthma.

The diagnostic use of ether anæsthesia is frequently illustrated in surgery, where it is employed in order to examine fractures, explore cavities for abscessed growths or foreign bodies, and to detect malingering. Emerson T. Sisson has suggested the employment of ether-vapor, in place of hydrogen, in Sisson's method of determining the presence of perforations in the intestines, after laparotomy, for gunshot wounds.<sup>1</sup>

**Spiritus Ætheris Compositus** (U. S. P., B. P.). — In hysteria, flatulent colic, and nervousness this solution is much in demand. Compound spirit of ether is likewise very serviceable in the treatment of hiccup, functional palpitation of the heart, or syncope. It will often afford relief in gastralgia, and will sometimes prove of marked benefit in angina pectoris. It is a moderate stimulant and antispasmodic, and is popularly known as Hoffmann's anodyne.

The following formula, containing compound spirit of ether, are useful:—

**R** Sodii bicarbonatis . . . . . 6| Gm. or ʒiiss.  
 Spt. ammon. arom.,  
 Tinct. zingiberis . . . . . aa 4| c.cm. or fʒj.  
 Spiritus ætheris comp. . . . . 120| c.cm. or fʒiv.

**M** Sig.: Two teaspoonfuls in water for hysteria or flatulence. Repeat when necessary.

**R** Spiritus ætheris comp. . . . . 30| c.cm. or fʒj.  
 Vini coce . . . . . 60| c.cm. or fʒij.

**M** Sig.: From one-half to a tablespoonful, in water, every hour or two, as a sedative in hysteria, dysmenorrhœa, or flatulent colic.

**Spiritus Ætheris Nitrosi** (U. S. P., B. P.), spirit of nitrous ether, popularly known as sweet spirit of nitre, is an alcoholic solution of ethyl-nitrite, yielding, when freshly prepared and tested, not less than 4 per cent. of ethyl-nitrite. It is made by the action of sulphuric acid upon sodium nitrite, potassium carbonate, water, and alcohol.

The pharmacopœia direct that it should be kept in small, glass-stoppered bottles, in a dark place remote from lights or fire. Very much of the spirit of nitrous ether dispensed is deficient in strength, and has become acid from age. When this has occurred it should not be used. The loss of the ethyl-nitrite is prevented, to a large extent, by a combination with an alkali or with an acetate or citrate. When fresh, it renders excellent service in tea-spoonful doses, well-diluted, given several times a day, in scanty secretion of urine in elderly people.

Nitrous ether resembles the other nitrites in its sedative effects upon the system, but its action is overcome or modified in this form by the comparatively large quantity of alcohol accompanying it, which really makes spirit of nitrous ether a diffusible stimulant. For this reason Whitla

especially commends it in the dropsy of debilitated subjects. In fever may be given in cold water or lemonade, or in combination with other remedies, as aconite or veratrum viride. It acts upon the skin as well as upon the circulation, and reduces the temperature. It is useful, above all, in the febrile affections of infancy and childhood. It enters into Brown mixture (Mist. glycyrrhizæ co.), of which it constitutes 3 parts in 100, forming popular remedy for acute bronchitis, and which is used as a vehicle for quinine and other remedies.

Spirit of nitrous ether can be employed in the following combination with advantage:—

R Spiritus ætheris nitrosi,		
Aquæ camphoræ,		
Liq. ammon. acetatis . . . . .	aa 60	c.cm. or f3ij.
Antimonii et potassii tart. . . . .		065 Gm. or gr. j.
Morphinæ sulphatis . . . . .		03 Gm. or gr. ss.

M. Sig.: A tablespoonful in water every hour or two until relieved. For acute bronchitis, acute rheumatism, and in fevers.

R Spiritus ætheris nitrosi,		
Elix. humuli (N.P.),		
Syr. lactucarii . . . . .	aa 60	c.cm. or f3ij.

M. Sig.: From a half to a tablespoonful every hour when unable to sleep. Serviceable in insomnia, general nervousness, and debility.

### **ÆTHER ACETICUS (U. S. P., B. P.).—Acetic Ether.**

Dose, internally, 0.60 to 2 c.cm. (or *mx-xxx*).

Acetic ether is a liquid composed of about 90 per cent., by weight, ethyl-acetate ( $C_2H_5C_2H_3O_2$ ) and about 10 per cent. of alcohol containing a little water (U. S. P.). It is soluble in 10 parts of water (at 59° F.), and mixes in all proportions with alcohol, ether, chloroform, and fixed or volatile oils. It enters into cologne water (spiritus odoratus, U. S. P. 1890), has similar effects upon the system to ethyl-oxide, and also can be used in inhalation as an anæsthetic, but is slower in its action.

According to the experiments of Krautwig on rabbits, moderate quantities of acetic ether greatly increase the respiratory capacity, the effect augmenting in proportion to the dose. There was no influence from the same quantities upon the blood-pressure and no ill effects upon the heart. Inhalation of the vapor of acetic ether allays laryngeal and bronchial irritation. In spasmodic asthma and in nervous cough also it may be used with good effect. It is rather more irritating to the skin than ordinary ether.

### **ÆTHER VALERIANICUS.—Valerianic Ether.**

**Pharmacology and Therapy.**—Valerianic ether, or the ethylic ether of iso-valerianic acid, is a colorless fluid, having an odor resembling that of valerian. It is a less volatile fluid than ordinary ether. The dose of valerianic ether is 0.12 c.cm. (or *mij*), but in practice it is found preferable to dilute it with sulphuric ether, and it is thus prepared and put up in sealed gelatin capsules, each capsule containing about 4 drops. Valerianic ether is a serviceable remedy in dysmenorrhœa, nervous headache and excitement, asthma and other spasmodic disorders, neuralgia, and nervous vomiting. It is of advantage in mania a potu, by controlling arterial and nervous e

ment and tremor. In periodic hay fever, Dr. J. D. Christman, of Allentown, Pa., found it decidedly useful.<sup>1</sup>

**ÆTHYLIS BROMIDUM.**—Hydrobromic Ether, or Ethyl Bromide ( $C_2H_5Br$ ). (It must not be confounded with **Ethylene Bromide**.)

**Pharmacology.**—This liquid has rather a pleasant odor and sweetish taste. When pure it is colorless, volatile, non-inflammable, and resembles ether or chloroform in its effects when taken internally or by inhalation. It is very slightly soluble in water, but freely soluble in alcohol and ether, in chloroform and oil. Air and moisture cause its decomposition. Under the influence of light the bromine gradually separates, causing discoloration of the ethyl, when it becomes unfit for use, owing to the poisonous action of bromine.

**Therapy.**—For anæsthesia, the pure ethyl bromide only should be used, as dangerous symptoms, even fatal results, have been ascribed to the use of impure preparations. It is thought that some, at least, of the deaths may have been caused by the employment of ethylene bromide instead of ethyl bromide. An easily applied test for the purity of ethyl bromide is given by Sternberg: if a drop of ethyl bromide be let fall in a solution of potassium iodide 3 centimetres (about  $1\frac{1}{4}$  inches) deep, it should reach the bottom without being colored violet. In experiments upon man, ethyl bromide has generally proved fatal by arrest of respiration. Sæver, however, has reported a case in which death occurred from a temporary cessation of the heart's action. Chemical examination demonstrated that a pure sample had been employed. In other cases, which did not terminate fatally, the inhalation of ethyl bromide occasioned nausea, vomiting, collapse, spasm of the glottis, cyanosis of the face, or other distressing symptoms. In some instances irritability of the stomach, loss of appetite, and prostration continued for days after the anæsthetic had been given.

In dosage, it stands between ether and chloroform, and probably occupies the same relative position with regard to safety. Its characteristic effects, when inhaled, are the rapid approach of anæsthesia, its brief duration, and the rapid return of consciousness. It is, consequently, ill adapted for use in prolonged operations. When sprayed upon a part it induces local anæsthesia. It may be inhaled in epilepsy, chorea, and other spasmodic diseases (about 4 c.c.m., or f5j, at a time). Not very inflammable and not unpleasant, it may be used instead of ether for minor surgical operations. One advantage which ethyl bromide possesses is that it does not irritate the mucous membrane of the upper respiratory tract. The agent is not appropriate for use in the reduction of fractures and dislocations, as it is liable to excite muscular spasm. It is regarded as unsafe in the case of drunkards and those suffering from disease of the kidneys, liver, or lungs.

From a series of experiments relative to the action of ethyl bromide, Simon-Denis concludes that small quantities produce narcosis without lowering arterial pressure. Large amounts diminish blood-pressure by depressing the peripheral vasomotor constrictor system. It is without action upon the central vasomotor dilator system or upon the vagi. Toxic

<sup>1</sup> *Medical Bulletin*, Jan., 1892.

doses disturb the action of the heart, but, as a rule, produce arrest of respiration before that of the heart. The same precautions should be taken in administering ethyl bromide as when giving chloroform.

**Coryl.**—Under this name a mixture of methyl chloride and ethyl chloride has been employed as a local anæsthetic in dentistry and minor surgery. Though it does not produce as much cold as methyl chloride, it has the advantage of being a fluid at 32° F., while the latter boils at a much lower temperature.

**Ethylene Bromide.**—This fluid has at first a sweetish and subsequently a burning taste, and an odor which resembles that of chloroform. It dissolves in water and mixes with oil or alcohol. Ethylene bromide has been used with success in a number of cases of epilepsy as a substitute for potassium bromide. It contains 90.9 per cent. of bromine. The dose for adults is from 0.18 to 0.5 c.cm. (or *mini-viii*) thrice daily, and can be gradually and cautiously increased to 2 c.cm. (or *f5ss*) two or three times a day. It can be administered in wine or in capsules. It is never used in inhalation.

**ÆTHYLIS CARBAMAS** (U. S. P.).—**Ethyl Carbamate, or Ethyl Urethane** ( $\text{CONH}_2\text{OC}_2\text{H}_5$ ). This is an ester of carbamic acid, obtained by the reaction of alcohol upon urea or one of its salts (U. S. P.). It can also be obtained by the action of ammonia or ethyl carbonate, or chlorocarbonate, and likewise by direct union of cyanic acid with ethyl alcohol. Ethyl carbamate, or urethane, is in the form of tasteless, white crystals, which are soluble in water, alcohol, ether, chloroform, and glycerin. The aqueous solution is of a neutral reaction.

**Physiological Action.**—Von Jäksch<sup>1</sup> found it markedly hypnotic in doses of 0.50 to 1 Gm. (or gr. viiiss-xv) in various pathological conditions. Urethane is not an analgesic, and does not relieve the neuralgic pains of locomotor ataxia, for instance. Urethane resembles paraldehyde in being free from any decidedly depressing action upon the circulation and respiration, differing in this important respect from chloral hydrate, and its ally, chloral. When the circulation is weak, urethane is to be preferred as a hypnotic instead of chloral, although the latter has a stronger hypnotic action (Cullingworth). Overdoses, however, cause distinct depression of the spinal cord, heart, and respiration. Death from a fatal quantity is caused by asphyxia.

**Therapy.**—In adults it is recommended for use as a sedative and hypnotic, where other agents cannot be used, in doses of 1 Gm. (or gr. x) every two hours. Demme regards it especially suited to children, giving 0.25 Gm. (or gr. iv) at the age of 1 year as a true hypnotic. He considers that larger doses are safe even in weakly children, as he has seen no effect upon the circulation, respiration, digestion, or nerve-centres. As an emmenagogue he used it successfully in eclampsia. It may also be given in solution hypodermically in doses about one-fourth of those for ordinary use. Abbott reports a case of tetanus cured in two days, from 0.58 Gm. (or gr. ix) of urethane every two hours, with 2 Gm. (or gr. xxx) administered at night. Maretti, also, successfully treated a case of tetanus by means of urethane. Prof. J. P. Crozer Griffith looks upon urethane in ordinary doses, as an

<sup>1</sup> "Jahresbericht der Pharm. Therap.," 1885.

weak and unreliable hypnotic, though in large doses it may at times prove useful. Chloral and urethane may be combined, forming **Chloral-urethane**, an alcoholic solution of which is known as **Somnal**. **Uralium**<sup>2</sup> is a similar substance to, if not identical with, somnal. Uralium is a crystalline substance, soluble in alcohol and ether, but insoluble in cold water. It has been given as an hypnotic in doses varying from 1 to 3 Gm. (or gr. xv-xlv).

**ETHYLIS CHLORIDUM.**—Chloric Ether, or **Ethyl Chloride** ( $C_2H_5Cl$ ).

Ethyl chloride is a colorless fluid of ethereal odor, and boils at  $50^{\circ}$  F. It produces local anæsthesia by its rapid evaporation. The skin is first reddened, after which it becomes perfectly white, and a snow-white coating forms upon its surface. Ethyl chloride is put up in hermetically-sealed test-tubes containing 9.25 c.cm. (or f℥iiss), one end being drawn out into a long point. When this is broken off the heat of the operator's hand projects a fine spray upon the surface to be anæsthetized. Ethyl chloride has been used successfully to allay the pain of neuralgia, lumbago, and migraine. It has also been found serviceable in minor surgery and dentistry. Commercially, it is supplied under the name of "Kelene," by which name it is known in Europe. Ethyl chloride has also been employed for general anæsthesia, but it is less safe than ether. A death has been reported from its use, by George K. Gifford.<sup>3</sup>

**ETHYLIS IODIDUM.**—Hydriodic Ether, or **Ethyl Iodide** ( $C_2H_5I$ ).

This is very analogous to ethyl bromide, iodine merely replacing the bromine. It can be administered from a vial in drops on a handkerchief or in gelatin capsules containing 0.30 c.cm. (or *mv*) each. It is not used during anæsthesia, but may be cautiously inhaled for syphilis, bronchitis, phthisis, catarrh, whooping-cough, asthma, or other spasmodic diseases. Dose, 0.3 to 1.2 c.cm. (or *mv-xx*), by inhalation.

**AGARICUS ALBUS.**—Purging Agaric. (*Polyporus officinalis*, *Boletus officinalis*, order, Basidiomycetes, Hymenomycetes.) The European larch agaric is a fungus which grows in large, hoof-shaped masses horizontally from the trunk, and penetrates, with its mycelium, deeply into the wood. The masses are collected in Europe and Asia Minor, and, after peeling and washing, they form yellowish-white, friable, spongy, irregular balls, from the size of an orange up to that of a cocoa-nut. It has a heavy, fungus-like odor; a sweetish, followed by a bitter, nauseous taste; and its powder is irritating to eyes and nose. It largely consists of resinous matter, **agaricin**. In doses of 0.65 Gm. (or gr. x) or more it acts as a purgative; small doses is tonic and anhydrotic.

**Physiological Action.**—In small doses (0.065 to 0.32 Gm., or gr. i-iv) it acts like atropine, but does not dilate the pupil. It is a compound of the active principle of which is termed agaricic acid. Hoffmeister has shown that the substance usually employed under the name of agaricin or agaric acid is an impure product. Pure agaric acid is a white, light, crys-

<sup>1</sup> *Annuaire of the Universal Medical Sciences*, 1899, vol. v, p. A-150.

<sup>2</sup> *Monitore degli Ospitali*, Milan, Feb. 6, and *British Medical Journal*, March 16,

*British Medical Journal*, July 8, 1905.

talline powder, of a silky lustre. It crystallizes out of absolute alcohol in groups of tuft-like needles or as distinct rosettes. Its melting-point is  $138^{\circ}$  C. ( $280.4^{\circ}$  F.). The free acid is but slightly soluble in cold water but is moderately soluble in boiling water. Its alkaline combinations are freely soluble, but its heavy metallic salts are insoluble. It is a strong local irritant, and its subcutaneous injection results in active inflammation, with the production of pus. On account of its slow absorption it produces no grave symptoms in warm-blooded animals. The subcutaneous or intravenous injection of a soluble salt first excites, and then paralyzes the vagus and vasomotor centres. Death is preceded by convulsions, results from cessation of respiration or, in animals when artificial respiration is kept up, from the extreme fall of blood-pressure. The influence upon the secretion of sweat is not central, but is exerted upon the secretory glands.

**Therapy.**—Agaricin, in doses of 0.005 to 0.065 Gm. (or gr.  $\frac{1}{12}$ –j), is used to check night-sweating, and sometimes to suppress lactation.

R Agaricin. ....	0.065 Gm. or gr. j.
Acid. sulph. aromat. .... 15	c.cm. or f3iv.
Elixir ..... 45	c.cm. or f5iss.

M. Sig.: Take one drachm every four hours in water.

Agaricin also suppresses perspiration due to other morbid causes. A solution of agaricin in alcohol has been suggested as of value in hypericidiosis. It has also been recommended to combine a small quantity of Dover's powder with each dose of agaricin, when there is a tendency to looseness of the bowels following its use.

In order to reduce the fever and restrict the night-sweats of pulmonary tuberculosis, Dr. J. M. Anders sometimes resorts to the following combination:—

R Quinin. sulphat.,	
Antipyrin. .... aa	155 Gm. or gr. xxiv.
Agaricin. ....	10 Gm. or gr. iss.

M. et ft. capsulæ no. xij.

Sig.: One capsule three times a day.

**AGARICUS CHIRURGORUM.**—*Polyporus Igniarius* is an allied fungus to the preceding, but is used solely on account of its porous texture. It has been employed as a mechanical hæmostatic and for its slow burn as a moxa. It may be soaked in potassium nitrate or chlorate solution which makes it more inflammable.

**AGARICUS MUSCARIUS.**—*Amanita Muscaria*, or *Fly-fungus* (*Basidiomycetes*, *Hymenomycetes*), is a poisonous mushroom, consisting largely of fungus-cellulose. Its active principle is a syrupy alkaloid, **Muscarin**. It is without taste or odor, but produces powerfully-intoxicating effects somewhat analogous to pilocarpine in its action, and antagonized by atropine. *Amanita Verna*, or *Phalloides*, allied species of mushrooms, are also poisonous. In addition to **muscarin**, they contain **phallin**, and also a third principle, which has not been isolated. For the latter two elements no

has been found. They act like serpent-venom, in causing solution of the blood-vessels. Treatment of mushroom-poisoning should commence with attempts to clear the alimentary canal; then use atropine and diffusible stimulants. Digitalis may also be given hypodermically, and stimulating agents administered.

**Physiological Action.**—The action of the heart and of the lungs is depressed by large doses of agaric, the heart being finally arrested in diastole. Smaller doses diminish blood-pressure and reduce temperature, although the bodily heat may be secondarily increased. The secretions of the skin, the liver, and intestinal tract are increased, while that of the kidneys is sometimes reduced or suppressed. The muscular system is relaxed, but convulsions may occur from accumulation of carbonic acid in the blood. Upon the brain a marked narcotic or stupefying effect is observed, so that it has been used in Asia as an intoxicant. The pupil contracts from the effects of the internal administration, while the local application of muscarine may cause dilatation.

**Therapy.**—Administered medicinally, muscarine has some reputation in checking the fever and sweating of phthisis. It may be used in affections of the respiratory tract where there is a deficiency of secretion or in disorders of the alimentary canal where the same indication is to be met, and to overcome a tendency to constipation. Muscarine can therefore be combined with such drugs as belladonna, hyoscyamus, strychnine, aloin, *Opuntia sagrada*, or sulphur, with advantage, as in the following formula:—

R Muscarine .....	20	Gm. or gr. iij.
Ext. nucis vomice .....	065	Gm. or gr. j.
Aloin.		
Ext. belladonnæ folior .....	aa	10 Gm. or gr. iss.
Ext. gentianæ .....	1	Gm. or gr. xvj.

M. et ft. pil. no. xvj.

Sig. One pill two or three times a day. Beneficial in constipation and in catarrh of the fundice.

The dose of muscarine is usually 0.008 to 0.13 Gm. (or gr.  $\frac{1}{8}$ -ij), in solution, or muscarine nitrate may be given in somewhat smaller doses. For the sweating of phthisis, Murrell uses a 1-per-cent. solution, of which the dose is 0.30 c.cm. (or *mv*).

**AGATHIN** is the name bestowed upon a new synthetical compound discovered by Dr. Israel Roos, of Frankfort-on-the-Main. It is a derivative of acetoacetic acid, and its chemical composition is expressed by the title "acetoacetaldehyde-methylphenylhydrazin."

Agathin occurs in the form of small, light-green, crystalline scales, without smell or taste, insoluble in water, soluble in alcohol and ether, melting at 74° C. (165° F.).

**Physiological Action and Therapy.**—Moderate doses have no ill effect upon animals. When administered to the human subject, agathin generally increases the appetite and excretion of perspiration. It has been found beneficial clinically in neuralgia and rheumatism, being generally given in the dose of 0.50 Gm. (or gr. viij) two or three times a day. Its effect is not immediately exerted, and its use, it is claimed, does not usually appear to be accompanied by any drawbacks. On the contrary, Ilberg and others have observed cases in which agathin gave rise to headache, vertigo,

insomnia, vomiting, diarrhœa, thirst, sensation of heat, and smarting pain during micturition.

**AILANTHUS GLANDULOSA.**—*Ailanthus-tree*, or *Chinese Sumac*. The *Ailanthus*, or *Tree of Heaven* (belonging to the natural order *Simarubaceæ*), brought from China, is now naturalized in this country, and, being ornamental, is used as a shade-tree. The inner bark, which is the part used, contains an oleoresin and a volatile oil.

The fluid extract (0.60 to 4 c.cm., or *mx-f3j*) and the tincture (in doses of 2 to 7.5 c.cm., or *f3ss-ij*) have been used. The bark may be given in doses of from 0.32 to 0.65 Gm. (or gr. v-x).

**Physiological Action.**—When taken in full doses, *ailanthus* nauseates and purges; it also gives rise to vertigo, headache, pains in the back and limbs, and prostration, with numbness or tingling. Both respiration and pulse-rate are reduced; death results from arrest of respiration.

**Therapy.**—The fresh bark has been used in the treatment of tapeworm, in decoction (15.5 Gm. to 473 c.cm., or *3iv-Oj*) or the oleoresin (in c.cm., or *f3j*, doses). It has also been used in malignant scarlatina, spasmodic disorders, and in dyspepsia. An infusion of the leaves has been employed in dysentery.

**AIR.**—A mixture of oxygen and nitrogen, with smaller quantities of carbon dioxide, argon, and watery vapor, together with accidental organic and inorganic constituents, composing the atmosphere, which we breathe. (For the effects of air, see section devoted to *Climatotherapy* also *Pneumotherapy* and *Pneumatic Differentiation*. For Liquid Air, see section on *Heat and Cold as Therapeutic Agents*.)

**AIROL.**—This is a trade designation for bismuth-oxyiodogallate, which is a grayish-green, odorless, tasteless powder. It is insoluble in alcohol, water, etc. It has been employed as a surgical antiseptic dusting powder or as an emulsion with glycerin (10 per cent.), or also as an ointment, as a substitute for iodoform. *Airol* has also been used internally as an intestinal astringent, in doses of 0.13 to 0.32 Gm. (or gr. ii-v) several times daily. In ophthalmic practice Bonivento had good results in for cases of infectious, ulcerous keratitis, the remedy being lightly dusted upon the affected area after preliminary antiseptic cleansing. Its application is usually painless.

**ALBARGIN.**—A trade name for gelatose silver nitrate. (See *Argentum*.)

**ALCOHOL (U. S. P.). SPIRITUS RECTIFICATUS (B. P.).**—*Alcohol Spirit of Wine* ( $C_2H_5OH$ ).

#### *Preparations.*

*Alcohol Dilutum* (U. S. P.).—Diluted Alcohol (equal parts alcohol and water).  
*Spiritus Frumenti* (U. S. P.).—Whisky (contains about 50 per cent. of alcohol).  
*Spiritus Myrciæ* (U. S. P.).—Bay-rum. For external use.

*Vinum Album* (U. S. P.).—White Wine (10 to 12 per cent. alcohol).

*Vinum Rubrum* (U. S. P.).—Red Wine (10 to 12 per cent. alcohol).

*Alcohol Absolutum* (U. S. P., B. P.).—Absolute Alcohol (containing not more than 1 per cent. by weight, of water).

*Spiritus Vini Gallici* (U. S. P., B. P.).—Brandy (contains about 50 per cent. of alcohol).

*Mistura Spiritus Vini Gallici* (B. P.).—Mixture of Brandy (brandy, 113 c.cm.; cinnamon water, 113 c.cm.; refined sugar, 14 Gm.; two yolks of eggs). Dose, 30 to 60 c.cm. (or 1℥-ij).

*Vinum Aurantii* (B. P.).—Orange-wine (contains 10 to 12 per cent. alcohol by volume).

*Vinum Xericum* (B. P.).—Sherry Wine (contains not less than 16 per cent. of alcohol by volume).

#### Not Official.

*Spiritus Genevæ*.—Gin (dilute alcohol flavored by juniper-berries).

*Spiritus Jamaicensis*.—Jamaica Rum (spirits from molasses).

*Spiritus Odoratus*.—*Eau-de-Cologne*, Cologne-water.

Alcohol is a liquid composed of 91 per cent., by weight (94.9 by volume), of ethyl-alcohol, and of 9 per cent., by weight (5.1 by volume), of water. Specific gravity, 0.820 at 59° F. It is a transparent, colorless, volatile, inflammable substance, with a characteristic, pungent, rather agreeable taste and odor. The British Pharmacopœia recognizes absolute alcohol and proof spirits, the latter containing 90 per cent., by volume, of ethyl-alcohol. **Proof spirit** contains 50 per cent. of absolute alcohol.

**Pharmacology.**—The hydrate of the hydrocarbon radical ( $C_2H_5$ ) is generally understood to be meant by the term alcohol, although many other radicals are known to the chemist. Ethyl-alcohol, also, is the alcohol of brandy, whisky, wine, and various spirits and cordials. Its effects upon the organism are less toxic than those of other alcohols, such as amylic, methylic, or butylic. During distillation of grain, unless carefully managed, considerable amylic alcohol will pass over with the ethylic, especially if the process be continued too long. By keeping whisky stored for several years, the amylic alcohol becomes largely changed into various ethers, which impart a flavor or bouquet to the spirit. The United States Pharmacopœia, however, directs that grain-spirit (whisky) should be at least four years old, and the spirit from fermented grapes (brandy) at least four years old. Wine is made by fermentation without distillation. Red wine is a deep-red, alcoholic liquid, made by fermenting the juice of colored grapes in the presence of their skins; white wine is of a pale-amber or straw color, and is obtained by fermenting the unmodified juice of the grape, free from seeds, stems, and skins. *Spiritus Genevæ* (gin, or Hollands) is not official: it is obtained by steeping juniper-berries to diluted alcohol. Rum, or molasses spirit (*spiritus rumi*, or *Jamaicensis*), is made by distillation from sugar or molasses which have undergone alcoholic fermentation; it is about the same alcoholic strength as whisky.

Alcohol dissolves alkaloids, fatty and resinous substances, and is largely used as a menstruum in obtaining the active principles of drugs in an available form for administration. It is the basis of the U. S. P. spirits, tinctures, and elixirs; spirits being solutions of volatile substances in alcohol; tinctures, solutions of active principles of plants, generally obtained by maceration and percolation. An elixir is a cordial flavored with orange or grape, generally used as a vehicle for other remedies. Malt liquors—ale, beer, porter, etc.—are produced by fermentation of malt and hops, and con-

tain nutritive material, together with a small proportion of diastase, which makes them useful in certain cases of weak digestion. They contain from 6 to 10 per cent. of alcohol. Malt liquors can be taken by those who suffer from the cerebral effects of wine, but to some they are unpleasant on their effects upon the brain, owing to the oil of hops which they contain (Rossbach).

Absolutely-pure alcohol is rarely found, even in the laboratory of the chemist. Owing to its great affinity for water, it will in time abstract from the air. Absolute alcohol, of the shops, usually contains about 2 per cent. of water. It is a colorless, pleasant-smelling liquid, with a sharp, watery taste. When added to water, heat is developed, and the mixture does not measure as much as the sum of its constituents, owing to combination. Besides its affinity for water and its power as a solvent, it has a coagulating action upon albumin, and is an antiferment when in solution containing at least 18 per cent. of alcohol.

**Physiological Action.**—Owing to volatility, it gives a cool sensation to the skin at first, but afterward, if evaporation be interfered with, it causes irritation and heat, and, if continued, produces inflammation. It also hardens the integument by abstracting water from it, coagulating some of its albuminoid constituents, and dissolving its fat. It has the same effect upon mucous membranes, thus enabling it to act as an astringent. It has some anæsthetic action, possibly by reducing the congestion by its cool or constringent effects upon the smaller blood-vessels.

After alcohol, in the strength of ordinary spirits, is swallowed, in small quantity (15 to 60 c.cm., or fʒss-ij), there is a sensation of heat in the epigastrium, which soon diffuses itself over the body. The experiments of Beaumont showed that small amounts increased the vascularity of the stomach and stimulated the flow of gastric secretions. Under favorable circumstances, therefore, alcohol increases the digestive power, causing an augmented gastric juice. If taken in large quantities, appetite is lost and nausea appears, and the digestive power is suspended. As a result of long-continued indulgence in alcohol, the stomach undergoes changes in its coat, new areolar tissue being formed, which, by its subsequent contraction, strangulates the gastric glands; hence, dyspepsia and gastric catarrh, with morning vomiting, are very common among drunkards. In addition to structural changes, alcohol, in excess, precipitates pepsin from the gastric juice, and thus increases digestive difficulties.

H. Wendelstadt,<sup>1</sup> of Bonn, as a result of some experiments made to determine the influence of alcohol on the respiration in man, found that there was much individual variation, but in 29 cases in which pure alcohol was ingested, 7 showed diminution of respiratory activity; but, when the alcohol was taken in the form of wine, only 2 showed such diminution, while the amount of increase in every case in which it occurred was greater. The increase was also more marked in cases of fatigue or debility. He therefore concludes that in debilitated states of the body, alcohol, especially in the form of wine having much aroma, is the best stimulant.

Dr. Glaser has recently studied the effect of alcohol upon the kidneys and urine. He finds that a moderate quantity of alcohol causes irritation of the kidneys and alters the solubility of the urinary salts, favoring the

<sup>1</sup> *Lancet*, Feb. 17, 1900.

of oxalate of lime and uric acid. The influence does not extend beyond thirty-six hours, but the continued use of alcohol produces a cumulative effect. Dr. David Cerna, who has also investigated the action of alcohol, concludes that in large doses it enhances coagulation of the blood, while in small quantities it destroys the ozonizing power of that fluid and causes a separation of hæmoglobin from the corpuscles. Over-indulgence in alcohol has long been thought to impair the sexual power, and there seems reason to infer from certain experiments made by M. Bouin and M. C. Garnier<sup>1</sup> that it may actually cause decided degenerative changes in the testicles. Having induced chronic alcoholism in a number of white rats, in two of these animals they found atrophy of the testicles, with almost complete destruction of the epithelium of the seminiferous tubules.

Dubois noticed that certain plants exuded droplets of moisture over their surface when exposed to the influence of chloroform, ether, benzoin, and alcohol. He considers the process an indication that the vapors penetrated the protoplasma of the plant-tissues and forced out the water, taking its place. Meyer<sup>2</sup> bases a theory in regard to the effect of narcotics in man on his observation of this phenomenon, suggesting that certain substances in the protoplasma of the cell,—the lecithin, etc.,—so important to the healthy functioning of the cell, are dissolved out of their normal proportions of solution and combination in respect to the other components of the cell,—the water, salts, albumin, etc.,—by the tension of solubility between them and chloroform, alcohol, and other narcotics, analogous to the effect of salt in the organism. If this theory is correct, then all chemical substances which dissolve fat and bodies resembling fat—lecithin, protagon, etc.—must produce a narcotizing effect on living protoplasma, and the effect would be most marked on the cells which contain the largest proportion of these substances: the nerve-cells. The effect would also depend on the mechanical density of the narcotics for the other constituents of the cells besides the fatty matters, especially the water, and also on its co-efficient of division in a mixture of water and fatty substances.

Upon the nervous system alcohol first has an exciting effect, followed by depression and coma. The arterioles are dilated, thus admitting more blood to the brain, and this is succeeded by diminution of mental activity, arising from the effects of the alcohol upon the ganglion-cells, weakening their action. A similar effect is seen on the spinal cord, usually occurring later than, but sometimes preceding, the brain symptoms. The reflex action of the will is reduced and the power of co-ordination impaired, so that walking is a staggering gait, and finally the knees will no longer support the body. The paralyzing effect is also seen in the sympathetic system, since the dilation of certain vascular areas must be due to the loss of function of the vaso-motor nerves. The action upon the centres in the medulla is seen in the lowered temperature, the slowing of the pulse after a preliminary acceleration, and the sighing respiration or stertor. Death is produced by respiratory paralysis and lowering of the bodily heat. From this it is seen that alcohol will not protect from cold, but will actually hasten the occurrence of death from cold. The experience of Arctic voyagers is to the effect that those persons endure the rigors of the winter best who abstain from alcohol. Dr. Perkes, in the Ashantee campaign, also found that the fatigue of march-

<sup>1</sup> *Presse Médicale*, Jan. 17, 1900.

<sup>2</sup> *Archiv. f. Exp. Path. u. Pharmacologic*, xlii. 2 to 4.

ing in the tropics is borne better without the aid of a spirit ration, owing to the diminution of muscular and nervous energy and capacity for work due to the physiological action of this agent. The only advantage derived from its use was to take away the feelings of fatigue after the men had come into camp, and thus enable them to eat. It is also useful, in the form of hot drink, to revive a person, who has been exposed to cold, after the exposure has ceased. Major Charles E. Woodruff, United States Army, believes that small quantities of alcohol are useful in the tropics, to counteract the stimulating effect of excessive sunlight.

As to the changes that alcohol undergoes in the body, Anstie states that a variable amount (4 to 15 c.cm., or f5i-iv) disappears, or is burnt up in the blood or the tissues; this quantity may be increased by habit. The excess is thrown off by the lungs, kidneys, bowels, and possibly by the skin.

Prof. W. O. Atwater, of Middletown, Conn., from experiments to determine the effects of moderate doses of alcohol, found: 1. That extremely little of the alcohol was given off unconsumed. 2. That in the oxidation all of the potential energy of the alcohol was transformed into heat or muscular energy. 3. That the alcohol protected the material of the body from consumption just as effectively as the corresponding amounts of sugar, starch, or fat. It is, however, to be borne in mind that the influence of the alcohol upon the circulatory and nervous functions is especially important, and that the matters did not come within the limits of Atwater's experiments.<sup>1</sup> The inference sought to be drawn from these experiments that alcohol is a safe and useful food is questioned by Woodbury and Egbert, who assert that alcohol at the best is useful only as a stimulant and excitant to the circulation and nervous systems during emergencies, and they quote authorities who prove that as a food its objections outweigh its alleged advantages.<sup>2</sup>

**Toxicology.**—The symptoms and treatment of acute poisoning by alcohol differ so much from those of the chronic form of alcoholism that each state must be separately considered:—

1. Acute poisoning by alcohol manifests itself by an exaggeration of the physiological action. The rapidity with which grave symptoms appear is in proportion to the quantity of alcohol taken, its form, and, to some extent, its temperature, as hot drinks more rapidly intoxicate than cold. Where a large quantity is taken at once, as when a whole bottle of whiskey is drunk on a wager, or a comparatively large quantity administered to a child, the stage of excitement is too brief to be noticed, and the patient falls at once into a stupor, which may be followed by coma or fatal convulsions. Where the administration is spread out over a longer period, drunkenness comes on progressively, but ends in unconsciousness and insensibility, as the patient is said to be dead-drunk, because of his complete helplessness. Since alcohol increases the blood-supply of the brain (and especially since drunken men are apt to fall heavily and strike their heads), the state of alcoholic coma may often be accompanied by meningeal hæmorrhage or apoplexy. Intoxicated persons should never be allowed to sleep off the drunkenness, but should be treated as if they were poisoned, as—in fact—they are. The treatment consists simply in evacuating the stomach with emetics (mustard, etc.,) or the pump, and administering ammonia, either

<sup>1</sup> Bulletin No. 89, of the U. S. Department of Agriculture, Nov., 1899.

<sup>2</sup> Journal of the American Medical Association, March 31, 1900.

the aromatic spirit or the carbonate, both by the mouth and by inhalation. The spirit of Mindererus likewise fulfills the same purpose. Digitalis may be given hypodermically; or, if the patient is noisy, morphine and atropine in moderate doses. It is said that 30 or 60 c.cm. (or fʒi-ij) of cider-vinegar has a sedating effect; and after emptying the stomach with the stomach-pump it is well to introduce a pint of warm coffee,—it should not be *hot* coffee, for fear of injuring the stomach during unconsciousness. Artificial respiration and electricity may be required to keep up the breathing and prevent the undue accumulation of carbonic acid in the blood. Cold affusions should be used with care, on account of the lowering of temperature by the alcohol; but heat and sinapisms are of great utility. Apoplexy, or cerebral hæmorrhage, may be suspected when there is marked deviation of the eyes or unequal dilatation of the pupils, especially if there is co-existing paralysis of one side of the face or of the arm or leg. In such a case the question of surgical interference would come up, to decide upon the presence of fracture of the skull or meningeal hæmorrhage and the appropriate treatment therefor.

2. Chronic poisoning by alcohol may be shown by the changes taking place in the stomach, liver, and kidneys; increase of fibrous or areolar tissue, followed by contraction and destruction of the characteristic secretory cells, and fatty infiltration; or, in other words, the type of cirrhosis due to the long-continued action of alcohol upon the tissues. Gastric catarrh, constipation due to deficient action of the liver, and albuminuria from contracted and crippled kidneys are commonly met with in old alcoholic subjects. Chronic laryngitis and bronchitis, also chronic catarrhal pneumonia and fibroid phthisis, are also frequent in such subjects. The effects, however, are most marked upon the nervous system. Dr. Wilks has reported cases of paraplegia and numbness. Anæsthesia and violent shooting pains are followed the long-continued and excessive use of alcohol. A case of motor disturbance due to the habitual use of alcohol has been recorded by Dr. G. Kaempfer. A man, who had been an excessive drinker, was attacked, within half an hour after taking any alcoholic fluid, by an eruption of the skin consisting of patches of erythema of variable size and color.

The damage produced by the habitual consumption of alcohol is not confined to the drunkard, but is transmitted to his children. It has been abundantly shown that the offspring of alcoholics are degenerates, afflicted with morbid craving for drink and subject to epilepsy, idiocy, chorea, hysteria, and physical defects. When alcoholic poisoning is mentioned, we usually understand it to mean delirium tremens or mania a potu. These are not identical; the latter is, to all intents and purposes, an acute attack of mania caused or incited by alcoholic excess. Delirium tremens, on the contrary, is a milder form of delirium, due partly to the action of the alcohol on the brain, but also very largely to anæmia of the great centres. In delirium tremens the patient is violent, and requires several men to control him; if he is controlled, and the proper medicines given (potassium bromide, or hydropromate, or chloroform inhalations), the patient, after a period of sleep, usually rapidly recovers. In delirium tremens the symptoms are mainly those of anæmia of the brain; it is apt to occur after a period of drinking lasting several days, during which very little food is eaten, supported by vomiting from the excess of alcohol. Here the patient is in acute delirium, and has hallucinations of sight and hearing, which

in many cases may not greatly annoy him, but, on the other hand, his visions may be horrifying and very distressing. These patients are best treated with digitalis, and amyl nitrite may be cautiously given by inhalation, or nitroglycerin by the mouth. Nourishment must be given in a form readily assimilated and at short intervals, hot broths, well seasoned, being the most acceptable to the stomach. If, as is usually the case, the patient has been a steady drinker for a long time, alcohol should not be entirely withheld from him, but given in combination with food. In such subject the blood-vessels are generally the subject of atheromatous changes, and the heart requires its accustomed stimulation in order to carry on the circulation. If the patient cannot sleep, he may be helped by sodium bromid and chloral (aa 0.65 Gm., or gr. x), by hop-tea with capsicum, or the ammoniated tincture of valerian. For the debility and tremor, nux vomica has proved very useful in comparatively large doses of the tincture (2 c.cm. or f5ss, or more). Hypodermic injections of strychnine nitrate are also useful. After death from chronic alcoholism the organism shows change in every part, which Bartholow summed up in two words, "fibrosis and steatosis."

By inhaling the vapor of alcohol, complete anæsthesia may be produced, and the different degrees of intoxication up to insensibility. In such cases the stomach need not be emptied, but artificial respiration in the open air, or the inhalation of oxygen will soon restore the patient to consciousness. This may be hastened by a stimulating enema.

Absinthism, a form of alcoholic poisoning attended by epilepsy, following indulgence in absinthe, has been already discussed.

**Methylic spirit**, or wood-alcohol, on account of its cheapness, is sometimes used to adulterate whisky, or as a substitute for it, and is largely employed in the arts. Under the name of Columbia spirits it has an extensive sale. It is much more toxic than ethyl-alcohol, and has the peculiar property of causing optic neuritis and blindness.

**Therapy.**—Alcohol may be used as an evaporating lotion in cases of local inflammation, or of bruise or sprain. Diluted alcohol (90 c.cm., or f3iij with lead-water (30 c.cm., or f3j) and morphine acetate (0.65 Gm., or gr. x), applied upon a single layer of cloth or absorbent cotton and allowed to evaporate, forms an excellent lotion to keep down inflammation, and in point of cleanliness is much better than the old lead-water and laudanum. Absolute alcohol is used as an astringent application to exuberant granulations (polypi in the ear, and also applied as just directed to control acute inflammation of cellular tissue, and in erysipelas. Ordinary alcohol is a good application to prevent bed-sores, and for this purpose it is customary to add a little alum (4 Gm. to 473 c.cm., or 5i-Oj). Hot applications of alcohol relieve pain, and in facial neuralgia, cold in the face, or toothache, the employment of a small flannel bag containing hops and dipped in hot whisky will generally afford marked relief. In some skin diseases, as ulcers, loss of hair, frost-bite, excessive secretion of sweat or oil, fetid sweating, freckles, and vegetable parasitic affections, concentrated alcoholic preparations may be used. Some useful formulæ are here added:—

**R** Alcoholia,  
Glyceriti boroglycerini ..... aa 60| c.cm. or f3ij.

**M.** Sig.: Apply freely in excessive or fetid sweating, and in vegetable parasitic diseases of the skin.

When glycerin does not agree, we may prescribe:—

R Alcoholis .....	60	c.cm. or fʒij.
Cocainæ hydrochloridi .....	32	Gm. or gr. v.
Acidi borici .....	4	Gm. or ʒj.

M. Sig.: Use with old mualin or cotton in frost-bite, oily secretion, freckles, and other pigmentary deposits.

R Spt. vini gallici .....	120	c.cm. or fʒiv.
Tinct. nucis vomicæ .....	15	c.cm. or fʒss.
Tinct. capaci .....	7	50 c.cm. or fʒij.

M. Sig.: Apply on the scalp for loss of hair, with friction once daily.

Leloir recommends the local application of alcohol or an alcoholic solution as an effective abortive measure in herpes. The same treatment will relieve the pain of herpes zoster.

L. Neustadt<sup>1</sup> reports a case confirmatory of Biers and Salzwedel's experience as to the great value of alcohol dressings in tubercular lesions. In the case referred to there were tendo vaginitis and osteitis tuberculosâ of the left hand. After the daily applications of a compress wet with alcohol for six weeks, it was completely cured, although it had been pronounced a proper case for amputation previous to the treatment. Angerer has also reported 7 cases of local tuberculosis treated by alcohol, 3 of which were cured and 4 remarkably improved.

Its antiseptic virtues and the astringency which it possesses in consequence of its power of coagulating albumin renders alcohol, when properly diluted, an excellent gargle in pharyngitis, stomatitis, scurvy, and salivation. It is also useful to apply an alcoholic lotion to the nipples of nursing women, in order to prevent the formation of fissures. Alcohol possesses considerable value as an hæmostatic, and may be utilized in cases where capillary oozing occurs, the following prescription being very valuable:—

R Alcoholis, Liq. saponis, Fluidext. hamamelidis .....	aa 30	c.cm. or fʒj.
--	-------	---------------

M. Sig.: Employ as a styptic in local hæmorrhage.

To the action upon the digestive organs and the stimulating effect upon the nervous system and the circulation are to be ascribed the usefulness in the treatment of disease of alcohol judiciously given. It is not used in sickness to reduce temperature, although it accomplishes this in health; nor is it given as a narcotic, although its sedative action may not be undesired. In almost all cases it is intended to act as a restorative, and, therefore, its administration must be kept well within physiological limits. In some cases, especially in typhoid fever, unfortunate results have followed its use with too free a hand. In most cases of fever, from 60 to 120 c.cm. (or fʒii-iv) of whisky daily is amply sufficient for an adult, and more than this may do harm. It is judicious, however, to make allowance for the patient's previous habits. One accustomed to the daily use of alcoholic beverages will, generally speaking, require proportionately larger doses than an abstainer, when attacked by any severe disease.

In phthisis a tolerance seems to exist, and patients can take relatively large quantities without showing symptoms of intoxication. The late Austin

<sup>1</sup> *Prager medicinische Wochenschrift*, Feb. 15, 1900.

Flint reported the case of a young lady who took a pint of whisky daily for nearly two years, for pulmonary phthisis, and was finally cured. In the course of a disease, when the powers of life are succumbing, the first sound of the heart is weak; the pulse feeble, soft, and irregular, but generally rapid; when syncope or delirium threatens, alcohol should be given, endeavoring to combine it with food, such as broth, milk, gruel, etc. The period at which these symptoms generally appear is, in typhus fever, about the end of the first week; in typhoid, at the end of the second week; small-pox, when the secondary fever commences. The excellent practical rules formulated by Dr. Armstrong for the use of alcohol in fever may confidently be followed. Alcohol is beneficial when the dry tongue moistens under its use, the rapid pulse becomes more slow, the skin less parched, and the respiration more tranquil, and, it might be added, where it suits the patient. If opposite results follow, the remedy should be suspended. Under the above rules, Ringer adds that alcohol does good when it produces sleep and quells delirium. In measles, when the eruption turns dark or hæmorrhagic, alcohol is best given in as large doses as will be borne, and at short intervals, as pointed out by Dr. John M. Keating. In acute inflammation, as in pneumonia, when the heart begins to fail and symptoms of debility appear, alcohol can usually be given with marked benefit. In hypostatic congestion of the lungs, typhoid pneumonia, or the pneumonia of the aged, alcoholic stimulation is particularly indicated. Diphtheria, phlegmonous erysipelas, and tuberculosis of bones, joints, or glands are affections in which stimulation is demanded. The stronger alcoholic beverages—such as wine, whisky, or brandy—are valuable in old age, when digestion is weak and insomnia marked. Hot spirits and water, cautiously administered, is useful as a restorative in the condition of shock the result of injury. During convalescence from fevers, when the structures of the heart and stomach have been altered by the fever process and digestion is weak, it is often found that malt liquor in some form increases appetite and digestion, improves nutrition, and enables the patient to sleep better at night. In the same way, persons who follow sedentary occupations, and whose bodies are insufficiently nourished, often find much benefit from the use of alcohol in moderate quantities, given just before or after or taken with their meals. Its antiseptic powers are useful in infectious dyspepsia, where digestion is stopped by the growth of micro-organisms, which set up excessive fermentation in the stomach and intestinal canal. Its acknowledged value in the zymotic diseases, and pre-eminently in diphtheria, is partly due to its antiseptic action in the alimentary tract. In a similar manner, in cholera epidemics, alcohol has decided prophylactic effects, and this is not controverted. The fact that persons weakened by debauches and alcoholism are most liable to perish from the disease. In cholera infantum, also, brandy exerts an excellent influence; and, indeed, in many bowel disorders among adults (which are often connected with the growth of micro-organisms) alcohol in the form of brandy or red wine (port or Burgundy) is of great assistance in the treatment. When flatulent colic or neuralgic pains occur in the abdomen, cloths wet with hot whisky externally, and some hot toddy internally, give prompt relief; in infants, gin and hot water is a remedy often used for colic by old nurses.

**Forms of Alcohol.**—In order to estimate the effects of different forms of alcoholic liquors, the following comparative strength should be remembered:—

Brandy, whisky, rum, gin, cordials...	30 to 50	per cent. of absolute alcohol.
Spanish and Italian sweet wines....	13 to 17	" " " "
Black and claret.....	8 to 11	" " " "
Ale or porter.....	4 to 6	" " " "
Stout or beer.....	4 to 5	" " " "
Koumiss .....	1 to 3	" " " "

Champagne contains from 8 to 10 per cent., but the presence of the carbonic-acid gas makes it more "heady"; that is to say, the cerebral stimulation is produced more quickly, and with a smaller quantity of alcohol than by the still wines, and the after-effects in the way of headache or cerebral congestion are less apt to occur. Moreover, the carbonic acid acts as a sedative to the stomach, thus making champagne especially serviceable where the stomach is irritable, and where prompt stimulation is required, as in seasickness or in yellow fever. Where the expense is an insuperable objection, a good substitute may be made extemporaneously by the addition of carbonic-acid water or koumiss to wine or brandy.

**Special Applications.**—As an antidote in snake-bite, alcohol enjoys an extensive reputation, which has not much scientific foundation. The liquor should be given only, a wineglassful or so at a time, repeated at intervals, but should not be given in excessive quantities on account of the danger of the alcoholic coma. A ligature should be thrown around the limb or member bitten, if possible, and the part cut out or cauterized; if a finger, it might be safer to amputate it. If not, the ligature should after awhile be loosened gradually, and immediately tightened upon the reappearance of the symptoms. In this way the system will be able to throw off the poison; whereas, if the whole quantity were to be introduced at once, it would be overwhelmed. Alcohol here acts, not as an antidote, but as a cardio-vascular stimulant to keep up the circulation until the poison is eliminated.

In septic poisoning—septicæmia, sapræmia, dissecting wounds, etc.—alcohol is considered to have an antidotal effect, and, with quinine, constitutes the great reliance for overcoming the tendency to a fatal result and keeping up the strength. Alcohol is, in some measure, antidotal to the poison of the bacillus tuberculosis, and it is to this action that its unquestionable value in prolonging life in phthisis is due.

Phelps and Powell<sup>1</sup> claim that alcohol is the best antidote for carbolic-acid poisoning. Phelps declares it a safe and sure local application to prevent the caustic action of the latter upon the skin and mucous membranes. Several instances have been reported in which a fatal dose of the acid had been taken, but, owing to prompt use of whisky or brandy, the patient recovered. (See **Phenol**.)

Alcohol should not, as the rule, be given in liver disease, nor in nephritis. Except the sweet wines and malt liquors are inadmissible, but, if a stimulant be required, whisky may be used cautiously, on account of the tendency to kidney disease. Malt liquors and sweet wines are injurious in diabetes, but dry wine, whisky, and brandy sometimes answer a useful purpose in that disease by promoting nutrition without increasing the loss of sugar. During the course of a gonorrhœa or urethritis, it is customary to forbid the use of alcohol in any form. It should not be used in hypertrophy, with overaction of the heart.

For the relief of cancer of the breast, Hasse, in 1873 (at a meeting of

<sup>1</sup> *Merck's Archives*, Dec., 1899.

German Physicians' and Naturalists' Association), presented a communication advocating injection of alcohol. The subject of the treatment of cancer by interstitial injections of alcohol has since been reviewed editorially by I. C. E. de M. Sajous.<sup>1</sup> Dr. Edwin J. Kuh has reported a case of primary cancer of the naso-pharynx cured by injections of alcohol,<sup>2</sup> but subsequently reports several failures of the treatment.<sup>3</sup>

**ALETTRIS.**—Star-grass, Blazing-star, Mealy-starwort, Colic-root. *Aletris farinosa* (Liliaceæ) is an indigenous plant, the leaves of which spread upon the ground in the form of a star. The rhizome contains starch and a bitter principle, but appears to be free from tannin. The virtues of the root are extracted by alcohol. In small doses aletris is bitter tonic; it increases the appetite, loosens the bowels, and promotes the secretion of urine. In larger quantities it acts as a cathartic and emetic. Aletris has been used in colic, chronic rheumatism, and dropsy. It is said to be serviceable, likewise, in dysmenorrhœa. The dose of the powder is 0.65 Gm. (or gr. x). An infusion (1-16) is given in tablespoonful doses. The National Formulary contains a fluid extract.

#### **ALLIUM.**—Garlic.

##### *Preparation.*

*Syrupus Allii.*—The syrup of garlic contains garlic (20 per cent.), with diluted acetic acid, and sugar. Dose, 0.60 to 4 c.cm. (or *mx-f5j*).

**Pharmacology.**—Garlic is the bulb of the *Allium sativum* (Liliaceæ), a native of Asia and Egypt, but now naturalized in Europe and America and resembles the onion and leek in its chemical characters. Its active principle is a volatile, oily substance (0.25 per cent.). Garlic is more active than the others, owing to possessing a larger proportion of the active principle. The bulbs may be kept unchanged for years by placing them in large glass bottles containing a small amount of alcohol and securely closing the bottles by stoppers of glass or cork, as proposed by Mr. A. P. Sharp (*Proc. A. P. A.*, 1864). The pharmacopœia directs that garlic should be used without being dried.

**Physiological Action and Therapy.**—Garlic is antiseptic, but its effects are chiefly those of a stimulating expectorant. While its antiseptic properties have been tried in phthisis without successful results, it is useful as an expectorant in chronic bronchitis, or in suffocative catarrh (capillary bronchitis of infants). Here it may also be made one of the ingredients of poultices to be applied to the chest, or the oil may be used externally, but the offensive odor of garlic will in most families be a bar to its use. A garlic poultice may also be successfully employed in infantile convulsions, and relieves the pain of gastro-enteritis. The syrup is a good addition to cough mixtures, but cannot be used in conjunction with alkalis, such as ammonium carbonate or the bromides, on account of its containing free acetic acid. The syrup of garlic can be administered thus with service in the treatment of bronchitis, especially of children:—

<sup>1</sup> *Monthly Cyclopædia of Practical Medicine*, Jan., 1898.

<sup>2</sup> *Medical Record*, April 17, 1897.

<sup>3</sup> *Philadelphia Medical Journal*, May 28, 1898.

R Syrup. allii ..... 60| c.cm. or f3ij.  
 Spt. ather. nitrosi,  
 Glycerini ..... aa 30| c.cm. or f3ij.

M Sig.: From one to two teaspoonfuls in water every hour or two.

R Syrup. allii ..... 60| c.cm. or f3ij.  
 Syrup. picis liquidæ ..... 60| c.cm. or f3ij.

M Sig.: A teaspoonful or two in water every two or three hours.

The juice of garlic in the dose of 2 to 5 drops has been given for the relief of nervous vomiting.

Garlic, like the onion, has antiscorbutic effects, and is a stimulant carminative. Dose, 2 Gm. (or gr. xxx); best given as a syrup. It is destructive to lumbricoid or round worms. It is also efficient against ascarides when administered by the rectum. Garlic is a domestic remedy in whooping-cough, and a garlic poultice applied to the perineum is said to relieve strychnia.

**Allyl-tribromide.**—This compound, otherwise known as tribromhydrin, closely related to the oil of garlic, is a colorless or faintly-yellowish fluid, which has a specific gravity of 2.43, solidifies at 50° F., and boils at 422° F. Allyl-tribromide dissolves in ether, and in 5-drop doses, inclosed in capsules, has been given with advantage in various spasmodic affections, as hysteria, strychnia, whooping-cough, infantile convulsions, and angina pectoris.

**ALLIUM CEPA.**—The onion (*Liliacæ*) is cultivated everywhere, and the bulb is commonly used as a food. Onions are also largely used in domestic practice as a cataplasm for "earache" or for acute bronchitis; and added to sugar and water and given as a cough-syrup. Parkes ("Practical Hygiene") states that "on account of its volatile oils the onion is largely used, and is a capital condiment, and has an effect as an antiscorbutic." The oil appears to be identical with that derived from garlic,  $(C_4H_7)_2S$ . Onions contain phosphoric acid, citrate of lime, mucilage, and sugar, in addition to the allyl sulphide.

According to the careful studies of Dr. Pilacki, the consumption of onions causes a decrease of the assimilation and metabolism of nitrogenous material. The assimilation exceeds the loss of nitrogen. The urine is generally increased. The diminished assimilation may be due to the injurious effect of large quantities of onion upon the gastric juice and digestion. Dr. Popoff has shown that onions neutralize the acid of the gastric juice. In a small quantity, however, onions promote digestion. Onions, and especially garlic, produce a decided augmentation of secretion of bile. In strychnia great dependence is placed on the onion as a prophylactic against strychnia.

Dr. Whitla points out that, owing to the large proportion of sulphur which it contains, the Spanish onion may be satisfactorily employed in those cases of skin disease in which it is desirable to administer sulphur. The action of the volatile constituents enhances that of the sulphur. Roasted Spanish onion, eaten freely at bed-time, is an excellent laxative. The author mentioned values the onion particularly in chronic catarrh of the larger respiratory tubes. According to George Covert, sweet milk removes the odor of onion from the breath.

The raw sliced onion can be used as a counter-irritant; its volatile constituents are especially irritating to the conjunctiva.

**ALNUS.**—**Alder-bark.** The bark of the American alder or tag-alder *Alnus serrulata* (Betulaceæ), contains tannic acid, a resin, and an oil. It is used for its astringent effects, chiefly in the form of fluid extract or in fusion (diluted freely), as a mouth-wash for spongy gums, a gargle for sore throat, an injection in leucorrhœa, and for applications to ulcers. Internally, it has been given in diarrhœa and hæmaturia. It is reported to have alterative effects, and has been used successfully in scrofula, syphilis, and some cutaneous diseases. The dose of fluid extract is 0.6 to 2.1 c.cm. (or *mx-xl*). **Alnuin**, an alcoholic extract, composed principally of the resin, has been employed internally in doses of 0.065 to 0.20 Gm. (or gr. i-ij).

**ALOE** (U. S. P., B. P.).—**Aloes.**

**ALOE PURIFICATA** (U. S. P.).—**Purified Aloes:** a Strained Alcoholic Extract.

**Dose,** 0.065 to 1.30 Gm. (or gr. i-xx).

#### *U. S. P. Preparations.*

**Aloinum.**—**Aloin.** Dose, 0.006 to 0.13 Gm. (or gr.  $\frac{1}{10}$ -ij).

**Extractum Aloes.** Extract of Aloes. Dose, 0.03 to 0.32 Gm. (or gr. ss-v).

**Pilulæ Aloes.**—**Pills of Aloes.** Dose, 1 to 5 pills.

**Pilulæ Aloes et Ferri.**—**Pills of Aloes and Iron.** Dose, 1 to 5 pills.

**Pilulæ Aloes et Mastiches.**—**Pills of Aloes and Mastic.** Dose, 1 to 5 pills.

**Pilulæ Aloes et Myrrhæ.**—**Pills of Aloes and Myrrh.** Dose, 1 to 5 pills.

**Pilulæ Laxativæ Compositæ.**—**Compound Laxative Pills** (aloin, gr.  $\frac{1}{10}$ ; bella donna ext., gr.  $\frac{1}{10}$ ; strychnine, gr.  $\frac{1}{100}$ ; ipecac, gr.  $\frac{1}{100}$ ; glycyrrhiza, gr.  $\frac{3}{10}$ , each pill).

**Pilulæ Rhei Compositæ.**—**Compound Pills of Rhubarb.** Dose, 1 to 5 pills.

**Tinctura Aloes.**—**Tincture of Aloes** (10 per cent.). Dose, 7.50 c.cm. (or 3ij).

**Tinctura Aloes et Myrrhæ.**—**Tincture of Aloes and Myrrh** (of each, 10 per cent.). Dose, 2 to 7.50 c.cm. (or f3ss-ij).

#### *B. P. Preparations.*

**Aloinum.**—**Aloin.** Dose, 0.03 to 0.13 Gm. (or gr. ss-ij).

**Extractum Aloes Barbadosis.**—**Extract of Barbadoes Aloes.** Dose, 0.065 to 0.25 Gm. (or gr. i-iv).

**Pilula Aloes Barbadosis.**—**Pill of Barbadoes Aloes.** Dose, 0.25 to 0.50 Gm. (or gr. iv-vij).

**Pilula Aloes Socotrina.**—**Pill of Socotrine Aloes.** Dose, 0.25 to 0.50 Gm. (or gr. iv-vij).

**Pilula Aloes et Asafetidæ.**—**Pill of Aloes and Asafetida.** Dose, 0.25 to 0.50 Gm. (or gr. iv-vij).

**Pilula Aloes et Ferri.**—**Pill of Aloes and Iron.** Dose, 0.25 to 0.50 Gm. (or gr. iv-vij).

**Pilula Aloes et Myrrhæ.**—**Pill of Aloes and Myrrh.** Dose, 0.25 to 0.50 Gm. (or gr. iv-vij).

**Tinctura Aloes.**—**Tincture of Aloes.** Dose, 2 to 4 c.cm. (or f3ss-j) for repeated administration; for single administration, 6 to 7.5 c.cm. (or f3ss-ij).

**Decoctum Aloes Compositum** (B. P.), or **Baume de Vie**, contains about 0.25 Gm. (or gr. iv) aloes to 30 c.cm. (or f3j), with cardamom, licorice, saffron, and myrrh. Dose, 15 to 60 c.cm. (or f3ss-ij).

Aloes also enters into compound extract of colocynth and compound tincture of benzoïn (U. S. P., B. P.); compound pill of colocynth (B. P.); compound pill of hyoscyamus (B. P.); and compound pill of gamboge (B. P.).

**Pharmacology.**—Aloe is the inspissated juice of the leaves of *Aloe vera*, *Aloe emmanensis*, and *Aloe Perryi* (Liliaceæ). Owing to the fact that aloe frequently contains foreign matters, the United States Pharmacopœia directs that for making preparations, purified aloes only should be used (obtained by dissolving commercial aloes in alcohol, passing the solution through a filter, and allowing the alcohol to evaporate). This occurs in dark masses of a yellowish-brown color, the fracture presenting a liver-like appearance (hence sometimes called hepatic aloes). It has a very bitter taste, is soluble in alcohol, less soluble in water (unless boiling), and contains **aloin**, **emodin**, a trace of volatile oil, and a resin. Barbadoes aloes and Socotrine aloes each contains a special variety of aloin, known as barbaloin and socoloin, which may be distinguished by tests from that present in Socotrine aloes, which is called **socaloin**. They are now equally official.

**Aloinum** (U. S. P., B. P.), or **Aloin**, is a neutral principle obtained from several varieties of aloes, chiefly Barbadoes aloes (yielding barbaloin) and Socotrine or Zanzibar aloes (yielding socaloin), differing more or less in chemical composition and physical properties according to the source from which it is derived. It is a yellowish-white, or brownish crystalline substance, soluble in hot water and alcohol, sparingly soluble in ether, chloroform, and benzol. It is of neutral reaction, destitute of odor, and its taste, which is sweetish at first, subsequently becomes very bitter.

**Physiological Action.**—The principal effect of aloes is that of a slowly-acting purgative, principally affecting the large intestine. It increases the peristaltic movements without producing excess of secretion; so that the feces are formed and only slightly softened. It is a true cholagogue, increasing the secretion of biliary salts, and renders the bile more watery when given in large doses. As it sometimes gripes, it is best to combine some carminative with it. It may cause irritation of the bladder, diminution of urine, and albuminuria from renal congestion. It also has emmenagogic properties. Following large doses, the uterus and appendages are more or less in a state of congestion and hæmorrhoids are apt to be irritated. If there has been an overdose and these symptoms are aggravated, it would be efficient to give large draughts of demulcents, and an anodyne in the form of an opium suppository. It is stated that such phenomena do not follow the administration of aloin, which requires only about one-third or one-half the dose in order to produce the physiological effects of aloes.

The chemical and physiological investigations of Professor Meyer seem to indicate that aloin itself is not an active purgative, but that it becomes gradually decomposed in the intestine into **emodin**, or **trioxymethylantraquinone**. It is thought that this may account for the slowness of its action.

Powdered aloes, dusted upon an abraded or blistered surface, may be absorbed and exert a purgative effect. Aloin has been detected in the urine.

**Therapy.**—Aloes, or aloin, is a slowly-acting purgative, and, therefore, should generally be administered at bed-time; in this way it operates during sleep, and griping is avoided. For the same purpose it is well to combine it with a carminative, as in the compound decoction, or the compound rhubarb pill, which is a useful purgative for an ordinary attack of constipation. The following are likewise excellent formulæ to use in the same class of cases.

R Vini aloes, Fluidext. rhamni purshianæ.....aa	22	c.cm. or f3vj.
Elix. aromatic. ....q. s. ad	180	c.cm. or f3vj.

M. Sig.: A tablespoonful morning and evening.

R Aloes purificatæ.....	12	Gm. or 3iij.
Pulv. glycyrrhizæ comp. ....	124	Gm. or 3iv.

M. Sig.: From one-half to three teaspoonfuls in water or milk, early in the morning or on retiring.

Kohlstock has experimented in the clinic of Professor Senator, of Berlin, with aloin and other cathartics applied locally to the rectum. The aloin was dissolved in a small quantity of glycerin and subsequently in formamide, 1 Gm. (or gr. xv) of the former to 10 Gm. (or gr. cl) of the latter. A dose representing, of the aloin, 0.38 to 0.50 Gm. (or gr. vi-vij), was found efficient, in all mild cases of constipation.

The pill form is also useful for the expulsion of ascarides, which are apt to lodge in the cæcum. With this may be combined injections of aloes in solution (4 Gm. to 473 c.cm., or 3i-Oj) and irrigation of the bowel. For the latter purpose, in young children, a soft catheter can be inserted beyond the sigmoid flexure of the colon. In anæmia affecting young girls (chlorosis) Sir Andrew Clarke claimed that constipation has much to do with its causation; he called it fæcal intoxication. Here aloes, in combination with iron, is of much service:—

R Aloes purificatæ.....	8	Gm. or 3ij.
Massæ ferri carbonatis.....	260	Gm. or gr. xl.
Pulv. aromatici.....	130	Gm. or gr. xx.

M. et ft. pil. no. xx.

Sig.: Take one or two at bed-hour.

Sir Andrew Clarke's pill is likewise valuable:—

R Aloin., Ferri sulph. exsic., Ext. belladonnæ alc. (B.P.), Ext. nucis vom., Pulv. ipecac., Pulv. myrrh, Saponis.....aa	103	Gm. or gr. ss.
---	-----	----------------

M. et ft. pil. no. j.

Sig.: One pill one hour before last meal, should the bowels not act during the day

Ipecac is omitted if there is any cardiac weakness.

In cases of hysteria, with anæmia and constipation, the pills of aloes with asafetida, may be given (3 to 6 daily). These have also a carminative effect. An atonic condition of the muscular coat of the large intestine may allow its contents to accumulate, to press upon the common bile-duct, and obstruct the passage of the biliary secretion into the upper bowel. This condition and the jaundice which is its result are relieved by the administration of aloes, with which belladonna and strychnine, or hyoscyamus and ipecacuanha, may be very usefully combined, in such formulæ as the following:—

R Aloes purificatæ.....	2	Gm. or 3ss.
Ext. belladonna folior.....	065	Gm. or gr. j.
Strychninæ sulphatis.....	03	Gm. or gr. ss.

M. et ft. pil. no. xij.

Sig.: A pill three times a day.

R Aloini .....	1065 Gm. or gr. j.
Ext. hyoscyami .....	65 Gm. or gr. x.
Ext. nucis vomicæ .....	005 Gm. or gr. j.
Pulv. ipecacuanhæ .....	13 Gm. or gr. ij.

M et ft. pil. no. x.

Sig. A pill three times a day.

Aloes is an excellent emmenagogue; given for several days before the expected period, it is generally successful, especially when employed thus:—

R Aloini .....	13 Gm. or gr. ij.
Mass. ferri carb. ....	240 Gm. or gr. xxxvj.
Apol. ....	4 c.cm. or f3j.

M et ft. capsulæ no. xij.

Sig. A capsule morning and evening for five or six days before the menstrual period.

In scanty menstruation, depending upon anæmia, the chalybeates should also be pushed, preferably using the preparations of iron which are non-constringing, such as the dialyzed iron, or the carbonate, or pyrophosphate, rather than the sulphate, which is contained in the official pill. When menstrual indigestion is caused by deficient secretion of bile, aloes is of special value, and enjoys a reputation as an ingredient in "dinner-pills" of many kinds. Where the mental symptoms of dyspepsia—drowsiness, depression of spirits, or melancholia—are marked, the use of a good aloetic pill immediately after dinner is often effective.

In cases where there are hæmorrhoids, the aloes sometimes irritates them; under such circumstances the proper course to pursue would not be to neglect such a valuable remedy, but to operate surgically upon the piles and remove them. The passive turgescence of the inferior hæmorrhoidal vessels, however, is not infrequently relieved by the use of aloes. Whitla states of having obtained surprising results in obstinate diarrhœa in children or adults from the administration of a few 30- to 60-c.cm. (or f5i-ij) doses of the compound decoction of aloes (B. P.). We may prescribe the following for an adult with obstinate diarrhœa:—

R Aloini .....	13 Gm. or gr. ij.
Sulphuris subl. ....	650 Gm. or gr. c.
Ext. belladonna folior. ....	13 Gm. or gr. ij.

M et ft. capsulæ no. xx.

Sig. A capsule three times a day.

In small doses aloes acts as an hepatic and intestinal tonic. Where diarrhœa is maintained by the action of germs of fermentation, the increased flow of bile exerts an antiseptic effect and the diarrhœa may be checked after a copious purgative; although the rule is that, where diarrhœa is due to irritation from abnormal condition of the contents, the cause of disturbance should be removed by a more prompt cathartic, such as sulphate of magnesia (or the citrate) or by an antiseptic purgative like calomel or blue mass. Aloetic purgatives should be used with care during pregnancy and lactation. The milk of women taking aloes will purge babes whom they suckle. Aloes may be used as a derivative in cerebral disorders.

A glycerole of aloes is prepared by evaporating the tincture and adding glycerin. This mixture may be applied to fissures, abrasions, and ulcers. The bitter taste of aloes is sometimes utilized by applying a solution to the lips of children in order to break them of the habit of biting their

nails or sucking their thumbs, or to the nipple when it is desired to wean an infant, which is unnecessary cruelty. The compound tincture of benzoir contains 2 per cent. of aloes. This fact should be borne in mind when treating cracked nipples with this preparation, as the infant may be weaned too early.

**ALPHOZONE.**—Disuccinyl Peroxide, or Succinic Dioxide ( $\text{COOH} \cdot \text{CH}_2\text{CH}_2(\text{CO})_2\text{O}_2$ ). A newly-introduced chemical compound, with powerful germicide properties, discovered by Prof. A. M. Clover, of the University of Michigan. It is a white, crystalline powder, soluble in about 60 parts of water, odorless, and with slight bitter taste. In combination with water it undergoes hydrolysis, and forms succinic peracid. It is claimed to be equal to mercuric bichloride as a germicide. It is used in  $\frac{1}{1000}$  to  $\frac{1}{3000}$  solution as an external application. It has also been used internally, both as a gargle and to be swallowed, in typhoid and other infectious diseases. Dose, 0.13 Gm. (or gr. ij), in half a glassful of water.

**ALTHÆA** (U. S. P.).—Marshmallow.

*Preparation.*

Syrupus Althææ.—Syrup of Althæa (5 per cent.).

**Pharmacology.**—The dried root of *Althæa officinalis* (Malvaceæ), collected from plants of second year's growth, and deprived of its periderm. It contains a mucilaginous principle, with about 2 per cent. of asparagin, but no tannin. *Althæa* is a constituent in *massa hydrargyri* (blue mass) and phosphorus pills.

**Therapy.**—The powdered root treated with hot water may be used as a poultice. It is slightly diuretic, on account of the asparagin, which would make it of service in children's diseases in the form of a fresh infusion, especially in Bright's disease. The confections are useful in sore throat, in scarlatina, and diphtheria. The syrup is an agreeable addition to cough-mixtures. Dose, indefinite. *Althæa* combined with benzoinated lard is a bland dressing for skin diseases. Asparagin has been recommended as a diuretic in gout and cardiac dropsy, in doses of 0.065 to 0.13 Gm. (or gr. i-ij).

**ALUMEN** (U. S. P., B. P.).—Alum ( $\text{Al}_2\text{K}_2[\text{SO}_4]_4 + 24\text{H}_2\text{O}$ ).

*Preparations.*

Alumini Hydroxidum (U. S. P.).—Aluminum Hydroxide. Dose, 0.20 to 1.30 Gm. (or gr. iii-xx).

Alumini Sulphas (U. S. P.).—Aluminum Sulphate. For external use.

Alumen Exsiccatum (U. S. P., B. P.).—Dried Alum (alumen ustum, or burnt alum). Dose, 0.065 to 0.32 Gm. (or gr. i-v).

Glycerinum Aluminia (B. P.).—Glycerin of Alum (about 13 per cent.).

**Pharmacology.**—The U. S. P. alum is potassium alum (containing not less than 99  $\frac{1}{2}$  per cent. of pure aluminum and potassium sulphate). The British Pharmacopœia recognizes both potassium alum and ammonium alum (aluminum and ammonium sulphate). Alum is in the form of translucent, white, octahedral crystals, with a sweetish, astringent taste and acid reaction. It contains water of crystallization, which can be driven off by heat,

forming dried alum. Ammonia alum, which was formerly the official alum, has very much the same properties, and is often dispensed for alum. The crystallized alum is not official. In appearance it is like silver, but is much lighter and more durable; is useful for making surgical and household powders.

**Physiological Action.**—Dried alum is astringent, and is a mild escharotic for fungous granulations. The glycerite (20 per cent.) is useful in cases of tonsillitis or pharyngitis of subacute character. In solution alum coagulates tissues by coagulating their albumin, and acts as an astringent.

**Therapy.**—It checks excessive sweating in phthisis when applied with acetate (4 Gm. to 473 c.cm., or 5i-Oj of whisky and water). It is used as an injection in leucorrhœa and in gonorrhœa, and a watery solution of the glycerite is useful as a collyrium in conjunctivitis. In the latter affection **alum** is sometimes applied (2 Gm., or 3ss, beaten up with the albumin of a fresh egg).

In chronic granular conjunctivitis, Dr. W. T. Montgomery, of Chicago, makes use of:—

R Cupri sulphat.,  
Zinci sulphat.,  
Ferri sulphat.,  
Aluminis ..... ss    32 Gm. or gr. v.  
Aq. destil. .... 30    c.cm. or f3j.

M. Sig.: Brush upon the inside of the lids once daily.

Applied locally in the form of powder or saturated solution, alum is an excellent styptic. A most useful alum styptic combination is the following:—

R Aluminis glycerini, (B. P.),  
Alcoholis,  
Lin. saponis ..... ss 60    c.cm. or f3ij.—M.

Compresses soaked in the preparation just formulated, or a solution of alum, may be used to restrain capillary hæmorrhage from wounds, bleeding from the gums, or leech-bites. In epistaxis a plug of cotton moistened in the water may be passed into the nares; a solution may be thrown in by syringe or powdered alum may be snuffed. These measures will frequently be successful. In chronic pharyngitis, tonsillitis, and nasal catarrh the application of powdered alum is beneficial. A prescription composed thus is also effectual:—

R Potass. liquisacti ..... 18 c.cm. or ℥iij.  
Aluminis glycerini ..... 90    c.cm. or f3ij.  
Succus iodi ..... 2    Gm. or 3ss.

M. Sig.: Apply with cotton or a camel's-hair brush once or twice a day over the parts.

It may also be used in solution as a gargle with good effect. The local application of a solution of alum is of benefit in cases of mercurial pytalism. Pearson asserts that gargling the throat with 4 to 8 Gm. (or 5i-ij) of alum, dissolved in about 180 to 210 c.cm. (or 5vi-vij) of a decoction of barley with a solution of 7.50 c.cm. (or f3ij) of honey of roses, is a serviceable practice in the case of speakers and singers, shortly before using the voice.

An injection of alum is a serviceable astringent in hæmorrhage from

the rectum or in gonorrhœa. For gleet, the following formula is recommended:—

R Pulv. aluminis .....	8	Gm. or 3ij.
Fluidext. geranii .....	15	c.cm. or fʒss.
Aquæ rosæ .....	135	c.cm. or fʒivss.—M

In the vulvitis of children, a solution of a drachm of alum to a pint of water is a serviceable local application and may from time to time be used as an injection. A solution of 0.65 to 473 c.cm. (or gr. x to the pint) is useful injection in chronic cystitis, as it relieves vesical pain and frequency of micturition, while decreasing the production ofropy mucus.

A lotion containing alum may be successfully employed in the prolapse of bowel of children. From 4 to 8 Gm. (or ʒi-ij) of alum to 473 c.cm. (or a pint of water, or alcohol), is a beneficial application in hyperidrosis. It is said that 0.65 Gm. (or gr. x) of alum, placed upon the tongue, will sometimes arrest a paroxysm of asthma (Ringer). According to Ringer, many cases of chronic ozæna are rapidly relieved by irrigating the nasal chambers with a solution containing a drachm of alum to the pint of water. The discharge checked and the fœtor removed. Pruritus of the vulva sometimes yields to hot alum solution. The local astringent action of this substance is sometimes found beneficial in purpura. An ointment containing alum is often useful in herpes, and the same preparation removes the offensive odor of bromidrosis. The following formulæ are of service in the diseases just named:—

R Pulv. aluminis .....	4	Gm. or ʒj.
Phenylis salicylatis .....	2	Gm. or ʒss.
Bismuth. subnit. ....	4	Gm. or ʒj.
Ungt. zinci oxidi .....	31	Gm. or ʒj.—M.
R Pulv. aluminis .....	15/5	Gm. or ʒss.
Glycerini .....	30	c.cm. or fʒj.
Aquæ hamamelidis .....	150	c.cm. or fʒv.—M.

In chilblains, also, a solution of alum has been used with asserted advantage.

As an emetic in croup, a heaping teaspoonful of alum may be dissolved in 120 c.cm. (or fʒiv) of simple syrup, of which a teaspoonful is given every fifteen minutes until vomiting is produced. It is useful in bronchorrhœa and in whooping-cough, especially where the secretion is excessive. Given internally, alum checks hæmorrhage and profuse discharges. Whitla esteems it the best remedy in hæmorrhage of the bowel due to typhoid fever. It may be given with good result in the hæmatemesis dependent upon cirrhosis of the liver and in hæmoptysis. The local action of alum may be aided by its internal administration in the night-sweats of phthisis. It checks excessive production of mucus in chronic gastric and intestinal catarrh, and it relieves the pain of gastralgia and enteralgia. Alum is an efficient remedy in some forms of diarrhœa.

Clysters containing alum have been successfully employed in chronic dysentery, and even in the acute form of the disease have sometimes been found of service. The drug may likewise be given internally in the management of dysentery.

Whitla considers the internal exhibition of alum of service in leucorrhœa. The following formulæ are advised:—

<b>R</b> Pulv. aluminis .....	12	Gm. or 3iij.
Acidi sulph. arom. ....	4	c.cm. or f3j.
Infus. ment. geranii, .....	60	c.cm. or f3ij.
Syrup. zingiberis .....	90	c.cm. or f3iij.

**M** Sig: One to two teaspoonfuls in water every half-hour or hour until hæmorrhage is arrested. For hæmoptysis, hæmaturia, menorrhagia, and uterine hæmorrhage.

<b>R</b> Pulv. aluminis, Phenyls. saboylatis .....	aa	6/50 Gm. or gr. c.
---	----	--------------------

**M** et ft. capsulæ no. xx.

**Sig:** A capsule three or four times a day. Employ especially in catarrh of the bladder and prostaticitis.

<b>R</b> Pulv. aluminis .....	13	Gm. or gr. cc.
Tinct. kino .....	45	c.cm. or f3iss.
Tinct. opii camph. ....	30	c.cm. or f3j.
Acidi sulph. arom. ....	4	c.cm. or f3j.
Spt. vini gallici .....	q. s. ad 150	c.cm. or f3v.

**M** Sig: One to two teaspoonfuls in water every three or four hours. Serviceable in acute diarrhœa, dysentery, and in hæmaturia.

Some cases have been reported in which alum was thought to be useful in diabetes mellitus. It would probably prove of more decided utility in diabetes insipidus.

In comparatively large doses (2.60 to 4 Gm., or gr. xl-3j) alum acts as a purgative, and has been used in colica pictonum. In this condition it relieves the pain and overcomes the constipation. Dr. Phillips speaks of its being useful in other forms of gastralgia and colic. It has proved of benefit in intermittent fever in 0.32 Gm. (or gr. v) doses, although its action is not uniform in this affection. Iron-alum has been employed in intermittent hæmaturia. For boils in the ear, a solution of aluminum acetate (25 per cent.) may be dropped into the ear frequently, and the canal plugged with cotton. Alum is sometimes used as an adulterant of baking-powder, and its use for this purpose undoubtedly causes indigestion.

The aluminum salts are antiseptic and can be used as injections for leucorrhœa (0.65 Gm. to 30 c.cm., or gr. x-f3j), and saturated solutions are mild astringents. The oleate of aluminum arrests morbid discharges when used as a local application.

**ALUMNOL** is the trade-name given to a substance discovered by the chemist of Breslau. It consists of a mixture of aluminum salts of naphthol-sulphonic acid, and contains 5 per cent. of aluminum and 15 per cent. of naphthol. Alumnol occurs in the form of a fine white or light pink-colored powder, free from odor, not hygroscopic, readily soluble in water, soluble in glycerin, less so in alcohol, and insoluble in ether. Its solution in alcohol exhibits a beautiful blue fluorescence. The solutions possess an acid reaction. The taste of alumnol is sweetish and astringent. Alumnol precipitates albumin and gelatin, but is redissolved in excess of those substances. It possesses marked penetrative action. It strikes a blue color with solutions of ferric chloride. Alumnol darkens upon exposure to the light, without losing its properties.

**Physiological Action.**—This substance is antiseptic, astringent, and, in concentrated form, cauterant.

Alumnol exerts no toxic influence, except when employed in very

large quantities and under very favorable conditions for absorption. In practice, no aluminum was found in the urine of patients who had been treated by large doses and for a considerable period.

**Therapy.**—Alumnol is a serviceable application to ulcers, wounds, and abscesses. It may be used as a lotion, ointment, or plaster. For the irrigation of abscess-cavities it may be used in a 10- to 20-per-cent. solution. A 1-per-cent. solution is beneficial as an injection in gonorrhoea and in endometritis, due to gonorrhoea, sticks or bougies containing from 2 to 5 per cent. may be employed with advantage.

A 4-per-cent. solution dropped into the eye arrests the flow of tears for several minutes: a property which will, in certain instances, materially facilitate examination.

Dr. Stipanics, of Budapest, has used alumnol with advantage in the treatment of chronic rhinitis, hypertrophic rhinitis, simple ozæna, acute and chronic pharyngitis, tonsillitis, etc. This writer regards the remedy as of special efficacy in affections of the larynx. Hoarseness due to laryngeal catarrh was speedily removed by inhalations of  $\frac{1}{2}$ - to 1-per-cent. aqueous solutions. Dr. Wolffberg recommends a 4-per-cent. solution for the purpose of cleansing the eyes in gonorrhoeal ophthalmia. By 1 Brieger alumnol has been used with success in the treatment of purulent inflammation of the middle ear.

M. Chotzen has reported his experience with this remedy in more than three hundred cases. He describes it as a beneficial application to chancres and chancreoids, balanitis, and erosions. Solutions containing from 5 to 10 per cent. are of value in moist and papular eczema, acne, and furunculosis. An alcoholic solution of 2.5 to 10 per cent. is effective in urticaria, sycosis, and psoriasis. Incorporated with lanolin, in the strength of 2.5, 10, and 20 per cent., it is successful in eczema, seborrhoea capitis, psoriasis, and favus. In erysipelas and lupus, alumnol is also employed with good results. In these affections Dr. Chotzen applied the remedy according to the following formula:—

R Alumnol .....	4j	Gm. or 3j.
Adipis laneæ .....	10/4	Gm. or 3v.
Paraffini mollis .....	13	c.cm. or f3iiss.
Ceresin <sup>1</sup> .....	2j	Gm. or 3ss.
M. et ft. ungt.		

**Aluminum acético-tartaricum.**—This compound occurs in the form of almost-colorless pieces, having an odor resembling that of vinegar, slightly-acid and not disagreeable taste. It is soluble in water, but not in alcohol. It is chiefly used as a mouth-wash and gargle. A 50-per-cent. solution is recommended in the treatment of frost-bite. This substance has been applied also as a dressing to wounds. It is non-toxic, astringent and antiseptic.

**Boral and Cutol.**—Aluminum borotartrate (under the name of **Boral**) and aluminum borotannate (under the title of **Cutol**) have been brought forward as antiseptic and astringent preparations, suitable for use in dermatology. Boral is soluble, and cutol is insoluble, in water. The latter may be rendered soluble by the addition of tartaric acid, in which form

<sup>1</sup> Ceresin is a natural mineral product which closely resembles white wax. It consists of a mixture of solid paraffin with some oxygenated bodies, and is found in Galicia and southern Utah.

is claimed to be useful as an injection in gonorrhœa. Cutol has been employed with alleged success in facial erysipelas.

**Aluminum boroformate.**—This compound is made by heating together boric acid, formic acid, and alumina. It occurs as large crystalline scales, soluble in water, contains 33.5 per cent. alumina, and has been used as a substitute for other preparations of aluminum. A solution of boroformate, saturated with ammonia and evaporating the clear fluid, constitutes aluminum ammonio-boroformate.

**Sozal.**—Under this name an organic salt of aluminum has been introduced for use as an antiseptic application. Sozal is obtained by dissolving aluminum hydrate in phenol-sulphonic acid. It is a crystalline substance, readily soluble in water, glycerin, and alcohol. Sozal has an astringent taste and a faint odor of carbolic acid. A 1-per-cent. solution was found beneficial as an injection in abscess, tuberculous ulcers, etc.

**ALVELOZ** is the milky juice of *Euphorbia heterodoxa*, belonging to the Euphorbiacæ: a native of Brazil. The usual irritating effects of the juice of plants of this genus is very marked in alveloz, which is said to act as a caustic upon the skin very much like zinc chloride. It has been used in treating cancerous and syphilitic lesions with asserted success, and the application is comparatively painless.

**AMBLAGRISEA.**—Ambergris is an odorous, fatty substance, found in large masses floating upon the water, and is believed to be produced in the intestines of the spermaceti-whale. It has a consistence like wax, softening at the temperature of the hand, and melting below the boiling-point of water; it is almost entirely volatilized by heat, and is inflammable. In composition it is like cholesterin, and is not saponifiable. It is believed to have some antispasmodic effects, and is official in the French Codex as a 10-per-cent. tincture. Ambergris is used in making perfumery.

**AMINOFORM.**—A trade name for Hexamethylenamine.

**AMMONIACUM (B. P.).**—Gum Ammoniac.

**Dose,** 0.32 to 1 Gm. (or gr. v-xv).

#### *Preparations.*

**Emplastrum Ammoniaci cum Hydrargyro (B. P.).**—Ammoniac and Mercury Plaster (contains ammoniac, 2 oz.; mercury, 3 oz.; with olive-oil, 56 grains; and sublimed sulphur, 8 grains).

**Mistura Ammoniaci (B. P.).**—Ammoniacum Mixture (ammoniac, 5; syrup of Tolu, 10; distilled water, 150). Dose, 15 to 30 c.cm. (or fʒss-j).

**Emulsum Ammoniaci (not off.).**—Emulsion of Ammoniac (4 per cent.). Dose, 4 to 15 c.cm. (or fʒi-iv).

**Pharmacology.**—Ammoniac is a gum-resin obtained from *Dorema Ammoniacum* (Umbelliferæ), containing a volatile oil. It occurs in the form of tears, of variable size, hard and brittle, having a faint, unpleasant odor and a bitter-sweet, somewhat acrid, taste. It forms a milky emulsion when rubbed up with water.

**Therapy.**—It is a stimulating expectorant and laxative, and resembles

asa fetida in its effects upon the system. It has been used, with alkalies, to relieve chronic bronchitis and asthma. It is especially beneficial in chronic bronchitis associated with emphysema, or occurring in aged persons. The algid stage of cholera has been treated in the Fiume Hospital by gum ammoniac internally, conjoined with stimulants and the hypodermic injection of ether. Warm baths were also administered. The plasters are useful in glandular and joint swellings. By fusing ammoniac and other resins with caustic potassa resorcin is obtained, which is a valuable antiseptic, and is official.

**AMMONIUM.**—Ammonium has not been isolated and is known only in its combinations, which are numerous and important. According to Berzelius its constitution is  $\text{NH}_4$ ; it is therefore a compound radical, and as such forms permanent salts which are analogous to potassium salts. Ammonia ( $\text{NH}_3$ ) is a gas, which can be liquefied by pressure. It is soluble in water and in alcohol.

#### *U. S. P. Preparations (Liquid).*

**Aqua Ammoniae.**—Water of Ammonia (contains 10 per cent. of gaseous ammonia). Dose, 0.12 to 0.60 c.cm. (or *mii-x*).

**Aqua Ammoniae Fortior.**—Stronger Water of Ammonia (28 per cent. gaseous ammonia). External use.

**Linimentum Ammoniae.**—Liniment of Ammonia (ammonia-water, 35; alcohol, 5; cotton-seed oil, 60 c.cm.). For external use.

**Spiritus Ammoniae.**—Spirit of Ammonia (10 per cent.). Dose, 0.30 to 1.0 c.cm. (or *mv-xv*).

**Spiritus Ammoniae Aromaticus.**—Aromatic Spirit of Ammonia. Dose, 2 to 4 c.cm. (or *f3ss-ij*).

**Liquor Ammonii Acetatis.**—Solution of Ammonium Acetate. Spirit of Ammonia. Dose, 4 to 15 c.cm. (or *f3i-iv*).

**Tinctura Guaiaci Ammoniata.**—Dose, 2 to 4 c.cm. (or *mxxx-lx*).

**Tinctura Valerianae Ammoniata.**—Dose, 2 to 4 c.cm. (or *f3ss-ij*).

#### *B. P. Preparations (Liquid).*

**Liquor Ammoniae.**—Solution of Ammonia (contains 10 per cent., by weight, ammonia,  $\text{NH}_3$ ).

**Liquor Ammoniae Fortis.**—Strong Solution of Ammonia (32.5 per cent. weight, of ammonia,  $\text{NH}_3$ ).

**Liquor Ammonii Acetatis.**—Solution of Ammonium Acetate. Dose, 7.5 to 15 c.cm. (or *f3ii-vj*).

**Liquor Ammonii Citratis.**—Solution of Ammonium Citrate. Dose, 7.5 to 15 c.cm. (or *f3ii-vj*).

**Spiritus Ammoniae Aromaticus.**—Aromatic Spirit of Ammonia, Spiritus Ammoniae Compositus, Spirit of Sal Volatile. Dose, 1.20 to 2.40 c.cm. (or *mxxx-xl*).

**Spiritus Ammoniae Fœtidus.**—Fetid Spirit of Ammonia. Dose, 1.20 to 2.40 c.cm. (or *mxx-xl*).

**Linimentum Ammoniae.**—Liniment of Ammonia (solution of ammonia, 25 c.cm.; almond-oil, 25 c.cm.; olive-oil, 50 c.cm.).

Ammonia is contained in several of the B. P. official tinctures, also in the Ammoniated Liniment of Camphor.

#### *Official Solid Preparations.*

**Ammonii Iodidum (U. S. P.).**—Ammonium Iodide. Dose, 0.32 to 0.65 Gm. (or *v-x*).

**Ammonii Salicylas (U. S. P.).**—Ammonium Salicylate. Dose, 0.13 to 0.65 Gm. (or *ij-x*).

- Ammonii Valerianæ* (U. S. P.).—Ammonium Valeriate. Dose, 0.13 to 0.32 Gm.  
or gr. ii-v.
- Ammonii Benzoas* (U. S. P., B. P.).—Ammonium Benzoate. Dose, 0.13 to 0.65 Gm.  
or gr. ii-xx.
- Ammonii Bromidum* (U. S. P., B. P.).—Ammonium Bromide. Dose, 0.65 to 1 Gm.  
or gr. x-xxv.
- Ammonii Carbonas* (U. S. P., B. P.).—Ammonium Carbonate. Dose, 0.13 to 0.32 Gm.  
or gr. ii-v or xx.
- Ammonii Chloridum* (U. S. P., B. P.).—Ammonium Chloride. Dose, 0.32 to 1.30 Gm.  
or gr. v-xxi.
- Trochisci Ammonii Chloridi* (U. S. P.).—Troches of Ammonium Chloride.
- Glycyrrhizinum Ammoniatum* (U. S. P.).—Ammoniated Glycyrrhizin. Dose, 0.03 to 0.06 Gm.  
or gr. ss-v.
- Hydrargyrum Ammoniatum* (U. S. P.).—Ammoniated Mercury, White Precipitate. Used only externally.
- Ammonii Phosphas* (B. P.).—Phosphate of Ammonia. Dose, 0.32 to 1.30 Gm.  
or gr. v-xx.

**Pharmacology and Physiological Action.**—Ammonia is a gaseous body, very irritating, even suffocating, to the air-passages, and may cause acute inflammation with œdema of the glottis. It stimulates the trifacial nerve, increases the blood-tension by reflex action upon the vasomotor centre, and prevents syncope. If applied to the skin it is rubefacient, and, if diffusion is prevented, it will soften and vesicate the skin. The strong solution also produces vesication and softens the cuticle. Ammonium chloride, on the other hand, is cooling and absorbent. The chloride, after absorption, hastens cellular proliferation of the bronchial mucous membrane and liquefies retained mucous secretions. The carbonate is probably decomposed in the digestive tract, and its effects are identical with those of the gas or of aqua ammonia in stimulating the heart and circulation.

Ammonia acts upon the ganglionic nervous system especially, and has a direct effect upon the higher centres, thus differing from alcohol. It increases the functional activity of the spinal cord and is a promptly acting cardiac stimulant. Its accelerator nerves and the heart itself are stimulated by medicinal doses of ammonia. Blood-pressure is moderately increased, but in large doses ammonia interferes with the oxygen-carrying power of the red blood-corpuscles, and if long continued produces emaciation. Ammonia likewise stimulates the respiratory centre. In small doses the aromatic spirit of ammonia acts as an antacid and a carminative; but the protracted use of ammonia, by neutralizing the gastric juice, enfeebles digestion, and may excite gastro-intestinal catarrh. Injected into the blood-vessels, the red-corpuscles are liable to become dissolved, and after death the blood remains fluid. Ammonia likewise assists in maintaining the solution of the solids of the blood. Such injections are likely to be followed by vomiting. The carbonate may be given for the same purpose by the mouth, but, in large doses, is apt to cause vomiting. Ammonia increases the secretions not only of the bronchial mucous membranes, but also the intestinal, and may set up diarrhoea. The solution of ammonium acetate acts upon the skin, especially in fever. Ammonia has no special action upon the kidneys, except that the urine is increased by oxidation of ammonia, according to the observation of Dr. Hance Jones, who also found that nitric acid made its appearance in the urine after the administration of ammonia or its salts; it is eliminated especially by the kidneys, broncho-pulmonary tract, and skin. Ammonia possesses marked antiseptic virtues.

**Poisoning.**—As the ammonia-water, or "spirit of hartshorn," is found

in every household, cases of poisoning by accidental swallowing not rarely occur. When the stronger solutions are swallowed, there is great distress, burning pain along the œsophagus and in the stomach, with choking sensations from inhaling the gas or the admission of a few drops into the larynx. After death there are evidences of softening and acute inflammation of the stomach.

**Treatment.**—Vomiting is likely to occur immediately, but if not, the administration of large quantities of bland liquid, such as water, oil, or milk would be serviceable, and if the solution of the gas has been taken it may be neutralized with vinegar or lemon-juice. Treatment should be promptly instituted in order to avoid such a degree of inflammation as would produce stricture of the œsophagus. If the patient is in a state of shock, warm infusion of coffee may be administered by the mouth or rectum and tincture of digitalis, or strychnine given hypodermically. The diet should be liquid only.

**Therapy.**—The local uses of ammonia have been already intimated. In sprains, bruises, and old rheumatic swellings the liniment is of service, especially if some oil of turpentine or chloroform be added.

The water of ammonia may very serviceably enter into the composition of a stimulating application in alopecia. In the headache, which attends disordered menstruation or the menopause, Dr. Tilt has seen Raspail's sedative lotion afford much relief. This preparation contains 60 c.cm. (or fʒij) of stronger ammonia, 62.2 Gm. (or ʒij) of common salt, 9.25 c.cm. (or fʒiiss) of spirit of camphor, and 1 litre (or Oiiʒij) of water. The liquid may be applied upon a sponge or linen cloth. Weak solutions of ammonia will sometimes relieve the itching of urticaria. For this purpose 7.5 c.cm. (or fʒij) of the official water of ammonia may be added to a pint of water, or ammonium carbonate may be employed in the strength of 4 Gm. (or ʒj) to 120 c.cm. (or fʒiv) of water. The following combinations of ammonia are also of service for external use:—

R. Aque ammoniæ,  
Fluidext. arnicæ,  
Lin. saponis,  
Olei terebinthinæ ..... aa 60| c.cm. or fʒij.

M. Sig.: Rub in well several times a day. For rheumatism, bruises, and sprains.

R. Lin. ammoniæ ..... 60| c.cm. or fʒij.  
Spt. chloroformi ..... 30| c.cm. or fʒj.  
Lin. menthol<sup>1</sup> ..... 60| c.cm. or fʒij.  
Tinct. opii ..... 30| c.cm. or fʒj.

M. Sig.: Apply well over the surface, when necessary for lumbago, neuralgia, and sciatica.

R. Spt. ammon. aromat. .... 15| c.cm. or fʒss.  
Tinct. capsici ..... 30| c.cm. or fʒj.  
Spt. lavandulæ ..... 7.50 c.cm. or fʒij.  
Tinct. nucis vomicæ ..... 15| c.cm. or fʒss.  
Lin. camphoræ ..... 75| c.cm. or fʒiiss.

M. Sig.: Apply with friction to the scalp for loss of hair and for dandruff.

<sup>1</sup> Linimentum menthol as suggested by Martindale (see "The Extra Pharmacopœia," London) is composed of menthol, 3 parts; chloroform, 4 parts; and olive oil, q. s. to make 16 parts.

In acralgia, thimble-blistering may be practiced over the painful spots of the extremities, by dropping some stronger aqua ammonia upon absorbent cotton, and confining it with a watch-glass or thimble in contact with the skin.

Spirit of ammonia is a good application to wounds caused by stings of insects or snake-bites. In the latter case, ammonia-water can also be injected into a vein in order to counteract the depressing effects of the venom. In poisoning by sewer-gas intravenous injection of the official aqua ammonia has good effect. Ammonium-chloride solution (8 to 15.5 Gm. to 473 c.cm., or  $\mathfrak{z}\text{ij}$  to  $\mathfrak{z}\text{ij}$ ) removes ecchymosis from contusions. This solution is applicable likewise to epididymitis after the acute stage has subsided. It is, in fact, an excellent dressing in the latter stage of superficial inflammation, and promotes the absorption of exudation. Dr. J. H. Freeman, of Nevada City, Cal., warmly recommends ammonium chloride in the treatment of rhus-toxicodendron poisoning. He dissolves 8 Gm. (or  $\mathfrak{z}\text{ij}$ ) of the salt in 120 c.cm. (or 5 fl. oz.) of water, and directs it to be applied to the affected parts two or three times a day. The swelling and the burning pain rapidly disappear.

Internally, ammonia is invaluable as a cardiac and nervous stimulant in pneumonia and all typhoid conditions, in poisoning by prussic acid, in syncope, and in heat-exhaustion. The carbonate is the most eligible form, given in doses of 0.32 to 0.65 Gm. (or gr. v-x). In capillary bronchitis in infants the following answers a good purpose:—

R Ammonii carbonatis .....	75 to 150 Gm. or gr. xli-xxiv.
Syr. tolutani .....	15 c.cm. or $\mathfrak{f}\mathfrak{z}\text{iv}$ .
Liq. ammonii acetatis .....	75 c.cm. or $\mathfrak{f}\mathfrak{z}\text{ijss}$ .
M. Sig.: Give a teaspoonful every hour or every two hours.	

According to Dr. Beverley Robinson, ammonium carbonate, in rather large and frequently-repeated doses, is very efficient in aborting a cold. The following formula is often most efficient as an expectorant, especially in the early stage of bronchitis:—

R Ammonii carb. ....	4	Gm. or 3j.
Syr. eucalypti .....	15	c.cm. or $\mathfrak{f}\mathfrak{z}\text{iv}$ .
Vini ipecac. ....	11	c.cm. or $\mathfrak{f}\mathfrak{z}\text{ij}$ .
Syrup. tolutani. ....	30	c.cm. or $\mathfrak{f}\mathfrak{z}\mathfrak{j}$ .
Spt. chloroformi .....	11	c.cm. or $\mathfrak{f}\mathfrak{z}\text{ij}$ .
Aq. camphoræ .....	q. s. ad 120	c.cm. or $\mathfrak{f}\mathfrak{z}\text{iv}$ .
M. Sig.: One to two teaspoonfuls every hour or two until relieved.		

In the broncho-pneumonia of children, Marfan orders:—

R Ammon. acetat.,		
Sodii benzoat. ....	aa 150	Gm. or gr. xxiv.
Syr. vini gall. ....	4	c.cm. or $\mathfrak{f}\mathfrak{z}\mathfrak{j}$ .
Syr. tolutani,		
Syr. anacisæ .....	aa 60	c.cm. or $\mathfrak{f}\mathfrak{z}\text{ij}$ .

M. Sig.: Dessertspoonful every hour or two according to age. The quantity of syrup is also regulated according to age.

The value of ammonium carbonate in scarlet fever has been extolled by Hart, Wilkinson, and Witt. It was employed in 0.20 to 0.32 Gm. (or gr.  $\mathfrak{ss}$  to  $\mathfrak{ss}$ ) doses, hourly, or at longer intervals, according to the severity of the case. It reduces fever and cerebral excitement and promotes sleep. The use of ammonium acetate is also highly recommended in scarlatina.

The plan is to administer the remedy in large doses, which have been found to be well borne, even by children. The carbonate has likewise been employed in measles, in which disease Ringer states that he has used it largely with considerable benefit. The same salt is valued by some practitioners in the treatment of small-pox and erysipelas.

Delirium tremens, being usually associated with cerebral anæmia and weakened cardiac action, may be benefited by ammonium carbonate.

For the relief of persistent epistaxis, small doses, 0.13 to 0.20 Gm. (or gr. ij-ijj), may be given from three to six times a day, or every ten minute during the hæmorrhage.

Ammonium carbonate and acetate have been used in diabetes mellitus. Eichhorst states that in two of his cases the use of the carbonate was followed by rapid disappearance of the sugar from the urine; yet the progress of the pulmonary lesions was not interrupted.

Pereira says that liquor ammonii acetatis is available in those cases of fever of a continued type where all violent action has subsided and the brain is not much disordered. Its diaphoretic action should be promoted by diluents and by warm clothing.

The aromatic spirit of ammonia may be given in threatened syncope and should be well diluted with water when administered. It is also useful in heat-exhaustion with small quantities of tincture of capsicum, which also relieves nausea. It is likewise of service in the sour stomach and tympanites which not infrequently occur in hysterical women. Nervous headache is often relieved by the same preparation. Ammonium chloride may be administered thus as an hepatic stimulant:—

R. Ammonii chlor. ....	12	Gm. or ʒiij.
Sodii chlorid. ....	4	Gm. or ʒj.
Fluidext. taraxaci. ....	60	c.cm. or fʒij.
Decocti aloes co. ....	ad 240	c.cm. or fʒviij.

M. Sig.: A dessertspoonful to a tablespoonful in water three or four times a day

The chloride increases the flow of bile (Ringer), and is, therefore, useful in torpor of the liver, sick headache, biliousness, and also in jaundice due to obstruction of the gall-ducts. It has some reputation as an emmenagogue. Ammonium chloride is esteemed of value in catarrh of the stomach and bowels, and Bartholow considers it useful in the first stage of cirrhosis.

M. Marotte esteems this salt as of value in cholera. He administers it in doses proportionate to the severity of the disease and states that it produces a return of warmth and perspiration and also stimulates the kidneys to action. Dr. J. J. Trussewitsch regards ammonia as one of the best cardiac stimulants in cholera. He gives it by hypodermic injection, making use of 3 to 8 drops of the saturated solution diluted with a syringeful of water. The effect is prompt, and continues for some time. It may also be given internally in the same disease.

In myalgia and neuralgia this salt is capable of affording relief, and should be given in rapidly-increasing doses until the effect is obtained or the system becomes intolerant of the remedy. It has also been used in intermittent hæmaturia. It is best given in capsules, on account of its nauseating, sea-water taste. Licorice covers the taste in mixtures.

Dr. H. Campbell's favorite prescription for neuralgia of the fifth nerve is:—

<b>R</b> Ammonii chloridi .....	2	Gm. or gr. xxx.
Tinct. gelsemii .....	50	c.cm. or m℥iiss.
Tinct. aconiti .....	06	c.cm. or m℥j.
Fluidext. glycyrrhizæ .....	4	c.cm. or ℥3j.
Aquæ .....	q. s. ad 30	c.cm. or ℥3j.—M.

**M. Sig.:** To be taken in one dose every hour when the pain comes on, until three doses are taken.<sup>1</sup>

Dr. G. Corrie states that ammonium chloride is an excellent remedy in *ostitis* from various causes. He gives it in doses of 1 to 2 Gm. (or gr. xv-xxx), and obtains marked and rapid relief.

In bronchitis in its first stage, with deficient secretion, it may be combined as follows:—

<b>R</b> Ammonii chloridi .....	8	Gm. or 3ij.
Potassii iodidi .....	1	Gm. or gr. xvj.
Tinct. ipecacuanhæ .....	2	c.cm. or mxxx.
Mist. glycyrrhizæ comp. ....	q. s. ad 120	c.cm. or ℥3iv.

**M. Sig.:** Dose, a tablespoonful every four hours.

This formula is of special service in acute catarrhal pneumonia. The chloride is particularly valuable in chronic bronchitis accompanied by profuse secretion. It is asserted that the continued use of large doses of this salt may excite ulceration of the stomach. It is also a remedy of great utility in tropical or malarial fevers, such as are encountered in India. In these fevers, of a highly inflammatory type, it must be given in doses not less than 1 to 1.30 Gm. (or gr. xv-xx) several times daily.

Dr. Attigate,<sup>2</sup> of Colombo, Ceylon, reports excellent results from ammonium chloride in acute, tropical dysentery, given in 4 Gm. (or 3j) doses every four hours and the patient placed on milk-and-arrowroot diet. In the majority of cases blood disappeared from the stools on the third or fourth day. In a few cases this treatment was supplemented by small doses of opium. In India ammonium chloride is esteemed to be especially valuable in malarial fevers of a highly-inflammable type; it should be given in doses of 1 to 1.30 Gm. (or gr. xv-xx).

In catarrhal conditions of the respiratory tract Krakauer recommends the use of ammonium chloride in the form of a spray. Ammonia carbonate may also be used as an emetic in such cases. In the later stages of pneumonia expectoration is promoted by the same remedy. Liquor ammonii acetatis is one of our most reliable diaphoretics, and enters into the composition of many fever mixtures:—

<b>R</b> Fluidext. aconiti .....	18	c.cm. or gtt. iij.
Spt. chloroformi .....	15	c.cm. or ℥3iv.
Liq. ammonii acetatis .....	75	c.cm. or ℥3iiss.

**M. Sig.:** Give a dessertspoonful every two or three hours in fever.

Both the ammonium chloride and the solution of the ammonium acetate are effectively given for the purpose of quickly removing the effects of *opium*, or sobering a drunken person.

Ammonium bromide has a special influence over whooping-cough, and may be substituted for the potash salt in epilepsy and nervous affections. A

<sup>1</sup> *New York Medical Journal*, Sept. 23, 1899.

<sup>2</sup> *British Medical Journal*, May 7, 1898.

double salt, ammonium and rubidium bromide, has recently been introduced as a remedy for epilepsy. The substance is readily soluble in water. Its dose is that of the other bromides. Active doses are from 2 Gm. (or gr. xxx) upward; as much as 8 Gm. (or 3ij) daily, or even more, may be given, dissolved in syrup of lemon and water. Laufenauer has used it in all the epileptic states with the exception of hystero-epilepsy.<sup>1</sup> In acute rheumatism with nervous symptoms, Da Costa reported good results from the use of ammonium bromide (1.30 to 2.60 Gm., or gr. xx-xl) several times daily.

A very suitable prescription for insomnia and in gouty subjects is:—

R Sodii bromidi .....	21	50 Gm. or 3vas.
Tinct. lupulini .....	60	c.cm. or f3ij.
Spt. chloroformi .....	7	50 c.cm. or f3ij.
Aquæ camphoræ .....	60	c.cm. or f3ij.

M. Sig.: Two teaspoonfuls in water every hour or two when necessary.

The valeriate enjoys some reputation for its influence over hysterical manifestations, and may be given in capsules (0.32 to 1.30 Gm., or gr. v-xx) or as an elixir<sup>2</sup> (not official):—

R Ammonii valeriatii .....	6	50 Gm. or gr. c.
Elixir aurantii .....	240	c.cm. or f3viij.
Aquæ ammonii .....	q. s.	ad react. neut.

M. Sig.: Dose, a tablespoonful, well diluted, in nervous attacks of women.

Of the remaining salts little need be said. The phosphate is diuretic and has been used in gout, which may be connected with deficient excretion of urea. The benzoate, where the urine is alkaline, as in cystitis, has advocates, as it is excreted as hippuric acid, and thus prevents phosphatic deposits. The nitrate is only used to prepare nitrous-oxide gas, which it yields by exposure to heat. The sulphate is used in making other salts. The iodide may be employed in syphilitic affections, where the other iodides are too depressing.

In the strength of 2 Gm. (or 5ss) to 30 c.cm. (or f3j) of glycerin, ammonium iodide is recommended as an efficient local application to enlarged tonsils, being painted upon the glands once daily with a camel's-hair brush. Ammonium borate, according to Professor Lashkevich, reduces expectoration and, at times, the pyrexia of pulmonary tuberculosis.

Aqua ammoniæ may be administered by cautious inhalation, hypodermically, or by the mouth, in shock, in chloroform-narcosis, in poisoning by hydrocyanic acid or hydrogen sulphide, and also in heart-clot, thrombosis and snake-poisoning. Where a prompt effect is needed, the remedy should be injected directly into a vein (0.60 to 1.20 c.cm., or mx-xx) diluted with sterilized water.

#### AMYGDALA AMARA (U. S. P., B. P.).—Bitter Almond.

#### AMYGDALA DULCIS (U. S. P., B. P.).—Sweet Almond.

The pharmacopœias recognize two varieties of almond (Rosacæ): 1 *Amygdala amara*, the seed of *Prunus Amygdalus*; variety, *Amara*. 2

<sup>1</sup> *Medical Bulletin*, July, 1890.

<sup>2</sup> In the National Formulary the elixir of ammonium valerianate contains vanilla and a little chloroform to cover the odor and taste of the salt, of which there are present 0.13 Gm. (or gr. ij) to 4 c.cm. (or f3j).

*Amygdala dulcis*, or sweet almond, which is the seed of *Prunus Amygdalus*; variety, *Dulcis*.

*Preparations.*

*Oleum Amygdalæ Amaræ* (U. S. P.).—Oil of Bitter Almond. Dose, 0.015 to 0.06 c.c.m. (or m℥.ss.).

*Aqua Amygdalæ Amaræ* (U. S. P.).—Bitter-Almond Water. Dose, 15 c.c.m. (or ʒi.).

*Syrupus Amygdalæ* (U. S. P.).—Syrup of Almond, "Orgeat" Syrup (containing equal parts of sweet and bitter almonds). Dose, 7.5 to 15 c.c.m. (or ʒi-ʒss.).

*Spiritus Amygdalæ Amaræ* (U. S. P.), Spirit of Bitter Almonds. Dose, 0.06 to 0.2 c.c.m. (or m℥-xx.).

*Emulsio Amygdalæ* (U. S. P.).—Emulsion of Almond (sweet almonds). Dose, 7.5 to 15 c.c.m. (or ʒi-ʒss.).

*Oleum Amygdalæ Expressum* (U. S. P.).—Expressed Oil of Almond (either bitter or sweet almonds). Dose, 7.5 to 15 c.c.m. (or ʒi-ʒss.).

*Unguentum Aquæ Rosæ* (U. S. P., B. P.).—Ointment of Rose-water ("Cold Cream").

*Oleum Amygdalæ* (B. P.).—Almond-oil (expressed from the Bitter or Sweet Almond).

*Mistura Amygdalæ* (B. P.).—Almond Mixture (compound powder of almonds, 20 Gm.; distilled water, 160 c.c.m.).

*Pulvis Amygdalæ Compositus* (B. P.).—Compound Powder of Almonds (contains sweet almonds, 20 Gm.; sugar, 10 Gm.; acacia, 2.5 Gm.).

**Pharmacology.**—Both varieties of almond contain fixed oil and emulsin, but only the bitter variety has also amygdalin. Hydrocyanic acid is formed when amygdalin and emulsin react upon each other, and it is to this acid thus formed that the sedative and antispasmodic effects of oil of bitter almond are due. Its toxic effects are also identical with hydrocyanic acid, and call for the same treatment.

**Therapy.**—The volatile oil of bitter almond must not be confounded with the fixed oil obtained from either variety by expression, the latter being of local application, especially in the form of ung. aquæ rosæ, to irritable and chapped hands or lips. In doses of 4 to 7.5 c.c.m. (or ʒi-ij), it is laxative and may be used as a substitute for olive-oil. The oil of bitter almond has been employed in emulsion as a local application in pruritus, and internally for the same purposes as hydrocyanic-acid solution. The official emulsion is made with sweet almonds, forms a soothing application, and may be combined according to these formulæ:—

R	Emuls. amygdalæ	30	c.c.m. or ʒj.
	Resinuth. subnit.	4	Gm. or ʒj.
	Dynamolis raduli	1	Gm. or ʒj.

M. Sig.: For local application to freckles and skin pigmentations.

R	Emuls. amygdalæ	30	c.c.m. or ʒj.
	Hydrarg. chlor. corros.	20	Gm. or gr. iij.
	Ammon. chloridi	25	Gm. or gr. iv.

M. Sig.: Valuable in skin pigmentations.

R	Hydrarg. chlor. corros.	1065 to	13	Gm. or gr. i-ij.
	Emuls. amygdalæ	120		c.c.m. or ʒiv.

M. Sig.: For external use in acne rosacea.

Under the name of **Resorbin**, Lebermann has introduced a mixture which is said to be very readily absorbed by the skin. It is made by emulsifying purest almond-oil with distilled water, a small quantity of yellow

wax, gelatin, and soap, and is brought to an exact consistence by the addition of a little lanolin. It is recommended as an excellent vehicle for active drugs in medication of the skin, and may be used in ichthyosis, pityriasis, scleroderma, sclerema neonatorum, seborrhœic eczema, prurigo, and scabies. Resorbin will, it is claimed, promote the absorption of mercury by the skin.

Bitter-almond water is a good vehicle in which to administer narcotic drugs. The syrup of almond may be appropriately added to cough-mixtures. The emulsion of almond is an agreeable demulcent, and may very well be employed as a vehicle of more active remedies.

Flour prepared from blanched sweet almonds is used in making bread, cakes, and puddings for diabetic patients. Almond-meal is used instead of soap for the toilet, rendering the skin soft and smooth.

**AMYLIS NITRIS** (U. S. P., B. P.).—**Amyl Nitrite**. A liquid containing about 80 per cent. of amyl (chiefly isoamyl) nitrite, when assayed by U. S. P. process. (There is also an amyl nitrate; but it never is used internally.)

**Dose**, 0.015 to 0.32 c.cm. (or  $m^1/4-v$ ), internally; by inhalation, 0.18 to 0.30 c.cm. (or  $miii-v$ ).

**Pharmacology**.—A clear, pale-yellowish liquid, of an ethereal, fruity odor, an aromatic taste, and a neutral or slightly-acid reaction. It is insoluble in water, but soluble in alcohol, ether, and chloroform, in all proportions. It volatilizes at ordinary temperatures, and should be kept in a glass-stoppered bottle, or in small glass pearls, each containing 0.18 to 0.30 c.cm. (or  $miii-v$ ). Vessels or tubes containing this fluid must be handled with care, as it readily explodes at ordinary temperatures. It results from the reaction of nitric acid upon amyl alcohol, and may be contaminated with nitric or hydrocyanic acid.

**Physiological Action**.—No local effects are ascribed to this remedy, but when taken internally, by the digestive tract, or by inhalation of its odor, very remarkable phenomena are produced. There is at once observed a flushing of the face, with fulness and throbbing of the temporal vessels, the patient complaining of headache, fulness, and oppression, with giddiness and confusion of ideas. The reflex excitability of the cord is diminished. The brain is indirectly influenced, and its functions exalted by the temporary congestion. The action of the heart becomes excessively rapid, with weakening of the pulse and marked lowering of arterial tension, owing to the general enlargement of the vessels, due to action of the drug upon the muscular coats of the arteries, and not to the nervous system or vasomotor centres. Larger doses occasion failure of cardiac action, arrest taking place in diastole. According to the investigations of the late Prof. Leech, of Manchester, the nitrites affect especially the blood and muscles. They depress the nerve-centres and nerves, but their action in this respect is less marked. Amyl nitrite diminishes oxidation, and the arterial and venous blood both become of the same dark color. Respiration and temperature are both reduced. Sugar appears in the urine after inhalation, probably as the result of increased circulation in the liver. It increases the flow of urine, possibly, in the same way, or because the liver-sugar may act as a diuretic. In poisoning from amyl nitrite the blood assumes a characteristic chocolate color, due to the formation of methæmoglobin.

In some patients the nitrites excite gastric irritation and diarrhœa.

Professor Leech regards these compounds as useful, unirritating diuretics. Amyl nitrite is absorbed and eliminated with great rapidity.

**Therapy.**—From a consideration of its physiological action Dr. Lauder Brunton was induced to recommend the use of amyl nitrite in the paroxysms of angina pectoris, and clinical experience has shown the value of the remedy. Whether the relief be due to lowering of arterial tension, as Brunton asserts, or to the alleviation of the neuralgic condition, as claimed by Johnson, is not very material, since by inhalation of a few drops of this remedy the patient has complete control over the attacks. Dyspnœa due to other forms of cardiac disease and to pulmonary lesions is also relieved by administration of this remedy. It is particularly adapted to symptoms dependent on a disease of the mitral valve, but aortic incompetence, according to Professor Leech, offers no objection to its use in small quantities when the breathing is oppressed. In asthma, where the spasmodic element is strong, amyl nitrite promptly affords amelioration.

Utzmann recommended as an injection in chronic cystitis, where the secretion is catarrhal and has a bad odor:—

R Amylis nitrilis . . . . .	30 c.cm. or mv.
Aquæ destillatæ . . . . .	120 c.cm. or f3iv.
M. Sig.: Tablespoonful in water sufficient for a vesical injection.	

Amyl nitrite can often be resorted to with benefit for seasickness, especially in this formula, given by Martindale:—

R Amylis nitrilis . . . . .	1 c.cm. or mxvj.
Alcoholis . . . . .	7½ c.cm. or f3ij.
Misce et adde:—	
Pulv. tragacanthæ . . . . .	38 Gm. or gr. vj.
Aquæ destillatæ . . . . .	q. s. ad 120 c.cm. or f3iv.

The powdered gum tragacanth should be in a dry four-ounce bottle, into which the amyl solution is poured, and the water added gradually afterward. Shake well. Dose, 4 to 7.5 c.cm. (or f3i-ij).

In epilepsy, tetanus, neuralgia, chloroform-narcosis, and in strychnine poisoning, amyl nitrite has been tried with gratifying results; in whooping-cough it has failed. Benefit results from its inhalation in neuralgic dysmenstrua, and it is recommended by Dr. Winterburn for the relief of after-pain. His practice is to saturate a small piece of tissue-paper with 5 or 6 drops of the nitrite and place it in a tightly-corked 8 Gm. (or 5ij) vial, from which the patient can inhale when the pain is severe. Professor Benedikt recommends a mixture of 5 parts of amyl nitrite with 10 parts of volatile oil of fennel, for the relief of angiospastic hemicrania. Five drops are to be put upon a handkerchief and cautiously inhaled. Amyl nitrite is beneficial in migraine dependent upon local vasomotor spasm.

In anæmic epileptics, the inhalation, immediately before a fit, may sometimes prevent the fit. The remedy should not be given to plethoric epileptics, nor to elderly people with brittle arteries. It is particularly adapted to those cases of epilepsy in which an appreciable interval occurs between seizure and convulsion. Dr. S. Weir Mitchell states that amyl nitrite may advantageously be employed as a means of diagnosis between undoubted *petit mal* and attacks simulating that disorder, but caused by temporary congestion of nerve-centres. In the latter class of cases amyl nitrite intensifies the

paroxysm. Sir Crichton Brown has found this agent specially serviceable in the *status epilepticus*.

Inhalation of amyl nitrite is serviceable in stimulating the heart in the event of sudden failure, which may occur in fatty heart or after hæmorrhage. It has proved beneficial in intermittent coryza. In intermittent fever it will avert or suppress the chill, but is without influence upon the hot stage.

In the treatment of epidemic influenza, or grippe, where pneumonia occurred as a complication, Dr. S. Solis-Cohen<sup>1</sup> had successful results from the administration, internally, of 5 drops of amyl nitrite in alcohol, ever three hours, associated with atropine sulphate, 0.0005 Gm. (or gr.  $\frac{1}{120}$ ), and strychnine sulphate, 0.003 Gm. (or gr.  $\frac{1}{20}$ ), every five hours; also, for a time ammonium carbonate, 0.65 Gm. (or gr. x), every hour, at first, afterward at longer intervals. Although recovery was delayed by infection with erysipelas, the patient made a good recovery.

In case of unpleasant, or serious, symptoms after the use of nitrite of amyl, the exhibition of ammonia by inhalation, by the mouth, or intravenous injection, and the hypodermic injection of atropine or ether (ethyl oxide) with cold water or ice-bag to the head, sinapism to the epigastri region, a mustard foot-bath, at the same time keeping the patient in the recumbent posture, will very soon be followed by relief.

**AMYL VALERIANATE**, Valerianate of Amyl, is an active preparation, which is regarded as a valuable hypnotic and antispasmodic. It is combined, according to Dr. W. F. Wade's formula, by taking 1 part of amyl valerianate to 19 of alcohol, to which is added amyl acetate in the proportion of 0.06 c.cm. (or *mj*) to 60 c.cm. (or *f̄ij*). Dose, 0.37 to 0.5 c.cm. (or *mvi-vij*). This dissolves cholesterol readily, and is considered better in cases of gall-stone than either chloroform or ether.

Amyl valerianate relieves the pain of hepatic colic and prevents recurrences. It has been found of advantage in muscular rheumatism and in dysmenorrhœa. It is useful likewise in relieving hysterical manifestations. Amyl valerianate is a colorless liquid of pleasant taste.

**AMYLENE HYDRAS**.—Amylene hydrate is tertiary amyllic alcohol (dimethylethylcarbinol).

**Pharmacology and Physiological Action.**—It is a mobile, colorless liquid, with a camphor-like odor. It boils at 102.5° C. (216.5° F.), and at 200° C. (392° F.) is decomposed into amylene and water. It forms compounds with chlorine, bromine, and with iodine. Oxidation converts it into acetic acid and acetone. Miscible with alcohol in all proportions, and is soluble in eight parts of water.

Harmack and Meyer state that amylene hydrate at first excites, but afterward successively paralyzes, all the nerve-centres. It likewise depresses the temperature. In medicinal doses, 3 to 4 c.cm. (or *mxlv-f̄ij*) it is said not to affect the respiration, the frequency of the pulse, or the action of the heart, but acts principally upon the cerebrum. In excessive doses it depresses the medulla and spinal cord, and causes death by respiratory failure. According to the experiments of Peiser, amylene hydrate diminishes the waste of nitrogenous tissue. He therefore regards it a

<sup>1</sup> Philadelphia Hospital Reports, vol. i, 1890.

particularly adapted to those cases in which an hypnotic is needed for prolonged use, and in which decided nitrogenous waste occurs.

**Therapy.**—It may be used as an antispasmodic in doses of 1 to 2 c.cm. (or  $\text{miv-xxx}$ ), given in capsules, in alcoholic solution (mixed with beer or wine), or with mucilaginous preparations. It has been used in insomnia and hysteria. In mental affections Dr. Hans Evensen regards amylene hydrate as somewhat uncertain, but finds it particularly useful in cerebral anæmia.

It has been given also in delirium tremens, and in nocturnal epilepsy. Nash coincided with Wildermuth as to the efficacy of amylene hydrate in frequent and severe attacks of epilepsy, especially where the bromides have failed. He thinks that *petit mal* and nocturnal epilepsy are much benefited by the drug. It has also been recommended for whooping-cough and to relieve the cough of phthisis. No dangerous after-effects have been observed from the use of this remedy.

### AMYLUM (U. S. P., B. P.).—Starch.

#### Preparations.

Glyceritum Amyli (U. S. P.).—Glycerite of Starch (10 per cent.). Local use.  
Glycerinum Amyli (B. P.).—Glycerin of Starch (about 12 per cent.).

**Pharmacology and Therapy.**—The official (U. S. P.) starch is the starch-grains obtained from the fruit of *Zea Mays* (Gramineæ). The British Pharmacopœia directs that starch be procured from the grains of common wheat, *Triticum sativum*; maize, *Zea Mays*; and rice, *Oryza sativa*. It is an important element of food, and forms a large part of rice, wheat, barley, arrow-root, and other commonly-used carbohydrates for administration to the sick. Starchy food should not be given to young infants, who have an insufficient saliva or intestinal juices to digest them, for they may undergo nutritive changes in the bowel and cause colic and diarrhœa. Starch is a fine, white powder, becoming adhesive when moist, and is a good application for burns or scalds, and for intertrigo, or chafing in infants. With boiling water the starch-granules swell and burst and a homogeneous mass results, which answers very well as a poultice for alleviating local inflammation. The glycerite is a useful application in some skin affections, though pure glycerin sometimes proves irritant, on account of its affinity for water. It is a convenient antidote to most corrosive poisons, when mixed with water. It is a test for free iodine, as it turns blue when brought in contact with this agent. Starch-water is made by mixing up a tablespoonful of starch with cold water to a smooth paste, to which a pint of boiling water is added, while stirring.

R. Aqua amyli .....	30	℥. ccm. or ℥j.
Bismuthi subnit. ....	2	Gm. or 3ss.
Tinct. opii .....	30 to	60 ccm. or $\text{miv vel x}$ .

M. Sig.: Inject into the bowel when necessary. Use in diarrhœa after each

### ANACARDIUM.—Cashew-nut.

**Pharmacology and Therapy.**—*Anacardium occidentale* (Terebinthaceæ) is a small tree, indigenous to tropical America, and naturalized in certain parts of Africa. The nut is inclosed within two shells, between which is contained an acrid, oily liquid, which turns black when in contact

with the air. The principal constituents of this fluid are **Anacardic Acid**, a white, crystalline substance, and **Cardol**, a yellowish or reddish oil.

The juice, or oil, is an active local irritant, and has been employed for the destruction of corns and warts, for the cure of obstinate ulcers, and ringworm. It has also been used as a topical agent in the treatment of leprosy. The tubercles and a portion of skin surrounding them are painted with the oil, which is then rubbed into the skin. After a little oozing a scab forms, and when it falls it is seen that the tubercle is diminished in size. The oil should not be applied to a surface of more than six inches square. In young persons and upon parts where the integument is thin the oil gives rise to violent irritation.

### **ANETHI FRUCTUS (B. P.).—Dill-fruit.**

#### *Preparations.*

**Oleum Anethi (B. P.).**—The Oil distilled from Dill-fruit. Dose, 0.03 to 0.18 c.cm. (or *mas-iiij*).

**Aqua Anethi (B. P.).**—Dill-water. Distilled from the fruit. This is a pleasant carminative and stimulant agent ordinarily employed to relieve flatulence or colic. Dill-water is an agreeable vehicle which derives its value from the volatile oil.

**Pharmacology and Therapy.**—Dill is the dried ripe fruit of *Anethum graveolens* (*Fam. Umbelliferae*), a native of Spain and the south of France. The seeds, as the fruit is commonly called, have a strong aromatic odor, less agreeable than fennel-seed, and a moderately pungent taste. The principal constituent is a pale-yellow, volatile oil, having a hot, sweetish-acid taste.

Dill-fruit has the property common to all aromatics, but is rarely used in this country. In flatulent colic of infants the oil can be given in doses of 0.06 to 0.18 c.cm. (or *mi-iiij*) on some sugar; the dose of the fruit to adults is from 1 to 4 Gm. (or gr. xv-3j).

### **ANHALONIUM.**—The dried tops of *Anhalonium Lewinii* (*Cactaceae*).

**Pharmacology.**—Mescal buttons, "pellote," have been used, in the religious ceremonies of the Indian tribes of the Southwest, as an intoxicant. Prentice and Morgan,<sup>1</sup> who investigated the physiological action, found that three "buttons" were usually sufficient to produce characteristic effects. Among these are hallucinations of vision, color-phenomena predominating, but with remarkable figures and forms. The mind was comparatively unimpaired, but the muscular system was much depressed. The pupils were dilated. The heart-action was at first slower and stronger, then rose to normal, and was never depressed. There was a sense of fullness of the stomach and occasionally nausea and vomiting. The passage of time was unnoticed, and insomnia existed for twelve to twenty-four hours; in this respect, and in the absence of exhilarating character from the visions, a sharp contrast is offered to *cannabis Indica*. Similar results were reported by Weir Mitchell. Several very toxic alkaloids have been isolated: **Anhalonine**, or **Pellotine**; **Mescaline**; **Anhalonidine**; **Lophophorine**; also a resinous substance, which appears to be an important constituent. Anhalonine, in decided doses, acts like strychnine as a convulsant and tetaniz-

<sup>1</sup> *Medical Record*, Aug. 22, 1896.

important in frogs. In man, small amounts act like opium, as a calmant, producing only weariness and temporary sleeplessness, in doses of 0.049 to 0.10 gm. (or gr.  $\frac{1}{10}$  to  $\frac{1}{10}$ ). After personal experience Dr. Havelock Ellis states that the phenomena of mescal intoxication are mainly a *saturnalia* of the specific senses, and chiefly an orgy of vision. He believes with Dr. Wm. Mitchell, that there is every likelihood that mescal will become popular. It certainly has a great future before it with those who cultivate the intoxicating drugs. At the same time it is of no little interest to the physiologist and psychologist.

**Therapy.**—The powdered buttons, fluid extract, and tinctures made from them have been used in the treatment of various conditions dependent upon nervous irritability, and with considerable success. In therapeutic doses (fluid extract *mss-j*, gradually increased to *mii-ijj*—or 0.025 to 0.20 gms.), it does not produce insomnia, but frequently removes its cause, and returns us to natural sleep; it has been of most use in symptomatic treatment, as in cases of nervous headache and cough, active delirium, mania, choreo-dystonia, and melancholia. It has also been used as a respiratory sedant in pneumothorax and angina pectoris. It has been recommended as an adjuvant to digitalis when used as a heart-tonic.

### ANIMAL EXTRACTS, SECRETIONS, AND SERUMS.

**Pharmacology.**—Various remedies of animal origin are now made use of in therapeutics. They contain certain complex organic compounds of iron, phosphorus, nitrogen, etc.; in some instances products of bacterial activity (ptomaines, toxins, antitoxins, etc.), and in others some internal secretion of normal glands or organs, which have been ascertained by experiment and observation to be available for the treatment of disease. They consist of extracts of organs, serums, and disease products. For instance, the extract obtained from the sheep's testicle by M. Brown-Séquard, and employed by him and others for the relief of organic and functional nervous disorders and certain constitutional diseases, owes its activity to and is described under the title of spermin hydrochloride, the virtue of testicular extract having been shown to depend upon the presence of spermin: a substance which is also contained in other glands, especially the pancreas.

**Physiological Action.**—The injection into the human body of extracts obtained from animal tissues may prove of service by modifying the constitution of the blood, or by supplying to it elements of which it stands in need. It is conceivable that, when the functions of certain organs, especially those concerned in nutrition and sanguification, are suppressed, the injection of the corresponding serums, secretions, or extracts derived from healthy animals may prove beneficial. Acting upon this theory, preparations representing muscular, nervous, cardiac, suprarenal, renal, and thyroid substance have been employed in practical therapeutics. As to the manner of formation of antitoxins, A. C. O'Sullivan holds that the organism stimulates the cells of the body to produce the antitoxin, and that it is not the blood-cells, but the tissue-cells, that do so. When we come to consider what the particular cells are which produce antitoxin, we are met with great difficulties. Tetanus affords the most promising field for solving the question, because it is evident that tetanic poison acts directly on the central nervous system. Wasserman has shown that an emulsion of

the brain of an animal which is sensitive to tetanus has strong antitetanic properties, while if the animal has been poisoned by tetanus its brain loses this power. Here we have a case of neutralization of antitoxin by toxin and this, not in the serum, but in the brain-cells themselves. Other experiments tend in the same direction, and we may say that in the case of tetanus, at all events, the cells of the brain, which are those attacked by the toxin, are also those which produce the antitoxin. It is easy to see that such a thing is extremely hard to prove or disprove in other diseases where no specific cells are especially attacked, and, of course, the view goes counter to all the work of Metchnikoff and his pupils on the protective action of the wandering cells of the body. As to the second question, how do the antitoxins act? the facts which have been established are the following: 1. The toxin enters into chemical, or molecular, combination with the cell-protoplasm, and when in this combination is neutralized: *i.e.*, is innocuous for other cells. 2. The toxin enters into chemical combination with the antitoxin, and when in this combination is neutralized. 3. The antitoxin is produced by the cell, and is thrown off by the cell into the blood. 4. The cells which produce the antitoxin are the same cells as those which combine with the toxin. We are almost forced to the conclusion that the element in the blood which proceeds from the cell and neutralizes the toxin in the blood is the same element which neutralizes the toxin in the cell. And so we arrive at the first part of Ehrlich's hypothesis: "That element or group of atoms in the cell-protoplasm which combines with the toxin when it is thrown off by the cell into the blood is the antitoxin." But we have seen that it is the action of the toxin on the cell, and that only, which stimulates the cell to produce the antitoxin; that is to say, when any of the combining groups of the cell-molecules are taken up by the toxin, they are replaced by the cell and replaced in very much increased numbers, as usually happens in tissue-regeneration. Ehrlich supposes that these combining groups, when they become numerous, lose their hold on the cell-molecules and pass over into combination with the molecules of the fluid in which the cell is bathed, and so get into the blood, and that the injection of a given quantity of toxin will stimulate the cells to produce many hundred equivalents of antitoxin. But there is more than this, for toxin does not merely combine with cell-protoplasm, it also destroys it. There is plenty of evidence to show that the part of the toxin-molecule which poisons is not the same as that which first combines with the cell-molecule. The toxins of diphtheria and tetanus, when kept in the liquid state, gradually lose their toxic power down to a certain point, but they do not lose their power of combining with antitoxin. It takes exactly the same quantity of antitoxin to neutralize a given quantity of toxin, no matter how long it has been kept or how weak it may have become. In Ehrlich's terms, the haptophore group in the toxin-molecule remains unaltered, while the toxophore group is changed. Thus, the toxophore group is much less stable and less rapid in combining than the other, and hence is probably much more complex. Many facts connected with the infectious diseases receive a ready explanation by means of this hypothesis: *e.g.*, what is a naturally-immune animal? A naturally-immune animal is one whose protoplasm-molecule contains few or none of the groups capable of combining with the toxin in question. Again, the incubation-period of a disease, which appears in poisoning

time as well as by the living organism, is the time in which it takes the combining group to get to work after the toxin has been anchored on the combining group by its combining group. Again, it is found that the production of immunity and of antitoxin, although the cause of both is the same, do not at all run parallel to one another in amount. An animal in the early stages of immunization may be hypersensitive to the poison while its blood is full of antitoxin; and, on the other hand, in the later stages animals are often found to be practically completely immune, while their blood yields no antitoxin at all.

**Therapy.**—1. *Organic Extracts.*—A glycerin-extract of gray matter of sheep's brain has been used by M. Constantin Paul with encouraging results in neurasthenia, locomotor ataxia, and senile debility. Dr. Dana has obtained amendment in the same class of cases from the use of a glycerin brain-extract, and instances particularly a case of rapidly-advancing bulbar palsy in which marked improvement was effected. Seven months after the beginning of the treatment no trace of the disease remained except slight fatigue after long conversation or mastication. In regard to some of the cases it is specially stated that the injection of water had been ineffectual, and that the amendment was not due, as thought by some critics, to suggestion. Dr. Julius Althaus, of London, has also given favorable testimony concerning the effect of injections of nervous substance. The brain-extract, which he terms **Cerebrin-alpha** (in order to distinguish it from the alkaloid cerebrin obtained from brain-matter), was prepared by mixing 1 part, by weight, of rabbit's brain with 1 part of glycerin and a 1-per-cent. carbolic solution. The extract of the cord is made in the same manner and is called **Myelin-alpha**, to avoid confusion with the myelin which is one of the constituents of the central nerve-fibre. Dr. Althaus found that the extracts were of no benefit when swallowed, as they were decomposed by the gastric juice. When injected into the substance of muscle they were active in the average dose of 0.30 c.cm. (or mv). Both extracts seemed of equal service in cerebral and spinal diseases. They were successful in locomotor ataxia, progressive muscular dystrophy, and in some maladies and conditions mainly characterized by loss of nerve-power. In functional nervous disorders good results were obtained from the use of these extracts alone, but in organic affections they seemed to act chiefly as adjuvants to other treatment. They were useful also in promoting convalescence from acute diseases and in relieving the disabilities of old age. From his experience, Dr. Althaus also dissents from the idea that the results are simply due to suggestion.

Babès has employed an emulsion made by mixing normal brain and spinal cord with broth in the proportion of 1 part of nerve-tissue to 5 of broth. About 4 c.cm. (or f3j) of the mixture was injected and proved useful in cases of epilepsy, melancholia, obstinate insomnia, chronic headache, neuritis, and other disorders of the nervous system.

**Spermin hydrochlorate or hydrochloride**, according to Professor Poehl and Senator, is the active agent in the orchitic fluid in producing the physiological phenomena chronicled by M. Brown-Séquard, in his communication to the French Academy. It is obtained from the testicular fluid of the lower animals by a carefully-conducted process, which protects the product from contamination by infectious micro-organisms and isolates it chemically pure, as a salt of hydrochloric acid. Spermin is a crystalline

substance, soluble in water and absolute alcohol, but insoluble in ether, absorbs water and carbonic acid from the atmosphere. From experiments upon rabbits, Dr. Stockwell, of Detroit, declares that this agent produces powerful and prolonged stimulation of the sympathetic nervous system most strongly manifested through the spermatic plexus. It stimulates the vasomotor centre, increases blood-pressure, and aids oxidation. In toxic doses it induces distressing tetanic spasm and interferes with respiration and spasmodic fixation of muscles, including the diaphragm. Cutaneous hyperæsthesia and increased muscular activity were observed. Sexual erections were marked in many instances. The hypodermic injection of an extract from the recent testicles of mammals was found by Brown-Séquard<sup>1</sup> to have a stimulating effect upon nutrition, and to be especially active as restorative in failing nutrition due to old age. Dr. H. P. Loomis, of New York, found that the injections, "as claimed, produce nutritive modification in the tissues of elderly men, due, probably, to stimulation of the nervous centres." In tuberculosis this substance has also been recommended. Marked improvement has been reported as occurring in some cases of leprosy after the injection of testicular fluid. In locomotor ataxia and various forms of paralysis the same treatment has been followed by amendment. Several hundred cases of tabes have been treated by this method by different observers and in a very large proportion the symptoms of the disease were unmistakably relieved. In hysteria, on the contrary, little or no good has resulted from the injections. They were also found inefficient in epilepsy. In delirious epilepsy and in various forms of insanity the practice has been followed by improvement. In anæmia, also, good results have been obtained. Brown-Séquard claimed that testicular fluid had been used with decided advantage in about 100 cases of cancer, in nearly all of which cessation of pain and hæmorrhage and cicatrization of ulcers demonstrate the efficacy of the method which he advocated. He also asserted that he was cognizant of cases of disappearance of uterine fibromata and of morbid deposits of connective tissue in the heart, arteries, and muscles. It is stated by those who have practiced this method that better results have, as a rule, been obtained in organic than in functional diseases. In chorea, however, Professors Ollier and Tessier and other writers have witnessed rapid improvement in consequence of these injections. Notable amelioration has, in a large number of cases of tuberculosis, followed the use of these injections. Professor Poehl, of St. Petersburg, is of the opinion that the injection of spermin is of service in Asiatic cholera, particularly in the early stage of the disease.

The injections of an extract were followed by relief in cases of insomnia, hypochondria, feeble heart, cardiac asthma, and spinal irritation as reported by Dr. H. C. Brainerd, of Cleveland.

The most decided results from the use of animal tissues or extracts have been observed following the administration of **Thyroid** preparations, especially in the treatment of myxedema.<sup>2</sup> This disease depends upon

<sup>1</sup> See paper by the author on "The Case of Dr. Brown-Séquard," *The Times and Register*, Nov. 30, 1889.

<sup>2</sup> See lecture by Dr. D. Uspenski, on "Brown-Séquard Fluid in Tuberculosis," in *Deutsche medizinisch-Zeitung*, Dec. 29, 1890.

<sup>3</sup> See report of London Clinical Society, *Lancet*, Feb. 4, 1893; also the *British Medical Journal*, Feb. 4, 1893.

of the functions of the thyroid gland. Dr. Murray, of New Castle, England, demonstrated that grafting of a healthy thyroid upon the body of the patient or the injection of an extract made from the gland is followed by remarkable and rapid amelioration. Thyroid extract is made by cutting the gland into thin slices, bruising, and adding about 4 c.cm. (or f3j) each of glycerin and sterilized water to each gland. After standing for twenty-four hours the fluid, which is thick and of a dull-red color, is strained. The quantity of the extract thrown in is 1.55 c.cm. (or mxxv), and the operation is repeated once or twice a week, according to the severity of the case and the rate of improvement. At the end of a month or six weeks the condition is generally been so signally benefited that the procedure can be practiced at longer intervals. The extract is prepared by mincing the gland, freshly taken from a healthy animal, maceration, and filtration under pressure. The operation and injection should be made with every antiseptic precaution. The numerous favorable cases, in all stages, which have been reported, leave no room for doubt that in this method we have acquired an effective weapon against a disease which had been unamenable to any other mode of treatment.

It has been demonstrated by Dr. Hector Mackenzie, of London, and Dr. H. L. Fox, of Plymouth, that the administration of the thyroid or a glycerin-extract of the gland, by the mouth, is, perhaps, as efficacious as the injection. The gland may be given raw, finely chopped, seasoned, and added to beef-teen, or it may be lightly fried. Thorough cooking would probably destroy its virtue. It is not necessary that a large quantity of the remedy should be taken. Half a gland or, at most, one gland, or an equivalent quantity of the extract, twice a week, is sufficient, and if a proper amount is attended vomiting and increased frequency of the pulse are produced. Caution must be enjoined as regards the sudden resumption of physical exertion when improvement takes place. A sudden or excessive strain upon a weakened heart may occasion syncope.

**Glandulæ Thyroidæ Siccæ** (U. S. P.).—Desiccated Thyroid Glands. *Thyroidium Siccum* (B. P.). Dry Thyroid is "the cleaned, dried, and powdered thyroid glands of the sheep (*ovis aries*), free from fat." **Liquor Thyroidæ** (B. P.) is a liquid that contains the products of the fresh and healthy glands in a 0.5-per-cent. phenol solution with glycerin. The dose of the powder is 0.06 (or gr. j), given in capsule, three times a day, to be gradually increased to 1 Gm. (or gr. xv). The dose of the liquid is 0.30 to 1 c.cm. (or ʒv-xv).

Dr. S. Solis-Cohen has observed that thyroid extract has a very decided diuretic power, and has employed it with satisfaction as a diuretic in a patient with no apparent disease of the thyroid gland. He speaks also of a case of acromegaly in which the administration of the same remedy alleviated headache, and suggests that it may be of service in a recent case by preventing or retarding enlargement of the pituitary body.

Hortoghe, of Antwerp,<sup>1</sup> has found that the continued administration of thyroid extracts exerts a depressing effect upon the functions of the pelvic organs and a stimulating effect upon the lacteal glands; in every case hemorrhagia was cured by them and menstruation became normal, while the lacteal secretions were remarkably increased. He also recommends it for congestive disturbances of the pelvic organs.

<sup>1</sup> *Bull. de l'Acad. de Méd. de Belgique.*

In some forms of amenorrhœa, especially of the congestive variety thyroid extract in small doses may be employed with asserted good results. At a recent meeting of the Liverpool Medical Institution Dr. Glynn relates that in young girls in whom temporary amenorrhœa, or a delay in menstruation in consequence of slight developmental changes occurred, the administration of thyroid extract in doses of 0.03 Gm. (or gr. ss) at bedtime proved sufficient to re-establish or to institute the function of menstruation.

Byrom Bramwell and Arthur T. Davies have reported several cases of stubborn psoriasis and eczema which were cured by thyroid feeding or the use of tablets of thyroid extract. Bramwell was led to make use of this agent on account of its favorable effect upon the skin in myxœdema.

Bruce<sup>2</sup> reports his observations with thyroid extract in twenty-three cases of insanity, including mania, general paralysis; puerperal, lactational, climacteric, syphilitic, and alcoholic insanity; he found that, to obtain benefit from this treatment, it was necessary in some cases to give massive doses (4 Gm., or gr. lx, daily). Its administration is contra-indicated in cases of mania where the excitement is acute, the loss of body-weight rapid and danger of exhaustion from malassimilation of food; but a course of the thyroid treatment led to ultimate recovery, where the recovery had been protracted, or where a tendency to drift into dementia existed, and especially in the insanity of the adolescent, climacteric, and puerperal periods.

From an investigation of the chemical composition of the thyroid gland Dr. Frederick Gourlay states that it contains no ferment capable of dissolving mucin, that the only proteid which can be obtained from it is a nuclealbumin, and is inclined to believe that its usefulness in the treatment of myxœdema is due to the presence of the nucleo-albumin. He asserts, also, that the secretion of the gland does not consist of mucin. The dried and powdered gland has also been employed under the name of **Thyroidin**. The powder is of a grayish-yellow color and a peculiar odor. It is thought to be better tolerated than the gland. The virtues of an entire gland of medium size are said to be represented by 0.59 Gm. (or gr. ix) of the powder. The efficacy of the gland does not seem to be lost by drying. The powder has been usually administered in the form of pills in daily doses of 0.10 to 0.2 Gm. (or gr. iss-ivss), which amount may be gradually doubled. Dr. Byrom Bramwell has derived the same results from the use of this preparation as from the gland itself or its extract.

Dr. J. D. Menzies, of the British navy, reports several cases in which thyroid tablets were of advantage in precocious malignant syphilis, specific medication being suspended. Dr. N. Yorke-Davies asserts that, in the treatment of obesity, the use of these tablets is of great assistance.

According to experiments and extended clinical observations of Rorge thyroid extract, though often efficacious, is still not a suitable remedy for a case of obesity. The advantages claimed for the method are that it effects positive results, and this without in any way restricting the patient's diet or his ordinary habits of life as regards exercise and occupation,—matters often of great importance in private practice; but certain well-marked subjective disturbances—such as palpitation, restlessness, tremor, and insomnia—go hand in hand with the improvements, and give the individual more or less

<sup>2</sup> *Journal of Mental Science*, No. xli, 1895.

discomfort. Thyroid tablets are sometimes used by patients without medical advice, and commonly for the reduction of adipose. G. Carrière (*Nord Médical*, Lille, November 1, 1905) has seen six cases of sudden angina, pulmonary edema, acute asystolia, from such unauthorized use of the remedy. The symptoms were violent and alarming, but the suppression of thyroid medication banished them completely and permanently. Some fatal cases have been reported. The toxic effects from this agent are grouped together under the general title of **Thyroidism**. The principal contra-indications to be found in constant, greatly-increased nitrogen excretion, an index of pathological albuminous breaking-down, and which cannot be terminated by simply cutting off the drug, but continues for an indefinite length of time after its administration has been stopped.

**Thyreoglobulin** constitutes about 10 per cent. of the gland (wet) and contains the iodine constituent of the thyroid in the original form it has in the gland. According to Oswald,<sup>1</sup> thyreoglobulin was found to have the same influence on the excretion of nitrogen in animals in metabolic equilibrium as the entire gland. His view is confirmed by its action in two cases of myxedema. He obtained from thyreoglobulin a product resembling iod-thyrin (supposed to be the bearer of the specific qualities of the gland), but containing 14.3 instead of 9.3 per cent. of iodine.

Dr. Charles Macalester, of Liverpool, used preparations of the **Thymus Gland** with advantage in cases of pseudohypertrophic paralysis and general lymphadenoma.

Méhuiez, in ten cases of goitre and one of Graves's disease, obtained encouraging results from the use of thymus glands. He gave at one dose 10 or 15 Gm. (or 5ii ¾-iv) of raw sheep's thymus, finely cut up and spread upon toast. The quantity was gradually increased to 25 Gm. (or 5viss).

**Nephrin**, a saline, glycerin extract of the cortical substance of the kidney, has been proposed as a remedy in cases of nephritis. Subcutaneous injections of nephrin will, it is thought, prove of service in the treatment of uræmia. M. Dieulafoy has described the results of his experimental use of nephrin in an aggravated case of uræmia. The patient suffered with suppression of urine, œdema of the lung, copious perspiration, and diarrhoea, an abundance of urea being contained in the excreted fluids. After injections of nephrin, urine was again secreted, sweating of urea ceased, the mind cleared, and the patient was able to speak. Further clinical experiments were tested made by Teissier and Fraenkel. These observers found that the injection of a glycerin-extract of sheep's kidney in patients suffering from uræmia augmented the power to excrete toxic substances in the urine. The subjects experienced a sense of general amelioration. Albumin, at least in some cases, disappeared from the urine during the days when the injections were given. There was little or no influence upon the quantity of urine passed.

**Glandulæ Suprarenales Siccæ** (U. S. P.). Desiccated Suprarenal Glands, are "the cleaned, dried, and powdered suprarenal glands of the sheep (*Ovis aries*), or ox (*Bos taurus*), freed from fat." This substance has been found to possess extraordinary astringent powers upon the smaller blood-vessels, causing intense anæmia when applied to the surface of mucous membranes. The adrenal extract, owing to its convenience and activity, is

<sup>1</sup> *Munch. med. Woch.*, 1890, xxxiii.

largely used in order to produce bloodless operations in nasal surgery. Extensive operations upon the septum, or upon the turbinated bodies, are now performed without hæmorrhage by means of a preliminary application of a solution, which may be prepared as follows:—

R. Glandul. suprarenalum siccæ.....	4	Gm. or 3j.
Acid. boric. ....	1	Gm. or gr. xvj.
Cinnamon-water .....	15	c.cm. or f3iv.
Camphor-water (hot) .....	30	c.cm. or f3j.
Distilled water (hot) .....	q. s. ad 60	c.cm. or f3ij.

Macerate for four hours, then filter.

Dr. E. A. Peters<sup>1</sup> has used a 10-per-cent. solution of the suprarenal extract for the pain in carcinoma of the mamma, stricture of the œsophagus, tuberculosis of the larynx, and periodontitis. In none of these patients was there any apparent deleterious effects.

Suprarenal extract has also been used in Addison's disease, with gratifying results in some cases, beginning with 0.13 Gm. (or gr. ij) three times a day and gradually increasing until 1.30 Gm. (or gr. xx) are taken daily. extract, for the pain in carcinoma of the mamma, stricture of the œsophagus, tuberculosis of the larynx, and periodontitis. In none of these patients were there any apparent deleterious effects.

In 1901, Takamine and Aldrich, working independently, isolated the active principle of the suprarenal gland, **Adrenalin** ( $C_{10}H_{15}NO_3$ ), which occurs as a light, white, microcrystalline powder, of a slightly-bitterish taste, leaving a numbed feeling on the spot of the tongue where it is applied. The names **Epinephrin** and **Suprarenin** have been applied to similar derivatives, by Abel and von Fuerth. Experiments showed that a drop of an aqueous solution in the strength of 1 to 10,000 blanched the normal conjunctiva within thirty to sixty seconds. Dr. Emil Mayer<sup>2</sup> gives his results with the use of this agent in thirty-five rhinological operations. He found that an application of a 1 to 1000 solution produced blanching of the tissues within a few seconds, the operations being either bloodless or attended with very little hæmorrhage, and in no instance was there any constitutional disturbance.

Dr. E. Fletcher Ingals<sup>3</sup> suggests that, if adrenalin is dissolved in a normal salt solution, it lessens the pain and smarting. He has found that a 1 to 5000 in normal salt solution acts with the same rapidity and intensity as the solution made with 2 Gm. (or gr. xxx) of the desiccated gland to 30 c.cm. (or f3j) of water. In acute coryza, acute laryngotracheitis, and acute laryngitis this agent has promptly reduced the swelling and congestion, and in a few days the patients were well. In order to prevent fungous formations in these solutions Dr. Ingals has suggested the following: 1 part of adrenalin to 5000 of liquid containing 0.50 Gm. (or gr. viij) of boric acid, cinnamon, and camphor-water, of each, 7.5 c.cm. (or f3ij); and distilled water, 15 c.cm. (or f3ss).

Abel<sup>4</sup> gave the name of **Epinephrin** to a body he isolated from adrenal extract, and to which he attributes the well-known effects on blood-pressure of this substance. From the reactions of epinephrin it would seem

<sup>1</sup> *Lancet*, March 2, 1901.

<sup>2</sup> *Philadelphia Medical Journal*, April 27, 1901.

<sup>3</sup> *Journal of the American Medical Association*, April 27, 1901.

<sup>4</sup> *Zeitschr. f. physiology. Chemie*, xxviii, p. 318.

belong to the group of animal alkaloids, and it is either identical with epinephrin, or is a derivative from it. It is obtained from aqueous extracts of the adrenals by the action of benzoyl-chloride, and from the benzoyl compound thus formed Abel isolated the free base, and made a picrate, bisulfate, hydrochlorate, and hydrobromate, as well as a triacetylnephrin and a benzylhydrazin derivative. Its various decomposition reactions seem to place to epinephrin a place among the pyrrol or skatol bases; treatment with dilute alkalis forms a dark pigment, which the author denominates as epinephrinic acid, and a base of coniin- or pyridin-like odor. On fusion with potassium, appreciable quantities of skatol result.

The free base cannot be produced except at the expense of its physiological efficacy. On the other hand, most of its salts react on the system very energetically; they have a slightly-bitter taste, cause a partial anæsthesia of the tongue, and produce a local vasoconstriction. When introduced into the circulation, small doses at first excite and then centrally depress respiration; heart-failure follows larger amounts. The insolubility of the preparation, however, which increases on keeping, unfortunately renders it of less avail therapeutically than might otherwise be expected; since the dose is far above that required to produce the physiological action. Uroerythrin, the normal pigment principle of the urine, in part exhibits similar properties to epinephrin, and the probability of a relationship between the two bodies seems very great.

**Extractum Pancreatis.**—Many cases of diabetes are dependent upon or at least associated with disease of the pancreas. It has been demonstrated by Minkowski and von Mering that removal of the pancreas causes glycosuria, irrespective of the nature of the diet. If, however, only a small proportion of the gland is left behind, diabetes does not develop. Furthermore, when pieces of the pancreas taken out of the abdominal cavity were grafted into the abdominal wall the advent of diabetes was prevented. Minkowski was led to believe that the pancreas performed some function indispensably necessary to the normal transformation of sugar within the organism. Professor Lepine has ingeniously argued that the pancreas generates a ferment which is necessary to assimilation of amylaceous foods. In view of these facts and hypotheses it was thought that the ingestion of the pancreas or preparations derived from that viscus might prove serviceable in the treatment of some forms of diabetes. Clinical experiments have been accordingly made in that direction and the results, which, unfortunately, fall far below expectation, have been published by Mackenzie, Hale-White, Neville, Wood, Battistini, and N. S. Davis (Jr.). The patients subjected to this method have generally experienced improvement of subjective symptoms, and some have gained in weight. The quantity of urine was not, as a rule, lessened; in one case reported it was even increased. The specific gravity of the urine were uninfluenced, and in most cases the amount of sugar was not materially lessened. In one case ingestion of raw pancreas was followed by severe erythema, accompanied by fever. We may, nevertheless, agree with the conclusion of Mackenzie: "For myself I would rather find an improvement in the general condition of the patient, increased strength, diminished thirst, and diminished quantity of urine as a result of treatment, than a diminution of the amount of sugar in the urine without such improvement." It is evident that liquor pancreaticus is no specific, and the effects in these cases are encouraging enough to induce me to make

further trial of it, and it is possible that in cases of true pancreatic diabetes the benefit might be greater."

The United States Pharmacopœia recognizes as official **Pancreatinum**: a powder which consists of the enzymes naturally existing in the fresh pancreas of warm-blooded animals. The British Pharmacopœia contains **Liquor Pancreatis**: a liquid containing the digestive principles of the fresh pancreas of the pig. These preparations are used mostly as digestive agents, especially in those diseases and conditions where starch and fat are imperfectly digested (see **Pancreatinum**). As these preparations contain the active principles of pancreas, and are more palatable than the raw gland, they may be administered in those cases of pancreatic diabetes where irritability of the stomach is a prominent feature. The injection of pancreatin into malignant growths has been recently advocated.

An extract prepared from the **Parotid Gland** has been used in doses of 0.13 to 0.32 Gm. (or gr. ii-v) in some of the functional disorders of the pelvic viscera, especially ovarian neuralgia, with gratifying results. Improvement has also been noted in acromegaly after the use of an extract from the **Pituitary Gland**; and preparations of **Cardiac Tissue** have been injected hypodermically for the relief of weak heart.

**Bone-marrow** has been given with decided advantage in anæmia by Dr. J. Dickson Mann, of Manchester, and Professor Fraser, of Edinburgh. The part which marrow performs in the development of red corpuscles allows us to believe that in this substance we have gained a valuable remedy. Dr. Mann thinks that, as the tissue-forming power is more active in young than in old animals, the bones of the former are preferable as a source of marrow-extract. The extract which he employed was made from the heads of long bones of animals freshly killed, together with other portions of bone which contain red marrow. The bones are broken into small pieces and digested in glycerin with frequent agitation. Several days are required to accomplish complete extraction. The result, after filtration, is of a red or reddish-brown color and has no unpleasant taste or odor. It may be given in teaspoonful doses once or twice a day, either by itself or spread between thin slices of bread. Dr. Mann gives the results of a case of hæmophilia in which extract of bone-marrow was employed. A boy had been repeatedly treated for attacks of hæmorrhage which had left him the subject of pronounced anæmia. After a few weeks of treatment by bone-marrow a marked increase in the number of red corpuscles had occurred and his face acquired a healthy color. The same result was obtained in anæmia from other causes. Professor Fraser's case was one of pernicious anæmia, which had lasted for about four months, when the patient entered the hospital. Treatment by means of iron and arsenic, both alone and combined, was altogether ineffectual, and the proportion of red globules and hæmoglobin steadily fell. After the administration of bone-marrow—which was given, uncooked, by the mouth—improvement was almost immediate, the quality of the blood began to change, and at the end of six months the man was practically in a normal condition. Dr. W. G. Bigger has published the history of a case of leukæmia, which was apparently cured by the use of bone-marrow, given raw, spread upon thin slices of bread, and produced a remarkable improvement in the symptoms of the disease. At the end of several months the boy was reported as perfectly well and the spleen of normal size.

2. *Scrums and Antitoxins*.—**Blood** has been used as a restorative for

many years, both by the stomach and by transfusion. Solares strongly recommends the serum from the blood of bullocks as a nutritive agent in wasting disease, especially in children. He considers it superior to muscle-extract in tuberculosis. It may be given by the mouth or the rectum. An interesting field of investigation relates to the employment of **Blood-serum** as a bactericidal agent and to the modification of the blood by means of bacterial products and the production of immunity or cure. The fundamental principle is the alteration of the serum in such a manner as to render it destructive to certain specific bacterial products. This method of treatment has been applied experimentally to several dangerous infectious diseases. Tetanus was one of the first maladies to be thus studied. Behring has conducted a series of experiments with a view of first rendering an animal immune to tetanus by inoculation with the toxin elaborated by the bacillus of that disease, and, secondarily, utilizing the serum of the immunized animal as a curative remedy for the established disease in another animal or human. Immunity is secured by successive injections with the toxin of tetanus on gradually-increasing doses. He believes that he has proved that injections of the immunized serum into the subjects of tetanus will cure that disease. The quantity of the modified serum must bear a certain proportion to the body-weight; so that much more is required for men than for small animals. Dr. Behring succeeded in preparing a standard serum of **tetanus antitoxin**. The longer the stage of incubation and the more advanced the course of the malady, the more favorable is the effect of the antitoxin. A number of cases in the human subject have been reported in which recovery appeared to be due to the employment of this method. The antitoxins are said to be in themselves harmless. In one of the successful cases the period of incubation was only six days. Dr. Joseph F. Hobson, of Chicago, Ind., reports the successful treatment of a case of tetanus, which developed on the tenth day after a compound fracture of the tibia. An injection of 10 ccm. (or  $5\frac{1}{2}$  i.) of the serum was given, and repeated at intervals of four to six hours for the next five or six days, when, owing to improvement, they were given with less regularity. Besides the serum, atropine hydrate, 1 Gm. (or gr. xv), and hyosine hydrobromide, 0.0006 Gm. (or gr.  $\frac{1}{1000}$ ), were given every four hours; also morphine sulphate hypodermically, 0.016 Gm. (or gr.  $\frac{1}{4}$ ), was given about four times daily when the patient was sleepless or nervous. The local wound was not laid open, as it appeared healthy. Recovery followed, the serum being discontinued on the tenth day. These procedures and their results have not failed to meet with adverse criticism, but in view of the inadequacy of former methods the path of inquiry is certainly legitimate, and it is probable that it will lead to an effectual means of combating a severe disease. The antitoxic serum is now also prepared in a dry state and sent out in tubes containing 4 or 5 Gm. (or  $5\frac{1}{2}$  i.): a quantity rather larger than the minimum dose regarded as curative in the case of a man. The dose varies according to the severity of the symptoms, and is repeated for several days in smaller quantity. The dried serum is to be dissolved in distilled water and subcutaneously injected. Several cases of recovery from tetanus of traumatic origin have been reported, in which intracerebral injections of antitoxin were given, in connection with other treatment. Roux and Bordeaux, from experiments at the Paris Pasteur Institute, demonstrated that the tetanic toxin is extracted from the blood and is fixed by the nerve-cells,

while the tetanic antitoxin, when injected into animals, remains in the blood; so that the antidote does not come in contact with the poison, and the two substances, though so near to each other, fail to meet. This explains why, in man as well as in animals, the subcutaneous and intravenous injections so often fail, for when they are resorted to the nervous system, as pointed out also by Dr. George G. Rambaud, has already fixed a smaller or greater quantity of the toxin, and while the antitoxin, thus administered, neutralizes the toxin circulating in the blood and limits the poisoning, it does not reach that which is attached to the cerebral or spinal cells. Of 45 tetanized guinea-pigs, treated with intracerebral injections, 35 recovered; of 17 others, treated with simple subcutaneous injections, only 2 survived; of 17 not treated with antitoxin at all, all died.

The technique of the operation in man is simple. After the removal of a small button of bone by a trephine ( $\frac{1}{4}$  inch), the intracerebral injection is made, into a neutral area, such as the forepart of the frontal lobes. The quantity of the serum injected is small (5 to 6 c.cm. of a concentrated serum made by drying 10 parts and thus redissolving in 5 parts) by the slow introduction of which any undue compression is avoided. In addition to the intracerebral injection, it is necessary to give antitoxin intravenously or subcutaneously for a few days, so that thereby the toxin circulating in the blood and any that may later be secreted at the site of injury, may be neutralized before it can affect the nervous centres. Out of 9 cases thus treated, collected by Rambaud, 4 recovered and 5 died. Successful cases have been likewise reported by Dr. Charles A. Church, of Passaic, N. J.; Dr. E. Forgal, Montpellier, France; and Dr. Semple of the Army Medical School at Netley, England.<sup>1</sup>

**Serum Antidiphthericum (U. S. P.).**—Diphtheria Antitoxin. This is a fluid separated from the blood of a horse, *Equus Caballus*, L., immunized through the inoculation of diphtheria toxin. It should be kept in sealed glass containers, in a dark place, at temperatures between 4.5° and 15° C. (40° and 59° F.). Behring originally obtained a curative serum from the blood of sheep which had been rendered immune to diphtheria. This serum has been clinically employed by Heubner, Henoch, von Bergmann, Kossell, and other observers with encouraging results.

Highly-satisfactory results are obtained from the official serum, which is now universally made from horse-serum. Diphtheria antitoxin of good quality is now manufactured in this country by many municipal laboratories, also by H. K. Mulford & Co., of Philadelphia; Parke, Davis & Co., and Frederick Stearns & Co., of Detroit, and others.

The use of diphtheria antitoxin is not altogether free from accident. The injections may occasion erythema, urticaria, fever, swollen glands, arthritis, hæmaturia, and albuminuria. They have also been thought to favor an increased tendency to paralysis. Several deaths have been reported directly following an injection of antitoxin. Owing to the precautions taken at present in the manufacture, such accidents are now extremely rare. The usual custom is to administer a maximum dose once daily (1000 to 1200 units), but Dr. John H. Musser advocates giving smaller doses (500 units) and repeating them every four or six hours, according to effect. Accumulating experience having shown the safety of this agent, larger doses are now

<sup>1</sup> *British Medical Journal*, Jan. 7, 1899.

administered. The ordinary dose given by some<sup>1</sup> is 2000 units, and this may be repeated every three hours in a severe case. Every care should be taken to obtain fresh antitoxin and to sterilize thoroughly the hypodermic needle and place of injection, which is usually in the lumbar region, or buttocks, or between the shoulders, or under the skin of the abdominal wall. The guiding principle in the administration of the serum is that it must be given until the characteristic effects are produced, namely: shriveling of the false membrane, diminution in nasal discharge, correction of fetid odor, and general improvement in the condition of the patient.

Edwin Rosenthal<sup>2</sup> has taken much pains in obtaining statistical information respecting the mortality records in cases of diphtheria, and with this end has obtained reports from one hundred and fifty-seven cities, in the United States, having organized bureaus of health. A summary of the results is as follows:—

Number of cases previous to the serum period, 182,256, with a mortality of 38.4 per cent. Number of cases since the antitoxin period, 132,548, with a mortality of 14.6 per cent. The latter were not all treated with serum; in computing those cases treated with the serum alone the mortality was 9.8 per cent.

J. Morris Turner<sup>3</sup> records his experience of the treatment of diphtheria in the Children's Hospital, Brisbane, and compares the results obtained since the injection of antitoxin was begun in that institution with those observed in the same hospital in the preantitoxin period, from July, 1889, to January, 1895. As regards laryngeal cases, in the author's experience an average mortality of 59.2 per cent. for the preantitoxin period has been reduced to an average mortality of 18.6 per cent. since the use of antitoxin. During the same periods, whereas formerly only 8.4 per cent. of the laryngeal cases recovered without operation, since the introduction of antitoxin an average of 38.4 per cent. have recovered without operation. As regards operation cases alone, whether intubation or tracheotomy, or both, the average mortality of 65.7 per cent. for the preantitoxin period has been reduced to an average of 28.4 per cent. for the antitoxin period. The author states that in the five years that have elapsed since the introduction of the use of antitoxin, "the diminution in the hospital mortality of diphtheria has been nothing short of marvelous to all but a few who had made themselves acquainted with the thorough and unimpeachable experimental basis on which the new treatment had been based." He emphasizes the importance of its early administration, and concludes that, with certain necessary qualifications, such as the occasional difficulty of diagnosis during the early stages, "no child ought to die of diphtheria."

**Pneumonia Serum.**—Drs. G. and F. Klempner recommend a curative serum for croupous pneumonia. Immunity in rabbits was produced by injections of saliva from patients, a glycerin extract of pneumococci, and, under certain conditions, bouillon-cultures. Immunized serum acts with great certainty when injected directly into the blood-current, and is believed to neutralize the poisonous products of the pneumococci. These investigators conclude that "we have in the serum of immune rabbits, the poisonous

<sup>1</sup> *New York Medical Journal*, November 14, 1903.

<sup>2</sup> *Medical Press*, Sept. 19, 1900.

<sup>3</sup> *International Medical Journal of Australasia*, Dec. 20, 1899.

action of which we are able to destroy, a specific against pneumonia." The action of the material was tried in six patients suffering with pneumonia, and in every case there was a considerable reduction of temperature, pulse, and respiration. The effect was manifested in from six to twelve hours, and in two cases the temperature remained normal, while in the remaining cases it rose at the end of six hours. In several cases treated by other observers an improvement followed the use of this method. In other cases failure has resulted. In one case of pneumonia following influenza, Fourrière derived benefit from the injection of 11 c.cm. (or f5iij) of goat's blood, the operation being repeated four days later, the blood presumably acting by virtue of the bactericidal quality of its serum.

An **antipneumococcic serum** now in the market is obtained by injecting living cultures of the pneumococcus into the veins of a horse, and, when immunity has become established, separating the serum from the recently-drawn blood of the animal, and, after the addition of a small amount of preservative (tricrosol), it is sealed up in small flasks. This remedy is used by hypodermic injection (dose, 10 to 20 c.cm., or f5ii  $\frac{3}{4}$ -v) in cases of acute croupous pneumonia. The results reported by Dr. James C. Wilson<sup>1</sup> were not very encouraging, affording a mortality of 22.2 per cent. against 20 per cent. by other methods; but this is pronounced a tempting field for further investigations in serum-therapy.

Similar experiments have been made, with excellent results, in the treatment of *glanders* in the horse by means of immunized serum. **Mallein**, but have not yet been extended to the human subject. Mallein, as it is called, is now employed principally for diagnostic purposes, but it should not be used when the temperature is above normal. Bernheim has made use of the same principle in the treatment of more than 100 cases of tuberculosis and asserts that the effect was beneficial, and states that in thirty patients the physical signs and symptoms had shown improvement for five months.

Prophylactic and curative inoculations have been recently employed against *typhoid fever*. Fraenkel and Manchot obtained a sterilized liquid from a culture of typhoid bacilli in bouillon, made from the thymus gland of a calf. They employed it clinically upon fifty-seven cases of typhoid fever, administering 0.5 c.cm. (or mviiss) of the sterilized fluid by deep injection into the buttock, without unfavorable local or general effects. The next day 1 c.cm. (or mxv) was similarly injected into the buttock of the other side. In the majority of cases the second injection produced chilly sensations, elevation of temperature, followed by a decided fall. The injections were given every other day, with amelioration of symptoms and early defervescence. Klemperer and Levy subsequently injected similar bouillon cultures of typhoid bacilli into dogs and obtained a blood-serum capable of immunizing susceptible animals and of treating the disease, after infection.

In South Africa this preventive antityphoid inoculation was carried on in officers and men, during the siege of Ladysmith, of which Dr. A. E. Wright<sup>2</sup> gives some statistics, in tabular form. He states that while it is at this stage impossible to determine precisely that the inoculated were protected, yet the results would appear to be distinctly encouraging, inasmuch as they show that the proportion, on the one hand, of attacks, and, on the

<sup>1</sup> *Journal of the American Medical Association*, Sept. 8, 1900.

<sup>2</sup> *British Medical Journal*, July 14, 1900.

other hand, of deaths, from typhoid, was seven times smaller in the inoculated than in the uninoculated. Dr. A. Conan Doyle, in a letter from South Africa to the *British Medical Journal*, regrets that inoculation for enteric fever was not made compulsory, and considers this a mistake, which will not be repeated in any subsequent campaign. If it had been made compulsory, the army would have escaped from most of its troubles. The strong impression, based upon experience, is "that, although it is by no means an absolute preventive, it certainly modifies the course of the disease very materially."

*Cholera* is another infection which it is sought to control by injection. Vaccination with products derived from the cholera bacillus. Professor Kossel has separated from cultures a material which he terms anticholerin: a clear, brownish-yellow viscid liquid, which has been purified by removal of products deleterious to the animal organism. Anticholerin has no toxic effect upon man, but is thought to antidote the virus of cholera. A trial at the Hamburg hospital, limited to serious cases, is said to have given encouraging results.

M. Haffkine has devised a method of vaccination with matter derived from pure cultures of cholera bacilli, and is now engaged in prosecuting experiments on a large scale in India, with what benefit remains yet to be seen. The theory is now advanced that the bactericidal power of blood-serum resides in the nuclein, the reproductive element of blood-cells, and that the nuclein contained in immunized serum acts by stimulating the organs of sanguification. In response to this stimulation a fresh supply of blood is given to the blood.

In *syphilis* the serum of the lamb and of the ox has been injected into selected subjects, in a number of cases, by Italian clinicians, and the symptoms of the malady have undergone decided improvement. The quantity employed was about 6 c.cm. (or f5iss), thrown, upon alternate days, into the subcutaneous tissue of each buttock. No other medication was used in these experimental cases. Cotterell made use of dog's serum in two cases of recent syphilis. The rash and other manifestations quickly disappeared under the influence of the injection. Some observers have thought that improvement followed the injection of dog's serum in pulmonary tuberculosis and neurasthenia. The serum of the dog was experimentally employed by Tommasoli in three cases of lupus. The results, however, proved of doubtful utility. Though the lesions were partially modified, especially in one case, the disease took on fresh activity at the end of a month. The subject deserves continued investigation. It appears that the blood of animals insusceptible to syphilis may have an antagonistic action to the virus of that disease.

A report upon the properties and uses of **Nuclein** has been made by Dr. S. S. Kossel. It is obtained from the nuclei of vegetable cells, the pulp of onion, and yolk of egg. It is distinguished from other albumins or globulins by the presence of phosphoric acid. Nuclein is a colorless or yellowish powder, insoluble in water and alcohol, but soluble, after long boiling, in weak alkaline solutions and in water. It is given in the daily dose of 1 to 2 Gm. (or gr. xxx-4v), and causes a considerable increase in the number of white corpuscles. Presumably for this reason it is efficacious in pleurisy, pneumonia, and other infectious diseases. Nuclein is thought to be possessed of diagnostic value in latent tuberculosis, producing a transient fever, with

congestion of the apices. The action of nuclein upon micro-organisms has been studied by Dr. Victor C. Vaughan, who, by its use, succeeded in curing guinea-pigs suffering with tuberculosis produced by inoculation. This investigator also states that the injection of nuclein into guinea-pigs renders them immune to pneumonia. The same method of therapy has been applied to tuberculosis in the human subject, with very encouraging results.

Adamkiewicz has endeavored to arrest the progress of carcinoma by injection of a substance which he calls **Cancroin** and which is a product of the living cancer-cell. In respect to chemical composition, cancroin is identical with or closely related to neurin. As prepared, cancroin is an aqueous solution of neurin, to which carbolic and citric acids have been added. Blood-serum or toxins from horses inoculated with erysipelas have lately been used by parenchymatous injection in carcinoma. The meager reports are conflicting. A serum antidotal to streptococcal infection has been administered subcutaneously by Roger, with reported favorable results in several cases of puerperal fever, erysipelas, and suppurative tonsillitis. Anti-streptococcal serum brought out by Marmorek as a remedy for scarlet and suppurating diseases has been used by Baginsky in scarlatina, who found that it is not a specific in the sense that antitoxin is against diphtheria. Louis Fischer has reported unfavorable experiences with this agent.

**Sarcoma** has been successfully treated by Coley, of New York, by a original method. The following are his directions for use of the combine toxic products of erysipelas and prodigiosus: Inject dose every day into the tumor, or in its neighborhood if inaccessible, aiming to get a rise of temperature to 102° to 104° F. Begin with 0.03 c.cm. (or *mss*) and increase dose as required. If the patient shows little or no reaction, the dose can be increased beyond 0.5 c.cm. (or *lviii*) without danger. If too great depression follows the injections, they may be given at longer intervals: two days or more. Shake the bottle before using, and keep well stoppered in a cool dark place,—on ice is best. The needle of the hypodermic syringe should be passed through an alcohol-flame before and after using. After removing stopper place sterilized needle of the hypodermic syringe into the bottle and withdraw enough, or a little more than enough, for the required dose, and quickly close the bottle. For first few doses, up to 0.18 or 0.24 c.cm. (or *mil* or *iv*); dilute with boiled water.

**Antivenene** is a curative serum obtained from a horse which has been immunized against snake-venom. According to Dr. Joseph McFarland, it is a very efficient antidote against the poison of venomous snakes. In the *International Medical Magazine*, September, 1900, he gives the results of experiments upon animals, and demonstrates the protective value of antivenene. The following is the treatment to be pursued when a patient has been bitten by a poisonous snake: 1. Immediately stop the circulation in the bitten part of the body, so as to prevent absorption of the poison. 2. Incise and enlarge the fang-wound and extract the poison by suction (preferably by a cupping-glass, or with the mouth, if the mucous membrane of lips is sound). 3. Inject hypodermically 0.18 to 0.37 c.cm. (or *milii-vj*) of a fresh 10-per-cent. aqueous solution of calcium chloride into about a dozen places around the wound. 4. Give strychnine hypodermically to stimulate the respiratory centre. Whisky should not be given at all, or only in very small doses, because an excess of alcohol still further depresses the heart already depressed by the venom. 5. Immediately inject 10 to 20 c.cm. (or

3ii  $\frac{2}{3}$ -vss) of antivenomous serum, and repeat the injection frequently. McFarland advises people living or going into regions where there is danger of snake-bites to carry a bottle of antivenomous serum with them. He pronounces permanganate-of-potassium injections of little value. Dr. Louis de Plasse, of New York, claims to have demonstrated the curative effects for Calmette's *Antivenene* in rattlesnake-bite.

**ANIODOL.**—M. Sedan, of Marseilles, has recently introduced an anti-ferment under this name, for which he claims remarkable power as a safe and always reliable antiseptic and an excellent deodorizer, even the most fetid cancerous or gangrenous wounds becoming odorless. This new product is a solution of trimethanal. In a solution of 1 to 100 it destroys, within five minutes, nearly all microbes; in the strength of 1 to 10,000 or even 1 to 20,000 it sterilizes any culture whatever. The exact bactericidal proportion has been fixed by M. Mérieux, director of the Pasteur Institute at Lyons, at 1 to 5600; but numerous experiments prove that the tubercle bacilli, contained in saliva, are destroyed in six hours by a solution of 1 to 500, which is a very satisfactory result.

It is necessary to understand the action of the strength solution used; doses that are too strong will sterilize a wound, but will dry it and prevent cicatrizing. A moderate dose, 1-4000 to 1-3600, on the contrary, favors healing. For the nostrils or mouth, a solution at 1 to 15,000, at the least, and 1 to 3000, at the strongest, produce complete disinfection. For disinfecting the hands and surgical instruments, a proportion of 1 to 2000 generally suffices.

**ANISUM** (U. S. P.).—*Anise.*

**ANISI FRUCTUS** (B. P.).—*Anise-fruit.*

Dose, 0.60 to 1.30 Gm. (or gr. x-xx).

#### *Preparations.*

**Oleum Anisi** (U. S. P., B. P.).—Oil of Anise. Dose, 0.30 to 0.60 c.cm. (or *mv-x*).  
**Aqua Anisi** (U. S. P., B. P.).—Anise-water (oil, 2 parts per 1000). B. P., distilled from fruit.

**Spiritus Anisi** (U. S. P., B. P.).—Spirit of Anise (10 per cent.). Dose, 4 to 7.5 c.cm. (or f3i-ij). B. P., 0.30 to 1.20 c.cm. (or *mv-xx*).

Anise also enters into the U. S. P. official *spiritus aurantii compositus*, *elixir aromaticus*, and *tinctura opii camphorata*.

Anise, or sweet cumin, is the dried, ripe fruit of the *Pimpinella anisum* (*Umbelliferae*). The physiological effects are due to its volatile oil, which is also found in star-anise (*Illicium verum*). It is carminative, and, having an agreeable odor and taste, is much used, in sweetened infusion, in treating flatulent colic in infants. Anise may be used in the form of hot, sweetened infusion; or given combined with other agents, as in the following:—

R. <i>Magnesi carb.</i> .....	2 80 Gm. or gr. xl.
Spt. chloroformi .....	30 c.cm. or <i>mv</i> .
Syrup. simplicis .....	75 c.cm. or f3ij.
Aque anisi .....	q. s. ad 30  c.cm. or f3ij.

M. Sig.: A teaspoonful, for a child under one year, every hour.

In bronchial catarrh, anise is expectorant and slightly sedative, and is therefore used in cough-mixtures. It has likewise been regarded as possessing the power to stimulate the secretion of milk, but without much ground.

**ANTHEMIS** (U. S. P.).—Chamomile.

**ANTHEMIDIS FLORES** (B. P.).—Chamomile-flowers.

*Preparations.*

**Extractum Anthemidis** (B. P.).—Extract of Chamomile. Dose, 0.13 to 0.50 Gm (or gr. ii-vij).

**Oleum Anthemidis** (B. P.).—Oil of Chamomile. Dose, 0.03 to 0.18 c.cm. (or mss-ij).

The dried flower-heads of *Anthemis nobilis* (Compositæ) collected from cultivated plants. The British Pharmacopœia requires that the flower should be expanded before being collected. The oil has a powerful lowering action upon the reflex excitability of the spinal cord. The hot infusion acts as an emetic when freely used. In smaller quantity it is aromatic and carminative, and favors perspiration and the action of the kidneys. It checks reflex cough. A very good combination after a severe cold, in simple fever and often in acute rheumatism, is prepared by pouring 473 c.cm. (or 1 pint) of boiling water over 31 Gm. (or 5j) each of chamomile-flowers and the leaves and flowering tops of boneset. The patient should drink about one half, hot, on retiring, as a diaphoretic, or the entire pint, should emesis be desired. A very excellent prescription for flatulence, and especially flatulent colic in children, is:—

R Infus. anthemidis,  
Mist. sodæ menth. .... aa 90| c.cm. or f3ij.  
M. Sig.: From one-half to two tablespoonfuls when necessary.

Locally, a chamomile cataplasm may be used when heat and moisture with some sedative action, are desired. The recent infusion is employed either hot or cold in domestic practice, in the treatment of colds, bronchitis and intestinal disorders, or dyspepsia. The oil has been proposed as an antidote in strychnine poisoning, and is useful in spasmodic asthma. The oil of chamomile, on account of its sedative action, is a very good addition to fatty preparations for various inflammations of the skin. Used in the ointments named, it will prove of value:—

R Ol. anthemidis ..... |30 to |60 c.cm. or *mv* vel x.  
Bismuth. subnit. .... 4 | Gm. or 3j.  
Ungt. zinci oxidi ..... 31| Gm. or 5j.

M. Sig.: Apply well over the surface for erysipelas, acute eczema, and erythema

R Ol. anthemidis ..... |37 to |75 c.cm. or *mvi* vel xij  
Hydrarg. chlor. mitis ..... |65 Gm. or gr. x.  
Ol. eucalypti ..... |30 c.cm. or *iv*.  
Adipis laniæ hydrosi ..... 31| Gm. or 5j.

M. Sig.: Use upon old muslin, and apply to the surface in infantile eczema and in seborrhœa.

**ANTHRAROBINUM.**—Anthrarobin is a yellowish powder, not soluble in acids or water, but soluble in alkalies, glycerin, and alcohol. Anthrarobin is related to chrysarobin, for which it is a useful substitute as an application in skin diseases. It produces less irritation and staining than chrysarobin, and is said to have no toxic effects. Antharobin is excreted, for the most part, by the urine unchanged, though some of it is oxidized to form alizarin. It colors the skin yellow and the hair red. In psoriasis, tinea versicolor, and

It is used in 10-per-cent. ointment or alcoholic solution, which should be made fresh at least every week.

Anthrarobin can be prescribed thus, with advantage:—

R Anthrarobini .....	4	Gm. or 3j.
Ungt. hydrarg. nitratis .....	2	Gm. or 3ss.
Ungt. zinci oxidi .....	31	Gm. or 3j.—M.

For chronic eczema and psoriasis.

R Anthrarobini .....	4	Gm. or 3j.
Ungt. hydrarg. oleatis (10 per cent.) .....	31	Gm. or 3j.—M.

Use in tinea versicolor, as well as in ringworm and favus.

**Hydroxylamin Hydrochloride** ( $\text{NH}_2\text{OHHCl}$ ), a substance allied to carbazone and chrysarobin, occurs in the form of colorless, hygroscopic crystals, soluble in water, alcohol, and glycerin. It has the advantage of not irritating the skin, but is highly irritant and is capable of producing toxemia. It has been used in psoriasis, lupus, scabies, and vegetable parasitic diseases. Hydroxylamin hydrochloride should not be applied, to begin with, in greater strength than  $\frac{1}{10}$  of 1 per cent. dissolved in equal parts of alcohol and glycerin. The proportion may be gradually increased within the limits of safety. This compound is not adapted to internal use. It is employed chiefly in photography as a developer.

## ANTIMONIUM.—Antimony.

### U. S. P. Preparations.

**Antimonii et Potassii Tartras.**—Antimony and Potassium Tartrate, Tartar Emetic. Dose, 0.0016 to 0.065 Gm. (or gr.  $\frac{1}{20}$ –j).

**Vinum Antimonii.**—Antimonial Wine (contains about 4 Gm. tartar emetic to 100 c.c.m., or 0.13 Gm. or gr. ij. in each 30 c.c.m., or f3j). Dose, 0.12 to 2 c.c.m. or mx–xxx, as an expectorant, or 4 to 8 c.c.m. (5i–ij) as an emetic for adults.

Tartar emetic also enters into *syrupus scillæ compositus* (U. S. P.). *Mistura Scillæ composita* (U. S. P.), or brown mixture, contains antimonial wine, 6 c.c.m. in 100, or of tartar emetic, about 0.008 Gm. in 30 c.c.m. (or gr.  $\frac{1}{2}$ , per ounce).

### B. P. Preparations.

**Antimonium Tartaratum.**—Tartarated Antimony, Tartar Emetic. Dose, as a cathartic, 0.0027 to 0.008 Gm. (or gr.  $\frac{1}{24}$ – $\frac{1}{8}$ ); as an emetic, 0.065 to 0.13 Gm. or gr. i–ij.

**Antimonii Oxidum.**—Antimonious Oxide. Dose, 0.065 to 0.13 Gm. (or gr. i–ij).

**Antimonii Nigrum Purificatum.**—Antimonious Sulphide (for pharmaceutical purposes).

**Antimonium Sulphuratum.**—Sulphurated Antimony (a mixture containing antimonious sulphide and oxide, antimonous sulphide and oxide, and sulphur). Dose, 0.065 to 0.13 Gm. (or gr. i–ij).

**Pulvis Antimonialis.**—Antimonial Powder. Dose, 0.20 to 0.38 Gm. (or gr. ii–vj).

**Pilula Hydrargyri Subchloridi Composita.**—Compound Pill of Mercurous Chloride and Antimonial Wine. Dose, 0.60 to 2 c.c.m. (or mx–xxx);

**Plummer's Pill.** Dose, 0.25 to 0.50 Gm. (or gr. iv–viii).

**Tartar Emetic.** 4 to 8 c.c.m. (or f3i–ij) to adults.

**Pharmacology.**—Antimonium and potassium tartrate, or tartarated antimony ( $2\text{K}[\text{SbO}]\text{C}_2\text{H}_3\text{O}_6 + \text{H}_2\text{O}$ ), is in colorless, transparent crystals, and should contain not less than 99.5 per cent. of pure antimonium and potassium tartrate, and should be kept in well-stoppered bottles (U. S. P.). It is a powerful irritant, and, applied to the mucous membranes, causes vesication. To the skin it gives a sensation of burning, with redness, followed by a pustular eruption, resembling small-pox, and deep

ulcers, which are slow in healing. When swallowed, it is a depressing emetic also causing an increase of the secretions of the intestinal tract, with occasional diarrhoea. It has a powerful diaphoretic action, and is eliminated by the bile, milk, sweat, urine, and the intestinal secretions. Upon the circulation it is depressing; under its influence the heart's action becomes weak and irregular, and the arterial tension is lowered. The pulsations are likewise retarded. The depression of the vasomotor system is both centric and peripheral. Respiration becomes slower and the bronchial secretions are increased. The brain is not directly affected, except that under certain conditions tartar emetic exerts a sedative action, especially when combined with opium. Large doses diminish reflex excitability of the spinal cord, and may produce both motor and sensor paralysis. A special action has been noticed upon the liver, the waste of nitrogenous elements being increased, with diminished oxidation of the non-nitrogenous elements. Excessive doses have a toxic effect upon motor nerves and muscles. The rate of absorption from the stomach and intestines is slow, and the rate of elimination by all the channels of excretion is also slow.

**Toxicology.**—Poisonous doses of tartar emetic (0.065 Gm., or gr.  $\frac{1}{2}$ , or more), cause vomiting, with burning pain at the epigastrium, severe colic, purging, and small, frequent pulse and early collapse, with much prostration of muscular system, rapidly occur. Respiration is shallow, and, as in cholera, the patient suffers from cramping pain in the calves of the legs. In some cases furious delirium has occurred. Death is usually preceded by stupor or convulsions. Toward the close of the case the urine may become bloody and scanty or may be suppressed. In some instances vomiting is absent and there is profound nervous prostration. Repeated small doses of tartar emetic may occasion a chronic intoxication, evidenced by nausea, purgation, a small, frequent pulse, and, finally, death from exhaustion. In this class of cases suspicion should be aroused that the drug has been administered for criminal purposes. Absorption and elimination are rapid. The drug is eliminated by the mucous membrane of the stomach and bowels, but especially by the kidney. Death may result from exhaustion, or from resulting gastro-intestinal inflammation. The antidote is tannic acid, which renders the salt insoluble, to be followed by demulcents and anodynes to relieve the pain. Depression is counteracted by alcohol and digitalis. Tartar emetic is incompatible with acids, alkalies, and drugs containing tannic acid. Infusions of coffee and tea are, therefore, both physiological and chemical antidotes to tartar emetic, and may be used to irrigate the stomach. The body should be kept warm by hot-water bags, and cardiac and respiratory stimulants given rather freely. Chronic poisoning produces constant nausea and entire anorexia, with subnormal temperature, moist, clammy skin, diarrhoea, and, finally, death from exhaustion.

**Therapy.**—Tartar-emetic ointment is a powerful counter-irritant, but is seldom used on account of the danger of producing sloughing and scars. The treatment of inflammation by tartar emetic in large doses has been abandoned, but fractional doses (0.0016 Gm., or gr.  $\frac{1}{60}$ ) alone or in combination with Dover's powder (0.13 Gm., or gr.  $\frac{1}{2}$ ) and nitre (0.20 Gm., or gr.  $\frac{1}{2}$ ) have proved very servicable in sthenic pneumonia and in pleurisy. In bronchial inflammation with deficient secretion the wine of antimony, or compound syrup of squills, is frequently given. Dr. I. G. Davis writes with approval of the action of the golden sulphuret of antimony in chronic bron-

He administers it in doses of 0.0012 to 0.002 Gm. (or gr.  $\frac{1}{80}$ - $\frac{1}{40}$ ) triturated with sugar of milk.

Tartar emetic should not be given in croup (especially diphtheritic), as it is too depressing. For bronchitis in children, Ringer advises a solution of 1 Gm. (or gr. j) to 473 c.cm. (or Oj) of water, of which a teaspoonful is given every quarter- or half- hour. Tartar emetic should rarely, if ever, be administered to infants or very young children.

Small doses of tartar emetic have also been recommended in orchitis, tonsillitis, parotiditis, muscular rheumatism, and spasmodic asthma. A combination of tartar emetic and opium is very serviceable in the delirious delirium which attends some cases of typhoid and typhus fevers. A similar condition in delirium tremens is relieved by the same treatment, which has also been used with success in puerperal mania. Ringer states that chorea is sometimes benefited by tartar emetic given in doses sufficient to induce vomiting, once or twice a day. Administered in the same manner it has been found capable of relieving rebellious cases of lumbago and muscular rheumatism. In acute gonorrhœa Surgeon-Major Lawrie regards 1 m. (or mxxv) of antimonial wine, given every second hour, as an excellent remedy.

In some skin diseases—as chronic eczema, psoriasis, and other scaly eruptions—the use of tartar emetic, or the oxide, or sulphurated antimony, in small doses, and frequently repeated, is of much service.

The so-called tolerance of antimony was due to the fact that after the action of the system became lowered by its action, comparatively large doses could be swallowed without producing vomiting.

**ANTINERVIN** (Salicylanilid-bromacetanilid) is a proprietary compound of acetanilid, salicylic acid, and bromine, with the formula  $C_6H_5NHCOOCH_3 + C_6H_4(OH)(COOCH_3) + C_6H_4Br.NH.CH_3CO$ , according to its introducer, Dr. Radlauer, of Berlin. It is a white, crystalline, granular powder, without odor, and almost tasteless. This substance is soluble in alcohol, dilute acid, and hot water, and almost insoluble in cold water; it is more soluble in water slightly acidulated with hydrochloric acid or in dilute solution of potassium-iodide. The dose is 0.32 to 0.50 Gm. (or gr. v-viij).

**Physiological Action and Therapy.**—Its physiological action is similar to that of other remedies of this class: it is antiseptic, antipyretic, and hypnotic. It resembles antipyrin in its effects upon the sensory nerves and has been used clinically (1) to relieve pain; (2) to produce sleep; (3) to allay spasmodic cough; (4) to reduce fever; (5) to arrest fermentation in infectious dyspepsia. In the small doses usually given (0.32 to 0.50 Gm., or gr. v-viij) it relieves headache and restlessness and produces natural sleep. In the treatment of influenza, or grippé, this drug reduces the fever and allays the restlessness. Where cough becomes spasmodic and paroxysmal, antinervin exercises a sedative effect and produces sleep. It is of advantage in whooping-cough (0.065 to 0.13 Gm., or gr. i-ij, every two hours) or in asthma, whether of cardiac or bronchial origin. It has been used in Germany with alleged success, in diabetes, reducing both the sugar and the amount of urine; and it is stated to be particularly serviceable in acute muscular rheumatism. Dr Ludwig Sior, of Darmstadt, ascertained that antinervin was given in 1 Gm. (or gr. xv) doses at hourly intervals for three hours, beginning about noon, it exercised a decided influence in

reducing temperature. The minimum temperature was generally reached from six to nine hours after the administration of the first dose. About twelve hours from the same period the temperature began gradually to ascend. The reduction of temperature was not accompanied by unpleasant manifestations. As a rule, copious perspiration and, frequently, a sleep of several hours were produced. In acute rheumatism its action was equal to that of sodium salicylate. It was beneficial in trifacial neuralgia, migraine, the pain of transverse myelitis, and in headache from various causes. As an analgesic it was usually given in doses of 1 Gm. (or gr. xv), repeated, when needed, twice during the day. In the cases where it was used no deleterious effects upon the heart or nervous system were detected.

**ANTIPYRINA** (U. S. P.).—Antipyrine.

**PHENAZONUM** (B. P.). (See *Phenazonum*.)

**APOCYNUM** (U. S. P.).—Apocynum (Canadian Hemp).

*Preparation.*

Fluidextractum Apocyni (U. S. P.).—Fluidextract of Apocynum. Dose, 0.30 to 1.20 ccm. (or *mcv-xx*). (100 per cent.)

**Pharmacology and Therapy.**—The dried rhizome and roots of *Apocynum Cannabinum*, or of closely allied species of *Apocynum* (Apocynaceæ) contains the bitter, resin-like glucosides, **Apocynin** and **Apocynein**, the former soluble in alcohol, the latter in water. These principles in small doses act upon the circulation, like *strophanthus*, as a tonic. In large amounts they are emetic, cathartic, and diuretic.

Apocynum usually, but not constantly, increases arterial tension. It acts as a diuretic without irritating the renal epithelium. It is probable that the emetic and cathartic effects of this drug are due to apocynein and its diuretic virtue to apocynin. The decoction of apocynum is irritant to the stomach and bowels, but the tincture is free from this disadvantage. The tincture (1 to 10) has been employed in the daily doses of 4 to 6 c.c. (or *mlx-xx*). A decoction has been used in the dose of 30 to 60 c.cm. (fʒi-ij) in the treatment of dropsy, but the fluid extract is more reliable.

Dr. W. T. Richmond regards apocynum as of value in the treatment of ascites, Bright's disease with or without dropsy, and valvular heart disease with general anasarca. He employs the fluid extract, beginning with 7 or 8 drops, and gradually increasing till the desired effect is obtained. Tolerant is established by continued use, and the dose must therefore be raised from time to time. Dr. Richmond has also seen it of service in jaundice. In the dose of 0.015 to 0.03 Gm. (or gr.  $\frac{1}{4}$ - $\frac{1}{2}$ ) apocynin has been used as an expectorant.

Dr. J. Glinski has found that apocynum relieves the functional disturbances which accompany organic heart disease and diminishes the amount of dullness in dilatation. The drug seems to have no cumulative effect.

**APOMORPHINÆ HYDROCHLORIDUM** (U. S. P., B. P.).—Apomorphine Hydrochloride ( $C_{17}H_{17}NO_2HCl$ ).

**Dose**, 0.003 to 0.006 Gm. (or gr.  $\frac{1}{20}$ - $\frac{1}{10}$ ) by hypodermic injection. In the mouth 0.006 to 0.015 Gm. (or gr.  $\frac{1}{10}$ - $\frac{1}{4}$ ).

**Pharmacology and Therapy.**—Apomorphine is an artificial alkaloid prepared from morphine or codeine by pure hydrochloric acid, 20 parts

the latter being added to 1 part of the former, in a strong glass tube, and exposed to a high temperature. Apomorphine hydrochloride occurs in the form of colorless or grayish-white crystals, soluble in water and alcohol, and insoluble in ether or chloroform.

According to the investigations of Reichert, toxic quantities of apomorphine give rise to convulsions followed by paralysis, chiefly of spinal origin. When given in ordinary medicinal amounts extreme prostration and uncontrollable vomiting may follow, with weak, thready pulse and low arterial pressure. Poisonous doses cause rapid and irregular respiration. Apomorphine hydrochloride is a systemic emetic and can be used hypodermically in the dose of 0.008 Gm. (or gr.  $\frac{1}{80}$ ) to empty the stomach. In smaller doses it can be given as an expectorant in bronchitis. It is of value in the treatment of dry, hacking cough, attended with little or no secretion. As the result of a series of clinical experiments, Murrell<sup>1</sup> has ascertained that apomorphine, given by the mouth, is tolerated in much larger doses than had been supposed. He was able to administer 0.065, 0.10, or 0.13 Gm. (gr. i, iss, or ℥iij) daily without exciting nausea. In these quantities he found apomorphine hydrochloride an excellent expectorant in chronic bronchitis, bronchopneumonia, and emphysema. Murrell usually prescribes the apomorphine in syrup of wild cherry, of tar, or of lemon. The addition of a few drops of dilute hydrochloric acid to the mixture is advantageous. The same observer has employed apomorphine as a spray with very satisfactory results. He has frequently given as much as 2 c.cm. (or fʒss) of a 1-per-cent. solution in distilled water for each inhalation. A combination of apomorphine and morphia is valuable, and has been employed by Rossbach in phthisis. The cough becomes less frequent and the sputum more fluid.

Apomorphine hydrochloride is often serviceable in the treatment of opiuma, the writer prescribing it thus:—

R Apomorphin. hydrochloridi . . . . .	13	Gm. or gr. ij.
Acid. hydrochloric. dilut. . . . .	8	c.cm. or fʒiiss.
Morphine hydrochloridi . . . . .	0.065	Gm. or gr. j.
Syr. toluatani . . . . .	30	c.cm. or fʒj.
Aq. chloroformi . . . . .	q. s. ad 240	c.cm. or fʒviij.

M. Sig : Fifteen cubic centimetres, or half an ounce, every third hour until opiuma is relieved.

Digitalis or strophanthus may be combined with the above if there is any cardiac debility.

Apomorphine should not be continued too long, as it is liable to produce pulmonary oedema.

Dr. Alexander F. Samuels has written of the value of apomorphine in epidemic croup, giving 0.0013 Gm. (or gr.  $\frac{1}{80}$ ) every five or ten minutes until vomiting is produced. If the child is unable to swallow, the remedy may be introduced beneath the skin. J. S. Horsley has found this alkaloid of service in controlling convulsions. He successfully employed hypodermic injections of 0.001 to 0.006 Gm. (or gr.  $\frac{1}{15}$ – $\frac{1}{10}$ ) in a case of strychnine poisoning. This writer recommends apomorphine in the treatment of convulsions and minor phenomena of hysteria. In hypodermic doses of 0.002 Gm. (or gr.  $\frac{1}{40}$ ) apomorphine hydrochloride is a valuable sedative and hypnotic.

<sup>1</sup>On the Action of Apomorphine and Apocodeine, with Reference to their Value as Expectorants in the Treatment of Chronic Bronchitis," by William Murrell, M.D., B.Sc.D., in the *Medical Bulletin*, March, 1891.

in cases of insomnia, delirium tremens, and morphinism. The first dose should be not more than half the above, in order to test the tolerance of the patient. Vomiting always indicates too large a dose. There is no danger of a drug habit being acquired. The remedy may also be used in maniacal delirium, hystero-epilepsy, chorea, and persistent hiccup. It has been administered to produce relaxation of a rigid os uteri. Apomorphine may also be administered, in combination with strychnine, by the mouth. Paul E. Bechet, of New Orleans, gives 0.002 Gm. (or gr.  $\frac{1}{300}$ ) of each of these, at three-hour intervals, in delirium ebriosum, or acute alcoholism.

**AQUA (U. S. P.).—Water (H<sub>2</sub>O).**

Potable water in its purest attainable state.

**AQUA DESTILLATA (U. S. P., B. P.).—Distilled Water.**

A colorless limpid liquid, without odor or taste, and perfectly neutral to litmus-paper.

**AQUA HYDROGENII DIOXIDI (U. S. P.), LIQUOR HYDROGENII PEROXIDI (B. P.).—Solution of hydrogen dioxide. (See *Barii Dioxidum*.)**

**ARASA** is a native of Brazil and Uruguay. The portion used is the bark of the root. It is employed in South America in cases of metrorrhagia, 2 Gm. (or 5ss) of the bark being boiled in a cupful of water and administered for several days before and during the menstrual period. The taste is said to resemble that of cascarrilla, and no unpleasant secondary effects have been observed.

**ARECA.**—Areca, or **Betel nut**, is the seed of *Areca Catechu* (Palmaeae). E. Johns found three alkaloids in areca-nut: **Arecoline**, **Arecaïne**, and **Guvacine**. Another, called **Arecaidine**, is an isomer of arecine. **Arecoline** is methyl-arecaidine, and is convertible into arecaidine and the latter into arecoline. It also contains tannic and gallic acids. **Arecaïne** is a crystalline body, soluble in water, insoluble in alcohol, ether, and chloroform. **Areca-nut** is a powerful tannicide and poison. The alkaloid arecaïne slows the heart and respiration, and purges by increasing intestinal peristalsis. Powdered areca has for a long time been used as a tannicide in veterinary practice. More recently this remedy has been used for the same purpose in the human subject. Dose, 0.32 to 1.30 Gm., or gr. v-xx (4 to 8 Gm., or 5i-ij, as a vermifuge). The fluid extract is the best preparation. Its administration should be preceded and followed by a purgative like castor-oil. **Betel-nut** is believed also to increase the secretions from the salivary glands, and has a slightly stimulating effect upon the cerebral centres. Large doses may cause tetanic convulsions. Death is caused by respiratory failure.

**Arecoline hydrobromide** is a myotic. When applied in  $\frac{1}{2}$ -per-cent. watery solution, it causes a slight stinging sensation for a few moments, but leaves no conjunctival or ciliary congestion. Chetwood-Aiken<sup>1</sup> considers it superior to eserine in the treatment of glaucoma. Its action is more rapid and more powerful, but its effect is of shorter duration, and is devoid of the headache and other unpleasant after-effects so often noted with eserine.

Lavagna<sup>2</sup> describes the action of **arecoline**, a drug extracted from the

<sup>1</sup> *British Medical Journal*, Jan. 14, 1899.

<sup>2</sup> *Giornale della R. Accademia di Medicina di Roma*, 1895, Nos. 3 and 4.

out of the Italian areca tree. Fröhner found some time ago that arecoline is the best sialagogue, being superior to pilocarpine, and that it equals eucaine as a laxative.

Dr. Lavagna has observed that the instillation of a drop of a 1-per-cent. solution of the hydrobromide into the conjunctival sac causes a sensation of warmth, and afterward some lachrymation and spasm of the eyelids. The irritation lasts scarcely more than a minute, and is followed by slight hyperæmia of the conjunctiva and subcorneal injection, which disappear after some minutes. After 2 minutes, violent clonic spasms of the iris are produced and there is distinct diminution of the pupillary space. The myosis is very noticeable after 5 minutes, and reaches its maximum in 10 minutes. This maximum is maintained for 25 to 30 minutes, after which the pupil begins to enlarge, and becomes normal once more after about 70 minutes. At the end of 90 minutes the pupil is about one-half millimetre larger than normal. Dr. Lavagna has not noticed any modifications in intra-ocular tension due to the drug. Before acting on the iris, arecoline causes a spasm of the ciliary muscle, which gives rise to increased refraction in the eye for the time being.

## ARGENTUM.—Silver.

### Preparations.

- Argenti Cyanidum** (U. S. P.).—Silver Cyanide. Dose, 0.0016 to 0.003 Gm. (or should contain not less than 99.9 per cent. of pure silver cyanide.)  
**Argenti Nitras Fusus** (U. S. P.).—Molded Silver Nitrate, Lunar Caustic. **Argenti Nitras Induratus** (B. P.).—Toughened Caustic (95 to 5). External use.  
**Argenti Nitras Dilutus** (U. S. P.).—Diluted Silver Nitrate (silver nitrate, 1 part; potassium nitrate, 2 parts). **Argenti Nitras Mitigatus** (B. P.).—Mitigated Caustic. Internal use.  
**Argenti Nitras** (U. S. P., B. P.).—Silver Nitrate. Dose, 0.01 to 0.03 Gm. (or gr. crystallised).  
**Argenti Oxidum** (U. S. P., B. P.).—Silver Oxide. Dose, 0.03 to 0.13 Gm. (or gr.)

**Pharmacology.**—Metallic silver is a white metal taking a high polish, and not easily affected by acids or by oxygen, although readily tarnished by sulphur. It is official only in the form of salts, of which the nitrate is most largely used. Silver nitrate is an anhydrous salt which crystallizes in rhombic plates. It is readily soluble in cold water, and has a styptic taste. Upon the addition of hydrochloric acid or a soluble chloride to a solution of the nitrate, a white, curdy precipitate is formed. The precipitate is wholly soluble in ammonia. The crystals, fused and cast in molds, present the form of round, grayish sticks. The cyanide is convenient for the extemporaneous preparation of hydrocyanic acid, which is obtainable by adding an excess of some mineral acid to the solution containing this salt. Metallic silver is used in surgery in the form of silver wire for sutures and for making cannule for tracheotomy, catheters, etc.

**Physiological Action.**—Silver nitrate, in weak solutions, acts as an astringent, and, in substance, coagulates the albumin of the tissues and destroys their vitality, acting as a caustic. The mitigated stick of lunar caustic is mild and superficial in its action; the pure nitrate may cause sloughing and necrosis. One objection to its use is the discoloration it leaves behind, the skin becoming black after exposure to the light. (When the physician's hands are stained with nitrate of silver in making an application, the color

may be removed by washing with a solution of cyanide of potassium. According to Hahn, the stains may be removed from the skin or clothing also by a solution containing 5 Gm. (or gr. lxxv) each of corrosive sublimate and ammonium chloride in 37 c.cm. (or f5x) of distilled water.) Local applications of silver nitrate whiten mucous membrane. When swallowed, symptoms of irritant poisoning appear, with pain, distress, and vomiting. Common salt is the antidote, and vomiting should be encouraged by administering warm salt water; after cleansing the stomach the bowels should be purged by oil. When any of the silver salts (but especially the nitrate) has been taken for a length of time, a slate-colored line appears along the gums and there is darkening of the conjunctiva, and soon afterward the entire surface of the body becomes dingy or slate-colored, due to the deposit of metallic silver in the pigment-layer of the skin and in all the constituents of the skin below the Malpighian layer. This condition is known as **Argyria**, and is permanent. The patient should therefore be carefully observed during the administration of silver, and the remedy from time to time intermitted. Argyria has also resulted from the local use of silver nitrate, as reported by Hutchinson, in the *Annals of Surgery* for April, 1892. In medicinal doses the silver salts act as a tonic to the nervous system and changes occur in the blood; tissue-change is increased; the flow of bile is also increased, and in larger doses there is embarrassment of the respiration, depression of the circulation, and reduction of temperature. Tetanic convulsions or paralysis may be produced by overdoses, the paralysis being of central origin.

**Therapy.**—Silver foil, or metallic silver in very thin sheets, is employed as a surgical dressing for wounds. At Johns Hopkins Hospital the practice originated of applying silver-leaf dressings for burns, the lesion being simply covered with the leaf without the use of any adhesive material. It is an excellent protective dressing which may be painlessly removed and renewed. It prevents suppuration and is said to reduce shock. In Albany Hospital it has been used as a dressing for laparotomy wounds, the leaf being retained by a gauze compress and bandage. Silver nitrate is used locally in 2-per-cent. solution, dropped into the eyes of newborn infants to prevent purulent conjunctivitis (ophthalmia neonatorum) after the method of Credé. G. E. De Schweinitz<sup>1</sup> has seen marked conjunctivitis neonatorum appear after the employment of Credé's method and has also observed severe cases of conjunctivitis with haziness of the cornea, and one case of persisting conjunctival hæmorrhage, which nearly proved fatal. He insists that Credé's method should be reserved for the eyes of those children who have passed through a birth-canal known to be infected, or from which the suspicion of infection could not be positively eliminated prior to the birth. Whenever infection, or the suspicion of infection, can be excluded, Credé's method is not necessary, milder methods of prophylaxis being sufficient. The mitigated stick is a good application to granular lids, chancroids, small-pox vesicles (in order to prevent pitting), and in general to excite a healthy action of granulating surfaces. In gynaecology, the lunar caustic, in solid form, is used in chronic cervical catarrh and in venereal sores. An application of the solid stick to the scrotum has a good effect in acute epididymitis or orchitis; also along the course of the affected vessels in lymphangitis of the forearm from a poisoned wound of the finger. Thoroughly applied to the

<sup>1</sup> *Philadelphia Medical Journal*, vol. iii, 351.

caused by the bite of a rabid animal, it is claimed by Youatt to be a protection against hydrophobia. For chronic nasal catarrh, it may be mixed with gum acacia, pulverized, and blown into the throat or nose. In pharyngitis, tonsillitis, and laryngitis, solutions (made with water or spirit of nitrous ether of 1.30 to 2.60 Gm. to each 30 c.cm., or gr. xx-xl per ounce) are applied with excellent results; Dr. Horace Green advocated the stronger solution applied with a probang to the larynx in diphtheritic croup. In appropriate cases these solutions are valuable in gonorrhœa and urethritis.

An abortive method of treating gonorrhœa has had its advocates, and consists essentially in the injection of a strong solution of silver nitrate during the early stage of the disease. Professor Diday insisted upon the importance of the following points: The strength of the solution should be 1.30 Gm. to 30 c.cm. (or gr. xxiv to f̄j) of distilled water, which, in most cases, will cause but slight pain at the moment of injection; if sharp pain is sustained immediately the fluid should not be allowed to remain for more than 15 or 20 seconds; when the pain is moderate it is allowed to remain for 1 or 2 minutes, according to the tolerance. This method has been abandoned on account of the liability of producing sloughing and stricture of the urethra. Better results are now obtained from the employment of the new silver compounds with albumin, casein, or nuclein, which destroy the gonococcus, and are less irritant to the mucous membrane.

In erysipelas the disease may sometimes be arrested by delimiting the affected area with silver nitrate. It has also been used with good results in herpes vulvæ, herpes, eczema, and lichen, when they occur in circumscribed patches. Boils may sometimes be aborted in this way, and a sty on the eye may be checked by an early application. Buboës are treated by incision, whether suppuration has occurred or not, by puncture, through which a 2-per-cent. solution of silver nitrate is injected. Recovery is said to be rapid and the formation of an unsightly scar is avoided. After disinfection of the wound, Simmons recommends the injection of a solution of silver nitrate, with a view to preventing the development of tetanus from contaminated wounds. The solution which he employs contains 0.65 Gm. to 30 c.cm. (or gr. x to f̄j). Dr. Lazzaro proposes silver fluoride as an efficient local application in anthrax. It is a brown or blackish-brown hygroscopic mass, slightly soluble in water, antiseptic, equal in caustic effect to the nitrate, and destructive to the anthrax bacillus, while harmless to the human organism.

The solid stick nitrate is useful in restraining the bleeding from leech-bites. When, in the course of a chronic illness, bed-sores threaten to form, the local application of a solution containing 1.30 Gm. to 30 c.cm. (or gr. xx to f̄j) of silver nitrate will avert the mischief. Ringer has found the same solution useful in whooping-cough. A solution may be applied to the throat by a sponge, or it may be used in the form of a spray. The latter method, however, is inapplicable to children less than three years of age. The stain produced, moreover, is a serious objection to the spray. A strong solution, or the solid stick, is a good stimulant to indolent ulcers and to ulcer of the tongue. A 2.60 Gm. (or gr. xl) solution in nitrous ether has been used in trichophytosis. A solution containing from 1.30 Gm. (or gr. xx) to 7.5 Gm. (or f̄j) to 30 c.cm. (or f̄j) of water may be successfully employed, by the introduction of small quantities (a few drops) into the sac of an hydrocele or spermatorrhea. A sponge probang saturated with a very weak solution of silver nitrate is sometimes of service in spasmodic stricture of the œsophagus.

Applications should be made occasionally, at intervals of several days. In pseudomembranous enteritis it is a good practice, in the intervals of paroxysms, to irrigate the bowel with 0.32 to 0.65 Gm. (or gr. v-x) of silver nitrate in a pint of water. Prolapsd rectum, especially in children, is benefited by cauterization with mitigated silver nitrate.

On account of the staining of the skin, silver nitrate is now little used internally, although it has acknowledged effects upon the nervous system. Caccianiga has collected 60 cases of acute lobar pneumonia in which treatment by silver nitrate seemed to be clearly beneficial. Of the group only 3 died. The dose was from 0.10 Gm. (or gr. iss) in children (eight to ten years) up to 0.25 to 0.32 Gm. (or gr. iv-v) in adults, given in pill or suspension. In cases of urgency, a 0.50-per-cent. solution of protargol was injected hypodermically. Beyond some vomiting, no ill effects were observed from the treatment either by silver nitrate or protargol. The most marked effect of the silver salt was the reduction of the temperature, which began in the first twenty-four hours and was noticed in all the cases. Apyrexia occurred by crisis in 48 cases, by lysis in 12. When small doses were given, apyrexia generally occurred by lysis; with larger doses, by crisis. In the defervescence due to silver, the pulse did not come down at the same time, but later. Silver oxide is said to be less subject to this objection and equally efficient, especially in the early stages of locomotor ataxia and in epilepsy. A double salt, the sodium and silver hyposulphite, has been recommended by Curci and others as efficacious in locomotor ataxia, and free from the disadvantage of staining the skin. It is very soluble in water, does not coagulate albumin, and may be given by the mouth in doses of 0.045 to 0.20 Gm. (or gr.  $\frac{3}{4}$ -ij), or hypodermically, from 0.01 to 0.045 Gm. (or gr.  $\frac{1}{8}$ - $\frac{3}{4}$ ) in the course of the day. In gastralgia, also, the silver salts are sometimes remarkably curative. They have effected improvement, likewise, in chronic gastritis and ulcer of the stomach. The silver nitrate has been successfully given for the purpose of allaying yeasty vomiting. When, in typhoid fever, symptoms of irritation in the alimentary tract become prominent, and peritonitis or hæmorrhage appears imminent, the following prescription was used by William Pepper, in the Philadelphia Hospital:—

R Argenti nitratis ..... | 13 Gm. or gr. ij.  
Mucilag. acaciæ ..... 60 | c.cm. or f3ij.

M. Sig.: A teaspoonful three or four times daily, combined with tincture of opium or belladonna, if necessary, for diarrhœa or constipation.

Silver nitrate sometimes yields good results in enteritis or colitis, especially if ulceration is present. Silver nitrate or oxide may also be given as follows:—

R Argenti nitratis.  
Extracti opii ..... aa | 13 Gm. or gr. ij.

M. et ft. pil. no. viij.

Sig.: A pill every four hours, for gastric ulcer.

R Argenti oxidi ..... | 13 Gm. or gr. ij.  
Ext. belladonnæ fol. .... 065 Gm. or gr. j.  
Ext. gentianæ ..... 130 Gm. or gr. xx.

M. et ft. pil. no. xvj.

Sig.: A pill three times a day.

An efficient prescription for neuralgia and chorea:—

R Argenti nitratis .....	20	Gm. or gr. iij.
Syrup. ipecac. ....	30	c.cm. or fʒj.
Morphinæ sulphatis .....	005	Gm. or gr. j.
Mucil. acacie .....	60	c.cm. or fʒij.

M. Sig.: A teaspoonful in water, three times a day, before meals. Exerts marked influence over chronic diarrhœa, especially of phthisis.

In gastric catarrh, the gastro-intestinal catarrh of phthisis, ulcer of the stomach, or chronic diarrhœa we may combine it as follows:—

R Codeinæ .....	20	Gm. or gr. iij.
Argenti nitrat. ....	38	Gm. or gr. vj.
Pulv. acacie .....	q. s.	

Div. in pil. no. xij.

Sig.: Give one every two to four hours.

In catarrhal jaundice, silver nitrate has been given in 0.005 Gm. (or gr.  $\frac{1}{100}$ ) doses with advantage. In pill form the effect is more sustained and the remedy can be given in larger doses than when in solution. When used in catarrhs of the stomach, the remedy is best given half an hour or so before meals, in order that the local effect may be secured. It should not be used for a long period; either in pill or in solution.

Dysentery, with ulceration of the large bowel, is very much benefited by large injections of weak solutions of silver nitrate (0.0075 to 0.015 Gm., or gr.  $\frac{1}{160}$  to 30 c.cm., or fʒj. of mucilage). Bartholow advised the internal use of the nitrate, combined with opium, in addition to the treatment by injections. According to the same writer, both the nitrate and the oxide are useful in nervous dyspepsia, cholera infantum, and jaundice depending upon catarrh of the bile-ducts. Silver is sometimes beneficial in chorea. Silver nitrate is occasionally able to check profuse perspiration, and may prove useful in menorrhagia. The nitrate has given relief in obstinate enteralgia.

Dr. Crocq, of Brussels, claims that silver nitrate is a valuable remedy in phthisis, promoting appetite and digestion, diminishing cough, expectoration, and night-sweats. He administers from 0.009 to 0.02 Gm. (or gr.  $\frac{1}{7}$  to  $\frac{1}{4}$ ) during the day. Mr. P. A. Brady, forty years ago, regarded this salt as of great value in the treatment of phthisis. He was accustomed to give it in doses of 0.01 Gm. (or gr.  $\frac{1}{60}$ ) combined with 0.20 Gm. (or gr. iij) of Dover's powder three times a day. Dr. Thomas Mays, of Philadelphia, reported some remarkable results from hypodermic injections of solutions of silver nitrate in the skin of the neck, over the pneumogastric nerve, in the treatment of phthisis pulmonalis. In some cases, striking benefit was noted.

Various remedies have been proposed for the **Argyria**, or the skin discoloration produced by silver. Unfortunately, none has proved reliable, and in the vast majority of cases the stain proves permanent. It has been claimed that blistering will lighten the color. Dr. Eichmann states that in two cases the color disappeared after the use, four times a week, of potash-and-soap ointment. Potassium iodide has been given internally for the same purpose. However, it is by no means as common now as formerly, since silver is no longer so largely employed in the treatment of epilepsy and locomotor ataxia.

**Argentamine** is a 10-per-cent. solution of silver phosphate in an aqueous solution of ethylenediamin. This solution is said to contain as much silver as a 10-per-cent. solution of silver nitrate. This new combination is

brought forward as a substitute for the silver nitrate. Argentamine is a permanent, limpid fluid, readily miscible with water, of an alkaline reaction and ammoniacal odor. It does not precipitate albumin, and has a very slight caustic action. The solution is a clear, colorless liquid, and, according to Dr. Schaffer, possesses bactericidal properties which will render it valuable in the treatment of gonorrhœa and diphtheria. In the anterior urethra it should not be used stronger than 1-2000; for the posterior urethra, 1-250. In ophthalmology it has been used in 5-per-cent. strength. It becomes decomposed when left exposed to the light.

**Argentum Credé,**<sup>1</sup> or soluble metallic silver (colloidal silver), as originally recommended by B. Credé, of Dresden, at the Moscow Congress, is used in medicine as a 10-per-cent. ointment: the unguentum Credé. It is employed by inunction, using 3 Gm. (or gr. xlv) for an adult, or for children 1 Gm. (or gr. xv), especially in septic cases. More recently Credé has used colloidal silver in a pill, containing 0.01 Gm. (or gr.  $\frac{1}{100}$ ) with sugar of milk, glycerin, and water, q. s., giving 2 pills two or three times daily in acute erysipelas, and in cases of gastro-intestinal disease in which it has been customary to give the nitrate of silver. Argyria was not observed.<sup>2</sup>

Dr. Oscar Werler<sup>3</sup> warmly advocates the use of the lactate and citrate of silver, for the power of penetrating the entire organism and effecting a general disinfection of the entire body. In sepsis he obtained good results by inunction and the washing of the wound with citrate-of-silver solution (1 to 4000). The method by inunction with unguentum Credé (made with soluble metallic silver) and local application to the wound of silver-citrate solution, is suited both to chronic sepsis and furunculosis.

**Argonin.**—An organic combination of silver with casein has been introduced under this name by Drs. Röhmann and Liebrecht. Argonin contains one-fiftieth the amount of silver present in the nitrate. It is soluble in water, non-irritant, not precipitated by salt, and is claimed to be antidotal to the gonococcus. Dr. Johann Jellinek, of Budapest, Hungary, has written on a new preparation of argonin called "Argonin L." He extols this preparation as having the advantage of not decomposing after being kept in solution for several months, and again containing 10 per cent. of silver instead of 4.2 per cent. as in ordinary argonin. The author uses a 1-per-cent. solution in urethritis, both anterior and posterior. (See also *Largin*.)

**ARISTOL.**—(See *Thymol Iodidum*.)

**ARMORACIA RADIX (B. P.).**—Horse-radish Root.

*Preparation.*

*Spiritus Armoracæ Compositus (B. P.).*—Compound Spirit of Horse-radish. (Contains also bitter orange-peel and nutmeg.) Dose, 4 to 7.5 c.cm. (or f3i-ij).

**Pharmacology and Therapy.**—The fresh root of *Cochlearia Armoracia* collected from cultivated plants.

Horse-radish, in its fresh state, grated to a pulpy mass, to which a little vinegar is added, is a familiar condiment as a dressing for meat at our tables. It is pungent, and excites the flow of secretions of salivary and gastric glands

<sup>1</sup> This is also called "Collargolum," as prepared by von Heyden.

<sup>2</sup> *Klin. Therap. Wochenschrift*, 1898.

<sup>3</sup> *Deutsche medicinische Wochenschrift*, Oct. 6, 1898.

and stimulates the appetite. It contains an active principle analogous to the oil of mustard, and yields about 0.5 per cent. of oil. It also contains a resin. Externally, horse-radish is rubefacient. Internally, it is a stimulant to the stomach and increases the urinary flow. The addition of ground horse-radish to cider makes it actively diuretic, and useful in dropsy. It has been used with success in scurvy. The dried root is not employed in medicine. The compound spirit is a good addition to other diuretics.

**ARNICA (U. S. P.).—Arnica-flowers (Leopard's-bane).**

**Dose,** in substance, 0.65 to 2 Gm. (or gr. x-xxx).

**ARNICÆ RHIZOMA (B. P.).—Arnica-rhizome.**

**Dose,** in substance, 0.65 to 2 Gm. (or gr. x-xxx).

*Preparations.*

**Tinctura Arnice (U. S. P.).—Tincture of Arnica (20 per cent.).** Dose, 0.60 to 2.00 (or six-f3ss).

**Tinctura Arnice (B. P.).—Tincture of Arnica from the root.** (5 per cent.).

**Pharmacology.**—Arnicae flores, the dried flower-heads of Arnica montana, are official in the U. S. P., but not in the B. P., which recognizes only the rhizome and roots. The plant belongs to the natural order Compositæ, and is indigenous to northern Europe and Siberia and also the northwestern part of the United States. The flowers are orange-yellow, disk-shaped, with rays, of feebly aromatic odor, and of a bitter, unpleasant taste. **Trimethylamin** has been obtained from the flowers, but the principal constituent to which its local effects are probably due is a **volatile oil**; besides this there is a glucoside, **arnicin**, and also inulin, tannic acid, resin, and other unimportant elements. According to some writers, arnica also contains two alkaloids, **arnicine** and **cytisine**, the latter of which is apparently identical with the principle of the same name derived from the laburnum.

**Physiological Action.**—Applied to a delicate skin, arnica frequently produces redness and inflammation resembling erysipelas. A pustular eruption may also be produced by the application of this remedy. It acts as a counter-irritant and revulsive. Internally, in small doses, it has some stimulating influence, raising the blood-pressure and the action of the heart, producing a feeling of warmth over the body and increasing the secretions. It has been shown that small quantities of arnica exert a stimulating influence upon the pneumogastric nerves. Larger doses cause depression, paralysis of the heart, followed by vomiting and collapse. Death results from the cessation of the heart's action, and in part from the accumulation of carbonic acid in the blood. Atropine is the physiological antidote, with stimulants, artificial respiration, and counter-irritation.

**Therapy.**—Tincture of arnica is externally used in domestic practice and by some foreign practitioners as a remedy for sprains, contusions, myalgia, rheumatism and local paralysis, and it is also believed to have some influence over hemorrhages. It is asserted by some authorities that any necrosis it may have in causing absorption of ecchymosis is really due to the violence of the tincture which is commonly used. The author, from clinical experience, believes that arnica has most effective local action upon the tissues, particularly in rheumatism, boils, abscesses, and in all thickened conditions of the integument. The following combinations are especially of

R *Tinctura arnicæ*,  
 Lin. saponis,  
 Tinct. opii ..... aa 30| c.cm. or f3j.

M. Sig.: Apply with friction for boils, abscesses, and thickening of the skin.

R *Tinctura arnicæ*.  
 Aquæ hamamelidis dest. .... aa 80| c.cm. or f3iij.

M. Sig.: Use on muslin or lint for hæmorrhages. A rheumatic joint may be covered with cloths saturated with the arnica and witch-hazel, the combination often being more effective when applied hot.

Arnica has been used internally in large doses in mania with high arterial excitement, in delirium ebriosum, and in acute rheumatism in sthenic subjects. Small doses of the tincture are useful in fever attended with much depression. This remedy may likewise be beneficially employed in chronic diarrhœa, chronic dysentery, and in various forms of hæmorrhage. It has been thought to be useful in paralysis of the bladder.

**ARSENI IODIDUM** (U. S. P., B. P.).—**Arsenous Iodide** ( $AsI_3$ ). (See **Arseni trioxidum**.)

**ASAFÆTIDA** (U. S. P., B. P.).—**Asafetida**.

Dose, 0.65 Gm. (or gr. x).

#### Preparations.

*Emulsum Asafetidæ* (U. S. P.).—Emulsion of Asafetida (4 per cent.). Dose, 15 to 30 c.cm. (or f3ss-j).

*Pilulæ Asafetidæ* (U. S. P.).—Pills of Asafetida (each containing 0.20 Gm., or gr. iij, of asafetida). Dose, 1 to 4 pills.

*Tinctura Asafetidæ* (U. S. P., B. P.).—Tincture of Asafetida (20 per cent.). Dose, 2 to 4 c.cm. (or f3ss-j).

*Pilulæ Aloes et Asafetidæ* (B. P.).—Pills of Aloes and Asafetida (equal parts of each). Dose, 0.25 to 0.50 Gm. (or gr. iv-viiij).

*Spiritus Ammonie Fætidus* (B. P.).—Fetid Spirit of Ammonia (contains 7.5 Gm. of asafetida in a menstruum of 10 parts of strong solution of ammonia with 90 parts of alcohol: 90 per cent.). Dose, 1.20 to 2.50 c.cm. (or mxx-xl).

*Pilula Galbani Composita* (B. P.).—Compound Pill of Galbanum (contains 33 per cent. of asafetida). Dose, 0.25 to 0.50 Gm. (or gr. iv-viiij).

**Pharmacology.**—Asafetida is derived from the rhizome of *Ferula fætida*, and probably from other species of *Ferula* (Umbelliferae), and is obtained, by incision, from the living root. The source of the asafetida of commerce must still be considered doubtful; it usually is brought to this country from Afghanistan and India. The drug is an oily gum-resin and is a ferulaic ester of asaresinotannol. It occurs as rough, irregular, rather soft masses, of brown color, somewhat garlicky odor, and acrid to the taste. The odor depends upon a **volatile oil**, which appears to be allylpersulphide. The agent also contains **ferulaic acid**, resin, gum, bassorin, with traces of acid calcium malate (Pelletier) and in commerce usually is much adulterated.

**Physiological Action.**—The effects are moderately stimulating, anti-spasmodic, and expectorant. Large doses cause vomiting and diarrhœa, especially in persons unaccustomed to its use. In medicinal doses it is carminative, and increases the quantity of the gastric juice. The sexual functions are said to be stimulated, and a general feeling of warmth is diffused through the body. Asafetida increases the action of the heart and arterial

pressure, stimulates the functions of the skin and kidneys, and is a mild general excitant. It is eliminated by the lungs, bowels, skin, and kidneys.

**Therapy.**—Asafetida is not used locally (although the plaster was formerly official), since, to those unaccustomed to its use, the odor is very offensive. This, however, makes it additionally useful in treating some nervous disorders, such as hysteria. Goodell advised that a teaspoonful of the mixture be mixed with hot water under an hysterical patient's nose, and in given by the stomach, or as an enema. In nervousness of children, the oil is serviceable, and in colic, or convulsions, the emulsion or milk of asafetida may be used freely as an injection. The mixture of magnesia and asafetida (not official) is used as a carminative for infants with colic, but the oil in it must not be overlooked. The pil. galbani comp. is used for flatulence and intestinal indigestion, in elderly people. The combination of asafetida is theoretically useful in amenorrhœa, but, practically, it is just in those cases that asafetida can only rarely be used, on account of its odor and taste. Italian physicians recommend the systematic administration of asafetida during pregnancy, when there is a history of previous abortions, when abortion is immediately threatened. It is given in doses gradually increasing from 0.20 to 1 Gm. (or gr. iii-xv) a day, after which the amount is, in the same manner, reduced. Its use is not advocated, however, in cases dependent upon syphilis, tuberculosis, or disease of the uterus and its appendages. The favorable influence of asafetida in these cases has been confirmed by Warman, who found that the drug reduced hæmorrhage, had a tranquillizing effect, and was particularly useful in cases of habitual abortion. Small doses of asafetida are valuable in the later stages of bronchitis, especially that occurring in old people. Its combination of expectorant and sedative virtues likewise renders it of service in emphysema. It may also be advantageously employed in spasmodic asthma, especially used as follows:—

- R Emuls. asafetidæ ..... 30| c.cm. or f3j.  
 Elix. ammon. valerianatis,  
 Elix. humuli ..... aa 45| c.cm. or f3iss.  
 M. Sig.: A teaspoonful or two in water every hour or two.

As an antispasmodic and expectorant, asafetida has been employed in whooping-cough. It may also be given with advantage in chorea, especially when that affection occurs in weakly girls about the period of puberty and associated with menstrual difficulty. In the flatulence and constipation of dyspepsia, it is a good remedy, and is especially appropriate on account of its undoubted exhilarant effect upon the brain. The mixture of asafetida inserted into the rectum is efficient in promoting the expulsion of flatus, and may be resorted to in the tympanites of typhoid fever. Asafetida can be administered internally, thus:—

- R Tinct. asafetidæ,  
 Tinct. cardamom. co. .... aa 30| c.cm. or f3j.  
 Spt. ammon. arom. .... 4| c.cm. or f3j.  
 Aquæ menth. pip. .... 60| c.cm. or f3ij.  
 M. Sig.: One to two teaspoonfuls in water every two or three hours.

**ASAPROL.**—Calcium beta-naphthol-alpha-monosulphonate ( $[C_{10}H_7SO_2]Ca + 3H_2O$ ) has, for convenience, been termed asaprol. It is a white powder, very soluble in water and alcohol, and is destruc-

tive to many forms of bacteria. It is administered in daily doses of 2 Gm. (or gr. xxx), gradually increasing to 4 Gm. (or 5j). Asaprol is incompatible with alkaline iodides, sulphates, and with most of the alkaline salts. Quinine and its salts are also incompatible with this compound. Asaprol reduces febrile temperature and augments the secretion of urine. This substance has rendered service in the treatment of influenza, gout, asthma, boils, carbuncles, tonsillitis, etc. Asaprol is of advantage in acute rheumatism, and in chronic forms of the disease it is useful in relieving pain. It is useful, also, in atonic dyspepsia. This remedy has been employed as an antipyretic in typhoid fever and pneumonia and as an analgesic in sciatica, intercostal neuralgia, and tic douloureux.

### ASCLEPIAS.—Pleurisy-root.

#### *Preparation.*

Fluidextractum Asclepiadis.—Fluid Extract of Asclepins. Dose. 1 to 4 c.cm. (or *mxv-f3j*).

**Pharmacology.**—The root of *Asclepias tuberosa* (Asclepiadææ) contains resin and fatty matter. **Asclepiadin** is a mixture of resin and glucoside, precipitated from a strong alcoholic tincture by the addition of cold water, or tannic acid. It has been given in doses of 0.065 to 0.32 Gm. (or gr. i-v).

**Physiological Action.**—The infusion is used in the southern portion of this country as a diaphoretic and expectorant; in large quantities it is emetic and cathartic. It depresses the heart's action and increases the functional activity of the skin and kidneys.

**Therapy.**—The recent infusion (31 Gm. to 473 c.cm., or 5j to 0j; dose, a wineglassful) is used in domestic practice for colds and pulmonary affections of an inflammatory and catarrhal character. In diarrhæa, dysentery, and painful disorders of the stomach or bowels it is often effective, a very good prescription being:—

R Fluidext. asclepiadis .....	60	c.cm. or f3ij.
Spt. vini gallici .....	30	c.cm. or f3j.
Syrup. rubi idæi .....	90	c.cm. or f3iij.

M. Sig.: A teaspoonful to a tablespoonful every hour or two, for diarrhæa and dysentery.

As a diaphoretic, it is used in the exanthemata, in order to facilitate the eruption and reduce the fever, and it is said to be advantageous in articular rheumatism, in controlling the inflammation and reducing the heart's action.

A decoction, made from the root-bark of *Asclepias syriaca*, also possesses diuretic properties, and has been found useful by Dr. G. D. McGauran in the relief of renal dropsy. In œdema of cardiac origin it appears to be of no avail. A tincture of the root of *Asclepias verticillata* has a popular reputation in the South as an antidote to the bites of venomous serpents and insects, as well as in hydrophobia. Three hundred and sixty c.cm. (or f3xiij) of a hot saturated decoction are said to relieve pain, produce perspiration, and promote sleep.

**ASEPTOL.**—**Sozolic Acid.** A syrupy, dark liquid, freely soluble in alcohol, water, and glycerin. It contains orthophenol-sulphonic acid (33 1/2

ment) diluted with water, and resembles carbolic acid in odor, though weaker. It is less caustic, but is decidedly antiseptic, and is said not to be toxic. When used, it is to be diluted (1 to 20 or more) for surgical practice.

**ASPARAGUS.**—*Asparagus*. The root of *Asparagus officinalis* (Liliaceæ), when fresh, is used in decoction or infusion (31 to 62 Gm. to 473 c.cm., or 1 to 10j), as a diuretic, laxative, and blood-purifier. The fresh shoots are also used, and increase the flow of urine, while imparting to it a peculiar, disagreeable odor; in some cases it has apparently caused congestion of the kidneys, and hæmaturia. **Asparagin**, which is obtained principally from the root, exerts a sedative action upon the circulation, reducing the force and frequency of the heart's action, and causing frontal headache. The peculiar odor caused by urine passed after the ingestion of asparagus depends, in all probability, according to Professor Nencki, upon the presence of methyl-asparagin. This substance is thought to be produced in the albuminous excretion which accompanies the germination of the plant.

**Therapy.**—*Asparagus* was believed by the ancients to have valuable emmenagogue properties, and was used as an emmenagogue; the writer confirms the observation of Ehrhardt, that a discharge resembling that of gonorrhœa or urethritis may be caused by eating asparagus. *Asparagus* is usually considered harmful in gonorrhœa. Though it increases or even excites scalding, its action appears to be very uncertain. Berkely Hill,<sup>1</sup> in a series of twenty cases, allowed one-half the number to eat asparagus and found that some could partake of it with impunity, while in others it produced increased congestion and flow of discharge.

The ingestion of asparagus, therefore, causes, in some individuals, disturbance of the functions of the kidney and a notable decrease in the amount of urine excreted. A fluid extract is used in doses of 4 to 15 c.cm. (or ʒss-ʒj).

It has been claimed that asparagus has special effects upon the uterus and is oxytocic after miscarriage, or in labor. A tincture (1 part of the dried root to 8 of proof-spirits) is used as a diuretic, in doses of 2 to 4 c.cm. (or ʒss-ʒj), by Dr. Jefferson, of England. Asparagin, in doses of 0.13 to 0.20 Gm. (or gr. ii-ij), may be used as a diuretic in dropsy, and, according to Whitt, seems to act in gout like weak doses of colchicum. It is also of some value in cardiac dropsy, chronic rheumatism, and gout. The combination of asparagin with one of the bromides for the latter affections in this prescription is often of value:—

R. Asparagin .....	1j	Gm. or gr. xvj.
Solutio bromidi .....	10ʒ	Gm. or 3v.
Syrup. aurantii .....	120j	c.cm. or ʒʒiv.

M. Sig.: Two teaspoonfuls in water three or four times a day.

**ASPIDIUM** (U. S. P.).—*Aspidium*.

**FILIX MAS** (B. P.).—*Male Fern*.

Dose (in powder), 2 to 6 Gm. (or ʒss-iss).

*Preparations.*

**Oleoresina Aspidii** (U. S. P.).—Oleoresin of *Aspidium*. Dose, 2 to 7.5 c.cm. (or ʒss-ʒj).

"Chronic Urethritis and its Treatment," London, 1890.

tive to many forms of bacteria. It is administered in daily doses of 2 Gm. (or gr. xxx), gradually increasing to 4 Gm. (or 5j). Asaprol is incompatible with alkaline iodides, sulphates, and with most of the alkaline salts. Quinine and its salts are also incompatible with this compound. Asaprol reduces febrile temperature and augments the secretion of urine. This substance has rendered service in the treatment of influenza, gout, asthma, boils, carbuncles, tonsillitis, etc. Asaprol is of advantage in acute rheumatism, and in chronic forms of the disease it is useful in relieving pain. It is useful, also, in atonic dyspepsia. This remedy has been employed as an antipyretic in typhoid fever and pneumonia and as an analgesic in sciatica, intercostal neuralgia, and tic douloureux.

### ASCLEPIAS. Plenrisy-root.

#### *Preparation.*

Fluidextractum Asclepiadis.—Fluid Extract of Asclepias. Dose, 1 to 4 c.cm. (or mxxv-℥j).

**Pharmacology.**—The root of *Asclepias tuberosa* (Asclepiadæ) contains resin and fatty matter. **Asclepiadin** is a mixture of resin and glucoside, precipitated from a strong alcoholic tincture by the addition of cold water, or tannic acid. It has been given in doses of 0.065 to 0.32 Gm. (or gr. i-v).

**Physiological Action.**—The infusion is used in the southern portion of this country as a diaphoretic and expectorant; in large quantities it is emetic and cathartic. It depresses the heart's action and increases the functional activity of the skin and kidneys.

**Therapy.**—The recent infusion (31 Gm. to 473 c.cm., or ̄j to Oj; dose, a wineglassful) is used in domestic practice for colds and pulmonary affections of an inflammatory and catarrhal character. In diarrhœa, dysentery, and painful disorders of the stomach or bowels it is often effective, a very good prescription being:—

R Fluidext. asclepiadis .....	60	c.cm. or ℥ij.
Spt. vini gallici .....	30	c.cm. or ℥j.
Syrup. rubi idæi .....	90	c.cm. or ℥iij.

M. Sig.: A teaspoonful to a tablespoonful every hour or two, for diarrhœa and dysentery.

As a diaphoretic, it is used in the exanthemata, in order to facilitate the eruption and reduce the fever, and it is said to be advantageous in articular rheumatism, in controlling the inflammation and reducing the heart's action.

A decoction, made from the root-bark of *Asclepias syriaca*, also possesses diuretic properties, and has been found useful by Dr. G. D. McGauran in the relief of renal dropsy. In œdema of cardiac origin it appears to be of no avail. A tincture of the root of *Asclepias verticillata* has a popular reputation in the South as an antidote to the bites of venomous serpents and insects, as well as in hydrophobia. Three hundred and sixty c.cm. (or ℥viij) of a hot saturated decoction are said to relieve pain, produce perspiration, and promote sleep.

**ASEPTOL.**—**Sozolic Acid.** A syrupy, dark liquid, freely soluble in alcohol, water, and glycerin. It contains orthophenol-sulphonic acid (33  $\frac{1}{2}$ ).

per cent.) diluted with water, and resembles carbolic acid in odor, though fainter. It is less caustic, but is decidedly antiseptic, and is said not to be toxic. When used, it is to be diluted (1 to 20 or more) for surgical practice.

**ASPARAGUS.**—**Asparagus.** The root of *Asparagus officinalis* (Liliaceæ), when fresh, is used in decoction or infusion (31 to 63 Gm. to 473 c.cm., or ʒi-ii to Oj) as a diuretic, laxative, and blood-purifier. The fresh shoots are used as food, and increase the flow of urine, while imparting to it a peculiar, heavy odor; in some cases it has apparently caused congestion of the kidneys, with hæmaturia. **Asparagin**, which is obtained principally from the root, has a sedative action upon the circulation, reducing the force and frequency of the heart's action, and causing frontal headache. The peculiar odor emitted by urine passed after the ingestion of asparagus depends, in all probability, according to Professor Nencki, upon the presence of methylmercaptan. This substance is thought to be produced in the albuminous disintegration which accompanies the germination of the plant.

**Therapy.**—Asparagus was believed by the ancients to have valuable aphrodisiac properties, and was used as an emmenagogue; the writer confirms the observation of Ehrhardt, that a discharge resembling that of gonorrhœa or urethritis may be caused by eating asparagus. Asparagus is usually considered harmful in gonorrhœa. Though it increases or even excites scalding, yet its action appears to be very uncertain. Berkely Hill,<sup>1</sup> in a series of twenty cases, allowed one-half the number to eat asparagus and found that some could partake of it with impunity, while in others it produced increased congestion and flow of discharge.

The ingestion of asparagus, therefore, causes, in some individuals, a disturbance of the functions of the kidney and a notable decrease in the amount of urine excreted. A fluid extract is used in doses of 4 to 15 c.cm. (or ʒi-iv).

It has been claimed that asparagus has special effects upon the uterus as an oxytocic after miscarriage, or in labor. A tincture (1 part of the dried tops to 8 of proof-spirits) is used as a diuretic, in doses of 2 to 4 c.cm. (or fʒss-j) by Dr. Jefferson, of England. Asparagin, in doses of 0.13 to 0.20 Gm. (or gr. ii-iiij), may be used as a diuretic in dropsy, and, according to Whitla, appears to act in gout like weak doses of colchicum. It is also of some service in cardiac dropsy, chronic rheumatism, and gout. The combination of asparagin with one of the bromides for the latter affections in this prescription is often of value:—

R Asparagin .....	1	Gm. or gr. xvj.
Sodii bromidi .....	194	Gm. or ʒv.
Syrup. aurantii .....	120	c.cm. or fʒiv.

M. Sig.: Two teaspoonfuls in water three or four times a day.

**ASPIDIUM (U. S. P.).—Aspidium.**

**FILIX MAS (B. P.).—Male Fern.**

**Dose** (in powder), 2 to 6 Gm. (or ʒss-iss).

#### Preparations.

**Oleoresina Aspidii (U. S. P.).—Oleoresin of Aspidium.** Dose, 2 to 7.5 c.cm. (or ʒss-ij).

<sup>1</sup> "Chronic Urethritis and its Treatment," London, 1890.

**Extractum Filicis Liquidum (B. P.).**—Liquid Extract of Male Fern. Dose, 3 to 6 c.cm. (or *mxlv-xc*).

**Pharmacology.**—*Aspidium* is the dried rhizome of the *Dryopteris Filix-mas* and of *Dryopteris marginalis* (Filices) (U. S. P.), and the rhizome of *Aspidium Filix-mas* (B. P.). The Male Fern, or *Dryopteris Filix-mas*, is found in almost every portion of the world; the *marginalis* is indigenous to North America. The rhizome, the portion employed (which deteriorates on being retained for a long time), has a sweetish-bitter, astringent taste, with some slight odor. It contains an active principle, **Filicio acid**, a fixed and volatile oil, filix-tannic, and gallic acids. Its virtues are due to the ethereal extract, or oleoresin. The rhizome of male fern contains intercellular glands, which hold a greenish secretion. When sections of this are preserved in glycerin, crystals are formed, which are soluble in ether. It is to this secretion that the anthelmintic qualities of the drug are due, according to Lauren.<sup>1</sup> The **oleoresin of aspidium** is a dark, thick fluid, of a bitter and nauseous taste. According to Professor Kobert its virtues do not depend entirely upon the filicic acid present, but also upon the **ethereal oil**. From his chemical and physiological investigations E. Poulsson concludes that the crystalline substance heretofore known as filicic acid is really the anhydride of the acid, and he proposes to call it **Filicin**. On standing, filicic anhydride precipitates from preparations of male fern as a granular, white powder without taste or smell, insoluble in water, but soluble in boiling alcohol. If these small crystals are dissolved in alkali and reprecipitated by acid, they become again converted to the active form of filicic acid.

**Physiological Action and Toxicology.**—*Aspidium* possesses the power of expelling, and perhaps destroying, *tæniæ*. Harley believes that it is only able to detach the entozoön from the intestinal wall. It is especially active against the *bothriocephalus latus*.

Large doses of the ethereal extract, or oleoresin, may occasion nausea, vomiting, and choleraic diarrhœa, followed by death from the congestion and inflammation of the gastro-intestinal tract by the irritant action of the drug. In the *Wiener klinische Wochenschrift* is reported the case of a child, 5½ years old, to whom 7.5 c.cm. (or *f3ij*) of the oleoresin were given, in three doses, within one hundred minutes. In an hour and a half, part of the tapeworm was expelled, then vomiting occurred, and somnolence, which was followed by twitching, sopor, and trismus of ten minutes' duration, ending in death five hours after the last dose of the extract.

A post-mortem examination of a case of poisoning and death from male fern revealed congestion and ecchymoses of the stomach and blood-clots over its surface. Poisoning from male fern should be treated by the administration of magnesium sulphate and by the hypodermic injection of water of ammonia, from 0.60 to 2 c.cm. (or *mx-f3ss*), properly diluted. According to Prevost and Binet, death usually results from paralysis of the heart, which is found, after death, firmly contracted and unresponsive to irritation. Male fern generally reduces the amount of urine secreted.

**Therapy.**—As a *tæniacide*, the ethereal extract, or oleoresin, is the most efficient preparation, but being a thick, bitter, nauseous substance, it is best given in capsules. It can be given, but not so well, in milk or mucilage. It can be acceptably administered with an equal quantity of aromatic syrup

<sup>1</sup> *Therapeutische Monatsheft*, April, 1899.

of rhubarb. The dose should be preceded and followed by a purgative. Calomel may be given as a preliminary purge. A full dose of castor-oil, two hours after the administration of the remedy, will usually bring away the entire parasite. Trousseau and Pidoux advise the restriction of food to a milk diet for a day or two previous to the institution of the treatment. Whitla has found that male fern is efficient among children, in a reduced dose, when combined with turpentine.

This combination of male fern often acts well:—

R Oleoresinæ aspidii .....	2	c.cm. or f3ss.
Ol. peponis expressi .....	15	c.cm. or f3ss.
Ol. terebinthinæ .....	2	c.cm. or mxxx.

M. Sig.: Take at a dose after fasting, and follow by a purgative.

Lanara claims good results from the application of male fern in eczema. The formula which he employs is as follows:—

R Ext. filicis liquidi (B. P.) .....	28	c.cm. or 3viiss.
Alcoholis .....	15	c.cm. or f3ss.
Ext. myrrh.,		
Ext. opii .....	aa 4	Gm. or 3j.

M. Sig.: For external use.

In several cases of cysticercus disease, Dr. R. Feletti has observed improvement to follow the use of ethereal extract of male fern. The result was especially favorable when the lesions were situated in the subcutaneous or muscular tissues.

In Finland, the *aspidium spinulosum* is used as a tæniacide more frequently than the official drug, as it is a more common variety in this region. It was found to be equally efficient in doses of 1 to 4 Gm. (or gr. xv-lx) of the extract, by Lauren and Schumann.

### ASPIDOSPERMA.—*Aspidosperma* (Quebracho).

#### Preparation.

Fluidextractum *Aspidospermatis*.—Fluid Extract of *Aspidosperma*. Dose, 2 to 4 c.cm. (or f3ss-j).

**Pharmacology.**—The bark of *Aspidosperma Quebracho-blanco* (Apocynaceæ): a large tree of Brazil. It contains six alkaloids, the most important of which is **Aspidospermine**. The others are named *Aspidospermatine*, *Aspidosamine*, *Quebrachine*, *Hypoquebrachine*, and *Quebrachamine*. It also contains tannin and two sugars (quebrachit and inosit).

*Aspidospermine* commercially consists of the mixed alkaloids of the bark. It occurs in the form of colorless crystals, insoluble in water, moderately soluble in alcohol and ether.

*Quebracho* is also found in *Catamarca*, of the Argentine Republic, where it has a popular reputation as a febrifuge and antiperiodic. Another species, the red *quebracho*, contains a large amount of tannin and less of the bitter principles. It is used largely for tanning leather, and is sometimes mixed with white *quebracho* as an adulteration.

**Physiological Action.**—*Quebracho* is bitter and stimulant to the salivary glands, astringent to the intestinal tract. In large doses in animals it produces paralysis of the limbs, of central origin.<sup>1</sup> It also causes salivation, paralysis of respiration, and diminished frequency of the heart's action;

<sup>1</sup> F. Penzoldt, *Berliner klinische Wochenschrift*, No. 19, 1879.

death is caused by paralysis and convulsions due to apnoea. Moderate doses retard breathing, and make inspiration slower and fuller. Aspidospermine increases the respiratory movements in the higher animals by stimulating the respiratory centres. It is said also to cause an excess of oxygen to be taken up by the red blood-cells, and may thus induce apnoea. In man it has no influence upon the temperature or the frequency of the pulse, but is said by Hale to "impart some tonic to the heart."

**Therapy.**—The special action upon the motor apparatus of respiration makes quebracho valuable in treating dyspnoea of all kinds, whether bronchial, cardiac, or nervous. In emphysema, with or without asthma, it has been very serviceable in the form of fluid extract, 1.20 to 2.50 c.cm. (or *xxx-xl*), several times a day. Quebracho is also of service in spasmodic croup. Dr. Picot states that it is advantageous to the respiration when taken before hill-climbing. The effect of quebracho in relieving cyanosis is very marked. In the case of a child, suffering with double pneumonia, Dr. Lawrence witnessed decided improvement of the respiration and circulation follow the use of this remedy. This drug very sensibly diminishes the pulse and temperature in acute rheumatism and inflammations of serous membranes. An elixir, a wine (6 per cent.), and a tincture (40 to 50 per cent.) have also been used. The alkaloid, aspidospermine, has been employed as a febrifuge, and, according to Guttmann, its dose as an antiperiodic is 1.20 Gm. (or gr. xvij), the ordinary dose being 0.065 to 0.13 Gm. (or gr. i-ij). It is soluble in oils or 50 parts of pure alcohol. Bardet has given aspidospermine in dyspnoea with good results. In serious cases the drug can be well administered by hypodermic injection. Quebrachine hydrochloride has been given both by the mouth and by hypodermic injection for the relief of dyspnoea, the dose employed being from 0.065 to 0.13 Gm. (or gr. i-ij). Triturates of  $\frac{1}{10}$  and  $\frac{1}{100}$  of aspidospermine (all the alkaloids) are also used. The solid extract is a useful preparation for asthma, given in 0.065 Gm. (or gr. j) doses three times a day. The fluid extract is no longer official.

**ASPIRIN**, or acetyl-salicylic acid. ( $C_6H_4(COO-HCO_2CH_3)_2$ ), is obtained by heating acetic anhydride with salicylic acid; it occurs in white, crystalline needles, which have a melting-point of  $135^\circ C.$  ( $275^\circ F.$ ). It is readily soluble in alcohol and ether; not very soluble in cold water; but is soluble in an acid solution like gastric-juice, and gives with ferric chloride, a blue color.

Wohlgemuth<sup>1</sup> reports his results in 10 cases suffering with rheumatoid manifestations; in 2 cases of acute rheumatism in which salicylic acid and antipyrin had been used with negative results, aspirin was given in doses of 3 Gm. (or gr. xlv) daily; the patients improved almost immediately; pain and swelling disappeared within a few days, without any gastric disturbance. The remaining 8 cases were not true joint rheumatism; some had scarlet fever, others diphtheria or angina; these patients were given 1 Gm. (or gr. xv) three times daily for eight days without feeling any ill effects. The action of aspirin on the rheumatic joint is identical with salicylic acid, and is, according to this author, to be preferred to sodium salicylate, chiefly because of its non-irritating character when administered by the mouth: it should be given in powder, and not in a solution. Ellerson<sup>2</sup> observed a general erythema produced by five grains of aspirin. It yielded promptly

<sup>1</sup> *Therap. Monat.*, No. 7, 1904.

<sup>2</sup> *Therap. Monat.*, May, 1899.

to salines, and a dusting powder locally. Tinnitus aurium has been noticed after its administration, and it often causes profuse perspiration. Occasionally it depresses the heart. It is recommended as a good antipyretic for la grippe.

**ATROPINA** (U. S. P., B. P.).—Atropine ( $C_{17}H_{23}NO_3$ ).

**ATROPINÆ SULPHAS** (U. S. P., B. P.).—Sulphate of Atropine. (See *Belladonna*.)

**AURANTII AMARI CORTEX** (U. S. P.).—Bitter Orange-peel. The dried rind of the fruit of *Citrus Amara*, *Citrus Bigaradia*, and *Citrus Vulgaris* (Rutaceæ).

**AURANTII DULCIS CORTEX** (U. S. P.).—Sweet Orange-peel. The undried, outer rind of the ripe fruit of *Citrus Aurantium* (Rutaceæ).

**AURANTII CORTEX RECENS** (B. P.).—Fresh Bitter Orange-peel  
“The fresh outer part of the pericarp of *Citrus Aurantium*.”

**AURANTII CORTEX SICCATUS** (B. P.).—Dried Bitter Orange-peel.  
“The dried outer part of the pericarp of *Citrus Aurantium*.”

#### *U. S. P. Preparations.*

*Oleum Aurantii Corticis*.—Oil of Orange-peel.  
*Fluidextractum Aurantii Amari*.—Fluid Extract of Bitter Orange-peel.  
*Syrupus Aurantii Florum*.—Syrup of Orange-flowers.  
*Syrupus Aurantii*.—Syrup of Sweet Orange-peel.  
*Tinctura Aurantii Dulcis*.—Tincture of Sweet Orange-peel (20 per cent.).  
*Tinctura Aurantii Amari*.—Tincture of Bitter Orange-peel (20 per cent.).  
*Spiritus Aurantii Compositus*.—Compound Orange Spirit. Used in making the elixir aromaticum, and also the aromatic fluid extract of *rhamnus purshiana*.  
*Elixir Aromaticum*.—Aromatic Elixir.  
*Aqua Aurantii Florum*.—Orange-flower Water.  
*Aqua Aurantii Florum Fortior*.—Stronger Orange-flower Water.  
The dried peel of bitter orange enters into the U. S. P. compound tinctures of cinchona and gentian. Orange-flower water is used in syrup of calcium lactophosphate.

#### *B. P. Preparations.*

*Aqua Aurantii Floris*.—Orange-flower Water.  
*Syrupus Aurantii*.—Syrup of Orange. Dose, 2 to 4 c.cm. (or f3ss-j).  
*Syrupus Aurantii Floris*.—Syrup of Orange-flower. Dose, 2 to 4 c.cm. (or f3ss-j).  
*Tinctura Aurantii*.—Tincture of Orange. Dose, 2 to 4 c.cm. (or f3ss-j).  
*Infusum Aurantii*.—Infusion of Orange-peel (dried bitter orange-peel, 5 Gm.; boiling distilled water, 100 c.cm.). Dose, 15 to 30 c.cm. (or f3ss-j).  
*Infusum Aurantii Compositum*.—Compound Infusion of Orange-peel (orange-peel and lemon-peel, with cloves, in boiling distilled water). Dose, 15 to 30 c.cm. (or f3ss-j).  
*Vinum Aurantii*.—Orange-wine (wine made by the fermentation of a saccharine solution to which fresh bitter orange-peel has been added; 10 to 12 per cent. of alcohol).

The dried bitter orange-peel enters into the B. P. compound spirits of horseradish, and compound tinctures of cinchona and gentian; the tincture of orange into aromatic syrup, and aromatic syrup of cascara.

**Pharmacology.**—The United States Pharmacopœia preparations are obtained from the bitter, *Citrus amara*, *Bigaradia*, or *Vulgaris*, and from the sweet orange, *Citrus aurantium* (*Aurantiaceæ*): the fruit of small trees which grow in warm regions of the Eastern and Western Hemispheres. The British Pharmacopœia preparations are made from the outer part of the pericarp of the *Citrus Aurantium*.

**Therapy.**—Orange-juice, with water and sugar, may be used as a drink for fevers and as an antiscorbutic. Care should be taken, after typhoid fever, not to allow children to suck the juice from the orange, as death has been caused by the passage of a seed through an ulcerated patch in the intestine. Death has also been caused by a child's eating the fresh rind, which contains the volatile oil. Erythema, œdema, vesicles, and pustules may be occasioned by paring bitter oranges. The elixir is an agreeable vehicle for other remedies, having the alcoholic strength of a cordial. The other preparations are pleasant flavoring agents.

**AURI ET SODII CHLORIDUM (U. S. P.).**—Gold and Sodium Chloride ( $\text{AuCl}_3 + \text{NaCl}$ ).

**Dose,** 0.001 to 0.006 Gm. (or gr.  $\frac{1}{50}$ – $\frac{1}{10}$ ).

**Pharmacology.**—A mixture composed of equal parts, by weight, of dry gold chloride and dry sodium chloride, containing not less than 30 per cent. of metallic gold. On account of its position among metals, gold has been credited with having some special medicinal value, although not a normal constituent of the human body. It is practically non-corrosive, and was formerly used to some extent to protect instruments from rusting. In a pure state, gold is too soft for most purposes, although it is the best material for wire and for filling teeth. The only gold preparation official is the gold and sodium chloride. This forms an orange-colored powder, slightly deliquescent in the presence of dampness, freely soluble in water. It is easily decomposed by sunlight and by organic matter, and is best dispensed as a tablet triturate. Lainer has recently prepared a **gold and potassium chloride** by dissolving pure gold in aqua regia by the aid of heat and adding a concentrated solution of potassium chloride. The compound is said to be stable and neither acid nor deliquescent, but no clinical reports of its use have yet been made.

**Physiological Action.**—The effects of the gold and sodium chloride resemble those of the mercuric chloride. It has very decided bactericidal powers. According to Sternberg, a solution of 1 to 40,000 restrain the growth of anthrax bacillus, and one of 1 to 8000 destroys it. This statement has been questioned by L. Hektoen, who found that 1 to 40,000 delayed the growth, but that 1 to 8000 did not destroy it. A strength of 1 to 1000 destroys the bacillus of diphtheria and 1 to 500 the bacillus of typhoid fever. Gibbes and Shurley demonstrated its bactericidal power against bacillus tuberculosis by physiological experiments upon animals.<sup>1</sup> In concentrated solution it has an escharotic action upon the skin. Internally, in very small doses, it acts upon the glandular structures of the stomach and liver,—stimulating nutrition and assimilation; but, in larger doses, it produces violent gastro-enteritis, without ulceration or salivation. These symptoms have been produced in an adult by 0.065 Gm. (or gr. j), and this same dose has

<sup>1</sup> *Therapeutic Gazette*, April 15, 1891.

produced death in a dog in four minutes, as reported by Daniel R. Brower.<sup>1</sup> In anæmia it increases the percentage of hæmoglobin and the number of red blood corpuscles, but large doses reduce the oxidizing power of the red blood-cells. Large doses excite salivation, but do not affect the teeth, cheeks, or gums. This salt exercises a constipating effect upon the bowels. Upon the brain and spinal cord its effects are those of a tonic. In some instances it produces decided mental exhilaration. When its use has been too long continued it gives rise to what has been termed "auric fever," a condition characterized by profuse sweats and an increase of saliva and urine. The remedy acts upon the kidneys, increasing the urinary flow, and the secretion, after large doses, is colored yellow. Renal hyperæmia with albuminuria is caused by toxic doses. It is claimed that gold has aphrodisiac powers, causing painful erections in men and increasing the menstrual flow in women. Gold is removed from the body chiefly by the kidneys, but to some extent also by the liver and bowels. For the gastro-enteritis, vomiting, etc., similar to corrosive chloride of mercury, caused by large doses, the antidote is albumin and demulcents.

**Therapy.**—From the physiological action upon the glandular system of the stomach and liver, and the resulting improvement in the powers of assimilation, gold may be especially valuable in atonic dyspepsia, enabling the patient to digest more food. It is of decided service in nervous dyspepsia. Also, in gastric catarrh, chronic inadequacy of the hepatic functions (torpid liver), and early stage of cirrhosis, the gold and sodium chloride is a useful remedy. Administered in this prescription, it often is most effective in gastric catarrh and torpid liver:—

R Auri et sodii chloridi .....	103 Gm. or gr. ss.
Ext. nucis vomicæ .....	20 Gm. or gr. iij.
Ext. taraxaci .....	4 Gm. or ʒj.

M. et ft. pil. no. xxx.

Sig.: Two pills three times a day.

In cirrhosis of the kidney, and albuminuria due to interstitial nephritis, according to Millard, it has a special place. Culbertson reports relief of a case of albuminuric retinitis from gold and sodium chloride. This salt is beneficial in arteriosclerosis and the vertigo of the aged dependent upon atheromatous vessels, and also in vertigo due to indigestion. It is useful in hysteria and functional impotence. In spasmodic affections (whooping-cough, laryngismus stridulus) it has some advocates. Where amenorrhœa or dysmenorrhœa is due to deficient innervation, and not to local lesion or obstruction, this remedy has given good results, and also in habitual abortion. Uncomplicated chronic ovaritis is benefited by the administration of gold. The double salt is also said to afford relief from ovarian neuralgia. Following out the physiological action, we find that, in spinal sclerosis, premature senility, in depression and hypochondria, it has a high degree of efficiency. This remedy has also been given with advantage in neurasthenia, progressive general paralysis, utero-ovarian congestion, menorrhagia, subacute metritis, nymphomania, and spermatorrhœa. Dr. John Strahan, of Belfast, suggests that it may be useful in insomnia dependent upon cerebral anæmia. In the treatment of impotence, Professor Glenn, of the University of Tennessee, has found the following combination of service:—

<sup>1</sup> *Journal American Medical Association*, Oct. 1, 1899, p. 754.

<b>R</b> Auri et sodii chloridi .....	20	Gm. or gr. iij.
Strychnin. sulphat. ....	065	Gm. or gr. j.
Zinci phosphidi .....	20	Gm. or gr. iij.
Ext. damianæ .....	4	Gm. or 3j.

M. et ft. in capsulas no. xxx.

Sig.: One capsule thrice daily.

Gold and sodium chloride is, in some cases, an efficient substitute for mercuric chloride in the treatment of syphilis, and it has been given in this combination, where there was an undue susceptibility to mercury, with decided benefit:—

<b>R</b> Auri et sodii chloridi .....	065	Gm. or gr. j.
Ext. sanguinaris .....	13	Gm. or gr. ij.
Ext. calumbæ .....	2	Gm. or gr. xxx.

M. et ft. pil. no. xxx.

Sig.: One pill three times a day.

Gold also proves of avail in the late manifestations of syphilis, and is sometimes effectual, after failure of the mixed treatment by means of mercury and iodine, or when these remedies cannot be borne on account of idiosyncrasy or debility. It has been of service in ulcerations of the throat, laryngitis, ozæna, diseases of the bones, and syphilitic cachexia. Dr. J. A. Robinson reports two cases of diabetes mellitus in which gold and sodium chloride caused a steady decrease and final disappearance of glycosuria. In hypochondria and melancholia the double salt is highly recommended. In one case of pyelitis, Dr. G. Frank Lydston, of Chicago, found the hypodermic injection of gold and sodium chloride to produce decided improvement. Gold chloride is useful in the treatment of chronic tobacco poisoning and morphine addiction.

From the results of fifty-two experiments made upon various species of warm-blooded animals, Calmette concludes that the subcutaneous injection of gold is antidotal to the poison of the cobra di capello. He believes that the venom may be neutralized, even after it has been absorbed, and that the treatment may be successfully applied to human beings. His method is to cast an elastic ligature around the limb, to inject 7.50 to 9.25 c.cm. (or f3ii-iiss) of a 1-per-cent. solution of gold chloride into the wound and beneath the surrounding skin, not more than 1 c.cm. (or mxv) being deposited at any one spot. Injections are also made at the level of the ligature as well as between it and the heart. The solution may be thrown either into the connective or muscular tissue. As soon as the injections have been made, the ligature may be removed. The method merits trial in the case of bites from other venomous serpents, since, as Weir Mitchell has shown, the poisons are substantially of the same chemical composition.

In appropriate cases this salt may be given under the skin. Thus Gibbes and Shurley<sup>1</sup> have reported successful results in twenty-seven cases of pulmonary tuberculosis, by gold and sodium chloride given hypodermically, in doses of 0.003 to 0.01 Gm. (or gr.  $\frac{1}{20}$ - $\frac{1}{6}$ ), during three to eight months. Pepper also reported a case of phthisis apparently cured by this drug.<sup>2</sup>

Dr. Joseph Drzewiecki reports the cure of a case of lupus by the internal

<sup>1</sup> *Loc. cit.*

<sup>2</sup> *University Medical Magazine*, Dec., 1895.

administration of the same salt in the dose of 0.0003 Gm. (or gr.  $\frac{1}{150}$ ) three times a day.

**AVENA.**—Oat, the fruit of *Avena sativa* (Gramineæ), is used as a food in the form of meal, of which cakes, gruel, or porridge is made. It is a highly-nutritious food, containing oil, nitrogenized principles, carbohydrates, phosphates, etc.; but on account of its concentrated form and the presence of irritating fragments of the outer coat, containing silica, oatmeal is likely to cause indigestion, and in young children diarrhoea. The habit of eating porridge with milk and large quantities of sugar is apt to cause sour stomach and pyrosis, which may be avoided by using butter or cream and salt instead of the milk and sugar. Skin eruptions have been attributed to the use of oatmeal, particularly eczema, in infants, which are cured by a change of diet. An alcoholic tincture of oats has been supposed to have a sedative action upon the cerebral centres and to remove the craving for drink. For the latter, it would be more rational to recommend an infusion than a tincture.

**AZEDARACH.**—Azedarach (Pride of China). The dried root-bark of *Melia azedarach* (Meliaceæ) is used in our Southern States in the form of a decoction (124 Gm. to 946 c.cm., or  $\text{Ṣiv-Oij}$ , boiled down to 473 c.cm., or  $\text{Oj}$ ), as a vermifuge, in cases of round worm 15 c.cm. (or  $\text{fṣss}$ ) being given to a child every two or three hours until the bowels are freely moved. Large doses may cause vertigo, dilated pupils, and stupor. A fluid extract has been also used (dose, 4 c.cm., or  $\text{fṣj}$ ), but the fresh decoction is the best preparation.

**BALSAMUM CANADENSE.**—Canada Turpentine. (See *Terebinthina Canadensis*.)

**BALSAMUM PERUVIANUM** (U. S. P., B. P.).—Balsam of Peru.

**Dose,** 0.30 to 1 c.cm. (or  $\text{mv-xv}$ ).

**Pharmacology.**—A balsam obtained from *Toluifera Pereiræ* (Leguminosæ) U. S. P.; *Myroxylon Pereiræ* (B. P.): a tree of Central America. It is a brown, heavy liquid, of fragrant odor and a warm, rather acid taste, containing resin, volatile oil, and both benzoic and cinnamic acids. It is inflammable, burning with a white smoke and fragrant odor. It is entirely soluble in 5 parts of alcohol, and should not diminish in volume when agitated with an equal bulk of benzin or water. The National Dispensatory states that the balsam contains 60 to 64 per cent. of benzyl benzoate ( $\text{C}_7\text{H}_5\text{C}_6\text{H}_4\text{CO}_2\text{C}_7\text{H}_5$ ), a colorless oil, vanillin, cinnamic acid, benzyl cinnamate, and 30 to 38 per cent. of resin, composed of benzoic and cinnamic esters of perurresino-tannol.

**Physiological Action and Therapy.**—Peruvian balsam is carminative, stimulant, and expectorant. It has been extolled in Europe by Landerer and Schnitzler in phthisis pulmonalis and chronic bronchial catarrh, given in capsules or emulsion, and also used in an inhaler. Professor Landerer has convinced himself that the virtue of balsam of Peru in tuberculosis depends upon the presence of cinnamic acid, which he has of late employed in place of the balsam. The cinnamic acid of which he makes use, however, is obtained from storax. It is colorless, crystalline, feebly soluble in cold water, freely soluble in hot water, alcohol, and warm oil. A 5-per-cent. emulsion of the acid is prepared with almond-oil, yolk of egg, and normal salt solu-

tion. Before use, the emulsion must be rendered alkaline by a few drops of a 25-per-cent. solution of liquor potassæ. The emulsion is preferably thrown into a vein. The method is not applicable to the later stages of pulmonary tuberculosis. From 0.12 to 0.37 c.cm. (or *mii-vj*) of the emulsion are injected twice a week. In lupus, Landerer employs an alcoholic solution of 1 part of cinnamic acid, 1 part of cocaine hydrochlorate, and 20 parts of alcohol, 0.06 to 0.12 c.cm. (or *mi-ij*) being injected into the nodules till 0.60 c.cm. (or *mx*) have been used at one *séance*. At the end of a week the procedure is repeated. As it is a deodorant and antiseptic, it is useful as a local application to open wounds and compound fractures, and also in the treatment of ozæna and old ulcers. In uterine affections we may use:—

R Iodoformi .....	15	5	Gm. or ʒiv.
Balsami Peruviani .....	7	5	c.cm. or ʒij.
Adipis lænæ hydrosi .....	62		Gm. or ʒij.

M. Sig.: For local application on absorbent cotton or carded wool.

In infantile eczema we may prescribe:—

R Acidi borici .....	2	Gm. or ʒss.
Balsami Peruviani .....	60	c.cm. or <i>mx</i> .
Adipis lænæ hydrosi .....	31	Gm. or ʒj.
Ol. amygdalæ expressi .....	q. s.	ft. ungt.

M. Sig.: Apply frequently upon soft linen.

Balsam of Peru, pure or in an ointment, is an efficient application in pruritus of the vulva and senile paræsthesia. It is likewise efficacious in scabies. Leucoplakia, or local epithelial thickening of the mucous membrane, is removed by applications of Peruvian balsam; in leprosy it may be thoroughly rubbed into the affected areas. It is also a good local application for diphtheria. The internal use of Peruvian balsam has been recommended by Trousseau and Pidoux in chronic intestinal catarrh and typhoid fever. Nuggia has found it serviceable in the gastro-intestinal disorders of childhood. The external application of balsam of Peru has, in some instances, been followed by an erythematous, urticarial, or eczematous eruption. Dr. Lohaus has reported a case of fatal gastritis in a six-day-old babe caused by balsam of Peru which had been applied to the mother's nipples on account of fissures.

### **BALSAMUM TOLUTANUM** (U. S. P., B. P.).—Balsam of Tolu.

Dose, 0.32 to 1 Gm. (or gr. v-xv).

#### *Preparations.*

Tinctura Tolutana (U. S. P., B. P.).—Tincture of Tolu (20 per cent.). Dose, 2 to 4 c.cm. (or ʒss-ʒj).

Syrupus Tolutanus (U. S. P., B. P.).—Syrup of Tolu. Dose, 7.5 c.cm. (or ʒij) or more. B. P., 2 to 4 c.cm. (or ʒss-ʒj).

Tinctura Benzoini Composita (U. S. P., B. P.).—The compound tincture of benzoin contains Tolu. Dose, 1.30 to 4 c.cm. (or *mx*-ʒj).

**Pharmacology and Therapy.**—A balsam obtained from *Toluifera Balsamum* (Leguminosæ; U. S. P.); *Myroxylon Toluifera* (B. P.): a tree of New Granada. It is a resinous exudation, which yields 7 per cent. of an acid, aromatic, oily liquid, chiefly benzyl benzoate, with a little benzyl cinnamate. Also 0.5 to 1 per cent. of a volatile oil, chiefly **Tolene**, and 75 to 80 per cent. of resin. It has an agreeable odor and taste.

Balsam of Tolu is, when fresh, a thick, viscid fluid, but is, in time, converted into a hard, translucent solid. It is slightly antiseptic and expectorant; the syrup is a favorite basis for cough-mixtures, chiefly on account of its pleasant taste. The balsam itself may be administered in emulsion with egg or mucilage. It should not be used during acute attacks of inflammation. The syrup covers the taste of chloral or croton-chloral (Brunton).

**BAPTISIA.**—Wild Indigo. The root of *Baptisia tinctoria* (Leguminosæ), indigenous to North America. Baptisin, an impure resin, is considered to have cholagogic properties (dose, 0.065 to 0.32 Gm., or gr. i-v), and has been found of service in amenorrhœa. The decoction or fluid extract may be used as a cathartic in large doses, or tonic astringent in small. In typhoid fever and bowel disorders, small doses of a tincture have been used, but not according to the best practice. The decoction may be employed as a douche in nasal catarrh, chronic ulcers, leucorrhœa, etc., or as a mouth-wash in stomatitis.

**BARIUM CHLORIDUM.**—Barium Chloride. Barium, in its action upon the blood-vessels, resembles both ergot and digitalis. It causes the cardiac contractions to become more slow and forcible. Tonic spasm of involuntary muscular fibre is produced, peripheral blood-vessels are constricted, and blood-pressure rises. Peristalsis is likewise excited. Overdoses give rise to salivation, thirst, vomiting, purging, embarrassed breathing, slow pulse, dilated pupils, and paralysis of the extremities. In experiments upon animals Pilliet and Malbec found that barium chloride, injected subcutaneously in toxic doses, caused diarrhœa, albuminuria and hæmoglobinuria, and convulsions, followed by rigidity. After death lesions were found in most of the organs. The glomeruli of the kidneys were particularly affected, and hæmorrhages into the straight tubes were also observed. According to M. Bardet, barium chloride occasions coagulation of the blood, and death results mechanically from embolism. Death has occurred in consequence of 0.17 Gm. (or gr. iiss), the quantity not having been taken in one dose, but in daily portions of 0.015 Gm. (or gr.  $\frac{1}{4}$ ). The symptoms of intoxication manifested themselves at the end of a week. This, however, must be regarded as an exceptional case. The drug, in small medicinal doses, is devoid of active poisonous properties. Barium chloride is a white, crystalline substance, of a bitter and disagreeable taste, readily soluble in water. This salt is scarcely soluble in absolute alcohol, but dissolves in rectified spirit. The sulphates are incompatible with the salts of barium. In cases of poisoning the sodium, or magnesium, sulphate, with white of egg, may be used as antidotes. Usual dose is 0.006 to 0.03 Gm. (or gr.  $\frac{1}{10}$ - $\frac{1}{2}$ ) in solution.

**Therapy.**—Barium chloride may be used as a cardiac tonic in valvular insufficiency with irregularity of the heart. The late Prof. Da Costa observed that, in these conditions, it relieves pain and the sensation of uneasiness, acting as a fairly good diuretic and capable of being given for a considerable period without disturbing digestion. In minute doses it is a stimulant and alterant, and may be used in scrofula.

From an administration of this salt to seventy-six children, Lelli concludes that it is efficacious in the gastritis which accompanies the torpid form of scrofula, but that it is injurious in the florid form. In the beginning, the remedy irritates the mucous membrane of the bowel and renders

the process more acute, but the membrane is finally favorably modified. Barium has been recommended likewise in chlorosis and in cachectic conditions. In amenorrhœa it has been given with advantage. It has yielded good results in varicose veins and aneurism. It affords relief to the vascular phenomena of exophthalmic goitre.

An ointment of barium chloride ( $\frac{1}{2}$  to 1 per cent.) has been used for reducing enlarged glands.

**BARI DIOXIDUM** (Not Official).—**Barium Dioxide** ( $\text{BaO}_3$ ).

*Preparations.*

**Aqua Hydrogenii Dioxidii** (U. S. P.).—Solution of Hydrogen Dioxide, or Peroxide of Hydrogen. Three per cent. by weight of pure  $\text{H}_2\text{O}_2$ , equivalent to ten volumes of available oxygen.

**Liquor Hydrogenii Peroxidi** (B. P.).—Solution of Hydrogen Peroxide. Dose, 2 to 7.5 c.cm. (or f3ss-ij).

The dioxide, or peroxide, of barium should be anhydrous and kept in well-closed vessels. It is used in the manufacture of the solution of bleaching liquid, or dioxide of hydrogen, now entering largely into use for medical and surgical purposes.

**Pharmacology.**—The commercial dioxide of hydrogen is a colorless solution of this agent in water. It is, when undiluted, a syrupy fluid, destitute of odor, of a harsh, slightly-acrid taste, has a specific gravity of 1.45, and is of very unstable composition. Its formula is  $\text{H}_2\text{O}_2$ , and it decomposes into water and nascent oxygen, yielding 475 times its own volume of oxygen and leaving behind 1 volume of water. The freshly prepared official solution contains about 3 per cent., by weight, of the pure dioxide. This dilution is a clear fluid, having but little odor or taste, and is of a slightly-acid reaction, corresponding to about 10 volumes of available oxygen. Another strength employed by surgeons is called the 15-volume solution, because each portion of the solution yields 15 volumes of the oxygen. It is an active oxidizing and antiseptic agent. As it gradually decomposes it must be kept in a cool place and in loosely-stoppered bottles in order to prevent explosion.

**Physiological Action and Therapy.**—The solution of hydrogen dioxide destroys pus and the micro-organisms, which excite suppuration, and coagulates the albuminoid components of the inflammatory products. It has also the property of checking fermentation. It is destructive to the pathogenic micro-organisms and is an excellent agent for purifying drinking-water. Dr. Jakovleff has ascertained by experiment that the solution of hydrogen dioxide increases the general acidity of the gastric juice and the proportion of free hydrochloric acid, but diminishes the amount of lactic acid. It produces a marked increase of the digestive power of the gastric juice. When pure and of official strength, it is free from irritating qualities, and can be poured over wounds, injected into sinuses, or into the ear, or used as a spray in ulcerations of the pharynx and of the larynx. It produces a frothing up when it encounters pus, owing to the liberation of oxygen, and the cessation of this commotion indicates the removal of all the pus. The surface of the wound or ulcer becomes blanched, but is not injured by the application. As a rule, the fluid exerts an analgesic effect upon the surface with which it is brought into contact. Tubercular and mammary abscesses especially are

well treated in this way. Boils, carbuncles, felons, and ulcers are improved and their pain assuaged by the use of this remedy. Unhealthy or poisoned wounds and phlegmonous erysipelas receive decided benefit from the use of hydrogen dioxide. This solution is a beneficial application in cases of senile gangrene, phagedena, and syphilitic ulceration. It is peculiarly adapted for injection into cavities, fistulas, and sinuses communicating with bones or joints. This fluid, moreover, possesses the valuable property of disintegrating carious or necrosed bone, and is, therefore, of service in hip-joint disease. Granular pharyngitis and stomatitis are benefited by the same application. It has been utilized with advantage for the purpose of disinfecting cavities in carious teeth, in the treatment of abscesses of the alveoli or antrum, and for bleaching discolored teeth.

For the last-named purpose it is made into a paste with chalk or cuttle-bone. It enables the dentist to blanch and fill at the same sitting a sensitive pulp or cavity. Dr. H. F. Brownlee, of Danville, Conn., made use of hydrogen dioxide with marked advantage in a case of empyema which was characterized by the excessive amount of pus evacuated from the pleural sac.

For comedones, Unna advises the use of a preparation containing from 20 to 40 parts of hydrogen dioxide, 10 parts of lanolin, and 20 parts of vaselin. The application of the liquid is also of avail in acne. Hydrogen dioxide, on account of its bleaching properties, may be used to decolorize the dark lanugo hairs which not infrequently disfigure the faces of women. M. Gallois prefers hydrogen dioxide to tincture of iodine, as a parasiticide application in pityriasis versicolor. It is also effective in trichorrhæxis barbæ.

Dr. Golovin commends the action of hydrogen dioxide in various diseases of the conjunctiva and cornea. In ulcers of the cornea suppuration is diminished and healing promoted. Infiltrations undergo absorption. The remedy is of value in hypopyon, and may render operative interference unnecessary. Hydrogen dioxide is likewise beneficial in phlyctenular conjunctivitis and acute gonorrhœal ophthalmia. It has been used with good results in dacryocystitis. It is serviceable in suppurative diseases of the ear. Hydrogen dioxide has given very favorable results in the treatment of mastoid disease, being doubly beneficial by virtue of its action, both upon the pus and the bone. Care should always be taken to provide a free outlet for the frothy discharge caused by the peroxide, or pain will be increased and pus may be driven deeper into the attic and cells, and extend the infection.

In ulcerative tonsillitis, fetid breath, and in some bronchial affections, a spray of dilute hydrogen dioxide is productive of benefit. A spray of this agent is likewise of utility in chronic nasal catarrh, ozæna, and scarlatinal angina. It should be made alkaline before using. Hydrogen dioxide is a useful application in mercurial and other forms of stomatitis, and is also used as a disinfectant of the mouth during febrile and wasting diseases.

In diphtheria and croup its value has been established; a 2-volume solution is specially recommended in young children as a local application, and particularly after separation of the membranes in order to remove the odor and disinfect the surface.<sup>1</sup> It is stated by Dr. A. Jacobi, of New York, that in certain instances even a weak solution proves irritant to the throat, abrades the mucous membrane, and that it, consequently, sometimes proves

<sup>1</sup> Dr. E. R. Squibb, "On the Medical Uses of Hydrogen Peroxide," *Gaillard's Medical Journal*, March, 1889.

detrimental in diphtheria and must be abandoned in such cases. In gynecological practice this remedy has effected improvement in vaginitis and endometritis, and in chronic cystitis. It may be beneficially employed, likewise, in septic conditions resulting from abrasions or wounds of the female genital tract. It has been used with success in the treatment of gonorrhœa, of both sexes. It is thought to be especially valuable in the chronic form of the disease. Dr. Willard Parker Worster, of New York, has obtained good results from the treatment of chancres by hydrogen dioxide. The ulcer was sprayed every day and in the interval kept covered with iodol.

In surgery of the nose, hydrogen dioxide is used as a styptic. It is also of advantage in the treatment of passive hæmorrhages. It may be employed in the form of a spray for the relief of pulmonary hæmorrhage, or injected in cases of hæmaturia and hæmorrhages of the lower bowel. Spraying the post-nasal passages with a 1- or 2-per-cent. solution, combined with an alkali, will generally check epistaxis, even of severe type.<sup>1</sup> In carcinoma of the rectum or uterus it relieves pain and cleanses the diseased surfaces. The use of a spray of a 10-volume solution is recommended as a disinfectant of the sick-room in case of eruptive fevers and other infectious diseases.

It has been administered, well diluted, in gastric affections, and has been found useful in flatulent dyspepsia, heartburn, catarrh of the stomach and bowels, etc. It would probably be of service in the treatment of gastric ulcer. It has even ameliorated the symptoms of cancer of the stomach. Hydrogen dioxide, combined with tannin and injected into the intestine, is beneficial in chronic dysentery. Irrigation of the bowel by means of liquid soap, potash, and glycerin, combined with the internal administration of hydrogen dioxide, was found by Dr. Elmer Lee to yield favorable results in Asiatic cholera. In cholera nostras, typhoid and yellow fevers, the use of this agent either by irrigation or by the mouth promises to be of superior efficacy.

Sir Benjamin Ward Richardson, of London, has employed this agent for more than thirty years, beginning at a time when it was regarded as a chemical curiosity. He has reported a case of epilepsy of long standing cured by the use of 7.5 c.cm. (or f5ij) of a 10-volume solution twice daily in water. He advises a systematic trial of this remedy in epilepsy, especially in the Jacksonian variety. From a number of formulæ which have been published by Dr. Richardson the following have been selected:—

R. Acid. tannic. ....	65	Gm. or gr. x.
Glycerin. ....	30	c.cm. or f5j.
Sp. vini rectificat. ....	15	c.cm. or f3ss.

M. Sig.: Dose: one ounce in iced water. Recommended in asthenic cases. Used with advantage in the early stages of phthisis.

**Pyrozone.**—This name has been given to different standard solutions of hydrogen dioxide in water and ether. Medicinal pyrozone contains 3 per cent. of hydrogen dioxide in water. It is used internally and externally as an antiseptic remedy. Antiseptic pyrozone is a 5-per-cent. solution in ether, and is recommended as an application to ulcers, rhinitis, and diphtheria. In this strength pyrozone is used by dentists during operations, having been found of decided assistance in arresting bleeding and keeping the parts perfectly dry. Caustic pyrozone, a 25-per-cent. solution in ether, is an efficacious remedy in common and syphilitic ulcers, sinuses, etc. In dentistry it has been employed for the purpose of bleaching the teeth, in the treatment of dental abscesses, and in pyorrhœa alveolaris (Riggs's disease).

**BELLADONNÆ FOLIA** (U. S. P., B. P.).—Belladonna-leaves.

**BELLADONNÆ RADIX** (U. S. P., B. P.).—Belladonna-root.

Dose of powdered leaves or root, 0.006 to 0.13 Gm. (or gr.  $\frac{1}{10}$ -ij).

### U. S. P. Preparations.

#### LEAVES.

**Extractum Belladonnæ Foliorum.**—Extract of Belladonna-leaves. Dose, 0.0015 to 0.065 Gm. (or gr.  $\frac{1}{100}$ -j).

**Tinctura Belladonnæ Foliorum.**—Tincture of Belladonna-leaves (10 per cent.). Dose, 0.30 to 1.20 c.cm. (or mʒv-xx).

**Unguentum Belladonnæ.**—Ointment of Belladonna (contains, of the alcoholic extract, 10 per cent.).

**Emplastrum Belladonnæ.**—Belladonna Plaster.

**Pilulæ Laxativæ Compositæ** (U. S. P.).—Compound Laxative Pills (aloin, 1.3 Gm.; strychnine, 0.06 Gm.; extract belladonna-leaves, 0.8 Gm.; and ipecac, 0.40 Gm.; with licorice in powder, to make 100 pills. Each pill contains about 0.0005 Gm. [or gr.  $\frac{1}{200}$ ] of strychnine, and 0.008 Gm. [or gr.  $\frac{1}{25}$ ] of belladonna-extract). Dose, 1 or 2 pills.

**Pilulæ Podophylli, Belladonnæ, et Capsici** (U. S. P.).—(Each pill contains resin of podophyllin, 0.015 Gm. [or gr.  $\frac{1}{4}$ ]; extract of belladonna, 0.0075 Gm. [or gr.  $\frac{1}{8}$ ]; capsicum, 0.03 Gm. [or gr.  $\frac{1}{2}$ ]; with acacia and sugar of milk.) Dose, 1 to 3 pills.

## ROOT.

Fluidextractum Belladonnæ Radicis.—Fluid Extract of Belladonna-root. Dose, 0.006 to 0.12 c.cm. (or  $m^{1/10}$ -ij).

Linimentum Belladonnæ.—Belladonna Liniment (contains, of fluid extract, 95; camphor, 5 parts).

*B. P. Preparations.*

## LEAVES.

Extractum Belladonnæ Viride.—Green Extract of Belladonna (from fresh leaves and young branches). Dose, 0.015 to 0.065 Gm. (or gr.  $\frac{1}{4}$ -j).

Succus Belladonnæ.—Juice of Belladonna. Dose, 0.30 to 1 c.cm. (or *mv*-xv).

## ROOT.

Extractum Belladonnæ Alcoholicum.—Alcoholic Extract of Belladonna (containing 1 per cent. of alkaloids of belladonna-root). Dose, 0.015 to 0.065 Gm. (or gr.  $\frac{1}{4}$ -j).

Extractum Belladonnæ Liquidum.—Liquid Extract of Belladonna (contains  $\frac{1}{4}$  of 1 per cent. alkaloids). Dose, 0.03 to 0.06 c.cm. (or *ms*-j).

Tinctura Belladonnæ.—Tincture of Belladonna. Dose, 0.30 to 1 c.cm. (or *mv*-xv).

Linimentum Belladonnæ.—Liniment of Belladonna (contains liquid extract of belladonna, 25 c.cm.; camphor, 2.5 Gm.; distilled water, 5 c.cm.; alcohol, 90 per cent., q. s. ad 50 c.cm.).

Unguentum Belladonnæ.—Belladonna Ointment (100 parts contain 0.6 part of the alkaloids of belladonna-root).

Emplastrum Belladonnæ.—Liquid Extract and Resin Plaster (contains  $\frac{1}{2}$  per cent. of the alkaloids of belladonna-root).

Suppositoria Belladonnæ.—Belladonna Suppositories (each contains 0.001 Gm., or gr.  $\frac{1}{1000}$ , of the alkaloids of belladonna-root).

*Active Principles and Preparations.*

Atropina (U. S. P., B. P.).—Atropine ( $C_{17}H_{23}NO_3$ ). Dose, 0.0003 to 0.001 Gm. (or gr.  $\frac{1}{200}$ - $\frac{1}{100}$ ).

Atropinæ Sulphas (U. S. P., B. P.).—Atropine Sulphate. Dose, the same as atropine.

Oleum Atropinæ (U. S. P.).—Oleate of Atropine (contains 2 per cent. of atropine).

Unguentum Atropinæ (B. P.).—Atropine Ointment (2 per cent.).

Liquor Atropinæ Sulphatis (B. P.).—Solution of Atropine Sulphate (1 per cent.). Dose, 0.03 to 0.06 c.cm. (or *ms*-j).

Lamellæ Atropinæ (B. P.).—Discs of Atropine (each 0.013 mgr., or gr.  $\frac{1}{1000}$ , of atropine sulphate).

**Pharmacology.**—The dried leaves and the root of *Atropa Belladonna* (Solanaceæ), or deadly nightshade, are each official. The dried leaves must yield, when assayed by the United States Pharmacopœia process, not less than 0.35 per cent. of its alkaloids. The root is required to yield not less than 0.5 per cent. of its alkaloids. It is a native of Europe, and is cultivated here. All parts of the plant are active. The erect, purplish, branching stems stand about three feet high, and the leaves with short stalks are in pairs of unequal size, oval, entire. The large, cultivated leaves are said to have less of the active principle than the smaller leaves gathered while the plant is in flower. The roots are taken from plants at least three years old; those which are tough and woody, breaking with a splintering fracture, should be rejected. Belladonna contains **atropine** and **hyoscyamine**, or belladonnine. The United States Pharmacopœia defines atropine as "an alkaloid derived from *Atropa Belladonna* and other plants of the same family. As it occurs in commerce, it is usually accompanied by a small portion of hyoscyamine, from which it cannot be readily separated." The sulphate of atropine is a more permanent salt, neutral to litmus-paper, read-

ily soluble in water, and is generally preferred for medical purposes to the alkaloid. Atropine chemically is tropyltropine (formula  $C_{17}H_{23}NO_3$ ), and has been synthetically made by heating together tropine and tropic acid. By substituting different acids, Ladenberg obtained salicyl-tropine, benzoyl-tropine, cinnamyl-tropine, etc. Atropine and hyoscyamine are isomeric, but the former is the more stable form.

**Physiological Action.**—Locally, belladonna affects the end-organs of the sensory nerves, and reduces painful sensibility, contracts the vessels, and checks the action of the sweat- and mammary glands. It is readily absorbed through the unbroken skin, and symptoms of poisoning have appeared after its topical application. When applied to the eyes, belladonna (or its alkaloids) widely dilates the pupil and relaxes the ciliary muscle, so as to temporarily paralyze the power of accommodation of the eye. Double vision may be observed. In the throat, it produces dryness and choking sensations, and this is one of the first effects of its toxic action. The skin is also dry, the face flushed, and the surface-temperature increased  $1^\circ$  or  $2^\circ$  F.

Upon the brain it has an exhilarating effect, and a talkative delirium of mild form may appear. In some cases the delirium is of a violent type. Subsequently, sleep usually occurs. In the lower animals (frogs) atropine produces arrest of breathing, followed by convulsions. The transient flushing, or erythema, which appears after its use, is probably due to its effects upon the sympathetic system, as a stimulant. In some instances it produces a rash, which closely resembles that of scarlet fever and which may even be followed by desquamation. The influence of the drug upon the heart and circulation is believed to be indirect through the nervous system. Belladonna paralyzes the inhibitory filaments of the pneumogastric nerve, and, as a result, the heart, under the influence of the sympathetic plexus, runs at a rapid rate without being checked by the paralyzed pneumogastrics. The force of the heart's beat is also increased. Coincident with this, and as a result of its action upon the blood-vessels, arterial tension is increased. In toxic doses, however, blood-pressure is reduced. The contraction of the smaller vessels may be due to action upon the muscular fibres of the walls, or it may be secondary to the action upon the nervous system. Respiration becomes more rapid, owing to stimulation of the respiratory centre. Contradictory statements have been made in regard to the effect of belladonna upon the respiratory centre. Dr. David Cerna, as a result of experimental and clinical study, coincides with the observation of Reichert, that "atropine acts upon the respiratory function in two opposing ways, one (peripheral) tending to diminish, the other (central) tending to increase, the increase or the decrease of the respirations in the normal animal depending upon which one of these factors predominates."

The flow of urine is increased at first as the result of increased arterial tension, but there is no increase in the solid constituents of the urine. Larger doses decrease the quantity of urine, apparently by virtue of a paralyzing action on the terminations of the vagus, if we may accept the experimental results of Lazaro and Pitini.<sup>1</sup> The secretions generally are checked, notably those of the mouth and skin; the flow of milk is also arrested by it. Though intestinal secretion is at first diminished, it is, probably, subsequently increased, since the alvine evacuations become more frequent and more liquid

<sup>1</sup> *Archivio de Farm. e Terapia; v. Deutsche medizinisch-Zeitung*, Feb. 3, 1898.

during the administration of belladonna. In small doses it stimulates to more rapid movement the muscular coat of the bowel. Belladonna is eliminated chiefly by the kidneys, but partly by the bowels. Like other alkaloids, atropine is, to a certain extent, destroyed by the liver.

**Toxic Effects and Antidotes.**—Poisonous symptoms occasionally appear as the result of the introduction into the system of a very small quantity, either by absorption, as stated, or by passing from the eye into the nose, and thence into the throat. In such cases nothing more serious occurs than dryness of the throat, dilated pupils, possibly an erysipelatous or erythematous eruption upon the skin, and some fever and restlessness. Larger doses cause thirst, dryness, and aching of the fauces; flushing, rapid pulse, and hurried breathing; without decided increase of temperature, followed by coma or convulsions and death. The physiological antagonists which may be employed as antidotes are morphine, physostigmine, muscarine, and jaborandi (or pilocarpine). McGowan reports a case in which two injections of 0.03 Gm. (or gr.  $\frac{1}{2}$ ), of pilocarpine unquestionably saved life. Chloral-hydrate has also been used as an antidote. According to Binz, morphine is particularly serviceable in allaying the restlessness and mental excitement caused by belladonna. Failing respiration is combated by strychnine. External heat will be useful if a state of collapse occurs. Animal charcoal, fixed alkalies, and demulcents, followed by free evacuation of the stomach and bowels, may also be prescribed. The compound tincture of iodine is a chemical antidote, precipitating the atropine and rendering it inert.

**Therapy.**—Belladonna ointment, or the liniment of belladonna, may be used with good results in neuralgia and chronic rheumatism; also in local sweating. In the form of atropine it is a mydriatic, but is less used now than formerly, as it is liable to cause glaucoma. The solutions of atropine for ophthalmic practice, or for use hypodermically, should be freshly prepared and sterilized each time, in order to avoid the development of penicillium in the liquid, which destroys the alkaloid, besides giving us an infected solution. M. Berger advocates the combination of alkaloids, believing that in this manner the same effects may be obtained by smaller doses. As a mydriatic he employs:—

B Atropin. sulphat.,		
Duboisin. sulphat. .... aa	20	Gm. or gr. iiss.
Cocain. hydrobromat. .... 2		Gm. or gr. xxx.
Aq. destillat. .... 90		c.cm. or f3ij.—M.

In eye-practice, belladonna is used less frequently to dilate the pupil and relax the accommodation in order to facilitate examination of the eye and determine its refraction, than to prevent adhesions between the pupillary border of the iris and the lens, or to avoid protrusion of the iris through an ulcer of the cornea. According to the observation of Dr. George Carpenter, the instillation into the eyes of infants, though it may cause physiological symptoms, is unsatisfactory as regards its action upon the pupil, dilatation being generally very tardy and incomplete.

Some oculists consider atropine santonate as the best combination as a mydriatic, but atropine sulphate is the salt generally employed, in from 0.015 to 0.25 Gm. to 30 c.cm. (or gr.  $\frac{1}{4}$ -iv to f3j). The same solution is beneficially used in treating diseases of the ear, pain from inflammation of the middle or external ear, or membrana tympani, or earache, being relieved by dropping it in warm, when necessary. (See also **Homatropine**.)

Rigidity of the os uteri during labor is said to be relieved by local application of belladonna ointment. The same preparation is useful in spasms of the neck of the bladder or of the sphincter ani, and in vaginismus. If rubbed upon the abdomen, the extract of belladonna is said to check the vomiting of pregnancy and to relieve other reflex disorders dependent upon the gravid uterus. In leucorrhœa dependent upon inflammation of the cervix uteri, belladonna, in association with tannic acid, is a soothing application and retards discharge.

It relieves the pain of herpes zoster, and of irritable and malignant ulcers. It also is serviceable in painful hæmorrhoids and fissure of the anus. It checks the suppurative process in boils, and promotes the resolution of enlarged glands. For any local pain, the appended formula, known as *Ludlow's ointment*, is very useful:—

R Atropinæ sulphatis .....	103	Gm. or gr. ss.
Aconitinæ .....	10	Gm. or gr. iss.
Olei tiglii .....	12	c.cm. or mii.
Petrolati .....	31	Gm. or ʒj.

M. Sig.: To be used by rubbing in a piece about the size of an ordinary pea.

Belladonna ointment may be advantageously employed in the relief of inflamed joints. The following are also good combinations:—

R Ungt. belladonnæ .....	2	Gm. or ʒss.
Adipis lane hydrosi .....	15.5	Gm. or ʒss.
Cerati plumbi subacetat. ....	12	Gm. or ʒiij.
Ungt. zinci oxidi .....	15.5	Gm. or ʒss.

M. et ft. ungt.

Serviceable in furuncle, abscess, carbuncle, and herpes zoster.

R Cocaine hydrochloridi .....	32	Gm. or gr. v.
Ungt. belladonnæ .....	31	Gm. or ʒj.

M. et ft. ungt.

A good application in ulcerated carcinoma or sarcoma, irritable ulcers, etc.

The pupils and throat should be carefully watched when belladonna ointment is used upon open surfaces. Accidents, probably due to idiosyncrasy, sometimes follow the use of atropine solutions in the eye. In addition to the usual manifestation of belladonna poisoning, cellulitis of the eyelids and face, and epistaxis has been observed. In some persons the use of even perfectly neutral solutions of atropine proves markedly irritant to the conjunctiva and gives rise to what is known as "atropine conjunctivitis." It also acts as an irritant in certain cases of iritis, especially those occurring in traumatic patients with posterior synechia. Its use requires great caution in glaucoma. In latent cases it may excite an acute exacerbation. In inflammatory glaucoma it increases intra-ocular tension. Belladonna is an excellent local remedy in intercostal neuralgia or pleurodynia, and in the chest-pains of phthisis. The liniment may be applied with friction, and is a more cleanly agent, but strapping the chest with belladonna plaster is generally more efficient in pleurodynia or neuralgia. The plaster usually affords considerable relief in irritable heart. The same preparation is effective in lumbago and myalgia. It may be spread upon the abdomen in gastric or ovarian neuralgia, or, in these affections, the agent may be employed according to the method of Trousseau. This consists in combining 0.13 Gm. (or gr. i-ij) of the extract with 0.38 to 0.50 Gm. (or gr. ʒss to ʒj) of tannic acid, and applying it to the cervix uteri upon absorbent

cotton, or introducing it into the vagina in the form of a suppository. This combination is often valuable in leucorrhœa:—

R Ext. belladonnæ foliorum.....	1/60	Gm. or gr. xxiv.
Acidi tannici .....	6	Gm. or ʒiss.
Olei theobromatis .....	q. s.	

M. et ft. suppositoria no. xxiv.

Three or four suppositories may be used daily.

A suppository containing the extract of belladonna, alone or in union, with opium, is very valuable in dysmenorrhœa dependent upon spasm of the cervix uteri. Belladonna, locally applied, has the power of alleviating that perversion of sensibility known as paræsthesia, or pruritus. Hence, a lotion or ointment containing this agent may be successfully used in pruritus of the genitals, urticaria, and chronic eczema, attended with excessive itching. A prescription like the following may be written:—

R Betanaphthol.....	1/30	Gm. or gr. xa.
Ungt. camphoræ,		
Ungt. menthol. .... aa	8	Gm. or ʒij.
Ungt. belladonnæ .....	15/5	Gm. or ʒss.

M. et ft. ungt.

Or:—

R Acid. carbolici .....	2	c.cm. or fʒss.
Linimenti belladonnæ .....	60	c.cm. or fʒij.
Glycerini,		
Aq. rosæ .....	aa 120	c.cm. or fʒiv.—M.

The liniment of belladonna, applied several times a day, has a remarkable power in restraining local excessive sweating. A solution of atropine in equal parts of alcohol and chloroform, the strength being 1 per cent. (0.32 Gm., or gr. v, of the alkaloid to 30 c.cm., or fʒj, of menstruum), will sometimes, according to Bartholow, allay obstinate cerebral or reflex vomiting.

Instead of belladonna, atropine may be used in proper quantity in forming ointments and lotions. The following is an elegant ointment for use in chronic ovarian, uterine, or pelvic disease:—

R Atropin. sulphatis .....	1/13	Gm. or gr. ij.
Ol. neroli .....	37	c.cm. or mvj.
Ungt. aquæ rosæ .....	15/5	Gm. or ʒss.

M. et ft. ungt.

It has been asserted that atropine oleate (made by dissolving 1 part of atropine in 30 parts of oleic acid and adding 50 parts of olive-oil) makes a suppository of far more uniform composition than when extract of belladonna is employed.

Belladonna is chiefly employed internally to alleviate pain, relax spasm, and check excessive secretion or morbid discharge. It is a valuable remedy in neuralgia, especially of the trifacial nerve, though other forms are frequently amenable to its influence. Anstie esteemed it superior to any other agent in neuralgia of the pelvic viscera. Belladonna is beneficially given by the mouth in dysmenorrhœa, especially if the disorder is due to spasm of the neck of the womb.

Atropine is often productive of the happiest results in gastralgia, enteralgia, and gastric ulcer. As neuralgia is often expressive of insufficient

nutrition and is generally associated with anæmia, a combination of belladonna with iron, strychnine, and other tonic drugs is frequently successful. A formula similar to the following has been widely used:—

R Ext. belladonnæ fol. ....	25	Gm.	or	gr. iv.
Quinin. sulphat. ....	1 40	Gm.	or	gr. xxij.
Ferri sulphat. exsic. ....	50	Gm.	or	gr. viiss.
Strychnin. sulphat. ....	015	Gm.	or	gr. 1/4.
Oleoresinæ piperis ....	012	Gm.	or	gr. 1/4.
Arseni trioxidi. ....	50	c.cm.	or	mviiss.

M. et ft. pil. no. xv.

Sig.: A pill thrice daily.

For the relief of migraine, Trousseau was accustomed to administer 0.01 Gm. (or gr. 1/60) of the extract of belladonna, every hour, until the symptoms vanished or vertigo made its appearance. The form especially amenable to this treatment is the congestive headache, in which the pain is of a dull, compressive character, made worse by stooping over, with swelling of the face and throbbing of the temporal arteries, aggravated by noise; by movement of the body, efforts to read, or any intellectual exercise. In such cases the combined action of belladonna with a purgative like podophyllin or aloin is especially effective. The tincture or fluid extract of belladonna, or atropine sulphate, is useful in relieving the spasm of laryngismus stridulus, hiccough, spasm of the œsophagus, or local convulsive manifestations of hysteria. Intestinal, hepatic, or renal colic is ameliorated by this remedy. Belladonna is likewise of service in lead colic. A combination of atropine and potassium iodide is recommended as possessing decided efficacy in the treatment of plumbism. Belladonna has also been successfully employed for the relief of strangulated hernia, 0.015 Gm. (or gr. 1/4) of the extract being given hourly, spontaneous reduction occurring after administration of four to six doses.

Atropine in doses of from 0.001 to 0.0045 Gm. (or gr. 1/70-1/14) has been successfully employed by Dr. Batsch, of Grossenhain, in cases of intestinal obstruction where the symptoms were subacute or where there was necessity to temporize. In some cases a single injection sufficed to produce an evacuation, followed by recovery. In others, the injection resulted only in the escape of flatus and a small quantity of feces, definite relief only following a second injection on the next day.

Belladonna is of service in epilepsy, but needs to be given persistently in gradually-increasing doses for a long period of time. It is particularly applicable to the *petit mal* or nocturnal epilepsy and to anæmic subjects. Wachenheim reports a case of the treatment of epilepsy with combined usage of atropine and potassium bromide. He considers epilepsy in idiopathic cases as due to an autointoxication, producing an abnormal irritation on the part of the cortical cells. According to his theory, the mechanism of the treatment is as follows: The bromides diminish the sensibility of the cortical cells, which have become hyperæsthetic to variations in the blood-supply; atropine stimulates the vasomotor centres, thereby making the blood-supply more uniform. In the early stages of treatment bromides are useful to dull the irritability of the cortex until the proper vascular tonus is established. When that point has been reached, they are of less importance, and may be reduced or withdrawn. Neither the bromides nor atropine can in any way meet the causal indication. If the disease depends on a passing intoxication, these

drugs will suspend the destructive action of the epileptic seizures until the *materia peccans* has ceased to act; if there is a permanent cause, as seems to exist in the majority of cases, such treatment will naturally be at best only a palliative. Belladonna is one of the most esteemed remedies for whooping-cough. It should be exhibited in sufficiently large doses to produce dilatation of the pupils, and is generally well borne by children in proportionately large doses:—

R	Tinctura belladonnæ fol. ....	3		c.cm. or ml.
	Vin. ipecacuanhæ .....	1		c.cm. or ℥xv.
	Syr. tolutani .....	q. s. ad 60		c.cm. or ℥ij.

M. Sig.: Give a teaspoonful every hour to a child five years of age until relieved or physiological effects are observed, and then continue every three or four hours with same or half the quantity.

Belladonna is sometimes of signal service in spasmodic asthma. The most advantageous method of administration is that proposed by Dr. Salter, 0.65 c.cm. (or *mx*) of the tincture being repeated every two or three hours until disturbance of vision occurs or relief is obtained. The paroxysm may likewise be alleviated, though less certainly, by smoking belladonna-leaves in a pipe, or made into a cigarette. The tincture of belladonna is capable of affording marked benefit in exophthalmic goitre. When nocturnal incontinence of urine is caused by spasmodic contraction of the bladder, the fluid extract of belladonna is the best remedy which can be employed. The same treatment may be of avail in the incontinence of the aged. Atropine sulphate possesses considerable efficacy in spermatorrhœa and prostaticrhœa. It is best given at bed-time. Torticollis and muscular cramps are generally ameliorated by belladonna. Precordial pain and overaction of the heart are relieved by the internal use of belladonna. This drug enters very serviceably into remedies for habitual constipation. In disease of the kidney it relieves congestion by its action on the arterioles. In typhoid and typhus fevers, Dr. John Harley has derived decided advantage from the use of belladonna, which cleans and moistens the tongue and quiets the brain. Inflammation of the pharynx and tonsils is lessened by the use of belladonna, which may, with great utility, be combined with aconite and given in a solution of potassium chlorate. A suitable prescription may be thus formed:—

R	Potass. chloratis .....	5/20	Gm. or gr. lxxx.
	Acid. hydrochloric. dil. ....	6	Gm. or ℥iiss.
	Tr. aconiti .....	1	c.cm. or ℥xvj.
	Tr. belladonnæ fol. ....	2	c.cm. or ℥ss.
	Infus. rhois glabræ .....	q. s. ad 120	c.cm. or ℥iiv.

M. et ft. sol.

Sig.: Tablespoonful every third hour.

On account of its marked influence upon the throat, belladonna has been used in scarlatinal angina. Much has been written concerning its value as a prophylactic in scarlatina, but in the experience of the author no reliance can be placed upon the drug as a preventive of that disease. It possesses some virtue as an internal remedy in erysipelas, and in this affection also is usefully given in conjunction with aconite, especially if much fever and delirium are present. It is sometimes able to check the vomiting of pregnancy. Aphonia due to fatigue of the cords soon disappears under the use of atropine. Belladonna is useful in allaying nervous cough, and, according

to Bartholow and Fothergill, has an excellent effect in caseous pneumonia, provided it be given in the stage of deposit before softening has taken place. Small doses of belladonna or atropine three or four times a day check the profuse discharge of mercurial ptyalism. Prof. H. Köbner, of Berlin, finds that the administration of belladonna facilitates the treatment of certain affections of the mouth, as leukoplakia, mucous patches, syphilitic ulcerations, etc., as it restrains salivation and the consequent rapid removal of the slough produced by the caustic. He usually gives the extract of belladonna dissolved in water, but atropine pills may be used with equal advantage.

The free sweating which occurs in weakly children, after slight exertion or during sleep, is suppressed by belladonna. The copious watery discharge of the first stage of acute coryza is controlled by atropine, which is one of the best remedies also in the night-sweats of phthisis, given at bed-time in the dose of 0.0005 to 0.001 Gm. (or gr.  $\frac{1}{300}$ - $\frac{1}{200}$ ). The free discharge of chronic bronchitis is restrained by belladonna. Colliquative diarrhœa is arrested by the remedy, according to M. Delpage. In certain cases of metrorrhagia, which had proved unamenable to other remedies, the hypodermic injection of the atropine sulphate, in the dose of 0.0003 Gm. (or gr.  $\frac{1}{700}$ ) twice daily, has been attended with complete success. Hæmoptysis has also been controlled in the same manner. Atropine is useful in ulcer of the stomach when accompanied by hyperacidity. The remedy is beneficial in hyperæmic and inflammatory conditions of the brain or cord. Liégeois and other writers usually recommend the internal administration of belladonna in chronic urticaria. Atropine sulphate is a valuable agent for diminishing the effect of shock. It may be given, in the dose of 0.0006 or 0.0008 Gm. (or gr.  $\frac{1}{100}$ - $\frac{1}{150}$ ), hypodermically, after a severe injury or prior to a surgical operation. Sir James Brunton suggested that the hypodermic injection of atropine may be of service in the algid stage of cholera, and cited the case of a child who recovered apparently as a result of this treatment. Great caution should be exercised in employing this method, for, as pointed out by Professor Manassés, with the revival of the circulation and absorbent capacity, toxic manifestation might very readily be produced. In many cases it is advisable to introduce atropine into the affected tissues (parenchymatous administration). In dissipated neuralgia of large trunks, as, for instance, in sciatica, the most rapid relief is obtained by this method. In sciatica and myalgia it is a good plan to combine a small quantity (0.008 Gm., or gr.  $\frac{1}{6}$ ) of morphine sulphate with the atropine solution for subcutaneous injection. The effect of the alkaloid is heightened by the combination. Dr. I. L. Van Zandt<sup>1</sup> uses atropine sulphate, 0.001 Gm. (or gr.  $\frac{1}{200}$ ), hypodermically in the algid state of pernicious malarial fever. If no decided effects are produced in twenty or thirty minutes, the dose is repeated. As a synergist for the atropine he gives strychnine sulphate, 0.002 to 0.003 Gm. (or gr.  $\frac{1}{30}$ - $\frac{1}{20}$ ). Stirling has found the hypodermic use of 0.0004 Gm. (or gr.  $\frac{1}{150}$ ) of atropine valuable in a case of hæmorrhage from the lungs. In tic douloureux, likewise, atropine thrown under the skin is especially useful.

Moretti recommends the hypodermic injection of atropine in paralysis agens. Ostermayer esteems the same procedure as a valuable sedative and a potent hypnotic in the treatment of insanity. Massey has obtained good results in angina pectoris from the subcutaneous injection of atropine com-

<sup>1</sup> *Merck's Archives*, April, 1901.

bined with morphine. Leszynsky has reported the successful employment of hypodermic injections of atropine in a case of muscular torticollis, which was probably due to the influence of lead, as the patient was a painter. Various remedies, including electricity, had been used without effect. In torticollis excited by other causes the same procedure is of advantage. Some writers are of the opinion that belladonna retards the growth, as well as lessens the pain, of cancers, and promotes the absorption of enlarged lymphatic glands. Atropine is serviceably employed as an antagonist to a number of powerful vegetable poisons, as opium, morphine, physostigmina, agaricus muscarius, etc.

**BENZALDEHYDUM** (U. S. P.).—Benzaldehyde, Synthetic Oil of Bitter Almond. (See *Amygdala Amara*, page —).

**BENZANILID.** — Phenylbenzamid is a white powder, which melts at  $321.8^{\circ}$  F., is insoluble in water, soluble in alcohol, and, with difficulty, in ether. In chemical composition it is closely allied to acetanilid. It is without odor and has a slightly caustic taste. It is given in single doses of 1 Gm. (or gr. xv), and from 4 to 6 Gm. (or 5i-ss) may be administered in the twenty-four hours. Though at first well borne in these amounts, intolerance is generally manifested after several days' use.

**Physiological Action.**—Benzanilid depresses febrile temperature. Its effects are manifested from half to one hour after exhibition; the maximum is reached in four or five hours; the temperature then begins to ascend, and reaches its original height in ten to twelve hours. Respiration is not usually affected, though occasionally it is hastened. The pulse is rendered more slow and soft. Benzanilid produces no alteration in the quantity or reaction of the urine, but communicates to that fluid a greenish or even blackish color. After having been used continuously for several days it gives rise to pallor of the face and cyanosis of the mucous membrane. Dr. Luigi Cantu, of Pavia, states that it appears to have a cumulative effect.

**Therapy.**—The activity of benzanilid seems to be limited to the reduction of temperature, having no influence upon the course of the disease. It has been given in typhoid fever, rheumatism, pneumonia, neuritis, sciatica, malaria, etc. Dr. Cantu did not perceive any good effects from its use in cholera, neuritis, and sciatica. It exerted no favorable influence in malaria. It relieved the pain of acute rheumatism, but did not prevent extension of the disease to other joints.

**BENZINUM** (U. S. P.).—Petroleum Benzin.

**BENZINUM PURIFICATUM** (U. S. P.).—Purified Petroleum Benzin.

**Dose,** 0.60 to 2 c.cm. (or mx-f3ss), in mucilage or capsule.

**Pharmacology.**—A purified distillate from American petroleum, consisting of hydrocarbons ( $C_5H_{12}$  and  $C_6H_{14}$  and homologous compounds), chiefly of the marsh-gas series, and having a specific gravity of from 0.638 to 0.660, and boiling at  $45^{\circ}$  to  $60^{\circ}$  C. ( $113^{\circ}$  to  $140^{\circ}$  F.). Benzin, or petroleum-ether, is a clear, colorless, diffusive liquid, yielding inflammable vapors, which, when mixed with air, are explosive; it, therefore, should be kept in well-stoppered bottles, or tin cans, in a cool place, remote from lights or flame. It is soluble in alcohol, ether, and oils, but insoluble in water. Fats, resins, and caoutchouc are dissolved by it.

**Physiological Action.**—Benzin resembles oil of turpentine in its local effects, especially when applied with friction. It is likewise an irritant when swallowed, but does not cause vomiting nor diarrhoea. It produces intoxication, faintness, headache, palpitation, or convulsions, which may end fatally; death may also be caused by gastro-enteritis, though relatively large amounts have been taken and the poisonous action overcome. The treatment should be directed toward evacuating the stomach and bowels, and counteracting the effects of the agent by diffusible stimulants and atropine, or ether, hypodermically.

**Therapy.**—Externally, benzin is used as a counter-irritant, applied upon a flannel bandage, or with friction, for neuralgic or rheumatic pains, but its odor is penetrating and unpleasant. Locally, benzin has been used as a dressing for wounds and ulcers. The addition of 2 per cent. of menthol makes it a local anæsthetic. Its action must be carefully watched, however, as it has been known to cause extensive blistering and death from exhaustion. Internally it is not used in medicine, although it is a domestic remedy for lumbricoid worms and tænia. It is claimed to be a good parasiticide in itch and pediculosis. (See *Petroleum*.) Benzin has been employed with success in the treatment of trichinosis, and is thought by Dr. Putter, from an experience with twenty-seven persons who had eaten trichinous pork, to possess prophylactic virtues against this species of poisoning. Benzin has been administered by inhalation with asserted advantage in whooping-cough. It has recently been used for producing anæsthesia in Schleich's method, which employs a combination or mixture of ether, chloroform, and benzin. It has been shown, however, that the benzin has decided toxic effects, and that patients, sometimes, show a tendency to rapid collapse, requiring artificial respiration to prevent a fatal accident.

## BENZOINUM (U. S. P., B. P.).—Benzoin.

### *Preparations.*

**Adeps Benzoïnatus** (U. S. P.).—Benzoinated Lard (2 per cent.).

**Tinctura Benzoini** (U. S. P.).—Tincture of Benzoin. Dose, 2 c.cm. (or f3ss).

**Acidum Benzoicum** (U. S. P., B. P.).—Benzoic Acid. Dose, 0.32 to 1 Gm. (or gr. v-xv).

**Tinctura Benzoini Composita** (U. S. P., B. P.).—Compound Tincture of Benzoin (U. S. P. contains benzoin, 12 Gm.; aloes, 2 Gm.; storax, 8 Gm.; Tolu, 4 Gm.; alcohol, q. s. ad 100 c.cm.). A number of old remedies resembled it in composition, such as Turlington's balsam, Friar's balsam, Jesuit's drops, etc. Dose, 2 to 7.5 c.cm. (or f3ss-ij).

**Trochiscus Acidi Benzoici** (B. P.).—Benzoic-Acid Lozenge (0.03 Gm., or gr. ss, of benzoic acid in each, with fruit basis).

**Adeps Benzoatus** (B. P.).—Benzoated Lard (benzoin, 15 Gm.; lard, 500 Gm.).

Ammonium and Sodium Benzoates are official in both pharmacopœias, lithium benzoate in the U. S. P. only.

**Pharmacology.**—Benzoin is a balsamic resin obtained from *Styrax Benzoïn*, and from another unknown species of *Styrax* (*Styracæ*). The best quality is in light lumps or tears, but it also occurs in large masses. It contains, besides resin and a volatile oil, from 14 to 20 per cent. of free benzoic and cinnamic acids, the latter in small proportion. It also contains **Styracin**, 2 to 3 per cent., some vanillin, styrol, and benzaldehyde, with phenol-propyl cinnamati, 1 per cent., and 75 per cent. of the cinnamic esters of benzoiresinol

and resinetannol. The latter yield about one-third their weight of cinnamic acid. **Benzoic Acid** is in white, lustrous scales, or friable needles, permanent in air, having a slight, aromatic odor of benzoin; a warm, acid taste; and an acid reaction. It is soluble in 500 parts of water, 15 of boiling water, 3 of alcohol, or 1 of boiling alcohol, in fixed oils and alkaline solutions. Benzoic acid melts at 250° F. It forms neutral salts with the alkalies.

It is volatilized by heat. Two other sources of the benzoic acid of commerce are known: it is a derivative of toluol and also of hippuric acid, the hippuric acid being derived from the urine of horses and cattle. The benzoic acid may retain some traces of its source, and, therefore, the pharmacopœia directs that it shall smell of benzoin. Benzoin prevents fat from becoming rancid, and hence it is, in small quantity, a useful addition to ointments, for which the benzoinated lard is a good basis.

**Physiological Action.**—In solution in the form of the tincture, benzoin is protective to excoriated surfaces, and, like other gums, is antiseptic. After absorption it has a stimulating effect upon mucous membranes; part of it is decomposed in the system to form hippuric acid, and, being excreted by the kidneys, increases the acidity and the quantity of the urine. Benzoic acid has some power in preventing the growth of bacteria, possessing the advantage over carbolic acid of being non-poisonous. Sodium benzoate has a stimulating effect upon the liver, and, according to the experiments of Carl Virchow, increases nitrogenous elimination from the kidneys. Benzoic acid, or sodium benzoate, inhaled or taken internally, may, in exceptional instances, give rise to an erythematous, or small papular, eruption. In some cases of idiosyncrasy, urticaria may be produced.

**Therapy.**—The tincture, especially the compound tincture, is used to paint over abrasions and excoriations in order to protect the surface, particularly in cases of tender nipples. It may also be painted on the skin for chilblains after bathing the surface with 5-per-cent. solution of carbolic acid. It was formerly employed as a dressing for ulcers. As an expectorant, we may give tincture of benzoin in chronic bronchitis. The official camphorated tincture of opium (paregoric elixir) contains benzoic acid. In troublesome cough, the combination with opium is necessary, although the opium checks secretion and expectoration; a better combination would be:—

R Codeinæ .....	38	Gm. or gr. vj.
Acidi benzoici .....	15	5 Gm. or f3iv.
Syr. toluani,		
Aquæ camphoræ .....	aa 90	c.cm. or f3iij.

M. Sig.: Take a dessertspoonful every four hours.

Inhalations of steam impregnated with the compound tincture of benzoin are beneficial in acute and chronic laryngitis. Morell Mackenzie used a vapor of the compound tincture of benzoin, 1 teaspoonful to a pint of water at 140° F., inhaled frequently, for acute laryngitis.

The following gargle is recommended in pharyngitis:—

R Sodii benzoat. ....	65	Gm. or gr. x.
Tinct. benzoin. ....	2	c.cm. or f3ss.
Infus. rosæ fol. ....	15	c.cm. or f3ss.—M.

Sodium benzoate is also used with advantage in chronic diarrhœa and dysentery. In 0.65 to 2 Gm. (or gr. x-xxx) doses it is very useful in liver disorders, likewise in chronic indigestion dependent upon inactivity of the

liver and accompanied by an abundant excretion of uric acid. This salt is also of service in septic and febrile diseases, in doses of 8 to 15.5 Gm. (or 3ii-iv) daily (Senator). Owing to its solubility, it is preferable to benzoic acid, and is equally as efficient in acute rheumatism. In scarlet fever and small-pox, sodium benzoate reduces the temperature and mitigates the severity of the disease. This salt has proved very useful in the treatment of diphtheria, administered internally, and at the same time applied by insufflation to the seat of the lesion. Its employment has seemed to be attended with good results in typhoid fever and whooping-cough. The same remedy in the form of a spray has been extolled in phthisis, but it has no such decided effect upon the tubercle bacilli as had been hoped. Benzoic acid, in daily doses of 10 to 12 Gm. (or 3iiss-iiij), has been found of service in acute rheumatism, but is inferior to salicylic acid. In erysipelas, benzoic acid has been given with reported good results. It is of advantage in the treatment of chronic bronchitis.

In its exit from the system this acid acts as a gentle stimulant and local antiseptic to the bladder and urethra. In chronic cystitis with fermentation of urine and deposit of phosphates, benzoic acid is extremely useful, reducing the alkalinity of the fluid and the irritability of the bladder. For similar reasons it sometimes proves of service in chronic gonorrhoea, in obstinate irritation of the urethra due to the condition of the urine, and in incontinence caused by an alkaline reaction of the urine. In all these conditions sodium or ammonium benzoate may be used instead of the acid. Benzoic acid promotes the solubility of gravel, whether composed of urates or phosphates. A favorite formula of Dr. Golding-Bird was:—

R Sodii carbonatis .....	6	Gm. or 3iss.
Acid. benzoici .....	2/60	Gm. or gr. xl.
Sodii phosphatis .....	12	Gm. or 3iij.
Aq. ferventis .....	120	c.cm. or f3iv.

Solve et adde:—

Aq. cinnamom. ....	225	c.cm. or f5viiiss.
Tr. hyoscyami .....	15	c.cm. or f3iv.

M. Sig.: Two tablespoonfuls three times a day.

In uræmic conditions, and what has been called lithæmia, lithium benzoate has a most happy effect, carrying off the excess of uric acid and urates, acting also as a diuretic. Even in albuminuria, the benzoates have been used with advantage, especially calcium benzoate.

Freckles may be removed by the topical application of tincture of benzoïn, containing corrosive chloride of mercury:—

R Hydrarg. chlor. corros. ....	03	Gm. or gr. ss.
Tincture benzoini .....	9/25	c.cm. or f3iiss.
Glycerini .....	7/50	c.cm. or f3ij.
Aque roseæ .....	180	c.cm. or f3vj.

M. Sig.: Use as a lotion to affected spots.

The above may also be used in pityriasis versicolor, or moth-spots, and chronic urticaria. The compound tincture of benzoin is sometimes able to relieve the itching of urticaria and eczema. A solution of benzoic acid in cologne-water makes a pleasant application, frequently successful in urticaria. Mixed with an equal quantity of glycerin, the tincture or the com-

pound tincture is useful in chapped lips and hands. The compound tincture is a good styptic, and yields excellent results when injected into old sinuses. It disinfects the tract, and promotes healing. Benzoic acid is an efficient antiseptic application to unhealthy wounds and ulcers.

As a dentifrice, Professor Miller recommends:—

R. Acid. thymici .....	25	Gm. or gr. iv.
Acid. benzoici .....	3	Gm. or gr. xlv.
Tr. eucalypt. fol. ....	15	c.cm. or fʒss.
Alcohol. absolut. ....	90	c.cm. or fʒiij.
Ol. gaultheriæ .....	1.55	c.cm. or gr. xxv.

M. Sig.: A teaspoonful or two in half a glass of water, as a mouth-wash.

Bismuth benzoate is an excellent dressing to chronic, unhealthy, or sloughing ulcers, chancreoids, open buboes, chancres, and ulcerated lesions of late syphilis. It is usually applied in the form of a powder, the surface having previously been thoroughly cleansed by a weak solution of corrosive sublimate or hydrogen dioxide.

**BENZOL (B. P.).—Benzol or Benzene.** Phenyl hydride.

**Pharmacology.**—A mixture of homologous hydrocarbons obtained from light coal-tar oil. It contains about 70 per cent. of benzene ( $C_6H_6$ ) and 20 to 30 per cent. of toluene ( $C_6H_5CH_3$ ). This is distinct from and should not be confounded with benzin obtained from petroleum. It is a thin, colorless fluid, very volatile and inflammable, and has an aromatic, not very unpleasant, odor. It is almost insoluble in water, but dissolves in four parts of alcohol. It may be obtained by distilling a mixture of benzoic acid with lime, or by fractional distillation from naphtha: a derivative of coal-tar.

**Physiological Action.**—Benzol is antiseptic and antiparasitic, with but little local action beyond the extraction of oily matters from the skin. Owing to its solvent action upon many alkaloids, it might be useful in local medication by enabling the remedy to penetrate the skin. Taken internally, benzol produces intoxication, anaesthesia, and coma.

**Therapy.**—It has been given in a few drop doses as a remedy for dyspepsia, and also in trichinosis. It is employed in pharmacy as a solvent, but is not often administered, or employed in practical medicine. Dr. A. Da Socca has used, locally, with alleged good results, a mixture of 1 to 6 of tincture of iodine and benzol in diphtheria. Benzol has been advantageously given in whooping-cough by Dr. Robertson, in doses of 0.12 c.cm. (or *mij*) in mucilage to children six months of age. The same writer reports good results from the use of benzol in influenza. He administered it in the form of an emulsion in lemonade, 0.30 c.cm. (or *mv*) at a dose, repeated every three hours. It was always well tolerated. It had the effect of reducing temperature and relieving the general discomfort. Convalescence was generally rapid.<sup>1</sup>

**Nitrobenzol.**—This product, known commercially as the oil of mirbane, or artificial almond-oil, is used extensively in the manufacture of dyes, perfumery, and explosive compounds. Cases of acute or chronic poisoning follow the absorption of nitrobenzol. The workmen subjected to its influence frequently suffer from a train of symptoms which have been studied by Dr. Prosser White. The usual manifestations are sleepiness, headache, languor, and a severe form of anæmia. There is a decided loss of weight, the appetite

<sup>1</sup> *London Lancet*, Nov. 11, 1893.

becomes capricious or altogether fails, nausea and vomiting may occur, the skin becomes darkened in color and contains aniline. The temperature of the body is slightly raised, but the extremities become very quickly chilled. There is excessive waste of the muscles, especially those of the extremities. Anæsthesia is a characteristic symptom. Sensation in the extremities may be greatly impaired. The sexual appetite is weakened or lost. The reflexes are generally enfeebled. The eyes are not usually affected, though nitrobenzol may produce a peculiar form of retinitis, with great defect of sight. The pulse is feeble and thready, arterial tension is low, the blood is chocolate-colored or black. The corpuscles are decreased. No direct antidote is known. It is said that, when taken into the stomach, nitrobenzol may remain for some time unabsorbed, and an emetic or the stomach-pump will, therefore, be of service. A saline cathartic is also advisable, but oils, fats, and alcohol are not recommended. Counter-irritation to the chest, friction of the limbs, and ammonia as a stimulant may be employed. Artificial respiration is of avail. Dr. White states that 1 c.cm. (or *mxv*), taken by the mouth, has caused death. Lethely and Filehne give the fatal dose as varying from 0.12 to 7.5 c.cm. (or *mii-f5ij*). A case has, however, been reported by Dr. E. Cissel, of Vienna, in which a woman, it is stated, took nearly 105 c.cm. (or *f5iiss*) of nitrobenzol and yet recovered. The symptoms were deep coma, superficial respiration, small pulse, and dribbling of urine, which betrayed the toxic agent. Camphor injections were administered and artificial respiration was practiced. Consciousness returned and recovery followed; on the fourth day the urine resembled that of a case of cystitis.

**BENZOSULPHINIDUM** (U. S. P.), **GLUSIDUM** (B. P.), or **Saccharin**.—*para*-ortho-sulphamine-benzoic acid ( $C_7H_5NO_2S$ ) is a coal-tar derivative discovered in Professor Rensen's laboratory of Johns Hopkins University, and first described by C. Fahlberg in 1879. It is a sweet imide derived from toluene (B. P.). It is a white, crystalline powder, with an acid reaction, but an intensely-sweet taste. Its odor, which becomes stronger on heating, is faintly suggestive of nitrobenzol. This substance is soluble in parts of cold water, readily soluble in alcohol and ether. Saccharin dissolves also in glycerin. Its solubility in water is promoted by the addition of sodium bicarbonate in the proportion of 2 parts to 3 of saccharin. Commercial saccharin may contain a large number of impurities. Pure saccharin can be separated from the mixture by means of ether. Dose, 0.13 to 0.65 gr. (or *gr. ii-v*).

Saccharin forms soluble salts with the hydrates of carbonates of the alkali metals. It melts at  $220^{\circ} C.$  ( $428^{\circ} F.$ ), and when fused with potassic carbonate forms salicylic acid. One part dissolved in 70,000 parts of water imparts to the solution a distinctly-sweet taste; it is about 300 times sweeter than cane-sugar, which it resembles in taste, except for a peculiar slight odor of bitter almonds.

**Physiological Action.**—Saccharin is excreted by the kidneys unchanged; it is not decomposed in the body, and has little if any effect upon digestion, though the experiments of C. T. Fox have demonstrated that, when added to food, saccharin checks the action of saliva upon starch.

The only noticeable effects upon the urine are that it does not so readily undergo fermentation, and the chlorides are slightly increased. Pure saccharin is not possessed of toxic or deleterious effects upon the human

organism, even in doses as large as 5 Gm. (or gr. lxxv). Saccharin has considerable antiseptic virtue, which, according to Constantine Paul, is impaired when it acts in an acid medium.

**Therapy.**—Saccharin is chiefly employed to take the place of sugar in the diet of obese and diabetic patients. For this purpose it is best prescribed in the form of a syrup containing 10 parts of saccharin and 12 parts of sodium bicarbonate in 1000 parts of distilled water, made with gentle heat at 40° C. (104° F.). It has also been claimed by Dreschfeld that saccharin relieves some of the symptoms of acid dyspepsia. Dr. James Little asserts that saccharin freely administered is an efficient remedy in chronic cystitis with ammoniacal urine. Two parts of saccharin dissolved by means of 3 parts of sodium bicarbonate are said to form an excellent tooth-wash. Fournier has found a mouth-wash containing saccharin efficacious in aphthæ. By Dr. Felici, of Rome, it has been utilized as an application in ozæna. The crusts having been removed by vaselin-oil and the cavity cleansed with a saline fluid, a solution containing from 0.50 to 1 Gm. (or gr. vii-xv) of saccharin is applied twice daily to the affected parts. The remedy was especially useful in cases where there was atrophy of the turbinated bones and mucous membrane and in those characterized by the odor and discharge of ozæna without apparent anatomical changes.

Saccharin is largely used in confectionary to add to glucose and make it correspond more closely in sweetness with cane-sugar. It may be combined with quinine, in order to overcome the bitterness:—

R Quinin. sulphat. ....	4	Gm. or 3j.
Saccharin. ....	2	Gm. or gr. xxx.
M. et div. in chartulæ no. xxx.		
Sig.: Take one four times a day.		

### BERBERIS (U. S. P.).—Barberry.

#### Preparation.

Fluidextractum Berberidis (U. S. P.).—Fluid extract of Berberis. Dose, 0.10 to 0.30 c.cm. (or mii-v).

The rhizome and roots of the Oregon grape, or *Berberis aquifolium*, or of other species of *Berberis* (Berberidaceæ). It contains an alkaloid, **Berberine**, which also exists in *Hydrastis*.

Berberis is tonic and diuretic, and is believed to act as an alterative, making it valuable for the treatment of blood diseases, dyspepsia, hepatic disorder, habitual constipation, and skin diseases dependent upon unhealthy secretions or conditions of the digestive tract. Vehsemeyer claims to have produced decided improvement, in the case of an infant afflicted with leukaemia, by the administration of berberine sulphate. Berberis has been topically employed in conjunctivitis, and the berberine hydrochlorate has been used with advantage as an injection in gonorrhœa. Internally, berberine or its hydrochlorate may be given, in doses of 0.015 to 0.32 Gm. (or gr.  $\frac{1}{4}$ -v).

**BETANAPHTHOL** (U. S. P.).—Betanaphthol; Naphthol (B.P.). (See Naphthol.

**BISMUTHUM.—Bismuth.***Preparations.*

- Bismuthi Citras** (U. S. P.).—Bismuth Citrate. Dose, 0.065 to 0.32 Gm. (or gr. i-v).  
**Bismuthi et Ammonii Citras** (U. S. P.).—Bismuth and Ammonium Citrate. Dose, 0.065 to 0.32 Gm. (or gr. i-v).  
**Bismuthi Subcarbonas** (U. S. P.).—Bismuth Subcarbonate. Dose, 0.32 to 1.30 Gm. (or gr. v-xx).  
**Bismuthi Subnitrates** (U. S. P., B. P.).—Bismuth Subnitrate. Dose, 0.32 to 1.30 Gm. (or gr. v-xx).  
**Bismuthi Carbonas** (B. P.).—Bismuth Oxycarbonate. Dose, 0.32 to 1.30 Gm. (or gr. v-xx).  
**Bismuthi Salicylas** (U. S. P., B. P.).—Bismuth Salicylate. Dose, 0.065 to 1.30 Gm. (or gr. i-xx).  
**Bismuthi Subgallas** (U. S. P.).—Bismuth Subgallate. Dose, 0.3 to 1.30 Gm. (or gr. v-xx).  
**Bismuthi Oxidum** (B. P.).—Oxide of Bismuth. Dose, 0.32 to 1.30 Gm. (or gr. v-xx).

**Liquor Bismuthi et Ammonii Citratis** (B. P.).—Solution of Bismuth and Ammonium Citrate, or **Liquor Bismuthi** (0.05 Gm. in 1 c.cm., or gr. iij of bismuth oxide in 25 c.c.). Dose, 2 to 4 c.cm. (or f3ss-j).

**Trochiscus Bismuthi Compositus** (B. P.).—Compound Bismuth Lozenge (bismuth carbonate, magnesium carbonate, heavy, of each, 0.13 Gm., or gr. ij; precipitated calcium carbonate, 0.25 Gm., or gr. iv, with rose basis).

**Pharmacology and Physiological Action.**—Bismuth in the metallic form is not official, and has no medical interest. Its salts, however, are of great value, the insoluble ones differing greatly in their applications from those which are soluble. The **subnitrate** and **subcarbonate** are, or should be, in the form of white, impalpable powder, which has a slight astringent and absorbent action when dusted upon excoriated or ulcerated surfaces. The free use of subnitrate of bismuth as a dressing for wounds or ulcers may cause absorption and poisoning. Among the consequences are acute stomatitis and a dark discoloration of the gums, spreading over the entire mouth, caused by diarrhoea and nephritis. Dr. F. P. Henry,<sup>1</sup> of Philadelphia, reports a fatal accident of this character. When taken internally, these salts have very much the same effect along the digestive tract as upon the surface of the body, checking excessive secretion and exerting a sedative action. When injected under the skin, part of the salt is absorbed and poisoning may result. Or, if large doses are taken by the mouth, death may result from gastro-enteritis, the symptoms being very much like those caused by lead, and mercury. After death, bismuth is found in the liver and intestines, and in the urine and saliva. A purplish line upon the gums, such as that of lead, has been noticed. The treatment is by demulcents, emptying the stomach, and the administration of the antidotes to arsenic, with which native bismuth is usually combined. When the soluble preparations are given for a considerable time, the bismuth is apt to accumulate in the liver; but this is not likely to follow the administration of the insoluble salts. The solutions, or elixirs, purporting to contain bismuth in combination with pepsin, are unscientific and may be dangerous. The discharges from the bowels are blackened by bismuth. The tongue becomes coated with a discolored fur. The prolonged administration of bismuth subnitrate has been known to cause a large intestinal concretion. It may, under these circumstances, also give rise to sloughs in the mouth and gastro-intestinal ulcers, also to desquamative nephritis and albuminuria.

**Therapy.**—In using bismuth it is essential that it shall be pure and free from arsenic. When well made, the subnitrate, or subcarbonate, is very useful as a dusting-powder for excoriated surfaces, and as a dressing after wounds or amputations; but when used freely has led to poisoning by absorption. However, it is valuable in small wounds and in some old ulcers. Combined with mucilage (4 Gm. to 180 or 240 c.cm., ʒj to ʒvi-viij), it is a good injection for gonorrhœa during the early stage; or it may be used as a soluble bougie, or as a vaginal suppository for leucorrhœa. The same preparation is likewise useful in ulcer of the rectum.

The addition of a small proportion of carbolic acid or acetanilid will enhance its antiseptic effect. In acne, intertrigo, and erythema in infants, or in vesicular eczema, the subnitrate, or subcarbonate, of bismuth may be lightly dusted over the surface. In the case of wounds, the red oxyiodide is preferred by A. Sidney Reynolds<sup>1</sup> to iodoform, as an antiseptic and also as an ointment in skin diseases. This salt is a local anæsthetic and antiseptic. It does not stain the skin or clothing, and may be employed as a dusting-powder or an ointment. It is an excellent application to chancre, chancroids, open buboes, ulcers, unhealthy wounds, and phlegmonous erysipelas. The following is a good combination:—

R Naphthalin.....	2	Gm. or ʒss.
Bismuthi subiodidi .....	4	Gm. or ʒj.
Unguenti simplicis .....	25	Gm. or ʒviss.

M. et ft. ungt. Useful upon chancres, chancroids, and syphilitic ulcers.

Subnitrate of bismuth in powder has been used with success in simple ozæna, snuffed into the nostrils, though it is inferior to other remedies. It may also be employed in aphthous or nursing sore mouth, and in mercurial ptyalism. It may be of service in chronic conjunctivitis and granular lids. Made into an ointment, it is an excellent application to chancre, chancroids, irritable ulcers, erysipelas, blisters, pemphigus after the bullæ have ruptured, leaving raw surfaces exposed, the erythematous and bullous forms of burns, and in the first stage of dermatitis. In these conditions an ointment may be thus composed:—

R Bismuthi subnitratis .....	2	Gm. or ʒss.
Pulv. marantæ .....	15 5	Gm. or ʒss.
Morphinæ sulphatis .....	20	Gm. or gr. iij.
Adipis laniæ hyd. ....	15 5	Gm. or ʒss.

M. et ft. ungt.

An ointment consisting of bismuth subnitrate and boric acid, with lanolin and olive-oil, is regarded by Wertheimer as particularly appropriate to the treatment of burns in children. An ointment containing the oleate of bismuth is also valuable in diseases of the skin. It may be prescribed as follows:—

R Ext. belladonnæ folior. ....	65	Gm. or gr. x.
Ext. opii .....	1 30	Gm. or gr. xx.
Ungt. bismuthi oleatis .....	15 5	Gm. or ʒss.

M. For furuncles, carbuncles, and eczema of the genitals.

The internal administration of insoluble bismuth preparations is principally based upon their local action upon the stomach and intestinal tract.

<sup>1</sup> *Medical News*, Oct., 1886.

They form a coating over the inflamed or irritated surfaces and keep them from coming in contact, while they also exert an astringent and sedative effect. In gastralgia, irritable stomach, and some dyspeptic conditions they are of much value:—

R Bismuthi subnitratis .....	8	Gm. or 3ij.
Pepsini saccharati .....	4	Gm. or 3j.
Creosoti .....	24	c.cm. or miv.

M. et div. in chartulæ no. xij.

Sig.: Give one every hour until relieved. (The oil of gaultheria may be substituted for the creosote, in case of children, and the powders made smaller.)

In painful dyspepsia and gastralgia, Dujardin-Beaumetz prescribed:—

R Bismuthi subnitratis,		
Magnesiæ,		
Cretæ præparatæ,		
Calci phosphatis .....	aa 10	Gm. or 3iiss.

M. et div. in chartulæ no. xl.

Sig.: One powder before each meal.

Bismuth may be given in powder also, as:—

R Bismuth. subnit.,		
Magnesiæ carbonatis .....	aa 4	Gm. or 3j.
Morphinæ sulphatis .....		065 Gm. or gr. j.

M. et ft. chartulæ no. xij.

Sig.: A powder every hour or two. Employ in gastralgia, dyspepsia attended with acidity, and in cancer of the stomach.

In half-grown children with irritable stomach, the result of improper feeding, a good combination is:—

R Bismuth. subnit. ....	2	Gm. or 3ss.
Sodii bicarb.,		
Pulv. rhei .....	aa	065 Gm. or gr. x.

M. et ft. chartulæ no. x.

Sig.: A powder every four hours.

The following liquid combinations of bismuth are likewise of service, especially in gastric catarrh and some varieties of dyspepsia:—

R Bismuth. citratis .....	8	Gm. or 3ij.
Glycerini pepsinæ (B. P.) .....	90	c.cm. or f3ij.

M. Sig.: A teaspoonful before meals.

R Bismuth. subnit. ....	8	Gm. or 3ij.
Pulv. rhei .....	6	Gm. or 3iss.
Pulv. acaciæ .....	8	Gm. or 3ij.
Spt. myristicæ .....	750	c.cm. or f3ij.
Aquæ menth. pip. ....	240	c.cm. or f3viii.

M. Sig.: A tablespoonful in water every four hours.

The salicylate is a soft, white powder; insoluble in water, alcohol, ether, and chloroform, but soluble in acids. In gastro-enteritis, or summer complaint in young infants, the salicylate gives excellent results in small doses (0.065 to 0.13 Gm., or gr. i-ij). This combination is likewise valuable in the diarrhœa of typhoid fever, in which it is serviceably given with naphthol. Bismuth salicylate is useful for the purpose of securing gastric antiseptics in cancer of the stomach. It may be associated with betanaphthol or salol. This salt, also, is highly esteemed as a remedy in infantile diarrhœa.

Gastric ulcer is much benefited by the subnitrate in 0.65 to 1 Gm. (or gr. x-xv) doses, given every three hours, or oftener, if there is much pain. Where malignant ulceration is suspected, opium and belladonna may be administered at the same time. The vomiting of pregnancy may sometimes be relieved by bismuth subnitrate. It serves a useful purpose in the chronic gastritis so common in drunkards. In acidity of the stomach it is useful, and also in flatulent dyspepsia. A combination of bismuth with charcoal is efficacious in the latter condition, as:—

**R** Bismuthi subnitratis,  
 Pulveris aromatici ..... aa 8| Gm. or ʒij.  
 Carbonis ligni (recentis) ..... 15½ Gm. or ʒss.  
**M.** et div. in chartulæ no. xij.

In diarrhœa, the subnitrate is usually a reliable remedy, but, as Ringer advises, it should be preceded by a dose of castor-oil, in order to remove fermenting material or other causes of irritation. In the diarrhœa of phthisis, it can be given in combination with pepsin or pancreatin. It may be given in hot milk to children; but it is almost tasteless, and may be placed at once upon the tongue and washed down with water or milk. In chronic diarrhœa, bismuth subnitrate not infrequently affords marked relief. An excellent prescription for diarrhœa, particularly when acute, is:—

**R** Bismuth. subnit. .... 78| Gm. or ʒiiss.  
 Pulveris myristicæ ..... 2|60 Gm. or ʒij.  
 Aquæ cinnamomi,  
 Syrup. acaciæ ..... aa 60| c.cm. or ʒij.  
**M.** Sig.: Two teaspoonfuls every half-hour, or hour, until relieved.

In cases of infantile diarrhœa, when the stools are greenish, contain casein, and are accompanied by abdominal pain, Dr. Zinnès relies upon the following prescriptions:—

**R** Bismuth. subnitrat. .... 3| Gm. or gr. xlv.  
 Liq. calcis ..... 6 c.cm. or fʒiss.  
 Syrup. aurant. .... 15 c.cm. or fʒss.  
 Aquæ fœniculi ..... 60 c.cm. or ʒij.  
**M.** Sig.: Teaspoonful every two hours.

**R** Bismuth. subnitrat. .... 3| Gm. or gr. xlv.  
 Syrup. aurant. .... 15 c.cm. or fʒss.  
 Infus. calumbæ ..... 60 c.cm. or ʒij.  
**M.** Sig.: One or two teaspoonfuls every two hours.

In epidemic dysentery, large doses of bismuth have been administered with benefit. Trousseau was accustomed to order bismuth injections in dysentery.

A solution of bismuth and ammonia citrate is official in the British Pharmacopœia. An extemporaneous formula may be used, like the following:—

**R** Bismuthi et ammoniæ citrat. .... 32 Gm. or gr. v.  
 Aquæ chloroformi ..... 15 c.cm. or fʒss.  
 Elixir aurantii ..... 45 c.cm. or fʒss.

**M.** Sig.: Take 15 c.cm. (or fʒss) three or four times daily, for irritable stomach.

This double salt has been employed in the treatment of acute and chronic diarrhœa. P. Vigier has prepared a bismuth benzoate as a substi-

use for the bismuth salicylate, or subnitrate. Bismuth benzoate contains 27 per cent. of benzoic acid, and may be advantageously used as an intestinal antiseptic, and is a preferable substance to the salicylate as regards its elimination by the kidneys.

**Bismuth Subgallate, or Dermatol.** — Under this name Drs. Heinz and Liebrecht have introduced a new combination which occurs in the form of a fine, saffron-yellow powder, odorless and innocuous; insoluble in water, alcohol, and ether; not hygroscopic or otherwise affected by exposure to air or light. It possesses astringent, antiseptic, and desiccant properties. This substance is also possessed of local anæsthetic power. It is of especial value in lesions attended by profuse secretion, as eczema, burns, ulcers, wounds, and diseases of the eye and ear. Dr. Eugene Doernberger reports excellent results from its use in pemphigus, herpes zoster, and abscesses of the skin occurring in children. Dermatol has been advantageously applied to chancreoids and ulcerated chancres, to balanitis, varicose and other lesions of the leg. Suspended in mucilage, it has been used as an injection in acute and chronic gonorrhœa. Mixed with an equal quantity of castor-oil, a woman has employed it in the treatment of sore nipples. It is considered of value as a dressing to abdominal wounds and in perineoplasty. Tampons made of gauze impregnated with dermatol are of service in the treatment of uterine catarrh. A powder composed of 20 parts of dermatol, 10 parts of starch, and 70 parts of talc is a good application in hyperidrosis of the hands and feet. Dermatol may be used pure as a dusting-powder, as a 25-per-cent. ointment, a collodion emulsion, and as a 10- to 20-per-cent. gauze.

Colasanti and Dutto report favorably of the internal employment of dermatol in different forms of diarrhœa, including that of typhoid fever and cholera. It was given in daily doses of 2 to 3 Gm. (or gr. xxx-xlvi) in divided portions. Dr. Austin Flint recommends bismuth subgallate in the treatment of fermentative dyspepsia. He has had excellent results from its use in chronic cases, giving 0.32 Gm. (or gr. v) in capsule or tablet before and after each meal. A number of loose combinations of bismuth have lately been introduced as antiseptic remedies. **Phenol-bismuth, cresol-bismuth, and betanaphthol-bismuth** are decomposed in the stomach, the phenol and cresol being absorbed and eliminated by the kidneys, while the bismuth is almost completely removed by the bowels. Naphthol is partly eliminated with the urine and partly through the intestine. In daily doses of 1 to 3 Gm. (or gr. xv-xxv) Dr. Jasenski, of St. Petersburg, gave phenol-bismuth with advantage in typhoid fever, acute and chronic gastric and gastro-intestinal catarrh, and in diarrhœa. **Tribromphenol-bismuth** is a yellow, insoluble powder, without odor or taste and almost free from toxic action. It contains 49.5 per cent. of bismuth oxide and 50 per cent. of tribromphenol. Professor Hueppe, of Prague, recommends it as a valuable agent in the treatment of Asiatic cholera. **Betanaphthol-bismuth** is a brown, odorless powder, insoluble in water, and containing 80 per cent. of bismuth oxide. In doses of 1 to 2 Gm. (or gr. xv-xxx) it acts as an excellent intestinal antiseptic. Both betanaphthol-bismuth and tribromphenol-bismuth are efficient remedies in fermentative dyspepsia, and chronic intestinal catarrh dependent upon the presence of micro-organisms. Dr. Reynold W. Wilcox has found the former compound to answer an excellent purpose in chronic membranous enteritis. Tribromphenol-bismuth possesses rather a sweetish taste, and shares the astringent properties of other compounds of bismuth.

**Bismuth chrysophanate** has been introduced under the name of **dermol**. It is an amorphous yellow powder of neutral reaction, insoluble in the ordinary menstrua. It is proposed for use, in the form of ointment, in diseases for which chrysophanic acid is employed.

**Thioform** is a combination of bismuth, sulphur, and salicylic acid, and occurs in the form of a light, grayish-yellow powder insoluble in water, alcohol, and ether. Thioform is devoid of odor or taste. It is comparatively free from toxic effects, and has been used with success upon burns, ulcers, and sloughing wounds. Dr. E. Fromm reports favorably concerning its action in conjunctivitis, purulent ophthalmia, and the strumous ophthalmia of children. Thioform has also been employed as a styptic in the operation of enucleating the eyeball.

**Bismuth sulphite** has been found useful by Cesaris and Racchetti as an intestinal antiseptic and anthelmintic. **Bismuth tannate** has been used internally as an astringent in diarrhoea in doses of 0.65 to 2 Gm. (or gr. x-xxx).

**BOLDUS.**—**Boldo**, or *Peumus boldus* (Monimiaceæ), is an evergreen belonging to the western coast of South America. The dried leaves and stems contain a bitter extractive, a volatile oil, and a bitter alkaloid (about 0.1 per cent). **Boldine**. A tincture (5 per cent.) is used in 0.30 c.cm. (or *mx*) doses or more, gradually increasing, and produces vomiting and purging in full doses, and also a sedative or narcotic effect upon the brain. In small doses it is carminative and stimulant to the stomach.

**Therapy.**—In South America, this plant has some reputation for its influence upon genito-urinary disorders, gonorrhœa, gleet, cystitis, and catarrhal inflammations of the kidneys. It has also been used for rheumatism, and as a tonic in dyspepsia and general debility. In cirrhosis it is especially recommended by Camperon. Boldine, the active principle, has hypnotic powers, and has been successfully tried in France as a substitute for opium or chloral (Juranville). It also has a local anæsthetic action, like cocaine.

**BORAX** (B. P.).—**Borax**. (See **Acidum Boricum**.)

**BROMUM** (U. S. P.).—**Bromine**.

Dose, 0.12 to 0.18 c.cm. (or *mii-iiij*), well diluted.

**BROMOFORMUM** (U. S. P.).—**Bromoform**, **Tribromomethane** (CH Br<sub>3</sub>).

Dose, 0.06 to 3.25 c.cm. (*mj-l*).

#### Preparations.

**Calcii Bromidum** (U. S. P.).—**Calcium Bromide**. Dose, 0.32 to 2 Gm. (or gr. v-xxx).

**Lithii Bromidum** (U. S. P.).—**Lithium Bromide**. Dose, 0.32 to 1.30 Gm. (or gr. v-xx).

**Zinci Bromidum** (U. S. P.).—**Zinc Bromide**. Dose, 0.065 to 0.13 Gm. (or gr. i-ij).

**Camphera Monobromata** (U. S. P.).—**Monobromated Camphor**. Dose, 0.065 to 0.32 Gm. (or gr. i-v).

**Ammonii Bromidum** (U. S. P., B. P.).—**Ammonium Bromide**. Dose, 0.65 to 2.60 Gm. (or gr. x xl).

**Potassii Bromidum** (U. S. P., B. P.).—**Potassium Bromide**. Dose, 0.65 to 4 Gm. (or gr. x-5j).

**Sodii Bromidum** (U. S. P., B. P.).—Sodium Bromide. Dose, 0.65 to 4 Gm. (or gr. x-3j).

**Acidum Hydrobromicum Dilutum** (U. S. P., B. P.).—Diluted Hydrobromic Acid (10 per cent.). Dose, 1.20 to 7.5 c.cm. (or  $\text{mxx-f3ij}$ ).

*Unofficial Preparations.*

**Ethylis Bromidum**.—Bromide of Ethyl, or Hydrobromic Ether. For inhalation as a general anæsthetic.

**Auri Bromidum**.—Bromide of Gold. Dose, 0.01 to 0.03 Gm. (or gr.  $\frac{1}{8}$  to  $\frac{1}{4}$ ).

**Auri et Ammonii Chloridum**.—Chloride of Gold and Ammonium. Dose, as above.

**Niccoli Bromidum**.—Nickel Bromide. Dose, 0.065 to 0.32 Gm. (or gr. i-v).

**Syrupus Ferri Bromidi**.—Syrup of Ferrous Bromide (10 per cent.). Dose, 0.60 to 4 c.cm. (or  $\text{mxx-f3j}$ ).

**Coniine Hydrobromidum**.—Coniine Hydrobromide. Dose, 0.004 to 0.005 Gm. (or gr.  $\frac{1}{10}$ - $\frac{1}{12}$ ).

**Pharmacology.**—Bromine, which obtains its name from its offensive odor, is a brownish-red, non-metallic liquid element, obtained from seawater; combining readily with alcohol, ether, or chloroform; and soluble in 33 parts of water at 59° F. When added to water, ozone is liberated. It completely volatilizes upon exposure to the air, giving off a highly-irritating, suffocating odor like that of chlorine, with which it may be contaminated. The pharmacopœial tests require the chlorine to be not more than 3 per cent., and that there shall be only traces of iodine.

**Physiological Action.**—It is unfortunate that the smell of bromine is so obnoxious, since it is a true disinfectant, rivaling mercuric chloride, and, it is claimed, has even more influence than that agent in preventing the development of spores. A 2-per-cent. solution in water destroys the spores of anthrax. Applied to the skin, it is a penetrating caustic in its pure state, and, diluted, is astringent and antiseptic. Internally, its effects resemble those of iodine and chlorine, causing paralysis of the brain-centres, death resulting from paralysis of respiration.

In cases of poisoning by swallowing this agent, the stomach must be thoroughly irrigated, and a purgative like croton-oil administered in alkaline solution (Vichy water). When inhaled, warm vapor from the steam-atomizer with alkaline solution (Dobell's solution) would afford relief to the irritation. The bromides taken upon an empty stomach in concentrated form sometimes cause gastralgia, which may be relieved by hot water and an hypodermic injection of morphine, combined with atropine, if stupor be present. After death the bromides are found in the brain, principally (Doyon).

In medicinal doses the bromides and hydrobromic acid exert a sedative effect upon the functions of the brain, produce insensibility of the mucous membrane of the fauces, and allay irritability of sensory nerves, as is very well shown by their effect in the treatment of tinnitus aurium after administration of quinine. It has a special action upon the genito-urinary tract, obtunding sensibility and preventing erections or ovarian excitement. On the other hand, sodium bromide has, in a few instances, been known to produce nocturnal erections and seminal emissions from relaxation. The bromides act directly upon the spinal cord, reducing reflex action and, when continued, diminishing motor power and producing paralysis of the legs. The circulation is also affected by their action upon the cardiac ganglia. In the case of potassium bromide, we have superadded the toxic action of potash upon the heart-muscle, by reason of which, when given in large doses, the

arterial tension is reduced and the pulse-rate lowered. In the usual doses, however, this effect is hardly observable.

According to the studies of Germain Sée, potassium bromide causes dilatation of the heart. The right side of the organ appears to be more decidedly affected. It was said (by Hammond) to reduce the cerebral circulation, causing anæmia by contraction of the arterioles. It is probable that the hypnotic effect of bromides is due more directly to their action upon the brain-centres, especially the motor and intellectual portion of the cortex cerebri. To its faculty of reducing reflex nervous excitability is to be ascribed its well-known antispasmodic effects in convulsive disorders. No marked effect upon temperature or respiration has been observed from medicinal doses; very large doses may reduce both, and also diminish tissue-waste.

The rate and the force of the heart's action are likewise diminished and arterial pressure reduced by excessive doses. When continually administered in moderately-large doses, the bromides sometimes excite nausea and diarrhoea. A sedative action is exerted by the bromides upon the sympathetic nervous system.

The bromides have considerable diffusive power, and are found in most of the secretions and in the interior of glands like the liver; after long administration they accumulate particularly in this organ, and the amount of bromide retained in the liver is very great. It has been surmised that this saturation of the system by bromide predisposes to tuberculosis. M. Féré states that, although he has seen nothing in patients to corroborate the supposition, guinea-pigs saturated with potassium bromide and inoculated with tuberculosis succumb more rapidly than animals to whom the salt had not been given. It has likewise been shown that the bromides accumulate in the brain and other organs. The glandular elements of the skin are stimulated and an acneiform eruption follows their prolonged use.

The use of the bromides is occasionally followed by the development of erythema or a brownish discoloration of the skin. In other instances it has caused an eruption similar to that of eczema, wheals, or ulcers. The effect upon the skin may be produced within a day or two after administration of the drug, but usually occurs only after saturation of the system. An eruption occasionally appears upon the body of a nursing infant, when the mother is upon a course of bromide treatment. The bromides are eliminated from the system by the secretions generally, but more particularly by the glands of the fauces, skin, bronchi, and bowels, and by the kidneys. Absorption is much more rapid than elimination.

**Therapy.**—For its caustic effect, bromine has been used in alcohol (1 to 2 or 3) in hospital gangrene, and in gynaecology as an application to cancer of the uterus. Diluted with sweet oil (0.60 c.cm. to 30 c.cm., or *mx* to *f̄j*), it is a sedative dressing for rhus-poisoning or chancroids. Bromine is employed, like carbolic acid, as a disinfectant for drains, but is too offensive for use in this way in the sick-room. The bromides are not often used as topical remedies, though an aqueous solution of the strength of 0.65 to 1.30 to 30 c.cm. (or gr. x-xx to *f̄j*) may be serviceable in paræsthesia. Finely-powdered potassium bromide is stimulant to chronic ulcers, and has been advantageous in epithelioma. It has been applied, added to 5 parts of glycerin, to hæmorrhoids and fissure of the anus, in order to relieve pain. In treating laryngeal diphtheria, or membranous croup, the following may be used:—

R Bromi .....	30	c.cm. or mv.
Potassii bromidi .....	4	Gm. or 3j.
Syrupi simplicis .....	28	c.cm. or f3viiss.
Decoti althææ .....q. s. ad 120		c.cm. or f3iv.—M.

For a child of one year, the bromine should be reduced to one-third, and from one to four years two-thirds, of the quantity in this formula, of which 30 c.cm. (or f3j) are to be given every hour, while the symptoms are urgent (Beidenbacher). The official solution of hydrobromic acid has not answered the expectation of those who urged its use as a substitute for the bromides; it may be less liable to produce acne, but it is irritating and less efficient. It may be given for the relief of tinnitus aurium, headache, or to prevent unpleasant symptoms from the effects of quinine:—

R Quininae hydrobromidi .....	155	Gm. or gr. xxiv.
Acid. hydrobromic. dilut. ....	15	c.cm. or f3ss.
Elixir aurantii .....	105	c.cm. or f3iiiss.

M. Sig.: Dose, a tablespoonful after meals.

**Special Applications.**—The special use of the bromides is found in the treatment of convulsive disorders, such as spasm of the larynx or epilepsy. In the former affection a few doses of 0.65 Gm. (or gr. x) or more in a child, are usually sufficient to accomplish a cure; but in the latter the treatment often extends over months and years. When the bromides are continued for some time, **bromism** is apt to be produced, the physiological action of bromine being shown by eruptions upon the skin, especially of the face; loss of reflexes; dragging, heavy sensations; and difficulty in locomotion, and in some cases special tendency to convulsive attacks appear. It therefore becomes necessary to intermit the bromide or change from one to another, and if there is too much depression of the vital powers, digitalis may be prescribed in combination, or strychnine given hypodermically in minute doses (0.0005 to 0.001 Gm., or gr.  $\frac{1}{120}$ – $\frac{1}{60}$ ) several times daily. Brown-Sequard preferred a combination like the following, in treating epilepsy, for children ten years of age:—

R Potassii iodidi .....	4	Gm. or 3j.
Potassii bromidi .....	31	Gm. or 5j.
Ammonii bromidi .....	10	Gm. or 3iiss.
Potassii bicarbonatis .....	260	Gm. or gr. xl.
Spiritus chloroformi .....?	750	c.cm. or f3ij.
Infusi calumbæ .....q. s. ad 180		c.cm. or f3vj.

M. Dose, 7.5 c.cm. (or f3ij) morning and noon and 11 c.cm. (or f3iij) at night, increasing the quantity after the convulsions cease, but continuing the remedy at least especially at the time when the fits are liable to recur. If the patient be young the infusion of digitalis may be substituted for the calumba.

M. Ch. Féré states that most of the ill effects of the bromide may be avoided by the simultaneous administration of an intestinal antiseptic. In the management of epilepsy he has often made use of the following combination:—

R Potassii bromid. ....	6	Gm. or 3iiss.
Naphthol .....	4	Gm. or 3j.
Sol. salicylat. ....	2	Gm. or 3ss.

M. Sig.: To be divided into three doses. One dose to be taken three times a day.

In treating epilepsy, the partial insensibility of the fauces is the guide to the administration of bromides; this should be established as soon as possible and maintained during the continuance of the treatment, which should not be pushed to the point of bromism. Small doses of arsenic will prevent, to some degree, the eruption in persons especially susceptible to bromides, and it is well to alternate the iodides with the bromides in order to prevent undue accumulation of the latter in the system. The beneficial action of the bromides is particularly marked when epilepsy is due to disorder of the sexual apparatus. On the other hand, the *petit mal* is much less amenable to their influence than the general convulsive seizures. Potassium bromide has a certain sphere of usefulness in whooping-cough. It is of no avail when the bronchitis is severe, or when pneumonia is present; but in simple uncomplicated pertussis, above all when convulsions or a tendency to convulsions exist, this remedy is of great service in allaying the congestion of the nervous centres. Spasmodic asthma is, in some instances, considerably benefited by the exhibition of bromide, and its efficacy is enhanced by combination with the iodide. The bromides are of decided value in infantile convulsions, especially when these depend upon reflex irritation. They are likewise of service in the convulsions symptomatic of simple meningitis, and not altogether without avail in alleviating those of tubercular meningitis. Uræmic convulsions may sometimes be successfully treated by potassium bromide in combination with chloral-hydrate, assisted by active purgation and diaphoresis. When cholera infantum is associated with excessive nervous irritability, potassium bromide serves a useful purpose, as it does also in those cases in which flatulent colic of infants is connected with marked intestinal spasm. Dr. Harvey Vanatta, of Seal, Ohio, administered potassium bromide with success in a case of invagination of the bowel.

In treating nervous irritability, restlessness, and insomnia it is well to combine bromides with other hypnotic agents:—

R Potassii bromidi .....	1	vel	130 Gm. or gr. xv vel xx.
Chlorali hydrati .....			65 Gm. or gr. x.
Aquæ camphoræ,			
Syr. lactucarii .....	aa	4	c.cm. or f3j.

M. Sig.: Pro dosi. For nervous headache with insomnia.

The sedative and antispasmodic effects are increased by combination with gelsemium, asafetida, or valerian, and smaller doses are required than when each agent is administered alone. In Ménière's disease, Ferreri reports good results from the use of large doses of potassium bromide in conjunction with ferric valerianate. In the affections of the genito-urinary organs the bromides are of especial value when spasm or pain is present. The quantity of urine is increased and also the proportion of urea. The sexual functions are depressed; and the bromides are largely used as **anaphrodisiacs** in priapism and nymphomania, especially when given in conjunction with tartar emetic in minute doses.

A good formula used by the author for gonorrhœa with chordee is the following:—

R Potassii bicarb. ....	12	Gm. or 3iij.
Potassii bromidi .....	155	Gm. or 3iv.
Tincturæ hyoscyami .....	30	c.cm. or f3j.
Spiritus chloroformi .....	15	c.cm. or f3iv.
Inf. buchu .....	q. s. ad 240	c.cm. or f3viij.

M. Sig.: A tablespoonful in barley-water every three or four hours. This combination relieves scalding and chordee.

The following are also valuable prescriptions containing the bromides:—

R Sodii bromidi .....	27	Gm. or 3vij.
Antimonii et potassii tart. ....	03	Gm. or gr. ss.
Aquæ camphoræ,		
Spiritus ætheris nitrosi .....	aa 45	c.cm. or f3iss.
Syrupi aurantii .....	60	c.cm. or f3ij.

M. Sig.: Two teaspoonfuls in water every two or three hours until relieved. Serviceable in epididymitis, cystitis, and prostatitis.

R Ammonii bromidi,		
Salol. ....	aa 4	Gm. or 3j.

M. et ft. capsulæ no. xij.

Sig.: Two capsules every hour or two. Employ in gonorrhœa and all irritable conditions of the genito-urinary organs.

The menses are delayed and rendered less in quantity, by the use of the bromides. When menorrhagia is caused by ovarian congestion, potassium-bromide restrains the flow, and the same agent sometimes proves of service in metrorrhagia. In the profuse and irregular menstrual discharges, which often occur as the menopause is neared, the same remedy is of value. The headaches, flushing of the face, subjective sensations of heat, and other anomalous symptoms which characterize the same period receive notable relief from the bromides. Chordee occasionally yields to the same agent. In spermatorrhœa and atonic impotence, dependent upon irritation or sub-acute chronic inflammation of the deep urethra, the bromide is valuable by diminishing the reflex irritability of the genital centre in the cord. But, in diurnal pollution due to debility of the genital centre, this remedy is harmful and should be avoided. In all cases of reflex nervous disorders having origin in ovarian irritation the bromides have a well-established reputation, but should not be given freely in anæmic subjects. In reflex cough—or so-called uterine cough, stomach-cough, ear-cough, etc.—we may give:—

R Potassii bromidi .....	32 to	65 Gm. or gr. v vel x.
Syr. pruni Virg. ....	7½	c.cm. or f3ij.

M. Take every four to six hours. The above is also useful in the cough of children, in smaller doses.

When it is desired, in laryngology, to make an examination or an operation upon a very sensitive throat, the use, for a few days, of full doses of potassium bromide will greatly assist in reducing such hyperæsthesia. In various hysterical throat affections, the bromides are of the greatest value.

In irritability of the bladder in women who use sewing-machines, or others, the following is serviceable:—

R Potassii vel sodii bromidi .....	130	Gm. or gr. xx.
Infus. uvæ ursi .....	4	c.cm. or f3j.

M. Sig.: Take every hour or two until relieved.

In migraine, the combination with opium is valuable:—

R Tr. opii deodorat. ....	4	c.cm. or f3j.
Potassii bromid. ....	8	Gm. or 3ij.
Acid. hydrobromic. dil. ....	60	c.cm. or f3ij.
Syr. aurantii .....	q. s. ad 120	c.cm. or f3iv.

M. Sig.: Take a dessertspoonful in water, every two or three hours.

Cases of maniacal excitement, puerperal, alcoholic, or other, are relieved by full doses of bromides, especially when combined with chloral.

Many acute attacks of fever in children, with delirium, are promptly cured by bromides, in small doses given every few minutes. Seasickness and the vomiting of pregnancy are controlled by small doses of bromides in effervescent salt; large doses have occasioned temporary derangement of mind, and have brought this remedy into disrepute because improperly used. In poisoning by strychnine and in tetanus, large doses of the bromides have proved successful in subduing the convulsions.

In acute cerebral congestion potassium bromide is of great value through its influence upon the vasomotor system. It is very serviceably given in conjunction with the fluid extract of ergot, which aids its action by constricting the cerebral vessels. The headache and wakefulness are also relieved by the bromide. The same drug is efficacious in allaying cerebral vomiting. Insomnia, caused by nervous strain or excessive mental application, is successfully treated by means of the bromide. The headache of pachymeningitis is generally best controlled by a combination of potassium bromide and iodide, as:—

R Potassii iodidi .....	10	Gm. or 3iiss.
Potassii bromidi .....	10 5	Gm. or 3v.
Syrupi aurantii,		
Syrupi simplicis .....	aa 60	c.cm. or ℥ij.

M. Sig.: Dose, two teaspoonfuls three or four times daily.

In exophthalmic goitre, the excessive cardiac action may often be restrained by the bromide. This remedy may be useful in subacute and acute rheumatism, especially when the acute form of the disease is accompanied by considerable fever and delirium. The restlessness and delirium of the third week of typhoid fever are often admirably controlled by a bromide. The same agent is very efficacious in preventing the night-terrors of children. It is claimed that potassium bromide is useful in diabetes mellitus of nervous origin. The salt relaxes nervous spasm of the oesophagus and allays the nervous symptoms of rachitis. Potassium bromide and iodide are recommended in eliminating metals—as mercury, copper, or lead—from the system. The bromide may be useful in reducing enlarged lymphatic glands and spleen, though far inferior to the iodide. A bromide addition to a prescription increases the effect of hypnotic or narcotic medicines, and it is often able to obviate the unpleasant consequences of opium.

Victor Augagneur has found potassium bromide of service in certain syphilitic manifestations. Dysphonia or aphonia sometimes occurs, especially in women, in the sixth or seventh month of the disease. In the belief that it depends more upon disturbed innervation than upon the erythema of the laryngeal mucosa, he is accustomed to give bromide in combination with potassium iodide with very good results. In serious tertiary disease of the larynx the iodide may give rise to dyspnoea. In this condition it is advantageous to practice mercurial inunction and depend upon the bromide to reduce reflex excitability. When the dyspnoea has been allayed, the bromide and iodide may be administered in association. The addition of the bromide to the iodide is also of value in cerebral syphilis.

According to Dr. Wilks, the bromides often have a good effect in causing reduction of goitre. They have also been used with success in order to diminish the volume of fibroid tumors of the womb.

During administration of the bromides the digestive functions may become disordered, and it is necessary to occasionally give cholagogal cathartics to keep the liver up to its work.

In comparing the bromides we observe some difference in their effect and therapeutic applications.

Potassium bromide is the most frequently prescribed, and is the most efficient. Where the circulation is weak, the other salts, especially the ammonium salt, are to be preferred.

Sodium bromide is the least toxic, and is preferred in cases where nutrition is poor, especially in anæmic women and children. It is not so efficient in cases of a uric-acid diathesis or lithæmia, as other salts, and notably that of lithia.

Lithium bromide has been thought to possess more hypnotic power than the potassium bromide. Ammonium bromide combines the stimulating action of the ammonia with the hypnotic effect of bromine, and is useful in cerebral rheumatism. The manifestations of bromism are not so readily excited by the ammonium salt as by that of potassium or sodium. Ammonium bromide is useful in whooping-cough.

Nickel bromide, introduced by Da Costa for the treatment of epilepsy, has the advantage of the smallness of the dose, but the disadvantage of the metallic poisoning when too long continued. It is best given in effervescent salt or in the form of a syrup mixed with orange-flower water. The salt is green in color, deliquescent, and soluble in water. It is well borne by the stomach, relieves congestive headaches and convulsive movements. Zinc bromide is little used; it is supposed to combine the well-known action of zinc upon the central nervous system with the bromide action. The syrup of ferrous bromide has been employed for chorea in anæmic children, with good results.

Strontium bromide appears to have decided advantages over the other bromides in the treatment of epilepsy. Dr. Antony Roche has published<sup>1</sup> notes of successful cases and says that he has not met any case in which the bromide of strontium, given in the prescribed doses and according to his method, has failed to diminish the number of the attacks. In many instances there had been no return for periods extending to two, three, or even four years. He usually begins the treatment of epilepsy by ordering 2 Gm. (or 3ss) of the strontium salt, night and morning in some vegetable tonic infusion. Should this dose not control the attacks, he rapidly increases it until he finds the quantity that will suit the individual case. In cases where there is distinct warning before the attacks he gives 2 Gm. (or 3ss) at once, and directs this dose to be repeated every hour, if required. In this way he has succeeded in preventing an attack. In order to get the full benefit of the treatment he has found it necessary to give this remedy in large doses and to continue it for a long period. Dixon Mann in his "Manual of Medical Jurisprudence" says, with regard to the safety of this treatment, that strontium salts cannot be regarded as poisonous. He had himself taken 12 Gm. (or 3iij) daily for weeks without any unpleasant symptoms. The strontium bromide does not cause the depression that follows the potassium salt.

**Bromamid.**—Fischedick and Koechling have introduced a compound

<sup>1</sup> *Lancet*, Oct. 15, 1898, p. 987.

of the aniline group containing 75 per cent. of bromine and designated by them as bromamid. It is obtained in the form of colorless, odorless, and tasteless needle-shaped crystals, insoluble in water, but soluble in boiling alcohol, ether, chloroform, and the fixed oils. It melts at  $243^{\circ}$  F. and volatilizes at  $310^{\circ}$  F. without change. No symptoms are produced in dogs by doses of 2 Gm. (or gr. xxx). The pulse-rate is, in adults, retarded by a dose of 0.65 Gm. (or gr. x). Bromamid reduces a febrile temperature  $1^{\circ}$  to  $2.5^{\circ}$  F. without excessive sweating. It does not disorder digestion or produce diuresis. This substance has been employed as an antipyretic and antineuralgic in doses of 0.65 to 1 Gm. (or gr. x-xv) several times a day to adults and 0.065 to 0.32 Gm. (or gr. i-v) to children. Bromamid may be administered in capsules and wafers or suspended in a fluid.

**Bromipin** is a solution of bromine in sesame-oil (10 per cent.). It has been used internally in the treatment of epilepsy by Zimmermann, of Hanover. The dose is 4 to 15 c.cm. (or f5i-iv) three or four times daily; with epileptics the dose may be increased to double this quantity. (One tablespoonful of bromipin represents about 1.49 Gm., or gr. xxij, of combined bromide, equivalent to 2.20 Gm., or gr. xxxiv, of potassium bromide.)

**Bromoform.—Tribromomethane.** If to methane, or marsh-gas ( $\text{CH}_4$ ), be added 3 atoms of bromine in substitution for 3 of hydrogen, we get methyl bromide, or bromoform ( $\text{CHBr}_3$ ), analogous, therefore, in composition to chloroform or iodoform. Bromoform is an oily liquid, having an agreeable odor resembling that chloroform. It has a sweet taste, does not affect the mucous membrane of the mouth, and has no irritant effect. It is rapidly decomposed by light. Its density is 2.77, and it boils at  $150^{\circ}$  C. Insoluble in water, it dissolves in alcohol and ether, its reactions being similar to chloroform. It usually is present in small proportion in commercial bromine, and is made by adding bromine to a solution of an alkaline hydrate in alcohol or wood-spirit. A fluid ounce of bromoform contains 360 drops.

Bromoform was first introduced by Stepp, of Nuremberg, in 1889, as a valuable remedy in whooping-cough. In children aged from six months to one year, 0.12 c.cm. (or mij) may be given three or four times daily, and the dose is increased by about a drop for every additional year of age. The dose for adults is 0.545 to 0.80 c.cm. (or mvii-xij) in capsules. Bromoform diminishes the frequency, severity, and duration of the paroxysms of pertussis, has a favorable influence upon the mucous secretion, and generally abolishes vomiting and the hæmorrhages within a short period. The most severe cases are perceptibly benefited within eight days. Dr. S. Solis-Cohen has used bromoform with beneficial results, as a local application, in the treatment of tubercular and other ulcers of the throat. He recommends its combination with iodoform. The local application of bromoform is also of utility in ozæna.

Dr. Ponticaccia reports that bromoform, given in daily doses, progressively increasing from 1 to 3.25 c.cm. (or mxv-l), has an excellent sedative effect in cases of acute mania. He found the same remedy of value in delirium tremens, in which it allayed restlessness and induced sleep. Several fatal cases of poisoning from bromoform have been reported, the patient in each case being a child who had taken a large quantity (30 to 40 minims).

When bromoform is given suspended in a gummy mixture, accidents have happened through neglecting to thoroughly shake the bottle, before

pouring out the medicine. It is insoluble in dilute alcohol, but may be dissolved by the aid of glycerin, and a formula has been proposed by the late P. W. Bedford which forms a perfect and palatable solution (each fluidrachm contains 0.06 c.cm., or *mj*, of bromoform):—

R Bromoform .....	1	c.cm. or <i>℥xvj</i> .
Alcohol,		
Tr. cardam. co. ....	aa 7/5	c.cm. or <i>℥ij</i> .
Glycerini .....	45	c.cm. or <i>℥iiss</i> .—M.

**Bromogallie Acid.**—This substance, otherwise known as bromogallol, resembles bromic acid, in which two atoms of hydrogen have been replaced by bromine. The blood of a dog poisoned by bromogallol was of a saffron color and contained a large quantity of methæmoglobin. Respiration was at first accelerated, but afterward retarded. Lépine and Cazaneuve, of Lyons, have employed it as a *succedaneum* of potassium bromide. It appeared to be useful in chorea, but less efficient in epilepsy than the salt of potassium. This preparation, known also as gallobromol, has been used with success locally in eczema rubrum and other stubborn forms of eczema in the form of a 1- to 2-per-cent. solution, powder, or ointment. In cystitis and epididymitis 2- to 4-per-cent. solutions have been employed by irrigation.

**Bromol, or Tribromphenol,** is obtained by the action of bromine in excess on carbolic acid. It possesses antiseptic properties, and has been used with advantage in the local treatment of wounds, ulcers, and diphtheria. In the last-named affection Rademaker recommends a mixture of 1 part of bromol with 25 parts of glycerin. Bromol has been given internally in cholera infantum in doses from 0.005 to 0.015 Gm. (or gr.  $\frac{1}{32}$ – $\frac{1}{4}$ ). On the ground of his experimental and clinical investigations, Dr. Tschourilow states that tribromphenol is an excellent application in erysipelas. He made use of it in the form of a 1-, 2-, or 3-per-cent. ointment.

### BRYONIA.—Bryonia (Bryony).

#### Preparations.

**Tinctura Bryoniæ.**—Tincture of Bryonia (10 per cent.). Dose, 4 to 15 c.cm. (or *℥i-iv*).

**Extractum Bryoniæ Fluidum.**—Fluid Extract of Bryonia. Dose, 0.30 to 1 c.cm. (or *℥v-xv*).

**Bryonin.**—The active principle. Dose, 0.01 to 0.02 Gm. (or gr.  $\frac{1}{6}$ – $\frac{1}{3}$ ).

**Pharmacology.**—Bryonia alba and Bryonia dioica (Cucurbitaceæ) are the official sources of the root known as bryonia, which must be recently dried, as an old drug is useless. It contains two glucosides, **Bryonin** and **Bryonidin**; the former is a poison, and is the principal constituent; it appears in pearly crystals or in white powder; it is very bitter; soluble in water and alcohol. On being boiled with diluted sulphuric acid, bryonin splits up into glucose and a resin, **Bryogenin**. A second resinous principle, **Bryoresin**, is also found in the root.

**Physiological Action.**—The juice of the fresh plant blisters the skin. The drug, taken internally, acts as an irritant, and is a hydragogue cathartic. It also increases the flow of urine. Bryonia acts as an irritant upon serous membranes, and in toxic doses causes gastro-intestinal inflammation, with nausea and vomiting, and gives rise to symptoms of meningitis. Death has followed in several cases. Its antidotes are opium and stimulants.

**Therapy.**—As there are better purgatives, bryonia is not required for this purpose. It is reported to have been used with success in atonic dyspepsia. It is used, in small doses, in rheumatism, pleurisy, and other serous inflammations, after the fever has abated. It appears to be especially serviceable in the muscular pains and stiffness following colds. In chronic bronchitis it has been advocated. Bryonia has been recommended in the catarrhal stage of whooping-cough and in cases of enlarged spleen from chronic malaria, and, also, by Petresco, in cases of hæmorrhage, especially in epistaxis. In chronic or subacute pharyngitis, the tincture has been employed, with asserted good results.

**BUCHU (U. S. P.).—Buchu.**

**BUCHU FOLIA (B. P.).—Buchu-leaves.**

#### *Preparations.*

**Fluidextractum Buchu (U. S. P.).—Fluid Extract of Buchu.** Dose, 0.60 to 4 c.cm. (or *mx-f3j*).

**Infusum Buchu (B. P.).—Infusion of Buchu** (one to sixteen). Dose, 4 to 8 c. cm. (or *f3i-ij*).

**Tinctura Buchu (B. P.).—Tincture of Buchu** (20 per cent.). Dose, 2 to 4 c.cm. (or *f5ss-j*).

**Pharmacology.**—The dried leaves of *Barosma betulina* (Rutaceæ), derived from good-sized, erect, and widely-branching shrubs of southern Africa. They contain an **oleoresin**, which is the most active constituent. They also contain a bitter glucoside, **Barosmin**. The oil of Buchu contains 30 per cent. of the characteristic, crystallizable phenol known as diosphenol ( $C_{10}H_{10}O_2$ ). The fluid extract does not mix readily with water, on account of the presence of the oil and extractives.

**Physiological Action.**—Buchu-leaves have a strong, mint-like odor and a bitter, pungent taste. When taken into the stomach, a warming, carminative effect is produced by small doses, but very large ones cause irritation. The volatile oil diffuses into the blood, slightly stimulating the circulation, increasing the quantity of the urine, and imparting to it a peculiar, aromatic odor. In process of excretion the remedy acts as an astringent and disinfectant upon the urinary organs, especially the bladder. As a portion is eliminated by the bronchial mucous membrane, a stimulating influence is also exerted here in relaxed conditions accompanied by increased secretions. When used to excess or for a long period, or in too large quantity, the kidneys suffer and degenerate or inflammatory conditions are initiated.

**Therapy.**—The principal use of this agent is for disorders of catarrhal character affecting mucous membranes and diseases of the genito-urinary organs. In incontinence of urine, or want of tone in the bladder, good results usually promptly follow its administration. Buchu affords relief in irritability of the bladder, in subacute or chronic cystitis, and in pyelitis. Through the enterprise of the owners of proprietary remedies, buchu has a popular reputation for the cure of gonorrhœa, but, owing to the quantity of alcohol contained in the fluid extract, this should not be used during the existence of acute inflammation, and only with great care in chronic urethritis, or gleet. The recent infusion is perhaps the best preparation. It may be combined with *uva ursæ* (5iv of each to a pint of boiling water).

There are many good reasons for believing that the much-advertised "buchu-cures" for gonorrhœa contain no buchu-leaves whatever, but are made from the leaves of *uva ursi* and other domestic plants. Buchu resembles oil of turpentine very much in its physiological effects, and is useful in much the same class of cases. In gleet it appears to be highly serviceable. Buchu has been used with success in chronic bronchitis, atonic dyspepsia, influenza; and in chronic rheumatism it may be administered sometimes with advantage. Not having very decided diuretic properties, it is of little value in dropsy.

**BURSA PASTORIS.**—Shepherd's purse is a small plant belonging to the *Caryophyllaceæ*, a native of Europe, but growing luxuriantly in this country in uncultivated lands during the months of April and May. The plant has a bitter, astringent, and strongly-pungent taste. It contains a volatile oil, essential oil of mustard, a glucoside, bitter principle, resin, etc.

According to von Oefele, the virtues of the plant depend upon the presence of **bursinic acid**, the salts of which, with iron and sodium, may be given in 0.10 Gm. (or gr. iss) doses several times a day. Of the tincture, made with fresh leaves, the dose is 0.60 to 4 or 15 c.cm. (or *mx-f3i-iv*), given in cases of hæmorrhage from the lungs, kidneys, or uterus, and also in diarrhœa and dysentery. A fluid extract is also made, the dose of which is from 2 to 4 c.cm. (or *f3ss-j*). Both preparations are miscible with water without precipitation.

**BUTYL-CHLORAL HYDRAS (B. P.).**—Butyl-chloral Hydrate. (See Chloral Hydrate.)

**CACTUS.**—Cactus. Night-blooming *Cereus*, the *Cereus grandiflorus* (*Cactaceæ*), is a plant of Mexico, with large, showy, nocturnal-blooming flowers, of pearl-white petals, which have a heavy perfume. A tincture of the fresh stems and flowers (124 Gm. to 473 c.cm., or *3iv-Oj* alcohol) is named by Rubini to be a valuable cardiac tonic in doses of 0.06 to 0.30 c.cm. (or *mi-v*) three times a day. Probably these doses might be much increased, as Kunge gave 1.20 c.cm. (or *mx*) at once, and H. C. Wood was unable to perceive any effect from them at all. A difference might be accounted for on the ground that some use the fresh plant and others the stems and leaves recently dried, the latter being the stronger preparation. The constituents of Cactus are unknown. It contains several acids, glucosidal, resinous bodies, and also an alkaloid, which is present in very small quantity. Latet and Boy-Teissier determined that, in frogs, cactus increases cardiac action, but that the effect is transitory. Dr. Reynold W. Wilcox states that the physiological action of cactus is upon the intracardiac ganglia and accelerator nerves, through the cardiac plexus of the sympathetic system, and that there is no interference with the inhibitory nerves, nor does its administration produce any very marked vasomotor changes. It shortens the ventricular systole and increases the blood-pressure. Sultan has extracted an active principle, which he terms **Cactin**, from the young flowers of the plant. He states that cactin increases the energy of the cardiac contractions, heightens arterial tension, and has a direct action upon the motor centres of the spinal cord. It produces reflexes, increases the general nervous tone, and may be used for a long period without causing gastric symptoms or cumulative effects. Both pulse and blood-pressure are reduced by toxic amounts.

The action of the heart is rendered irregular and it is arrested in systole. Death is preceded by clonic and tetanic convulsions, caused by overstimulation of the motor tract of the cord. Dr. Wilcox found it especially useful in uncompensated cases of valvular disease, in relative incompetency due to muscular degeneration, in weak hearts after typhoid fever, in functional heart diseases from alcohol, dyspepsia, sexual exhaustion, etc., and in the palpitation of exophthalmic goitre. In aortic regurgitation, he considers it to be the drug *par excellence*, while in mitral stenosis it should be avoided. Watson Williams has found cactus beneficial in mild cases of angina pectoris. Cactus has also proved itself efficient in cardiac dropsy.

**CADMIUM.**—Cadmium is found combined with zinc, in native ores. It resembles tin in general appearance, and its salts are white and permanent; they are soluble in water. They are astringent and resemble the corresponding zinc salts, producing emesis, but they are principally employed for their local effects. Small doses of the salts of cadmium excite (whether given by the mouth or hypodermic injection) inflammation of the gastrointestinal mucous membrane, and ulceration may occur. In addition they may cause giddiness, loss of consciousness, and retardation of circulation and of respiration. Alkaline carbonates and white of egg are the proper antidotes. The ointment of the iodide (1 to 8 of lard) or the oleate may be used in chronic enlargement of glands or joints, and especially in goitre. It has also been recommended as an application in cases of enlarged spleen. It is said not to discolor the skin. Lincke has made use of injections of cadmium sulphate in leucorrhœa and gonorrhœa. The sulphate may be employed as an astringent wash (in solutions,  $\frac{1}{2}$  per cent.) or as an ointment (1 to 40 benzoinated lard). In solution the sulphate is used as a collyrium.

**CAFFEINA** (U. S. P., B. P.).—Caffeine, Theine ( $C_8H_{10}N_4O_2 + H_2O$ ).

**Dose**, 0.13 to 0.65 Gm. (or gr. ii-x). B. P., 0.065 to 0.32 Gm. (or gr. i-v).

*Preparations.*

**Caffeina Citrata** (U. S. P.).—Citrated Caffeine. **Dose**, 0.065 to 0.32 Gm. (or gr. i-v).

**Caffeina Citrata Effervescens** (U. S. P.).—Effervescent Citrated Caffeine. **Dose**, 4 to 12 Gm. (or 3i-ij).

**Caffeinæ Citras** (B. P.).—Caffeine Citrate. **Dose**, 0.13 to 0.65 Gm. (or gr. ii-x).

**Caffeinæ Citras Effervescens** (B. P.).—Effervescent Caffeine Citrate. **Dose**, 4 to 8 Gm. (or 3i-ij).

**Pharmacology.**—Caffeine is a feebly-basic proximate principle obtained from the dried leaves of *Thea sinensis* (Ternstroemiaceæ), or from the dried seeds of *Coffea arabica* (Rubiaceæ), and found also in other plants, or prepared synthetically (U. S. P.). An alkaloid usually obtained from the dried leaves of *Camellia Thea*, or the seeds of *Coffea arabica* (B. P.). Paraguay tea, or mate, the Brazilian holly (*Ilex Paraguensis*), also contains caffeine, and is largely used as a hot beverage and stimulant in South America. It exists also in the kola-nut of Africa, the fruit of *Sterculia acuminata* (Sterculiaceæ). It is closely related to theobromine, existing in theobroma cacao, and to cocaine, found in *erythroxylon coca*, both in chemical composition and effects upon the human body. Caffeine has been synthetically made from guanine; and also by heating, in closed tubes, theobromine silver with methyl-iodide.

Citrated caffeine is most frequently employed in medicine on account

of its greater solubility, but Tanret has recently shown that by the addition of an equal weight of sodium salicylate, or benzoate, the solubility of caffeine is greatly increased. Antipyrine has also been found to have the same action; so that by this means the hypodermic administration is greatly facilitated. One and a half Gm. (or gr. xxiv) of antipyrine will enable 1 Gm. (or gr. xv) of caffeine to dissolve in 30 c.cm. (or f3j) of distilled water, with the aid of heat, forming a permanently-limpid solution.

Caffeine is in the form of colorless, silky, inodorous crystals, sparingly soluble in alcohol and cold water (75 parts), but much more soluble in boiling water (9.5 parts). It is precipitated from its aqueous solution by tannic acid, or solution of potassium iodide and mercury; with the latter reagent the deposit is crystalline, whereas, with other alkaloids, the product is always amorphous when this test is employed. Caffeine was first extracted from coffee in 1821, by Pelletier and Caventou, and by Robiquet and Runge. According to Wurtz, it chemically is methyl-theobromine (or trimethyl-xanthine). The caffeine of commerce is usually derived from damaged tea.

**Physiological Action.**—It has been claimed by Dr. Mays, of Philadelphia, that the physiological effects of the caffeine obtained from coffee differ from those following the administration of the alkaloid from tea. Mays claims that theine possesses analgesic properties which are absent in caffeine; and that the latter will not affect the heart, while the former causes palpitation. Theine, he has asserted, when injected hypodermically, produces local anæsthesia, whereas pure caffeine will not affect sensibility. Tanret and others, on the contrary, regard caffeine as an efficient local anæsthetic. It has been held that the well-known differences in the physiological effects of tea and coffee were due to other constituents, and especially to volatile oils, and in the ordinary method of manufacture these might still contaminate the caffeine. It has been shown that tea contains another base, theophylline, which is isomeric, but not identical, with theobromine and paraxanthine. The presence of this base might also affect the physiological results. The experiments of Dunstan and Shepherd demonstrate that caffeine and theine are identical in chemical properties. Investigations with caffeine prove it to have very decided physiological powers. There is, after its administration, at first increase, but later diminution, of the activity of the reflex centres of the spinal cord. In frogs convulsions and muscular rigidity are excited; the heart's action is at first accelerated and afterward slowed. Arterial pressure at first rises, but subsequently falls. Caffeine stimulates the vasomotor centre and exerts a direct influence upon the heart. It assists the system to resist hunger and fatigue. It has a decided diuretic action. The secretion of urea is at first increased, afterward diminished. Sobieranski,<sup>1</sup> after a series of experiments in the line of Ludwig's theory of urinary secretion, found that, in animals killed at various intervals after the injection of indigo-carmin, this substance was secreted by the glomeruli alone; it was never found in the basal epithelium of the convoluted tubules, which again proves that this epithelium does not secrete. Further experiments proved that after the administration of diuretics, and while the system is acting under their influence, the injection of indigo-carmin varies in its effect. With caffeine, the cells of the convoluted tubules were no longer stained, only a weak coloration here and there in the secreting epithelium,

<sup>1</sup> *Centralblatt für Physiologie*, April 4, 1900.

which he explains by the assumption that caffeine paralyzes the absorbing power of the convoluted tubules, and to this he ascribes its diuretic action. The diuretic salts—sodium chloride, nitrate, and acetate—produce their effect through the blood's increasing the secreting power of the glomeruli while only slightly affecting the absorbing function of the tubules. Urea and kindred substances stand between these, as they raise the osmotic coefficient of the glomeruli on one hand, while they diminish the absorbing power of the convoluted tubules on the other.

When caffeine is given in ordinary doses the rate of respiration is reduced, blood-pressure lowered; temperature slightly increased, afterward diminished. The cerebral functions are stimulated, and, in many persons, wakefulness results. Delirium, alone or associated with visual hallucinations, is sometimes excited by the administration of caffeine. It counteracts the effects of narcotic remedies, and is valuable in the treatment of opium poisoning, although not a complete antidote. When taken into the stomach, caffeine diffuses readily into the blood, and is eliminated by the kidneys and the liver, principally. Small doses increase the appetite and facilitate digestion; there is some irritation of the digestive tract, increasing peristalsis and in some cases causing venous congestion and hæmorrhoids. From a dose of 0.75 Gm. (or gr. xij) of caffeine, Dr. Pratt experienced restlessness, sleeplessness, mental depression, and tremor. A dessertspoonful of the citrate of caffeine produced nausea, stupor, extreme pallor and debility, soft pulse, slow and sighing respiration; but recovery followed the use of emetics, hot applications, and brandy. Zenetz<sup>1</sup> calls attention to the dangers of caffeine. With doses of 0.20 to 0.32 Gm. (or gr. iii-v), two or three times a day, the blood-pressure rises slowly, but steadily, and the quantity of urine is increased. Between the fourth and sixth days the patient complains of constriction in the chest, dyspnoea, and restless nights, due to increased blood-pressure. Death may result from tetanic contraction of the heart. Caffeine continues to be excreted, from the urine, for at least ten to fifteen days after the last dose is taken; so that it resembles digitalis in producing a cumulative effect. Caffeine should be used with caution in all renal diseases, in arteriosclerosis, and atheroma, and all cardiac diseases secondary to them. Another danger of caffeine consists in the existence of idiosyncrasy or excessive susceptibility. Zenetz reports three cases of, in his opinion, death from caffeine; in each the heart was found to be so strongly contracted that it could be cut with difficulty. One was a young man with croupous pneumonia, who was only taking 0.20 Gm. (or gr. iij) three times a day and who died suddenly on the third day.

**Therapy.**—In migraine, caffeine citrata may be administered, 0.065 Gm. (or gr. j) every hour, with excellent effect; or a cup of strong tea or coffee given. Where there is co-existing liver, kidney, or stomach disorder, a purgative should begin the treatment. Anæmic headache also may be relieved by the administration of caffeine. The hypodermic injection of this agent is sometimes efficient in neuralgia; or it may be administered as follows:—

R Caffeine citrate . . . . . 1.30 Gm. or gr. xx.  
Acetphenetidin

Pulv. aromatic, . . . . . aa 2j Gm. or 3ss.

M. et ft. chartule no. x.

Sig.: A powder every two or three hours. Serviceable in migraine, and in neuralgia about the scalp, face, and in sciatica.

<sup>1</sup> Wiener medicinische Wochenschrift, Dec. 9, 1899.

R Caffeinæ citrat. ....	1 30	Gm. or gr. xx.
Acetanilidi. ....	1 30	Gm. or gr. xx.
Ext. cannabis Indicæ .....	20	Gm. or gr. iij.

M. et ft. capsulæ no. x.

Sig.: A capsule every two or three hours for neuralgia.

R Caffeinæ citrat. ....	2	Gm. or 3ss.
Ammonii bromidi .....	12	Gm. or ʒiij.
Elix. guaranæ .....	60	c.cm. or fʒij.

M. Sig.: A teaspoonful every hour or two until relieved of pain of neuralgia.

In despondency and hypochondriasis, caffeine, or a cup of hot coffee infusion, will sometimes serve a good purpose. It may be given in order to dissipate the drowsiness which is often produced by a hearty dinner.

As a cardiac stimulant in valvular diseases, dilated or fatty heart, or in the myocarditis accompanying rheumatism, in low fevers, and in dropsy due to weak heart, caffeine may be given hypodermically (0.065 to 0.13 Gm., or gr. i-ij, every two to four hours), or the sodio-benzoate may be employed as recommended by Huchard. When being administered in these cases, caffeine will sometimes give rise to so much insomnia that its use will have to be abandoned, or, at least, temporarily suspended. Dr. Petrescu, of Bucharest, indeed, claims advantage from largely increasing the usual doses, and states that he has administered with good effect as high as 2 to 4 Gm. (or gr. xxx-lx) daily for several consecutive days. Misrahi recommends the use of the sodio-benzoate in puerperal hæmorrhage, and states that when given hypodermically it acts more rapidly than ergot. In chronic Bright's disease caffeine diminishes albuminuria and dropsy. It may be used in co-operation with hydragogic cathartics in ascites. Uræmic coma may sometimes be lightened by the hypodermic administration of caffeine. The hypodermic injection of caffeine is also of assistance in the treatment of opium poisoning. It may be used during the intervals of administration of digitalis, or, where this drug is too slow, given in the following combinations:—

R Caffeinæ citrat. ....	3 25	Gm. or gr. l.
Liquor potassii citratis,		
Spiritus ætheris nitrosi,		
Infus. digitalis .....	aa 60	c.cm. or fʒij.

M. Sig.: A half-teaspoonful in water every three or four hours. Employ in valvular insufficiency, attended with dropsy.

In weak, dilated heart, with gouty tendency, and in nephritis, the following are useful:—

R Caffeinæ citrat.,		
Lithii citratis .....	aa 6 50	Gm. or gr. c.
Strychninæ sulphat. ....	0 15	Gm. or gr. ʒ/4.
Ol. gaultheriæ .....	30	c.cm. or mv.

M. et ft. capsulæ no. xx.

Sig.: One every four hours.

R Caffeinæ citrat. ....	3 25	Gm. or gr. l.
Tinct. strophanthi .....	4 50	Gm. or m℥xx.
Aquæ camphoræ .....	90	c.cm. or fʒij.

M. Sig.: A teaspoonful three times a day. Use in parenchymatous nephritis attended with dropsy.

In pneumonia, or congestion of the lungs with weak heart, in elderly patients, caffeine is an excellent remedy in moderate doses (0.065 to 0.13 Gm.,

or gr. i-ij, given hypodermically every two to four hours). It is likewise of value in the weakened heart of typhoid fever and pneumonia, after the febrile stage has passed. In the diarrhœa of relaxation, typhoid fever, sporadic cholera, etc., the sodio-benzoate or sodio-salicylate may be used, in combination with nux vomica or strychnine.

Cholera infantum and the diarrhœa of phthisis are not infrequently benefited by caffeine. An asthmatic paroxysm may often be relieved by this remedy. On account of its tendency to produce wakefulness it has, generally in the form of a strong coffee (either given by the stomach or injected into the rectum), long been a valuable adjuvant in the treatment of opium poisoning.

**Caffeine Tri-iodide.**—This compound, a dark-green crystalline substance, readily soluble in alcohol, is a stimulant and diuretic, which has been used in cardiac dropsy in the dose of 0.13 to 0.25 Gm. (or gr. ii-iv).

**Caffeine-sulphonic Acid.**—This compound, introduced by Drs. Heinz and Liebrecht, is claimed to stimulate the secreting power of the kidneys without increasing blood-pressure. It has been given in the form of a sodium combination, and, while acting as a good diuretic, had no ill effect upon the digestive processes. The salt is, therefore, well adapted to the treatment of cardiac or renal dropsy. Caffeine-sulphonic acid will also unite with lithium, and it is thought that this salt will prove useful in lithiasis, gout, and gravel.

**CAJUPUTI OLEUM (U. S. P.).**—Oil of Cajuput. (See *Oleum Cajuputi*.)

**CALAMUS (U. S. P.).**—Calamus (Sweet Flag).

#### *Preparation.*

*Fluidextractum Calami (U. S. P.).*—Fluid Extract of Calamus. Dose, 1 to 4 c.cm. (or *mxv-f3j*).

**Pharmacology.**—The dried, unpeeled rhizome of the *Acorus calamus* (Araceæ) is slightly aromatic and quite pungent to the taste, and is carminative. It contains a neutral, bitter glucoside, **Acorin**, a nitrogenous principle, a volatile oil, benzoic acid, etc.

**Therapy.**—In consequence of its feebly-aromatic taste, calamus is sometimes useful, and is popularly employed, in overcoming a tendency to flatulence, by chewing it slowly and swallowing the saliva. It is sometimes adopted as a substitute for tobacco, by those who desire to overcome the habit of chewing. It is a constituent in various "bitters" used as appetizers and stimulants. An infusion (31 Gm. to 473 c.cm., or  $\text{ʒi-Oj}$ ) may be administered in wineglassful doses as a stomachic tonic.

**CALCIUM.**—Calcium.

#### *U. S. P. Salts and Preparations.*

**Calx.**—Lime. Calcium Oxide. Not used internally.

**Calx Chlorinata.**—Chlorinated Lime (available chlorine, at least 30 per cent.); often improperly called chloride of lime.

**Calx Sulphurata.**—Sulphurated Lime (Crude Calcium Sulphide). A mixture containing at least 60 per cent. of Calcium Monosulphide, together with unchanged Calcium Sulphate, and Carbon, in varying proportions. Dose, 0.015 to 0.13 Gm. (or gr.  $\frac{1}{2}$ -ij).

**Calcii Bromidum.**—Calcium Bromide. Dose, 0.65 to 4 Gm. (or gr. x-ʒj).

*Calci Carbonas Precipitatus*.—Precipitated Calcium Carbonate. Dose, 0.65 to 2 Gm. (or gr. x-xx).

*Calci Chloridum*.—Calcium Chloride. Dose, 0.32 to 2 Gm. (or gr. v-xx).

*Calci Hypophosphis*.—Calcium Hypophosphite. Dose, 0.65 to 2 Gm. (or gr. x-xx).

*Calci Phosphas Precipitatus*.—Precipitated Calcium Phosphate. Dose, 0.65 to 2 Gm. (or gr. x-xx).

*Calci Sulphas Exsiccatus*.—Dried Calcium Sulphate. Contains 95 per cent., by weight, of calcium sulphate and about 5 per cent. of water. (Plaster of Paris for surgical purposes.)

*Creta Preparata*.—Prepared Chalk. Dose, 0.65 to 1.30 Gm. (or gr. x-xx).

*Hydrargyrum cum Creta*.—Mercury with Chalk (mercury, 38 Gm.; chalk, 57 Gm.; triturated together with honey and water and afterwards dried). Dose, 0.065 to 0.32 Gm. (or gr. i-x).

*Limentum Calcis*.—Lime Liniment (equal parts of lime-water and linseed-oil). For external use (formerly known as carron-oil).

*Liquor Calcis*.—Solution of Calcium Hydroxide, or Lime-water. Dose, 15 to 60 c.c.m. (or f3ss-ij). A saturated solution containing not less than 0.14 per cent. of calcium hydroxide of lime.

*Mistura Creta*.—Chalk Mixture (compound chalk-powder, cinnamon-water, and water). Dose, 4 to 15 c.c.m. (or f3i-iv).

*Potassa cum Calce*.—Potassa with Lime. Vienna or Caustic Paste (equal parts of potassa and lime).

*Powis Creta Compositus*.—Compound Chalk-powder (prepared chalk, 30 Gm.; sugar, 20 Gm.; sugar, 50 Gm.). Dose, 0.32 to 2 Gm. (or gr. v-xxx).

*Syrupus Calcis*.—Syrup of Lime. Dose, 2 to 4 c.c.m. (or f3ss-j).

*Syrupus Calcii Lactophosphatis*.—Syrup of Calcium Lactophosphate. Dose, 4 to 15 c.c.m. (or f3i-iv).

*Syrupus Hypophosphitum*.—Syrup of the Hypophosphites (calcium, 45 Gm.; sodium, 15 Gm.; dilute hypophosphorous acid, 2 Gm.; spirit of sugar, and water to make 1000 c.c.m.). Dose, 2 to 15 c.c.m. (or f3ss-iv).

*Syrupus Hypophosphitum Compositus*.—Compound Syrup of Hypophosphites (calcium hypophosphite, 35 Gm.; potassium hypophosphite, 17.5 Gm.; manganese hypophosphite, 17.5 Gm.; ferric hypophosphite, 2.25 Gm.; manganese hypophosphite, 2.25 Gm.; quinine, 1.1 Gm.; strychnine, 0.115 Gm.; sodium citrate, 3.75 Gm.; dilute hypophosphorous acid, 15 c.c.m.; sugar and water to 1000 c.c.m.). Dose, 2 to 15 c.c.m. (or f3i-iv).

### B. P. Salts and Preparations.

*Calx*.—Lime (obtained by calcining chalk, lime-stone, or marble).

*Calx Chlorinata*.—Chlorinated Lime, containing 33 per cent. of available chlorine.

*Calx Sulphurata*.—Sulphurated Lime (a mixture containing not much less than 20 per cent. of calcium sulphide [CaS], with calcium sulphate and carbon). Dose, 0.65 to 0.965 Gm. (or gr. 1/2, j).

*Calci Carbonas Precipitatus*.—Precipitated Calcium Carbonate (Precipitated Chalk). Dose, 0.65 to 4 Gm. (or gr. x-lx).

*Calci Chloridum*.—Calcium Chloride. Dose, 0.32 to 2 Gm. (or gr. v-xxx).

*Calci Hydras*.—Calcium Hydroxide (Slaked Lime).

*Calci Hypophosphis*.—Calcium Hypophosphite. Dose, 0.65 to 2 Gm. (or gr. x-xx).

*Calci Phosphas*.—Calcium Phosphate. Dose, 0.32 to 2 Gm. (or gr. v-xxx).

*Creta Preparata*.—Prepared Chalk. Dose, 0.65 to 4 Gm. (or gr. x-lx).

*Hydrargyrum cum Creta*.—Mercury with Chalk. Dose, 0.065 to 0.32 Gm. (or gr. i-x).

*Liquor Calcis*.—Solution of Lime (Lime-water). Dose, 30 to 120 c.c.m. (or f3i-iv).

*Liquor Calcis Chlorinata*.—Solution of Chlorinated Lime (3 per cent. of available chlorine). Dose, 1.20 to 4 c.c.m. (or mxx-f3j).

*Liquor Calcis Saccharatus*.—Saccharated Solution of Lime (calcium hydroxide, 10 Gm.; refined sugar, 100 Gm.; distilled water, 1000 c.c.m.). Dose, 1.20 to 4 c.c.m. (or mxx-lx). Contains about 2 per cent. of calcium hydroxide.

*Limentum Calcis*.—Liniment of Lime (equal parts of lime-water and olive-oil).

*Unguentum Hydrargyri Flava*.—Yellow Wash (corrosive sublimate, 0.40 Gm.; lime-water, 100 c.c.m.).

**Lotio Hydrargyri Nigra.**—Black Wash (calomel, 0.685 Gm.; glycerin, 5 c.cm.; tragacanth mucilage, 12.5 c.cm.; lime-water, q. s. ad 100 c.cm.). For external use.

**Mistura Cretæ.**—Chalk Mixture. Dose, 15 to 30 c.cm. (or f3ss-j).

**Pulvis Cretæ Aromaticus.**—Aromatic Powder of Chalk (cinnamon-bark, 80 Gm.; nutmeg, 60 Gm.; cloves, 30 Gm.; cardamom-seeds, 20 Gm.; sugar, 500 Gm.; prepared chalk, 220 Gm.). Dose, 0.65 to 4 Gm. (or gr. x-3j).

**Pulvis Cretæ Aromaticus cum Opio.**—Aromatic Powder of Chalk with Opium (containing 0.065 Gm., or gr. j, of opium in 2.60 Gm., or gr. xl). Dose, 0.65 to 1.30 Gm. (or gr. x-xx).

**Syrupus Calcii Lactophosphatis.**—Syrup of Calcium Lactophosphate. Dose, 4 to 16 c.cm. (or f3i-iv).

**Pharmacology.**—Lime is an alkaline earth which is usually obtained by calcining any native calcium carbonate, such as chalk, limestone, or marble, driving off the  $\text{CO}_2$  and leaving calcium oxide, which, when fresh from the lime-kilns, is in large, hard, grayish-white masses. In this state it is known as quicklime, which has a great affinity for water, even slowly taking it from the air. Under the influence of moisture, lime generates heat and breaks up into a wet powder, which is a mixture of calcium oxide and calcium carbonates, and constitutes slaked lime. When this is mixed with three or four parts of water, the product is called "milk of lime." It is alkaline in taste and reaction. Calcium oxide is only slightly soluble (1-760) in cold, and even less so in hot water. Chalk, or calcium carbonate, is a valuable antidote in cases of poisoning by carbolic, sulphuric, or oxalic acid. It is found in the household in tooth-powder, convenient for prompt administration.

**Physiological Action.**—Some preparations of lime are sedative, others astringent or caustic; quicklime is irritating and caustic to mucous membranes. Lime-water and chalk are astringent and alkaline; they reduce the acidity of the contents of the alimentary canal, thus relieving irritation, and also exert a slightly astringent effect. In patients suffering from deficiency of lime in the food, lime-water is a useful and acceptable remedy, and may be continued for a long time. Calcium phosphate serves an important function in promoting the nutrition of the motor apparatus,—bone, cartilage, tendon, and muscle. The presence of a certain proportion of lime-salts in the blood is essential to general nutrition. When this amount is reduced, disturbances arise, affecting particularly the bony and lymphatic glandular systems. Calcium chloride is more of an irritant; it has a reputation for its influence as an alterative. Potassa with lime, or Vienna paste, is used in surgery as a caustic. According to the investigations of M. Binet, the salts of the alkaline earths are capable of causing respiratory and cardiac affections, from which death may directly ensue. They may also cause derangement of the gastro-intestinal system. Eventually they may occasion loss of nervous excitability and muscular contractility. Toxic doses of calcium arrest the heart in systole. Calcium exerts a special action upon the nervous system, occasioning a condition of torpor with preservation of reflex excitability and sensibility.

**Therapy.**—Lime is an ingredient in depilatory powders, which are now superseded by the process of removal of hair by electrolysis. Freshly-slaked lime absorbs the products of decomposition, and is used as a disinfectant in cess-pools, manure-heaps, etc.; but the chlorinated lime, which prevents decomposition by virtue of the available chlorine, is far better. In the treatment of onychia maligna, Professor Vanzetti recommends the application of

caustic lime. Lime-water is a stimulating dressing for wounds and ulcers, and, combined with oil, is used as a dressing for burns. Carron-oil consists of linseed-oil and lime-water. It is suggested that the addition of  $\frac{1}{2}$  to 1 per cent. of thymol augments the value of carron-oil by rendering it an anti-septic application. A better dressing is made by beating up lard (unsalted) with lime-water and adding a few drops of oil of bitter almonds. A very good prescription to use in burns will be:—

R	Calcis præcip. ....	4	Gm. or ʒj.
	Phenolis liquefact. ....	8	Gm. or ʒij.
	Ol. olivæ,		
	Aquæ calcis .....	aa 150	c.cm. or fʒv.—M.

Carron-oil also relieves pain caused by the stings of wasps and other insects. According to Dr. Joseph Bell, applied to the face on a mask of cotton-wool, it will decidedly diminish the pitting in small-pox.

Lime-water is of undoubted value alone, or combined with glycerin, in the treatment of acute vesicular eczema. It may be employed for this as well as other varieties of eczema, especially when the surface is dry and irritable, with very great relief. Pruritus, which often becomes intolerable in eczema and other inflammatory affections of the skin, and itching present in old persons, may be relieved or cured by the application of lime-water, with rose-water, glycerin, or one of the oils. A very suitable application in the diseases just referred to is:—

R	Liquor calcis .....	90	c.cm. or fʒijj.
	Creosoti .....	60	c.cm. or mx.
	Pulveris zinci carb. (impur.) .....	31	Gm. or ʒj.
	Glycerini vel ol. olivæ. ....	90	c.cm. or fʒijj.

M. Sig.: Shake well and mop over the surface.

For the relief of pruritus ani, Dr. A. L. Berger advises the use of a pledget of cotton-wool soaked in the solution of chlorinated lime and introduced into the bowel. In seborrhœa, hyperidrosis, bromidrosis, and in bruises of the skin and deeper structures, the preparations of calcium are often used with great benefit. The following are excellent combinations:—

R	Calcii carb. præcip. ....	31	Gm. or ʒj.
	Glyceriti boroglycerinæ .....	15	c.cm. or fʒss.

M. Sig.: Smear over the parts bruised.

R	Calcii chloridi,		
	Calcii carb. præcip.,		
	Pulv. amyli .....	aa 31	Gm. or ʒj.

M. Sig.: Dust over the surface, especially in oily conditions of the skin and in excessive and fetid perspiration.

Prepared chalk is employed very largely, alone as well as an ingredient of many very good dentifrices, on account of its antacid, astringent, and sedative action upon the gums and the mucous membrane of the buccal cavity. Garretson recommended the appended formula as being a good tooth-powder:—

R	Cretæ prepar.,		
	Pulv. tridls Flor. ....	aa 15/5	Gm. or ʒss.
	Pulv. ossis sepiæ .....	8	Gm. or ʒij.
	Olei limonis .....	q. s.	—M.

Prepared chalk is a good dusting-powder in intertrigo and hyperidrosis, and may be used upon the surface of ulcers as a protective dressing.

The preparations of calcium are especially useful in childhood because of the deficiency of lime in the food of many children. Lime-water added to milk gives material for bones and teeth, improves nutrition, and overcomes a tendency to rickets. It relieves irritability of the stomach and vomiting.

The syrup of lime, or the English saccharated solution of lime, contains more of the base than the solution, and is a convenient antidote to poisoning by oxalic, sulphuric, and other mineral acids. In children's diarrhœa, often due to sour stomach, chalk mixture is very useful, and may be combined with an antiseptic and opiate:—

R Creosoti .....	24	c.cm. or <i>miv.</i>
Tinct. opii camph. ....	4	c.cm. or <i>f3j.</i>
Mist. cretæ ..... q. s. ad	60	c.cm. or <i>f3ij.</i>

M. Sig.: A teaspoonful every two hours to a child two years old.

The same mixture is useful in adults, with corresponding increase of dose and the addition of a decided astringent, such as tincture of kino, or fluid extract of coto-bark.

The following combination is said to be useful in phthisis and chronic pulmonary affections:—

R Creosoti .....	10	c.cm. or <i>f3iimxl.</i>
Alcoholis (80 per cent.) .....	90	c.cm. or <i>f3ij.</i>
Calci phosphat. ....	195	Gm. or <i>3v.</i>
Aquæ destillata .....	185	c.cm. or <i>f3v.</i>
Syrupi .....	105	c.cm. or <i>f3iiss.</i>
Vini alba (Malaga) ..... q. s. ad	1000	c.cm. or <i>Oi:f3ij.—M.</i>

Each tablespoonful contains about 0.16 c.cm. (or *miiss*) of creosote and 0.32 Gm. (or *gr. v*) of monocalcic phosphate.<sup>1</sup>

Other very effective prescriptions containing lime are:—

R Calci carbonatis præcipitati .....	12	Gm. or <i>3ij.</i>
Tincturæ gambir .....	30	c.cm. or <i>f3j.</i>
Tincturæ opii .....	75	c.cm. or <i>f3ij.</i>
Spiritus chloroformi .....	15	c.cm. or <i>f3iv.</i>
Pulveris acaciæ .....	8	Gm. or <i>3ij.</i>
Aquæ menth. pip. ....	195	c.cm. or <i>f3viss.</i>

M. Sig.: One or two teaspoonfuls in water every hour or two, for acute diarrhœa.

R Liquor calcis,		
Fluidext. coto corticis,		
Syrup. acaciæ .....	aa 30	c.cm. or <i>f3j.</i>

M. Sig.: From one to two teaspoonfuls in water or milk every three or four hours, for chronic diarrhœa.

**Special Applications.**—In the diarrhœa of relaxation in young children lime-water alone may be sufficient where the motions are too frequent and watery and acid in their reaction. It is also used per enema against thread-worms, and it may be given as an injection in leucorrhœa. In diphtheria much relief is experienced from the use of a spray of lime-water, preferably with the steam-atomizer, directed to the fauces, or from inhaling the vapors from slaking lime; it is claimed that the lime loosens the false membrane

<sup>1</sup> *Journal des Praticiens*, Feb. 24, 1900.

and partially dissolves it. It is also useful in the same manner in croup and acute bronchitis. The vapor obtained from chlorinated lime is advantageously inhaled in hay fever. In adults, where it is desirable to administer milk, it is often found necessary to add lime-water to it to prevent curdling. In the artificial feeding of infants the addition of lime-water to cows' milk is a decided service by rendering the curd more soft and flaky, and consequently more easy of digestion. Milk and lime-water will not infrequently relieve gastralgia, and even, in some instances, the pain of gastric carcinoma. In the latter affection it also allays the vomiting. The prolonged administration of lime-water renders the urine alkaline, and hence it may prove useful in lithiasis. It has been shown that, under the same circumstances, carbonic acid may appear in the urine. The acid is united to the lime and causes the fluid to emit an ammoniacal odor. In combination with opium and aromatics, as in the *pulvis cretæ aromaticus cum opio* of the British Pharmacopœia, chalk is of great value in diarrhœa. The carbonate of calcium is likewise beneficial in diarrhœa, and, finely powdered, is a good application in intertrigo and acute eczema. Calcium phosphate is useful in dyspepsia; also in anæmia, general debility, diarrhœa, in small doses, given frequently; it appears to have a stimulating effect upon the liver, and should be given in preference to mercury to infants with clay-colored stools, and rickets. The anæmia due to profuse suppuration, or to lactation, may be remedied by the administration of this salt. It is advantageous, moreover, in *mollities ossium*, delayed union of fractured bone, caries and osteitis, and scrofulous inflammation of the lymphatic glands. The acidulated phosphate has been warmly recommended as relieving the sickness of pregnancy.

*Calx sulphurata* is useful in styas, acne, and furuncles; given in 0.015 to 0.03 Gm. (or gr.  $\frac{1}{4}$ -ss) doses several times a day, it hastens maturation of pustules. If given early, it prevents the formation of pus, but, if suppuration has occurred, calcium sulphide limits its extent and favors early and complete evacuation. This combination is servicesable in both acute and chronic eczema. It is likewise beneficial in the suppuration of scrofulous glands. Dr. Frank P. Norbury finds it useful in acute tonsillitis, especially in strumous patients, with a tendency toward rapid suppuration. It prevents the formation of pus. Dr. Witherle, of St. Paul, states that calcium sulphide is beneficial in the early stage of pulmonary tuberculosis, even in doses as large as can be tolerated. The swelling of the upper lip and tip of the nose so often seen in scrofulous children may be decidedly improved by the exhibition, night and morning, of 0.015 Gm. (or gr.  $\frac{1}{4}$ ) doses of calcium sulphide. In diphtheria, during the period when the membrane is forming and suppuration is taking place, Phillips recommends the administration of this salt in doses of 0.01 to 0.015 Gm. (or gr.  $\frac{1}{6}$ - $\frac{1}{4}$ ) every hour or every two hours. A case of elephantiasis has been reported in which the salt was successfully employed.

It is given with good effects in ophthalmia and sores in scrofulous children. *Calx sulphurata* is the official equivalent of calcium sulphide, which has been used in conjunction with defervescent by Dr. T. M. Lloyd, of Brooklyn, N. Y., in measles and scarlatina, with the apparent result of shortening the course of the fever. In pertussis the same remedy reduced the number and severity of paroxysms. It was administered in doses of 0.03 Gm. (or gr. ss) half-hourly to children between two and five years of age. Rubbed

up with sugar of milk it was taken without repugnance. This salt will occasionally produce an eruption of vesicles, pustules, and furuncles. Dr. A. M. Osness advocates the treatment of diphtheria by local swabbing with a mixture of carbolic acid, tincture of chloride of iron, and alcohol, and the internal administration of calcium sulphide, 0.05 Gm. (or gr.  $\frac{3}{4}$ ), every half-hour for a period of thirty-six hours, water being taken freely to help elimination of the toxin.

**Calcium chloride** (not calx chlorata) is given, well diluted, in glandular enlargements, and is said to be curative in eczema and lupus; it is claimed that it aids cicatrization in tubercular ulcerations, and is useful in chorea and colliquative diarrhœas in strumous children. Calcium chloride allays vomiting produced by the presence of *sarcinæ ventriculi*.

Dr. Crombie, of the East Indian medical service, has found calcium chloride efficacious in the treatment of boils and pneumonia. Dr. A. E. Wright has ascertained by experiment that the addition of calcium chloride to blood renders coagulation more rapid. He has given the salt internally with advantage in a case of hæmophilia, and suggests that it will prove useful in the treatment of internal hæmorrhage and aneurism. He has known it to arrest an obstinately-recurring epistaxis and a severe hæmoptysis. In a case of hæmatemesis and gastro-intestinal hæmorrhage in a child 4 days old, L. A. Parry<sup>1</sup> gave frequent doses of 0.32 Gm. (or gr. v) of calcium chloride every hour during the day and every two hours at night. The child took 10.35 Gm. (or 160 grains) in three days, when the medicine was discontinued because bleeding had ceased for twenty-four hours. In cases of hæmophilia requiring surgical operation, great advantage has been observed from the administration of calcium chloride for a few days previous to operation, for reducing the bleeding.

Dr. S. Solis-Cohen prefers the calcium chloride to any other drug in the treatment of hæmoptysis, administering it in doses of 0.65 to 1 Gm. (or gr. x-xv) every second hour in glycerin, simple elixir, and water, or infusion of gentian. Dr. Saundby has employed the same salt with success in purpura hæmorrhagica, administering 0.38 Gm. (or gr. vj) every two hours during the day. Sir J. Sawyer has employed the chloride in chronic pulmonary tuberculosis with good results, and states that in addition to its other advantages it will often suppress night-sweats. Both the chloride and the carbonate have been serviceably given in order to restrain hæmorrhage caused by a fibroid tumor, and to check menorrhagia.

Calcium hypophosphite has a special reputation for the treatment of phthisis, and is a useful tonic in such cases. The official syrup of the hypophosphites, in appropriate cases, is one of the best general systemic tonics that we possess. It may be substituted by the following, when more strychnine or iron is desired:—

B Syrup. ferri lactatis .....		
Syrup. hypophosphitum .....	aa 120	c.cm. or fʒiv.
Strychninæ sulphatis .....		015 Gm. or gr. $\frac{1}{4}$ .
M. Sig.: A half-tablespoonful in water three times a day.		

Calcium bromide was brought forward, by Hammond, as a substitute for bromide of potassium in cases where the depressing effects of the latter

<sup>1</sup> *The Lancet*, July 16, 1898.

would forbid its use, such as epilepsy or chorea in anæmic subjects (in doses of 3 to 5 Gm., or ʒss-ij). Professor Germain Sée regarded both the bromide and chloride as advantageous in the treatment of dyspepsia and many disordered conditions of the stomach. This salt would, however, seem well adapted to fulfill the indications of a bromide in rachitic subjects. The bromide is held to contain one-sixth more bromine than the potassium bromide. Dr. H. Woods prefers the calcium oxyiodides to the other iodine preparations, as containing more iodine. According to the testimony of Dr. Beebe, who is corroborated by Dr. Lawrence, iodized calcium is of service in meningitis group. These writers advise that 0.01 to 0.02 Gm. (or gr.  $\frac{1}{10}$ - $\frac{1}{8}$ ), dissolved in water, should be given every fifteen, thirty, or sixty minutes, according to the severity of the symptoms. Grube reported good results in diabetes mellitus from the "egg-shell" treatment, the patient taking a teaspoonful of powdered egg-shell daily. This is also useful in boils. He suggested a powder in imitation of egg-shells for the same purpose and reports very encouraging results. Grube's powder contains calcium carbonate, 93 parts; with calcium phosphate and magnesium phosphate, each, 10 parts. Of this 4 Gm. (or ʒj) are to be taken daily. The syrup of calcium lactophosphate (made by dissolving calcium phosphate in lactic acid, with orange-flower water and syrup) is a pleasant and very useful remedy for improving nutrition in young children, especially if there be a serofulous taint. It contains about 0.75 Gm. (or gr. xij) of calcium phosphate in each ounce. It is also a valuable agent in treating many skin diseases due to malnutrition. This combination may be advantageously prescribed, in vesicular emphysema, chronic bronchitis, phthisis, debility, and wasting diseases, thus:—

R Syrup. calcii lactophosphatis .....	90	c.cm. or ʒiij.
Olei gaultheriæ .....	2	c.cm. or mxxx.
Pulveris acaciæ .....	4	Gm. or ʒj.
Liquor pancreatici .....	30	c.cm. or ʒʒj.
Olei morrhue .....	150	c.cm. or ʒʒv.

M. et ft. emulsio.

Sig.: A tablespoonful three times a day.

Dr. H. V. Knaggs ascribes valuable antispasmodic properties to calcium sulphite, in spasmodic diseases. He gives 0.003 Gm. (or gr.  $\frac{1}{20}$ ) to a child one year old, suffering with convulsions from dentition, meningitis, and even acute tuberculosis. A saturated aqueous solution of the bisulphite is an excellent non-poisonous disinfectant. The preparations of chalk, if given in large doses for a considerable period of time, may form intestinal concretions. Calcium salicylate, a salt which is soluble in water, has been recommended as a remedy in diarrhœa, especially that of children. The dose is from 0.50 to 1.30 Gm. (or gr. viii-xx), and it is given either alone or combined with bismuth salicylate. It is a white, odorless, and tasteless crystalline powder.

Calcium carbide has been used in inoperable cancer of the uterus by Braxator, of St. Petersburg, for its caustic action when brought in contact with water and the disinfecting properties of the acetylene. Under its use hæmorrhage has been checked and the ulcerative processes retarded.

**Calcium Eosolate** is a sulphosalt of the aliphatic creosote esters, and is said to contain 25 per cent. of creosote. Its formula is given as  $(C_8H_7S_3O_{12})_2Ca_2$ . In large doses it produces griping pains in the intestines, with diarrhoea. The therapeutic dose is from 0.25 to 0.65 Gm. (or gr. iv-x) three or four times a day. It is a grayish powder, feeling to the touch like finely-pulverized pumice-stone. Its odor is slightly pungent and somewhat ethereal, its taste a little acrid and leathery. It is soluble in from 8 to 10 parts of cold and in 7 parts of hot water. It is very slightly soluble in alcohol, and insoluble in chloroform and turpentine, but is readily dissolved by hydrochloric, citric, and by some other organic acids, while it dissolves only slowly in acetic acid.

Dr. Heinrich Stern,<sup>1</sup> of New York City, gives the history of a remarkable case of diabetes insipidus, in a boy of sixteen years, who was passing over one and one-half gallons of urine per day that had a specific gravity lighter than water. He was dwarfed in stature to that of a child of seven years, and for a long time had shown no signs of development. Under the calcium-eosolate treatment, in conjunction with 3 c.cm. (or *mxlv*) doses of fluid extract of ergot four times a day, he for the first time in years steadily began to increase in weight, lost his nervousness, the hydruria gradually diminished; though occasional increases occurred for a brief period, there was an increase in the excretion of solids, and thirst was diminished. At the time of the report the patient still continued to improve.

Five cases, reported by Dr. Stern, of diabetes mellitus under treatment with calcium eosolate and a milk diet ceased excreting dextrose, gained in weight, and improved otherwise. One of the cases at a later date died of endocarditis. Ten cases of phthisis showed decided signs of improvement under small doses of the eosolate in conjunction with other remedies.

### **CALENDULA (U. S. P.).—Marigold.**

#### *Preparation.*

**Tinctura Calendulae (U. S. P.).—Tincture of Calendula** (20 per cent.). Dose, 2 to 4 c.cm. (or *f3ss-j*).

**Pharmacology and Therapy.**—The dried ligulate florets of *Calendula officinalis* (Compositae) contain **Calendulin**, a volatile oil, an amorphous bitter principle, yellow coloring matter, etc. It is used as an emmenagogue and as a diaphoretic, in recent infusion. In the form of tincture, it is reputed to be tonic, antispasmodic, and alterative, and may be employed locally as a revulsive in sprains, bruises, or in superficial burns and scalds, resembling *arnica* in its applications, though less active.

### **CALUMBA (U. S. P.).—Calumba (Columbo).**

#### **CALUMBÆ RADIX (B. P.).—Calumba-root.**

Dose, 0.32 to 0.65 Gm. (or gr. v-x).

#### *Preparations.*

**Fluidextractum Calumbæ (U. S. P.).—Fluid Extract of Calumba.** Dose, 1 to 2 c.cm. (or *mxv-xxx*).

<sup>1</sup> *Journal of the American Medical Association*, xxxiv, p. 467.

**Tinctura Calumbæ** (U. S. P., B. P.).—Tincture of Calumba. Dose, 4 to 7.5 c.cm. (or ℥ij).

**Liquor Calumbæ Concentratus** (B. P.).—Concentrated Solution of Calumba. Calumba, 500 Gm.; alcohol [90 per cent.], 225 c.cm.; distilled water, q. s. ad 1000 c.cm. Dose, 2 to 4 c.cm. (or fʒss-j).

**Infusum Calumbæ** (B. P.).—Infusion of Calumba (5 per cent.). Dose, 15 to 30 c.cm. (or fʒss-j).

**Pharmacology.**—The dried root of *Jateorrhiza palmata* (*Menispermaceæ*) (U. S. P.); *Jateorrhiza Columba* (B. P.) of Africa contains, among its constituents, berberine, calumbin, calumbic acid, and starch. It is free from tannin, and therefore its preparations may be combined with iron.

**Physiological Action and Therapy.**—In composition and physiological action calumba resembles quassia and gentian, though lighter and more agreeable than some of the other remedies of this class, and more acceptable to the stomach. As a bitter tonic, calumba may be used during convalescence, or in atonic dyspepsia or other enfeebled constitutional conditions. It is believed to be somewhat sedative and antispasmodic; in cases where this quality is required it would be better to use the fluid extract or powder than the tincture. A small dose of the tincture or infusion of calumba will often relieve nausea and vomiting. Atonic diarrhœa is benefited by calumba. When the tincture is prescribed as an appetizer, the danger of forming the morbid habit should be kept in mind:—

R Ext. calumbæ .....	13 Gm. or gr. ij.
Sodii bicarb. ....	65 Gm. or gr. x.
Pulv. rhei .....	32 Gm. or gr. v.
Pulv. zingiberis .....	65 Gm. or gr. x.

M et ft. chart. Mitte tales no. xxx.

Sig. Take one before each solid meal, for weak digestion.

As a good carminative mixture Dr. Crutchfield prescribes:—

R Tr. calumbæ .....	11	c.cm. or fʒiij.
Sp. ammon. aromat. ....	6	c.cm. or fʒiss.
Tr. cardam. co. ....	q. s. ad 90	c.cm. or fʒiij.

M. Dose: Tablespoonful in water as required.

Dr. Schultz has had very good results from the tincture of calumba in the treatment of gastric catarrh. Calumba has been especially recommended as a valuable tonic in convalescence from influenza. Dr. A. F. Myers,<sup>1</sup> of Farmington Glen, Pa., considers calumba as the best of the vegetable tonics; both as a stomachic in mild forms of dyspepsia and as a general corroborant in the convalescent stage of acute diseases and in general debility.

**CAMBOGIA** (U. S. P., B. P.).—Gamboge, Pipe Gamboge.

Dose, 0.006 to 0.20 Gm. (or gr.  $\frac{1}{10}$ -iiij).

#### Preparation.

**Pilula Cambogiæ Composita** (B. P.).—Compound Pill of Gamboge (containing gamboge, *Bartiaedoes aloes*, compound cinnamon powder, of each, 1 part; hard soap, 2 parts; with syrup of glucose, 1 part. Mix to form a mass). Dose, 0.25 to 0.50 Gm. (or gr. iv-vij).

**Pharmacology.**—Gamboge is a gum-resin, obtained from the *Garcinia Hanburri* (Guttifera): a tree of Siam. It consists largely of cambogic acid (73 per cent.), and is partly soluble in alcohol and ether, and forms an emulsion with water. It has no official preparations in the United States Pharmacopœia, and is rarely administered by itself, but is a constituent of the compound cathartic pill (each pill containing 0.015 Gm., or gr.  $\frac{1}{4}$ , of gamboge).

**Physiological Action.**—Gamboge is not a systemic, but a local, irritating purgative. It is at first insipid, but afterward produces an acrid taste, with increased secretion of saliva. In the intestinal tract, it has a drastic, hydragogic, cathartic effect. It stimulates the intestinal glands, but not the liver (Rutherford), and is also believed to have some power as a diuretic, as it imparts a bright-yellow color to the urine. It carries off the bile in the intestinal canal and prevents reabsorption. Large doses cause vomiting and gastro-enteritis.

**Therapy.**—Gamboge has no local effect beyond staining the skin. It was formerly used in cardiac dropsy as an hydragogic cathartic to carry off large quantities of fluid and promote absorption, but the compound jalap-powder accomplishes this result more quickly, agreeably, and certainly. The compound cathartic pill is a good remedy for constipation and at the beginning of the treatment of malarial poisoning. In minute doses (0.006 Gm., or gr.  $\frac{1}{100}$ , every hour or two) it is claimed that gamboge affords much relief in flatulence and intestinal indigestion.

**CAMELLIA. — Tea.** The extemporaneously-prepared infusion of the dried leaves of *Camellia thea* (Ternstrœmiaceæ), or Chinese tea-plant, is now so widely used at the table as a beverage that it has given its name to the evening meal. It contains caffeine (or theine), theophylline (Rossel),<sup>1</sup> a volatile oil, tannin, etc. Green tea is made from the younger leaves, dried with a moderate heat, so as to retain their color (sometimes fraudulently colored with Prussian blue, turmeric, and copper), while the black tea is made of the older leaves, and contains more tannin. (See *Caffeina*, page 284).

**Physiological Action and Therapy.**—The effects of tea are not fully represented by caffeine; probably theophylline, which is isomeric with theobromine, and the volatile oil assist in producing its physiological action upon the system. Dr. Thomas H. Mays claims that the physiological action of caffeine derived from *Camellia* is different in its effects from that of coffee. It is an antidote to narcotic poisoning by virtue of its caffeine, and to antimony and many alkaloids on account of its tannin: it is also a physiological antidote to agents which depress nerve-function or the heart. In small doses infused with boiling water, tea is an agreeable stimulant, removing a sense of fatigue and giving a feeling of well-being. It is useful in headache from overwork or worry, and will often relieve migraine. Tea is an accessory food, but, on account of its convenience, it often becomes the principal article of food for persons who think that they cannot spare time to prepare a full meal, or have not the appetite to eat it. In many cases of what has been called tea-drinkers' dyspepsia, in sewing women, it is found, upon inquiry, that the tea is drunk with every meal, and that very little food is taken with

<sup>1</sup> *Zeitschrift für Physiologische Chemie. Therapeutic Gazette*, March 15, 1890.

it except bread or hot biscuit. Such cases of debility, palpitation of the heart, flatulence, anorexia, constipation, etc., are not really instances of "theism," but cases of starvation and chronic indigestion, and require good food, sunlight, exercise, and tonics. Men who deal in tea, and constantly taste it, only exceptionally show symptoms of nerve-disorder ascribable to this cause; even then it may be due to idiosyncrasy, for persons have different degrees of susceptibility to the effects of tea. Some cannot use it at all; others are proof, apparently, against any ill effects. Many can drink black tea who cannot stand the effects of green tea. Strong green tea may embarrass digestion and give rise to constipation. Tea may also diminish the tendency to sleep and in people of highly-nervous temperament may cause obstinate wakefulness. Ordinarily, the moderate use of tea relieves fatigue and disposes to mental cheerfulness.

**Theocine**, or synthetic theophylline, has been used with good results as a cardio-vascular stimulant, and also as a diuretic in dropsy. It acts chiefly upon the secreting function of the kidney. It relieves air-hunger in cardiac dyspnoea or asthma. Dose, 0.25 to 0.30 Gm. (or gr. iv-v), given usually with sodium acetate.

**CAMPHORA** (U. S. P., B. P.).—Camphor ( $C_{10}H_{16}O$ ).

Dose, 0.065 to 0.32 Gm. (or gr. i-v).

**ACIDUM CAMPHORICUM** (U. S. P.).—Camphoric Acid.

Dose, 0.30 to 2 Gm. (or gr. v-xxx).

#### *Preparations.*

**Ceratum Camphoræ** (U. S. P.).—Camphor Cerate.

**Camphora Monobromata** (U. S. P.).—Monobromated Camphor. Dose, 0.065 to 0.32 Gm. (or gr. i-v).

**Aqua Camphoræ** (U. S. P., B. P.).—Camphor-water (U. S. P. contains 8 Gm. to 1000 c.cm., or gr. iv-f3j). Dose, 4 to 15 c.cm. (or f3i-iv).

**Spiritus Camphoræ** (U. S. P., B. P.).—Spirit of Camphor (10 per cent.). Dose, 0.30 to 1.20 c.cm. (or mv-xx).

**Linimentum Camphoræ** (U. S. P., B. P.).—Camphor Liniment, Camphorated Oil (camphor, 20; cottonseed-oil, 80 parts). External use. (In B. P. olive oil is used.)

**Linimentum Camphoræ Ammoniatum** (B. P.).—Ammoniated (or Compound) Liniment of Camphor (camphor, 50 Gm.; oil of lavender, 2.5 c.cm.; strong solution of ammonia, 100 c.cm.; alcohol [90 per cent.], a sufficient quantity to make 400 c.cm.).

**Tinctura Camphoræ Composita** (B. P.).—Compound Tincture of Camphor (Paregoric, or Paregoric Elixir: tincture of opium, with benzoic acid, camphor, oil of anise, and alcohol). Each 4 c.cm. (or drachm) contains the equivalent of 0.015 Gm. (or gr.  $\frac{1}{4}$ ) of opium, or nearly 0.5 milligramme of anhydrous morphine in each cubic centimetre. Dose, 2 to 4 c.cm. (or f3ss-j).

Camphor is a constituent in the following official preparations: Camphorated tincture of opium, compound morphine powder, and cerate of subacetate of lead (U. S. P.); soap, belladonna, and chloroform liniments (U. S. P., B. P.); compound tincture of camphor and mustard liniment (B. P.).

**Pharmacology.**—Camphor is "the dextro-gyrate modification of the saturated ketone  $C_9H_{16}CO$ , obtained from *Cinnamomum Camphora* (Laurineæ), and purified by sublimation." The tree is a native of the East Indies and China. It contains a solid, volatile, fatty substance, or stearopten, which exists in all parts of the plant and crystallizes naturally in the wood and under the bark. As collected by natives, it is called crude camphor, which is subsequently purified and sublimed in this country. Camphor comes in white, translucent, partly-crystalline masses, of penetrating, aromatic odor and a

cool, acrid taste. It is lighter than water, in which it is very sparingly soluble, but is readily dissolved by alcohol and ethereal substances. Camphor is quite soluble in milk, which may often, therefore, be used as a convenient vehicle. It is easily ignited and burns with a smoky flame. With chloralhydrate, camphor combines when triturated, forming an oily liquid. When three parts of camphor are rubbed with one part of crystallized carbolic acid, a clear liquid is formed. Camphor cannot be powdered by trituration alone, but can be when moistened with alcohol, chloroform, or ether.

**Physiological Action.**—When applied to the skin, camphor slightly irritates and reddens the surface, and probably diffuses through into the deeper structures, so as to exert a local sedative effect. In considerable doses, camphor causes vertigo and confusion of ideas, diaphoresis, delirium, or stupor, followed by epileptiform convulsions and maniacal excitement. There is lowering of the reflex excitability of the spinal cord and muscular weakness. In some cases the first manifestation of its toxic action has been a sudden loss of consciousness with or without convulsions. Upon the circulation a stimulating effect is observed from small doses and the arterial tension is raised, but larger doses cause prostration and weakness of the heart's action. Camphor is antispasmodic, and is a valued sedative in allaying abnormal nervous excitability often encountered in women, especially in cases where opium disagrees or is undesirable. It is, in full doses, a sedative to the generative functions and allays pain attending menstruation. Poisoning has followed the use of a saturated solution in alcohol (Rubini's tincture, or so-called "mother-tincture"), which should not be used for internal administration as so small a quantity as 0.50 c.cm. (or *mviij*) has produced poisonous effects. Toxic doses give rise to inflammation of the stomach. In cases of poisoning, if any of the drug remain in the stomach it should be removed by the stomach-tube, the patient allowed to drink cold water freely containing magnesium sulphate (31 Gm., or  $\text{℥j}$ ), and the symptoms combated with arterial stimulants and hypodermic injections of morphine and atropine. Camphor is eliminated by the kidneys, lungs, and sudoriparous glands.

**Therapy.**—Camphor is highly prized in the household, for headaches and various neuralgic pains, the spirit, or "Eau Sedative,"<sup>1</sup> being applied upon a handkerchief or a flannel bandage. It is also a common ingredient in popular liniments. Camphor-chloral is used in neuralgia and myalgia as a rubefacient and anodyne. It dissolves morphine readily:—

R Morphine sulphat. ....	1 30 Gm. or gr. xx.
Camphor-chloral. ....	8  Gm. or $\text{℥ij}$ .—M.

For local application to painful spots.

Cavazzani applies to chancroids, with excellent results, a mixture of 5 parts of chloral hydrate, 3 of camphor, and 25 of glycerin.

A combination of camphor and carbolic acid (3 to 1) is a valuable antiseptic dressing for wounds, the odor being more pleasant than that of carbolic acid, and, the solution being anodyne, it cannot be diluted with water or glycerin, but mixes with oil or alcohol. It is a beneficial application in herpes and erysipelas, in vaginitis, vulvitis, and paresthesia of the vulva.

<sup>1</sup>The *Aqua Sedativa* (N. F.) consists of ammonia water, 125 c.cm. (or  $\text{℥iv}$ ); spirit of camphor, 12 c.cm. (or  $\text{℥iij}$ ); sodium chloride, 65 Gm. (or  $\text{℥ij}$  gr. lxxiv); and water sufficient to make 1000 c.cm., or two pints. This is also known as "*Eau Sedative de Raspail*."

The liquid overcomes the factor of lochial discharges. On account of its anæsthetic properties it is useful in the treatment of inverted toe-nail. It has been successfully given by the mouth in doses of 0.30 to 0.60 c.cm. (or gtt. viii to x) for the relief of gastric and intestinal catarrh. Carbolic-acid camphor is a serviceable local remedy in pharyngitis or tonsillitis. Paræsthesia may often be relieved by the topical use of this agent, either in its pure state or combined by some suitable excipient.

Saleol and camphor, and betanaphthol and camphor, also form fluids having valuable antiseptic powers. By mixing equal parts by weight of camphor and absolute alcohol, and dissolving pyroxylin in the solution (in the proportion of 1 to 40), an excellent substitute for collodion is obtained. Camphoid is the name given to the fluid, and it is also a good solvent for salicylic and carbolic acid, and iodoform. Camphoid forms, in drying, an elastic film, which is not dissolved by water and is a good coating for abrasions, superficial wounds, etc. A mixture of equal parts of camphor and menthol dissolved in a mineral oil has been used successfully by Dr. Seth S. Bishop, as a 10-per-cent. solution, in acute nasal catarrh and laryngitis. In hyperæmic rhinitis a 25-per-cent. solution can be used. A 3- to 5-per-cent. solution is sufficiently strong for injection into the ear for disease in the tympanum.

A solution of camphor in ether (30 to 180) has been applied to erythematous inflammation with benefit. Camphor has been used for the purpose of aborting boils. The seat of inflammation is touched three times a day with an alcoholic solution, and, after this has evaporated, the surface is covered with camphorated oil. Powdered camphor, likewise, is an efficient application to indolent ulcers, and has been used with success upon specific lesions of the genitals. Inhalation of a solution of camphor in cologne-water gives relief in that form of headache, which may occur at the menopause. Camphor and morphine, locally introduced or applied externally on a hot fomented poultice, allays toothache. A liniment or ointment containing camphor is useful in chilblains. The camphor ointment of the National Formulary (camphor, 22; white wax, 11; lard, 67 parts) may be used as an application to indolent ulcers. Camphor, either alone or combined as follows, yields serviceable antipruritics in eczema and paræsthesia:—

<b>R Camphoræ.</b>		
Betanaphthol	aa	65 Gm. or gr. x.
<b>M. et adde:—</b>		
Ol. anthemidis		30 c.cm. or mv.
Bismuth. subnit.	4	Gm. or 3j.
Pulveris marantæ	4	Gm. or 3j.
Ungt. zinci oxidi	31	Gm. or 5j.—M.
<b>R Camphoræ</b>		65 Gm. or gr. x.
Sulphuris sublimati	2	Gm. or 3ss.
Ol. eucalypti		60 c.cm. or mx.
Cresoti		50 c.cm. or mvijj.
Ungt. aque rose,		
Ungt. zinci oxidi	an	1515 Gm. or 3ss.—M.

Camphor with salicylic acid (14 to 11) combines with the aid of heat, and in the form of ointment, has been used in lupus and chronic ulcers. The odor of camphor is inhaled with some relief in coryza. Camphor cerate is a useful application for chapped hands and roughness of the skin, or the camphor can be incorporated in suet or lanolin:—

R Camphoræ .....	2	Gm. or 3ss.
Ol. neroli .....	18	c.cm. or miiij.
Phenolis liq. ....	24	c.cm. or miv.
Sevi .....	62	Gm. or 3ij.

M. Sig.: Rub a small piece in the palm of the hand until soft, and apply over the surface for chronic eczema; chapped hands; fissures on the lips, at the angle of the mouth, or around the nipples, anus, or genital organs.

R Camphoræ .....	130	Gm. or gr. xx.
Ol. juniperi .....	120	c.cm. or mxx.
Adipis luncæ hydrosi .....	31	Gm. or 3j.

M. Sig.: Use in the diseases above named.

Internally, camphor is valuable as an anodyne, antispasmodic, and carminative, in disorders of the digestive organs attended with pain or cramps, and is generally combined with astringents and opiates. Velpéau's diarrhœa mixture consists of equal parts of spirit of camphor, tincture of opium, and compound tincture of gambir.

For diarrhœa Hope's camphor mixture is useful, especially in diarrhœa of relaxation in elderly subjects. Parrish's camphor mixture (mistura camphoræ aromatica, N. F.) is also valued:—

R Tr. lavandulæ co. ....	120	c.cm. or f3iv.
Sacchari .....	15	Gm. or 3ss.
Aquæ camphoræ .....	473	c.cm. or f3xvj.

M. Sig.: A tablespoonful every three hours for diarrhœa.

This remedy is likewise very serviceable in infantile diarrhœa. It has been found efficient in Asiatic cholera, provided it be given at the inception of the disease.

Camphor, in 0.13 Gm. (or gr. ij) pills, is serviceable in dysmenorrhœa, hysteria, and obscure nervous manifestations in women. It may likewise be given to relieve palpitation of the heart. Monobromated camphor is esteemed a valuable remedy in chordee and irritable bladder; it has also been used in spasmodic affections, hysteria, epilepsy, chorea, delirium tremens, whooping-cough, etc.

R Camphoræ .....	130	Gm. or gr. xx.
Ætheris .....	q. s.	ad ft. pulv.
Ammonii carbonat. ....	1	Gm. or gr. xvj.
Pulv. opii .....	25	Gm. or gr. iv.

M. et div. in chartulæ no. xij.

Sig.: Give one every two or three hours, in coryza.

In order to allay the mental excitement of hysteria, M. Blocq orders:—

R Camphor. monobrom. ....	3	Gm. or gr. xlv.
Ext. quassiaæ .....	2	Gm. or 3ss.
Syrupi .....	q. s.	

M. et ft. pil. no. xxx.

Sig.: One, two, or three pills a day.

It has likewise been successfully employed in spermatorrhœa. Dr. Bourneville has obtained excellent results from the administration of monobromated camphor in the treatment of epilepsy, accompanied by frequent attacks of vertigo. As a result of his studies, Dr. Bourneville concludes that in vertiginous epilepsy the administration of monobromated camphor alone is remedial, but in the typical paroxysmal variety it should be given together

with a combination of bromides. It is a curious fact that the addition of a few drops of camphor to a glass of water will, when injected into the rectum, produce a prompt evacuation of the bowels, thus offering a means of overcoming a tendency to constipation.

Camphor has at times been successfully employed in the management of mania, melancholia, and delirium tremens. A combination of camphor and opium relieves the after-pains of labor. The same drugs are advantageously given in the form of a suppository after operations upon the ureter, and in prostaticorrhœa (enlarged prostate), cystitis, and, in fact, in all diseases of the genito-urinary organs, according to these formulæ:—

**R Camphoræ.**

Iodoform. vel aristol. vel iodol. . . . . aa 4| Gm. or 3j.

Ol. theobromatis . . . . . q. s.

**M et ft suppes. no. xv.**

**Sig.:** Insert one, when necessary, into the bowel.

**R Camphoræ.**

Lupulini . . . . . na 4| Gm. or 3j.

Ext. belladonnæ folior. . . . . 16 Gm. or gr. iiss.

Ol. theobromatis . . . . . q. s.

**M et ft suppositoria no. x.**

**Sig.:** Insert one in the bowel every two or three hours.

As camphor escapes from the system largely by the bronchial mucous membrane, it is a useful remedy in chronic bronchitis, especially when occurring in the weak or aged, or associated with emphysema. Its stimulant effects render it useful, also, in capillary bronchitis and typhoid pneumonia. The substance may be very serviceably administered in typhus or typhoid fever, or in the eruptive fevers, in order to strengthen the action of the heart. Professor Baelz,<sup>1</sup> of Tokio University, Japan, in fact, for five years has used camphor to the exclusion of all other medication, in typhoid fever, administering 1 Gm. (or gr. xv) daily. He considers it superior to any other drug that he has employed.

In influenza Dr. F. W. Devereux Long prescribes:—

**R Spiritus camphoræ,**

Tr. lavand. co. . . . . aa 7½ c.cm. or f3ij.

Sp. chloroformi . . . . . 4| c.cm. or f3j.

Mucilag. tragacanth. . . . . 60 c.cm. or f3ij.

Aquæ . . . . . q. s. ad 180 c.cm. or f3vj.

**M Sig.:** Two tablespoonfuls every fourth hour.

Liniment of camphor, or camphorated oil, is an excellent application to swollen and painful breasts during lactation. Injections subcutaneously of camphorated oil are said by Alexander to be of benefit in tuberculosis, acting as a tonic, strengthening the heart, and reducing fever. In laryngeal tuberculosis he applies it directly to the lesion. Obstinate hiccoughs were relieved by a hypodermic injection of camphorated oil, by James Tyson. Dr. J. Ross has made use of this combination in threatened heart-failure, in pneumonia, pneumonia, typhoid fever, and other debilitating diseases. This author gave 2 to 4 c.cm. (or gtt. xxx-lx) daily of a 1-per-cent. to 5-per-cent. solution. B. Alexander<sup>2</sup> has for eleven years used, in the treatment of pul-

<sup>1</sup>Journal of the American Medical Association, p. 1238, vol. xxxili, Nov. 11, 1899.  
<sup>2</sup>Munchener medicinische Wochenschrift, Feb. 27, 1900.

monary tuberculosis, hypodermic injections of the camphorated oil of the German Pharmacopœia (11 to 9), with remarkable benefit. The injections are made once a day, 1 to 3 cg. (or gr.  $\frac{1}{10}$ - $\frac{1}{2}$ ) each, in febrile or afebrile cases, or 1 cg. (or gr.  $\frac{1}{10}$ ) every day for four days and then suspended for eight. Improvement is noted after the second injection, even in advanced cases. Dr. Courtin reports good results in the treatment of tuberculous adenitis from injections of a mixture of 1 part each of betanaphthol and camphor and 4 parts of 60° alcohol.

**Borneol** is an artificial camphor obtained from oil of turpentine by treating it with hydrochloric acid. It is said to be identical in chemical composition, and to closely resemble, in its physical characters, the natural camphor. According to Stockman, it has the same effects upon the circulation, but shows a tendency to depress or paralyze the pneumogastric nerves, and induces palpitation of the heart.

**Camphoric Acid** is the product of the oxidation of camphor with nitric acid. It occurs in the form of fine, white, crystalline lamellæ, melts at 368.6° F., is slightly soluble in water, readily soluble in ethylic alcohol and ether. It is without odor, but has a somewhat acid and slightly astringent taste. In a healthy person it produces congestion of the face, neck, and conjunctivæ, with pain in the head. It checks the secretion of sweat, even in the normal man, but seems to have no influence upon the saliva or to cause dryness of the throat and skin. Camphoric acid is eliminated in the urine and preserves this fluid from undergoing putrefactive changes for several days. It may be given in doses of 0.50 to 4 Gm. (or gr. viii-ix). The ammoniacal urine of cystitis is speedily cleared and rendered acid by the administration of 1 Gm. (or gr. xv) three times a day. It is of avail, also, as a local remedy in chronic cystitis, the bladder being washed out twice daily with a  $\frac{1}{2}$ -per-cent. solution. A stronger solution than 1 per cent. is too irritant for use. The 1-per-cent. solution in water may be used in laryngological practice as a spray in catarrhal affections; it probably exerts some antiseptic as well as a sedative effect. The local application of a 2-per-cent. solution of camphoric acid is useful in acute coryza.

A 1-per-cent. solution is also a serviceable gargle in many forms of sore throat. Alone, or in combination with other remedies, such as boric acid or sodium borate, it is valuable in treating strangury and irritability of the bladder, and in the night-sweats of phthisis. The suppression of night-sweats is produced by daily doses of 2 Gm. (or gr. xxx), or more; certainly by single doses of 2 Gm. (or gr. xxx), according to the experiments of Combemale. Dr. Howard has also seen camphoric acid repress profuse perspiration in acute articular rheumatism. In a case of myoma of the uterus in which excessive nocturnal sweating had followed electrical treatment, Dr. Ralph Stockman, of Edinburgh, ordered 1 Gm. (or gr. xv) of camphoric acid at night, and after taking it for two weeks the tendency to sweating completely disappeared and never returned. The same author has used it in cases of hyperidrosis after influenza, and in other cases where there was certainly no tubercle present, and, in all of them, doses of 1 to 2 Gm. (or gr. xv-xxx) gave fairly satisfactory or good results. Dr. Stockman emphasizes its value in non-tubercular cases. He considers it as efficient as atropine, but in some obstinate cases it is less powerful as an anhydrotic than picrotoxin. Its toxicity is very slight. It may be used in spermatorrhœa

and in enuresis; and it has also been thought to have some influence over epistaxis, chorea, hysteria, and other spasmodic affections.

**Oxycamphor.**—By the action of hypochlorous acid upon camphor, and treating the product with an alcoholic solution of potassium hydroxide, **Oxycamphor** ( $C_{10}H_{14}O_2$ ) is formed, which crystallizes in needles, has the odor and taste of camphor, and can be sublimed without change. It melts at  $137^{\circ} C.$  (or  $278.6^{\circ} F.$ ). Oxycamphor reduces the excitability of the respiratory centre, and has been used by Rumpel, of Hamburg, and others, in doses of 0.50 to 1 c.cm. (or *mvijj-xv*); the maximum quantity in the day should not be more than 4 c.cm. (or *3j*). Oxycamphor in 50-per-cent. solution, in alcohol, is the most convenient for prescribing. This solution is now commercially also by the name (registered) of **Oxaphor**. Rumpel prescribes the drug in the following combination:—

R Spiritus oxycamphor (50 per cent.).....	12	c.cm. or <i>3iij</i> .
Spiritus vini .....	6	c.cm. or <i>3jss</i> .
Fluidextractum glycyrrhizæ.....	3	c.cm. or <i>mxlv</i> .
Aquæ destillatæ .....	q. s. ad 180	c.cm. or <i>3vj</i> .

M. Dose, a tablespoonful containing eight minims.

#### CANELLÆ CORTEX.—Canella-bark.

Dose, 0.60 to 2.60 Gm. (or gr. x-xl).

The bark of Canella Winterana (Canellaceæ), deprived of its corky outer and dried. This aromatic bark is sometimes called "white cinnamon." It contains a bitter extractive, **Eugenol**, and a volatile oil, but no tannin. As a stimulant, it is used in hot infusion. For dysmenorrhœa, the powder of aloes and canella (N. F.), anciently known as *hiera picra* (aloes 8 parts, canella 2 parts), is given, in doses of 0.65 to 0.30 Gm. (or gr. x-xx).

#### CANNABIS INDICA (U. S. P., B. P.).—Indian Cannabis, Indian Hemp.

##### Preparations.

**Fluidextractum Cannabis Indicæ** (U. S. P.).—Fluid Extract of Indian Cannabis. Dose, 0.06 to 0.60 c.cm. (or *mi-x*).

**Extractum Cannabis Indicæ** (U. S. P., B. P.).—Extract of Indian Cannabis. Dose, 0.03 Gm. (or gr. ss). B. P., 0.015 to 0.065 Gm. (or gr.  $\frac{1}{2}$ -j).

**Tinctura Cannabis Indicæ** (U. S. P., B. P.).—Tincture of Indian Cannabis (10 per cent., U. S. P.; 5 per cent., B. P.). Dose, 0.12 to 0.50 c.cm. (or *mii-vijj*), U. S. P.; 0.30 to 1 c.cm. (or *ssv-xv*), B. P.

**Pharmacology.**—Cannabis Indica officially is "the dried, prepared tops of the pistillate plants of Cannabis sativa (Urticaceæ), grown in the East Indies, and gathered while the fruits are still undeveloped and carrying the resin of their natural resin." Indian hemp should not be confounded with *Asclepias incarnata*, which is sometimes called white Indian hemp, or with *Artemisia Cannabinum*, Canadian hemp. A native confection made from hemp is called "hashish" or "gunjah"; an inferior kind is known as "bang." The American and East-Indian plants are botanically the same, but the latter contains a larger quantity of the active principles, which are a resin, a volatile alkaloid **Cannabinine**, and a yellow, aromatic, volatile oil. From the latter may be obtained **Cannabene**, of which the hydride is a crystalline substance. The resin appears to be, or to contain, the active constituent of the drug. Wood, Spively, and Easterfield, in addition to several others, isolated a substance from the resin for which they proposed the

name of **Cannabinol**. By oxidizing the resin with nitric acid, Bolas and France obtained a crystalline substance, oxy-cannabine<sup>1</sup> ( $C_{20}H_{20}N_2O_7$ ). Cannabis tannate has been employed in medicine in doses of 0.065 to 0.65 Gm. (or gr. i-x), but it does not appear to have very active therapeutic powers. Churrus is the native name for the impure or crude resin. A watery extract (the *Extractum Cannabis Indicæ Aquosum Fluidum*), according to Dr. Cowan Lees, has a manifest anodyne and hypnotic effect, while free from the intoxication, bordering on poisoning, which follows the use of the alcoholic preparations. The dose for adults is from 2 to 4 c.cm. (or mxxx-lx). It is claimed by Dr. Lees to be especially valuable for the relief of cough in tuberculosis of the lungs and also as a soporific in diseases of children. Hashishin is an unofficial alcoholic extract washed with water, used in dyspepsia and gastric neuroses. (Dose, 0.04 Gm., or gr.  $\frac{3}{4}$ , per day).

**Physiological Action.**—Indian hemp has no local action. Upon the digestion and circulation no evident effect is produced. It acts like opium, in first stimulating the nervous system and afterward depressing the vital functions. The primary stage of intoxication is accompanied by exhilaration, which lasts for some time before sleep occurs. During this period the imagination is actively engaged, intent upon visions of its own creation, which at first are pleasant, but which after awhile may become terrifying. It is noticed, as one of the first manifestations of the toxic effect, that the ideas of space and time are disturbed and become exaggerated; there is often a curious sense of double consciousness. Numbness and tingling in the extremities are observed, followed by anæsthesia and diminution of muscular sense. Cannabis is antispasmodic, analgesic, hypnotic, and, in the East, is believed to be aphrodisiac. If a large dose be taken, coma or catalepsy may supervene, but a fatal effect rarely follows. The subsequent results from indulgence in this drug as an intoxicant are dullness and lassitude, vertigo and headache, and diuresis, but not constipation. Frequent use of the drug brings about mental deterioration and unfitness for labor. The abuse of Cannabis Indica is a prolific cause of insanity in Eastern countries. An irresistible impulse to kill is, according to Dr. Thomas Ireland, occasionally one of the characteristic symptoms of intoxication from this drug. Dr. C. R. Marshall reports an interesting personal experience in which the characteristic toxic symptoms were produced by a small dose of **Cannabinol**, 0.1 to 0.13 Gm. (or gr. iss-ij).<sup>2</sup> A case has been reported by Dr. J. Nevins Hyde in which, after a dose of 0.065 Gm. (or gr. j) of Cannabis Indica, a papular and vesicular eruption made its appearance upon nearly every part of the body, and gave rise to severe itching. Toxic symptoms have been manifested after taking two doses of 0.75 c.cm. (or mxij) of the English tincture, four hours apart, as in a case reported by Dr. Antony Roche.<sup>3</sup>

**Therapy.**—Owing largely to the uncertain quality of the drug, hemp is not employed to the extent that its physiological action would warrant.

Cannabis Indica has been found extremely useful in acute dementia due to mental anxiety, and also in melancholia. This agent also may be successfully prescribed in order to combat the wakefulness of delirium tremens, and good results have been ascribed to it in the management of

<sup>1</sup> Dr. C. R. Marshall, on "The Active Principle of Indian Hemp," *Lancet*, Jan. 23, 1897.

<sup>2</sup> *Lancet*, Jan. 23, 1897.

<sup>3</sup> *Lancet*, Dec. 24, 1898.

tetanus. It has been employed with advantage in chorea, and may sometimes be of avail in epilepsy. Amelioration has been produced by this remedy in senile trembling and paralysis agitans. In neuralgia and migraine good results follow its cautious use. In other painful affections, Cannabis Indica may be resorted to with advantage. Dr. Stephen Mackenzie has found cannabis of value in the severe headache of cerebral tumors, in chronic and persistent cephalalgia, and in the violent pains of locomotor ataxia. He has found it of service also in gastralgia and enteralgia. It may be administered to mitigate the suffering caused by the passage of an hepatic or renal calculus. In acute or chronic rheumatism, in gout, and in carcinoma hemp may often be very serviceably substituted for opium, over which it has the advantage that it does not derange the secretions.

Cannabis Indica quiets the delirium of cerebral softening. Dr. R. T. Edes, of Boston, has, in a number of instances, observed the use of this drug to banish the tendency to bad dreams. It allays the itching of eczema. In the itching which accompanies many cutaneous affections, and particularly in senile pruritus, the internal administration of Cannabis Indica will often afford relief. In various uterine disorders it is used to relieve pain and bring about contraction of uterine muscular fibre. The pain of dysmenorrhœa may not infrequently be controlled by Cannabis Indica. Its influence upon the muscular structure of the womb renders it valuable in menorrhagia. Its virtue is enhanced, in this affection, by combination with ergot. It has been found particularly useful in the abundant floodings which sometimes precede the menopause, and, in fact, it possesses considerable power as a general hæmostatic.

Cannabis Indica has also been used with advantage in uterine subinvolution and chronic endometritis. The headaches which attend the grand climacteric will sometimes yield to this remedy. In combination with nuxvomica it is regarded by de Schweinitz as of value in headache dependent upon retinal asthenopia. It may be productive of good results in impotence unconnected with gross lesion. In spasm of the bladder and dysuria it gives relief, and also, in acute gonorrhœa with chordee, we see good effects from its exhibition. It can be given in either of these combinations with marked benefit for relieving the latter distressing symptom:—

R Fluidextracti cannabis Indicæ.....	2	c.cm. or f3ss.
Sodii bromidi .....	12	Gm. or 3iij.
Mist. sodæ menth. ....	90	c.cm. or f3iij.
Syrup. aurantii .....	60	c.cm. or f3ij.

Sig.: A tablespoonful at bed-time. Repeat every hour or two until relieved.

R Extracti cannabis Indicæ .....	20	Gm. or gr. iij.
Chlorali hydrati .....	4	Gm. or 3j.
Extracti opii .....	38	Gm. or gr. vj.
Ol. theobromatis .....	q. s.	

M. et ft. suppositoriæ no. xij.

Sig.: Insert one in the bowel on retiring, and every two or three hours when troubled with chordee.

By some practitioners it is esteemed of value in acute and chronic Bright's disease, the presence of hæmaturia especially indicating its employment. Trial has been made of the drug in diabetes mellitus. Though it may, at times, be able to moderate cerebral irritability, it exerts no marked influence upon the course or severity of the disease. The spasm of asthma

is sometimes very rapidly relieved by hemp. In whooping-cough, also, it may prove of service. It is a good remedy in irritable or reflex cough.

Mackenzie recommends the use of *Cannabis Indica* in hay fever and hay asthma. Germain Sée warmly recommends *Cannabis Indica* as a gastric sedative of particular value in functional disorders of the stomach and bowels attended with pain, acidity, and flatulence. He advises 0.04 Gm. (or gr.  $\frac{3}{4}$ ) of the extract to be given in three doses, or it can be prescribed in the form of the fluid extract, and creosote added with great advantage:—

R Fluidextracti cannabis Indicae.....	3	10 c.cm. or ml.
Creosoti .....	30	c.cm. or mv.
Syrup. acaciae .....	90	c.cm. or f℥iij.

M. Sig.: A teaspoonful before meals.

It is also of value in the treatment of gastric ulcer and may be combined with silver nitrate, the efficacy of which it increases. *Cannabis Indica* is said by Macconnell to be of value in diarrhoea dependent upon indigestion. *Cannabis Indica* is said to do good in exophthalmic goitre, and to cure, in some instances, the opium or chloral habit. The tannate of cannabin is a good hypnotic, and has been used for insomnia among the insane. The same property is shared by cannabin and cannabinone, both of which are given in doses of 0.03 to 0.13 Gm. (or gr. ss-ij). The oil of hemp-seed (*oleum cannabis*) is a drying, fixed oil expressed from the seeds; it is green in color, disagreeable to smell, and bland to the taste. It is used in the manufacture of a green soft-soap of deservedly high reputation in treating eczema and other skin diseases.

The tincture of *Cannabis Americana* is regarded by some as equal in value to copaiba or sandal-wood in the treatment of gonorrhœa. The preparation should be made from the fresh plant and be given in doses of 3 to 5 drops three or four times a day after subsidence of the acute symptoms.

### CANTHARIS (U. S. P., B. P.).—Cantharides. (Spanish Flies.)

#### Preparations.

Colloidium Cantharidatum (U. S. P.).—Cantharidal Collodion (60 per cent.).

Ceratum Cantharidis (U. S. P.).—Cantharides Cerate (cantharides, 32 Gm.; yellow wax and resin, aa 18 Gm.; lard, 22 Gm.; oil of turpentine, 15 c.cm.).

Emplastrum Picis Cantharidatum (U. S. P.).—Plaster of Pitch and Cantharides; Warming Plaster (Burgundy pitch, 92 Gm.; cerate of cantharides, 8 Gm.).

Tinctura Cantharidis (U. S. P., B. P.).—Tincture of Cantharides (10 per cent.). Dose, (U. S. P.), 0.06 to 0.60 c.cm. (or mi-x). (The British tincture is only 1 $\frac{1}{2}$  per cent.). Dose, 0.30 to 4 c.cm. (or mv-3j).

Acetum Cantharidis (B. P.).—Vinegar of Cantharides (10 per cent.).

Liquor Epispasticus (B. P.).—Blistering Liquid (50 per cent. with acetic ether).

Unguentum Cantharidis (B. P.).—Cantharides Ointment (cantharides, bruised, 1 Gm.; benzoated lard, 10 Gm.).

Emplastrum Cantharidis (B. P.).—Cantharides Plaster (35 per cent.).

Emplastrum Calefaciens (B. P.).—Warming Plaster.

Colloidium Vesicans (B. P.).—Blistering Collodion (blistering liquid, 40 c.cm.; pyroxylin, 1 Gm.).

**Pharmacology.**—*Cantharis vesicatoria* (class, Insecta; order, Coleoptera), thoroughly dried, at a temperature not exceeding 104° F., occurs in pharmacy, either whole or in a more or less fragmentary condition, or as a brownish powder, in which the bright-green fragments of the elytra are very noticeable. The dust is very irritating, and the eyes should be protected when the drug is powdered in the mortar. The perfect flies are stronger

than the powder, which often has been damaged by the ravages of mites or other forms of life. The active constituent is **Cantharidin**, the anhydride, or lactone, of cantharadinic acid (discovered by Robiquet in 1810) which is contained chiefly in the soft parts, and especially the generative apparatus, the blood, and in the eggs (Leidy). It is soluble in alcohol, ether, chloroform, etc. Besides this, which constitutes rather less than 1 per cent., there are a green oil, black matter soluble in water, a yellow viscid matter, fat, calcium and magnesium phosphates, acetic, formic, and uric acids, and a volatile principle upon which the fetid odor depends, and which, according to Magendorff, acts upon the system like cantharidin. The green coloring matter appears to be identical with chlorophyll.

**Physiological Action.**—When applied to the skin, an active preparation of cantharides causes burning pain with hyperæmia, to which, in the course of a few hours, succeeds the formation of vesicles, exhibiting a tendency to run together and form a large bleb corresponding with the area of application. If the action is continued, sloughing and ulceration result. The engorgement of the capillaries in the superficial structures is associated with hæmia of the deeper structures. When applied to the chest, the lung underneath becomes pale and anæmic, and, if its action be too long continued, a blister may cause inflammation of the pleura; or it may produce peritonitis if applied to the abdomen. Slight elevation of temperature attends the action of the blister, which may be followed by depression of temperature and weakening of the heart's action. Constitutional effects may be caused by absorption of the active principles through the integument. When introduced into the stomach, cantharides is capable of setting up much irritation and even gastro-enteritis, with vomiting, or purging and tenesmus. The active principles soon pass into the blood, and at first slightly stimulate the heart's action; but the effect is most marked upon the genito-urinary organs, as the kidneys are the chief organs by which they are excreted. Extreme irritation of the bladder is produced, the urine is voided frequently, and, owing to the congested state of the kidneys, often contains albumin and blood. There may be suppression of urine. Associated with this is priapism, with pain in the glans penis, urethra, bladder, and aching in the renal region. Sloughing of the external genitals has been known to occur in consequence of the administration of cantharides. Toxic doses, according to Cautieri, cause a rapid diminution of blood-pressure, decreasing the force of the heart's action, but increasing the pulse-rate. In fatal cases inflammatory changes are found in the alimentary canal, with intense hyperæmia of the bladder and kidneys.

The vulgar notion that cantharides causes erotic sensations, or increased sexual power, has no foundation except in the evidences of congestion and inflammation of the urinary passages just referred to. The results of swallowing a few grains of Spanish flies may be quite serious, and it is regarded by the law as a penal offense to administer this drug surreptitiously and with evil intent. The treatment of poisoning by cantharides is by bland drinks and opiates and a hot bath. Bismuth and cocaine are also of service. Animal charcoal has also been recommended as an antidote. An anæsthetic may be necessary.

**Therapy.**—Blisters are usually spread with cerate of cantharides, or preferably with the cerate of the extract of cantharides, the prescription being as follows:—

R Cerati cantharidis, q. s.

Fiat emplastrum 2 X 3 in.

Sig.: Apply to designated spot and allow it to remain four hours. Then remove it and substitute a moist compress.

The skin overlying the effusion should not be removed, but simply punctured to allow the serum to escape; the spot is then dressed with some bland fat, such as suet or benzoinated lard. A good way to raise a blister is to use the blistering collodion and paint one or two coats over the desired area, and lay over it a piece of waxed paper, under which the blister raises in a few hours. Saint-Philippe has suggested that the danger of strangury may be lessened by the preliminary use of an alkaline diuretic until the urine has become alkaline. It is also a good plan to sprinkle a small quantity of morphine and camphor over the surface of the plaster before it is placed in position. Blisters are employed therapeutically to relieve pain, to reduce inflammation, and as revulsants to promote absorption of inflammatory products. The warming plaster is very useful in pleurodynia. Meningeal or pleural inflammation may be checked by the prompt application of a good-sized blister to the scalp or to the chest. In iritis, blisters behind the ears are often serviceable. Dr. C. Ziem recommends painting cantharidal collodion behind the ear, extending downward as far as the jaw, in the treatment of certain acute inflammatory affections of the eye. He makes use of the same method for relief in cases of abscess of the thyroid gland, and inflammation of the frontal sinus and antrum of Highmore. In pericarditis, marked relief may be afforded by blistering. A blister over the stomach will arrest obstinate vomiting; and gleet is sometimes cured by a blister to the perineum. Vesication of the back of the neck is said by Swan to be a useful measure in cases of incontinence of urine. Neuralgia is promptly relieved by a small blister to the painful point; and neuritis is cured by fly blisters; that is to say, a succession of small blisters along the course of the nerve. In acute rheumatism, marked relief is sometimes afforded to a swollen joint by surrounding it with small blisters. A blister over the affected joint is a good remedy in chronic synovitis. A large blister over the heart, applied early in the course of acute rheumatism, is often remarkably successful in reducing temperature and relieving pain; probably, also, it is of use in obviating the tendency to endocarditis, or curing it if present. In pleural effusion, absorption may be hastened in a similar manner, and also the clearing up of the lung after pneumonia. The warming plaster here may be worn for several days, if the skin is not too sensitive. Blisters must be used with caution in aged or debilitated patients; also in children. They should not be applied to parts deprived of vitality by paralysis, or to cicatricial tissue, or where the skin is poorly nourished. The possibility of absorption and serious results should be kept in mind. Nor should a blister be allowed to remain on too long. Cantharis should not be used as a vesicating agent in the case of patients whose kidneys are damaged. The cerate, or tincture, of cantharides enters sometimes into the composition of pomades or lotions for the treatment of alopecia circumscripta, and cantharidal collodion painted over the patches, every week or ten days, is at times efficacious.

In small doses, not exceeding 0.12 to 0.18 c.cm. (or mii-iiij) daily of the tincture, cantharides has been commended as a stimulant to the urinary organs, in hæmaturia, Bright's disease of the kidneys, pyelitis, cystitis, incontinence of urine, gleet, and leucorrhœa; but is contra-indicated in active

conditions of inflammation. Given in this manner, it is claimed to relieve *chordee*. Ringer recommends full doses of the tincture of cantharides, in combination with tincture of iron and phosphoric acid or *nux vomica*, in the impotence due to old age, sexual excess, or masturbation. Cantharis has been employed with success in amenorrhœa due to atonic conditions, and has suppressed passive seminal emissions of the same character. Cutaneous affections, especially psoriasis and other squamous diseases, are sometimes much benefited by similar small doses of the tincture. It has been used to produce abortion, and, in these small doses just mentioned, has emmenagogic properties. There is some evidence to show that the internal administration of tincture of cantharides may check the progress of cancer. Several cases have been reported in which the tumor remained stationary and the symptoms improved, or in which, many years after removal of the growths, there had been no recurrence. It was given in association with the wine of camphor.

**Potassium cantharidate** has been introduced by Professor Liebreich as a remedy in tuberculosis, especially of the larynx. It is given by hypodermic injection, in doses of 1 to 2 decimilligrammes (or gr.  $\frac{1}{1000}$ – $\frac{1}{300}$ ). The injection excites a moderate degree of pain, but is not generally followed by pronounced febrile reaction. In cases of simple inflammation and tuberculous infiltration of the larynx, potassium cantharidate causes an exudation of serum, which is, however, quickly reabsorbed. Hoarseness diminishes and swallowing becomes less difficult. Tuberculous ulcers show a tendency to heal. In pulmonary tuberculosis it has been found without effect upon the fever, cough, expectoration, or physical signs. The treatment is apt to excite slight albuminuria and urobilinuria. Peterutti has reported three cases treated by him more than three years previously, according to this method, with, at the time, apparently unfavorable results. He subsequently found two of the cases completely cured and the third so much improved as to simulate a cure.

Benefit has sometimes resulted in cases of lupus and granular lids. The same method is said to have occasioned improvement in non-tubercular chronic laryngitis. Dr. Ch. Talamon states that, although he has witnessed no favorable effects of potassium cantharidate in tubercular cases, he has observed that the salt possesses a decided diuretic action, more especially in tuberculous patients. In order to avoid the pain to which these injections give rise, Dr. Hennig has employed **Cocaine Cantharidate** in tuberculosis and some other chronic affections, as *ozæna*, nasal and laryngeal syphilis, etc. He uses a solution of 3 to 6 parts of the remedy in 2000 parts of chloroform-water, and the quantity injected is equal to 1 to 5 decimilligrammes (or gr.  $\frac{1}{1000}$ – $\frac{1}{200}$ ) of cantharidin. Cocaine cantharidate is rather a simple mixture than a chemical combination and occurs in the form of an amorphous, white powder, destitute of odor and having a saline and pungent taste. It dissolves with difficulty in cold water, but is readily soluble in hot water. It is insoluble in ether, alcohol, and benzin. Cantharis tincture, internally, has been made use of as a systemic stimulant in adynamic conditions.

### CAOUTCHOUC (B. P.).—India Rubber.

#### *Preparation.*

**Liquor Caoutchouc (B. P.).**—Solution of India Rubber (India rubber, 50 Gm.; benzol and carbon bisulphide, of each, 500 c.cm.).

**Pharmacology.**—The prepared milk-juice of *Hevea Brasiliensis*, and probably other species; known in commerce as pure Para rubber. (See *Elastica*.)

**CAPSICUM** (U. S. P.).—**Capsicum** (Cayenne Pepper, African Pepper).

**CAPSICI FRUCTUS** (B. P.).—**Capsicum**.

**Dose**, 0.065 to 1.30 Gm. (or gr. i-xx).

#### *Preparations.*

**Fluidextractum Capsici** (U. S. P.).—Fluid Extract of Capsicum (alcoholic). **Dose**, 0.06 to 0.30 c.c.m. (or *mi-v*).

**Oleoresina Capsici** (U. S. P.).—Oleoresin of Capsicum. **Dose**, 0.003 to 0.12 Gm. (or *m<sup>1</sup>/<sub>30</sub>-ij*).

**Emplastrum Capsici** (U. S. P.).—Capsicum Plaster (contains oleoresin).

**Tinctura Capsici** (U. S. P., B. P.).—Tincture of Capsicum. **Dose**, 0.30 to 1 c.c.m. (or *mv-xv*). The United States preparation is 10 per cent. strength, and the British preparation is only 5 per cent.

**Pilule Podophylli, Belladonnæ, et Capsici** (U. S. P.).—Pills of Podophyllum, Belladonna, and Capsicum (resin of podophyllin, 1.6 Gm. [or gr. xxivss]; extract of belladonna-leaves, 0.8 Gm. [or gr. xij<sup>1</sup>/<sub>4</sub>]; capsicum, 3.2 Gm. [or gr. xlix]; sugar of milk, acacia, and glycerin, to make 100 pills). **Dose**, 1 pill.

**Unguentum Capsici** (B. P.).—Capsicum Ointment (bruised capsicum-fruit, 12 Gm.; spermaceti, 8 Gm.; olive-oil, 44 Gm.).

**Pharmacology.**—The dried, ripe fruit of *Capsicum fastigiatum* (Solanaceæ), deprived of its calyx (U. S. P.); the dried, ripe fruit of *Capsicum minimum* (B. P.), constitutes capsicum, or red pepper, which grows in the East Indies and on the coast of Guinea. Different varieties are cultivated all over the world for culinary and medicinal purposes. The *Capsicum annum* is most common in this country, of which there are a number of varieties, having different-shaped pods or large berries, the latter being picked green and used for pickling with vinegar. The chief constituent of red pepper is a crystallizable, acrid substance, **Capsaicin** (Thresh); also a yellow oil, resin, and a volatile alkaloid which in its odor resembles coniine.

**Physiological Action and Therapy.**—Capsicum occasions irritation when applied to the skin, and may produce vesication; it acts as a counter-irritant in relieving pain in the structures beneath, especially in neuralgia, subacute gout, chronic gout, rheumatism, and bronchitis. In the mouth the taste is hot and pungent, causing free flow of saliva, and similarly increasing the flow of gastric juice, producing warmth in the stomach, expelling flatus, and giving increased appetite and digestive power. Overdoses of capsicum will give rise to subacute or chronic gastritis. Excessive amounts cause severe pain, vomiting, and purging.

Capsicum stimulates the action of the heart and increases the digestive functions. It promotes the excretion of urine and possesses an aphrodisiac influence. A prescription of much utility in debility of the sexual organs is:—

R Pulveris capsici,  
Extracti cocæ ..... aa 4| Gm. or 3j.  
M. et ft. pilulæ no. xxx.  
Sig. Two pills three or four times a day.

Capsicum plaster may be used when mild counter-irritation is desired. The tincture of capsicum may be employed with advantage in chilblains

when the surface is unbroken. Dr. Rheims recommends that a strong tincture of capsicum-pods should be mixed with an equal quantity of mucilage of gum arabic. The mixture is brushed two or three times upon tissue-paper, which is then applied to the affected surface and quickly relieves the itching and pain. Discolored bruises and chronic rheumatic pains are likewise benefited by the same treatment. Sawyer suggests a tincture of capsicum made with official, pure ether in place of rectified spirit. He reports<sup>1</sup> that ether, by its action on the sebaceous secretion of the skin, is preferable to alcohol as a menstruum for drugs designed to produce a therapeutic effect on or through the skin. It has also the advantage that oil of turpentine or stearic oil is easily miscible with it, if requisite to add either. He states that a mixture of equal parts of ethereal tincture of capsicum, liquor ammoniac, oleum terebinthinæ, and oleum lini forms an excellent rubefacient ointment. An infusion of capsicum pods applied upon a piece of lint is remarkably efficacious in acute torticollis.

The tincture of capsicum is an excellent application to the mucous membrane of the mouth and especially the gums. It enters into very many tooth-washes, the following, used by Garretson, being very serviceable:—

R Tinct. capsici .....	7½	c.cm. or fʒij.
Spiritus odorat.,		
Alcoholis .....	aa 60	c.cm. or fʒij.
Tinct. quillajæ .....	45	c.cm. or fʒiiss.
Tinct. gentianæ comp. ....	30	c.cm. or fʒj.
Acidi acetici diluti .....	16	c.cm. or fʒss.
Phenolis liquefacti .....	12	c.cm. or mij.—M.

Capsicum infusion is used as an application to scarlatinal sore throat, or diluted as a gargle in tonsillitis, pharyngitis, or may be used as a gargle, thus:—

R Tinct. capsici .....	4	c.cm. or fʒj.
Potassii chloratis .....	12	Gm. or ʒiij.
Glycerini .....	60	c.cm. or fʒj.
Acidi hydrochlor. dil. ....	11	c.cm. or fʒiij.
Aque rosæ .....	ad 360	c.cm. or fʒxij.

Capsicum may be used externally as a hair-lotion for promoting the capillary growth:—

R Tinct. capsici .....	15	c.cm. or fʒss.
Tinct. Quillajæ .....	30	c.cm. or fʒj.
Glycerini .....	75	c.cm. or fʒij.
Tinct. cantharidis .....	11	c.cm. or fʒiij.
Spiritus rosmarini .....	45	c.cm. or fʒiiss.
Aque rosæ .....	240	c.cm. or fʒviij.

M. Sig.: Drop on the hair night and morning and brush the scalp well.

Capsicum is given internally after a debauch or in cases of drink-craving as a substitute for alcoholic drinks in extemporaneous infusion 31 Gm. to ʒss (or ʒi-ʒij, fʒij). Dose, 15 to 60 c.cm. (or fʒss-ij). In chronic catarrh of the stomach of drunkards, the tincture of capsicum, in 0.60-c.cm. (or gtt. x) doses before meals, serves as an appetizer. The tincture of capsicum is a valuable stimulant in delirium tremens. It may very serviceably be administered in beef-tea, and supports the heart, allays restlessness, and promotes

<sup>1</sup> London Lancet, May 17, 1890.

sleep. Capsicum, in fact, possesses a slight narcotic power, and can be given thus with marked effect:—

R Tincturæ capsici .....	7½	c.cm. or f3ij.
Sodii bromidi .....	12	Gm. or 3iij.
Elix. lupulini .....	120	c.cm. or f3iv.

M. Sig.: Two teaspoonfuls in water every hour or two.

It is an excellent remedy in flatulent dyspepsia:—

R Pulveris capsici .....	2½	Gm. or gr. xl.
Extracti nucis vomicæ .....	20	Gm. or gr. iij.
Extracti pancreatis .....	4	Gm. or ʒj.

M. et ft. capsulæ no. xx.

Sig.: A capsule after meals.

Capsicum is beneficial in typhoid fever and typhoid conditions, as a stimulant. It acts also as a useful adjuvant in the treatment of malaria. As this substance invigorates the muscular coat of the arteries, it may be advantageously employed in order to control hæmorrhage from the lungs or the womb. On account of its irritant effects, it is contra-indicated in acute inflammation of the stomach or bowels. As excretion takes place by the kidneys, capsicum should be prohibited in inflammatory conditions of the genito-urinary tract; but in chronic disorders it may often be employed with advantage. In chronic nephritis, pyelitis, cystitis, and prostatorrhœa it frequently proves decidedly beneficial.

**CARBO ANIMALIS** (U. S. P.).—**Animal Charcoal.** (Charcoal prepared from bone.)

Dose, 16 Gm. (or ʒss) in poisoning by alkaloids (for each grain).

**CARBO LIGNI** (U. S. P., B. P.).—**Charcoal.** (Charcoal prepared from soft wood and very finely powdered.)

Dose, 0.65 to 2 Gm. (or gr. x-xxx), or more. B. P., 4 to 8 Gm. (or ʒi-ij).

#### Preparation.

**Carbo Animalis Purificatus** (U. S. P.).—**Purified Animal Charcoal.** Dose, 0.65 to 4 Gm. (or gr. x-3j).

**Pharmacology.**—Animal charcoal is prepared from bone by exposure to heat; and wood charcoal is obtained by a similar process from soft wood. The former occurs as a black powder or mass, the latter in large fragments preserving the shape of the billets of wood, or as a fine light powder. Purified animal charcoal is the charred bone after treatment with hydrochloric acid, which removes the earthy salts and leaves only the carbon. Recently-burned charcoal readily absorbs gases. It is an excellent deodorizer, and it destroys organic impurities by oxidation, decolorizing solutions containing them and rendering them inoffensive to taste or smell, but it is not, properly speaking, an antiseptic. It is a useful filtering agent, when fresh, for purifying water. Internally, it is given in too small doses to exert much effect of this kind in the intestinal tract, but it aids in purifying the stomach, partly by mechanical action. It increases secretion and peristalsis. Robert B. Wild,<sup>1</sup> in a prize essay on "Charcoal as a Therapeutic Agent," says we

<sup>1</sup> *New York Medical Journal*, April 4, 1896.

have in charcoal, whether dry or mixed with water, a powerful oxidizing agent, and one which, being non-poisonous, can be administered in large doses.

**Therapy.**—Charcoal is a good dressing to old or offensive gangrenous ulcers, as it absorbs the foul material and cleans the wound. It is generally utilized in the form of the charcoal poultice, being beaten up with bread-crumbs or flaxseedmeal; or a small bag filled with powdered charcoal may be laid upon the poultice when it has been placed in position. It is sometimes used for tooth-powder, but it is open to the objection of scratching the teeth and discoloring the gums. Charcoal filters are useful in pharmacy, but not in the household, because, if not renewed daily, they lose their virtues, and only act as a breeding-place for germs of putrefaction and disease. Charcoal in powder or animal charcoal may be administered in cases of poisoning by organic poisons. In flatulent dyspepsia recently-burned charcoal is sometimes beneficial. It has been used to relieve the pain of gastric ulcer and gastralgia. In France it is sometimes prescribed as *magnesia noire*, and in England the term "black magnesia" is sometimes applied to powdered charcoal.

**CARBONEI DISULPHIDUM (U. S. P.).**—Carbon Disulphide ( $CS_2$ ).

**CARBONIS BISULPHIDUM (B. P.).**—Carbon Bisulphide.

**Pharmacology and Therapy.**—Carbon disulphide is a clear, very diffusive inflammable liquid, of strong, offensive odor. It is a highly-refractive fluid, has a sharp, distinctive taste and a neutral reaction. It is highly poisonous, and its odor is also an objection to its internal use. It gives rise to severe headache and marked nervous excitement. Frequent exposure to its fumes occasions anemia, physical and mental debility with, in some instances, amblyopia and epileptiform convulsions. Workers in rubber factories are liable to be affected by inhalation of carbon disulphide. The symptoms noted by Stadelmann<sup>1</sup> consisted of digestive disturbances, muscular weakness, tremor, ataxia, increased muscular irritability, painful muscular spasm, disturbed sensation; altered knee-jerk, sometimes increased, sometimes diminished, etc. These symptoms are not uncommon in Germany. Bernhardt states that the poison may affect the peripheral nerves and even give rise to a degenerative neuritis or paralysis. Hysterical symptoms have been observed. Stadelmann found no changes in the optic disk. Poisoning by this agent is treated by means of bromide and chloral, with the addition of stimulants if the circulation is depressed, although it is a valuable antiseptic, and has been used in typhoid fever, dyspepsia, and in gastric cancer. It has some anæsthetic and anodyne properties when inhaled. Locally, the vapor has been proposed to be applied for glandular enlargements and in defective secretion of cerumen in the ear. Local anæsthesia may be produced by the spray in neuralgia, etc. W. S. Cline claims that 15 c.cm. (or f3ss) of the disulphide of carbon, being well rubbed over the painful parts, will cure sciatica.

Rubber stoppers should not be used for bottles containing this substance, and these should be kept away from flame and in a cool place.

<sup>1</sup> *Berliner klinische Wochenschrift*, June 13, 1896.

**CARDAMOMUM** (U. S. P.).—Cardamom.

**CARDAMOMI SEMINA** (B. P.).—Cardamom-seeds.

Dose, 0.32 to 1 Gm. (or gr. v-xv).

*Preparations.*

**Tinctura Cardamomi** (U. S. P.).—Tincture of Cardamom (10 per cent.). Dose, 4 to 7.5 c.cm. (or f3i-ij).

**Tinctura Cardamomi Composita** (U. S. P., B. P.).—Compound Tincture of Cardamom (U. S. P. contains cardamom, 2; cinnamon, 2; caraway, 1; cochineal,  $\frac{1}{2}$ ; glycerin, 5; in dilute alcohol, q. s. ad 100 parts). Dose, 4 to 15 c.cm. (or f3i-iv). B. P., 2 to 4 c.cm. (or f3ss-j).

**Pulvis Aromaticus**.—Aromatic Powder (U. S. P.); consists of cardamom and nutmeg, aa 15 Gm.; cinnamon and ginger, aa 35 Gm.

**Pharmacology.**—Cardamom is the dried, nearly-ripe fruit of *Elettaria repens* (Zingiberaceæ) (U. S. P.); the dried, ripe seeds of *Elettaria Cardamomum* (B. P.). It comes from Malabar, although other sources are recognized in commerce. The seeds are inclosed in capsules, the latter being valueless except as a protection for the former, which contain a volatile oil holding a camphoraceous substance in solution.

**Therapy.**—The seeds of cardamom are sometimes chewed and swallowed to relieve flatulence, or the tincture or compound tincture may be used, the latter being a valuable carminative combination. Where alcohol is objectionable, the aromatic powder may be substituted for the compound tincture in the treatment of atonic dyspepsia and flatulence, or an infusion may be used (30 Gm. to 240 c.cm. [or f3j to f3viiij]).

**CARDUUS BENEDICTUS.**—Blessed Thistle. This plant belongs to the Compositæ and is a native of Asia and Europe. The leaves, sometimes the flowering tops, are used in decoction (1 to 8), and a fluid extract and solid extract have also been used. A bitter neutral principle, **Cnicin**,—crystallizing in colorless prisms, soluble in alcohol, less so in water,—appears to be the principal constituent; potassium nitrate is also present.

**Therapy.**—*Carduus* is a bitter tonic used in Germany in digestive weakness and chronic hepatic complaints; best given as the fluid extract (1 to 4 c.cm., or  $\text{mxxv-f3j}$ , at a dose), in which the menstruum is diluted alcohol. Cnicin has been given in doses of 0.32 to 0.65 Gm. (or gr. v-x) in intermittent fever, but in these quantities it is apt to cause nausea, vomiting, and diarrhœa. The *Carduus Marianus*, or St. Mary's Thistle, another variety, is used for the same purpose, but it is especially in repute for treating cases of gall-stones. It has also been extolled as an hæmostatic, laxative, and diuretic (Lobach).

**CAROTA.**—Carrot-fruit. The seeds of *Daucus carota* (Umbelliferae), of a grayish color, about  $\frac{1}{8}$  inch in length, contain a volatile oil of aromatic odor and taste. Used in powder as a carminative and diuretic.

**CARTHAMUS.**—Safflower. The dried florets of *Carthamus tinctorius* (Compositæ). This plant contains a yellow coloring-matter, **Safflor-yellow**; a red coloring-matter, and carthamin, or carthaminic acid. The latter is a red-brown powder, which, when mixed with chalk, forms "rouge." Inter-

nally, this agent is slightly stimulant and laxative. Hot infusions are euphoric, and are popularly given to expedite eruptions in exanthematous diseases (8 to 16 Gm. in 480 c.cm. of boiling water, given in doses of a wine-glassful).

**CARUM (U. S. P.).—Caraway.**

**CARUI FRUCTUS (B. P.).—Caraway-fruit.**

**Dose, 0.65 to 2 Gm. (or gr. x-xxx).**

*Preparations.*

**Oleum Cari (U. S. P.).—Oil of Caraway.** Dose, 0.06 to 0.30 c.cm. (or *mi-v*).

**Oleum Carui (B. P.).—Oil of Caraway.** Dose, 0.03 to 0.18 c.cm. (or *mas-ijj*).

**Aqua Carui (B. P.).—Caraway-water** (50 Gm. to 1000 c.cm. distilled to 500 c.cm.).

Caraway enters in the compound spirit of juniper (U. S. P.), the compound tincture of cardamom (U. S. P., B. P.), and spirit of juniper (B. P.).

**Pharmacology and Therapy.**—The dried, nearly ripe fruit of *Carum carvi* (Umbelliferae) contains a volatile oil, and is prized as a condiment. It is used as a stimulant in flatulence, or in combination to prevent griping of other medicines. A case has been reported in which 4 c.cm. (or *f5j*) of the oil of caraway produced cerebral congestion, delirium, and rigors in a man. Caraway has been thought to possess galactagogic properties.

**CARYOPHYLLUS (U. S. P.), CARYOPHYLLUM (B. P.).—Cloves.**

**EUGENOL (U. S. P.).—Eugenol.**

**Dose, 0.20 c.cm. (or *mijj*).**

*Preparations.*

**Oleum Caryophylli (U. S. P., B. P.).—Oil of Cloves.** Dose, 0.06 to 0.37 c.cm. (or *ss-vj*).

**Infusum Caryophylli (B. P.).—Infusion of Cloves** (2½ per cent.). Dose, 15 to 30 c.cm. (or *f3ss-j*).

Also enters into the U. S. P. preparations of compound tincture of lavender, aromatic tincture of rhubarb, aromatic syrup of rhubarb, and wine of opium.

**Pharmacology.**—Cloves are the unexpanded flowers of *Eugenia aromatica* (Myrtaceae), U. S. P.; the dried flower-buds of *Eugenia caryophyllata* (B. P.): a large tree of the Spice Islands and Africa. They are dark brown in color, about half an inch long, and have a strong, spicy odor and pungent, aromatic taste, owing to the presence of a heavy volatile oil (15 to 20 per cent.). They also contain **Eugenin**, tasteless crystalline substance; tannic acid; and a neutral, tasteless, odorless body, **Caryophyllin**, which crystallizes in needles. **Eugenol**, called also eugenic acid, constitutes four-fifths of the bulk of oil of cloves, is an unsaturated, aromatic phenol, insoluble in alcohol and but slightly soluble in water. It is also obtained from pimento, cinnamon, camphor, sassafras, and other similar volatile oils. Clove-stalks are the flower-stalks of the cloves; mother-cloves are the whole fruit.

**Physiological Action.**—Cloves are stimulant, carminative, and antiseptic. The oil has some anæsthetic influence over painful areas. In overdose it will cause gastro-enteritis, has a soporific effect, and occasions death from respiratory failure. The oil of cloves is eliminated by the kidneys, liver, bronchial mucous membrane, and skin. It possesses antiseptic virtues.

**Therapy.**—The oil of cloves is used to destroy sensation in the nerve of hollow, aching teeth, and quickly relieves pain. In combination with lanolin, it may be used for eczema. The infusion is used internally as a stomachic tonic for the relief of flatulence and pain, but it is generally given in combination with other remedies. Fractional doses, 0.03 or 0.06 c.cm. (or gtt. ss or j) of the oil of cloves, given in a little water, will rapidly allay excessive vomiting. Dentists sometimes use oil of cloves, mixed into a paste with thymol iodide, in carious teeth, as a root-filling.

The growth of tubercle bacilli is retarded by tincture of cloves, and Mannotti, in eighteen cases of local tuberculosis, obtained marked improvement from injections of a 10-per-cent. emulsion of cloves in olive-oil. In lupus vulgaris the repeated application of oil of cloves is said to cause separation of the epithelium and retrocession of the nodules.

The oil of cloves is a parasiticide and has been made use of as an application in pediculosis. **Eugenol**, a constituent of the oil of cloves, has been combined, by a patented process, to form a compound termed benzoyl-eugenol, or benz-eugenol. This product, it is thought, may prove useful in the treatment of tuberculosis.

The acetamide of eugenol, a crystalline substance, is an active antiseptic and is also an excellent local anæsthetic. This compound may be advantageously employed in dentistry and minor surgery. It is prepared by acting upon the sodium salt of eugenol with monochloroacetic acid, adding alcohol and chlorine-gas and treating with a strong solution of ammonia. Another combination which has been introduced is cinnamyl-eugenol, a colorless, crystalline substance, destitute of odor and taste, soluble in hot alcohol, ether, and chloroform. This compound has been applied to the treatment of tuberculosis.

#### **CASCA CORTEX.—Sassy-bark.**

**Pharmacology.**—The *Erythrophloeum Guineense* (Leguminosæ) is a large tree growing on the coast of Africa, which furnishes the ordeal-bark of Angola; otherwise casca, or sassy-bark. It contains an alkaloid, **Erythrophloëine**. A tincture (10 per cent.) has been used by Brunton, in doses of 0.30 to 0.60 c.cm. (or *mv-x*).

**Physiological Action.**—The powder causes sneezing when inhaled. The infusion or tincture gives rise to vomiting, purging, and intoxication, followed by death during convulsions. Upon the circulation erythrophloeum has an action like digitalis. Wilcox, of New York, found that in its action upon the vaso-motor system, it resembles digitalis and ergot combined.

**Therapy.**—In its native country sassy-bark is employed in the treatment of intermittent fever, flatulent dyspepsia, diarrhoea, and dysentery. Brunton finds the tincture useful in dilated heart without valvular disease; also in mitral disease and dropsy. The indications for its use are a rapid, low-tension pulse with venous congestion.

According to Prof. Germain Sée, sassy-bark is very useful in dyspnoea, markedly increasing the depth of inspiration. It disturbs the digestion more than digitalis. The hydrochloride of erythrophloëine is a salt in the form of a powder, soluble in water, which can be administered hypodermically in doses of 0.001 to 0.005 Gm. (or gr.  $\frac{1}{60}$ – $\frac{1}{12}$ ) as a local analgesic, but it is inferior to cocaine for this purpose.

**CASCARA AMARGA.**—Honduras Bark.

**Pharmacology and Therapy.**—The Cascara amarga (Simarubaceæ), or Honduras bark, has some reputation as a tonic and alterative. The fluid extract (dose, 2 to 4 c.cm., or f5ss-j, several times a day) may be used in syphilis, chronic liver disease, nasal catarrh, and skin diseases (eczema, psoriasis, syphilodermata, etc.).

**CASCARA SAGRADA** (B. P.).—Cascara Sagrada. (See *Rhamnus Pur-  
shiana*.)

**CASCARILLA** (B. P.).—Cascarilla Bark.

Dose, 0.13 to 1.30 Gm. (or gr. ii-xx).

*Preparations.*

*Infusum Cascarillæ* (B. P.).—Infusion of Cascarilla (5 per cent.). Dose, 15 to 30 c.c. (or f3ss-j).

*Tinctura Cascarilla* (B. P.).—Tincture of Cascarilla (20 per cent.). Dose, 2 to 4 c.c. (or f3ss-j).

**Pharmacology.**—The dried bark of *Croton eluteria* (Euphorbiaceæ) from the Bahama Islands. It has a warm, rather bitter taste, and emits a fragrant odor when burned. Cascarillin is a bitter neutral substance, with gallic acid, resin, and tannin as the principal constituents. There are no official preparations, but the fluid extract, infusion, and tincture are used, of which is miscible in water.

**Therapy.**—Cascarilla is a light tonic, somewhat stimulant and carminative, and the infusion has been used in low fevers. It may be profitably employed as a tonic in convalescence from typhoid fever or other exhausting disease.

**CASSIA FISTULA** (U. S. P.).—Purging Cassia.**CASSIA PULPA** (B. P.).—Cassia-pulp.

Dose, 4 Gm. (or 3j).

**Pharmacology.**—The dried, ripe fruit of *Cassia fistula* (Leguminosæ), one of the West Indies, is in cylindrical pods of a dark-brown color, containing from twenty-five to one hundred seeds in separate cells, and a dark-brown, soft, sweetish pulp, having an odor like prunes and containing about 6 per cent. of sugar. Good cassia yields about 30 per cent. of the pulp, which is the medicinal part of the drug. This is laxative in its action in doses of a drachm or more. There are no official preparations of cassia, but the infusion of senna contains 16 per cent. *Cassia fistula* promotes the secretion of bile and communicates a brownish or greenish tint to the urine.

**CASTANEA.**—Chestnut.*Preparation.*

*Fluidextractum Castanææ*.—Fluid Extract of Chestnut. Dose, 4 to 7.5 c.c. (or f3i-ij).

**Pharmacology and Therapy.**—The dried leaves of *Castanea dentata* (Fagaceæ), collected in September or October, while they are yet green. They contain tannin, gallic acid, salts, and gum. A recent infusion has

been employed with alleged success in whooping-cough, and might, on account of its astringency, be used for diarrhoea of relaxation. For the latter purpose the fluid extract, of which the dose is 1 to 4 c.cm. (or  $f\bar{3}^{\frac{1}{4}}$ , to j), is preferable.

**CASTOREUM.**—Castor is the dried preputial follicles, with their secretion, of the Castor fiber, or beaver, and freed from the small oil-sacks, associated anatomically with them. It is of unctuous consistency, a brown or reddish-brown color; a pungent, disagreeable smell; and a bitter, nauseous taste. It is soluble in alcohol and ether. Castor contains a volatile oil, a peculiar principle, of crystalline structure, termed **Castorin**, and salicylic aldehyde, together with other organic and inorganic constituents.

**Therapy.**—This substance has a certain stimulant effect upon the nervous system, and acts as an antispasmodic. It has been given in doses of 0.32 to 1.30 Gm. (or gr. v-xx) to control the spasms of hysteria and other convulsions, the tremors of typhoid fever, and those dependent upon an adynamic condition. It may be given with advantage in tympanites. Castor is supposed to possess emmenagogue properties, and has been administered in amenorrhœa and uterine colic. It is best given as the ethereal tincture (of the National Formulary), in doses of 4 to 12 c.cm. (or  $f\bar{3}i-ij$ ).

**CATAPLASMA KAOLINI (U. S. P.).**—Cataplasma of Kaolin. This new introduction into the pharmacopœia consists of kaolin, in No. 80 powder, 577 Gm., with boric acid, thymol, oils of gaultheria and peppermint, and glycerin, 375 Gm. It forms a smooth, light-gray paste, resembling soft putty in consistence. It is of agreeable odor and appearance.

When used, it should be spread on the skin as hot as it can be borne, or applied on strips of bandage.

This agent is hygroscopic, antiseptic, and resolvent. It is of great advantage in local inflammations, in cellulitis, sprains, boils, and also in internal inflammations, such as pleurisy, pneumonia, bronchitis, peritonitis, synovitis, mastitis, and orchitis. After being applied to the surface, absorbent cotton may be laid upon it, and a roller-bandage applied.

**CATECHU (B. P.), or GAMBIR (U. S. P.).**—Gambir, or Pale Catechu. Dose, 0.065 to 2 Gm. (or gr. i-xxx). B. P., 0.32 to 1 Gm. (or gr. v-xv).

#### *Preparations.*

**Tinctura Gambir Composita (U. S. P.).**—Compound Tincture of Gambir (gambir 5 per cent., and cinnamon 2½ per cent., in diluted alcohol). Dose, 2 to 8 c.cm. (or  $3ss-ij$ ).

**Trochisci Gambir (U. S. P.), Catechu (B. P.).**—Troches of Catechu (0.065 Gm., or gr. j, each). Dose, 1 or more.

**Pulvis Catechu Compositus (B. P.).**—Compound Powder of Catechu (catechu, 100; kino, 50; krameria, 50; cinnamon, 25; nutmeg, 25). Dose, 0.65 to 2.60 Gm. (or gr. x-xl).

**Tinctura Catechu (B. P.).**—Tincture of Catechu (20 per cent.; cinnamon, 5 per cent.). Dose, 2 to 4 c.cm. (or  $f\bar{3}ss-j$ ).

**Pharmacology.**—Gambir is an extract prepared from the leaves and twigs of *Orouparia Gambir* (Rubiaceæ). United States Pharmacopœia: an extract of the leaves and young shoots of *Uncaria Gambir*, British Pharmacopœia: a large tree of Pegu. It is in large masses, hard and brittle,

and porous on fracture; taste strongly astringent and sweetish; very dark color. The constituents of gambir extract, or cutch, are **Catechu-tannic Acid** and **Pyrocatechin**, or **Catechol**, the latter being insoluble in water; but the extract is entirely soluble in alcohol, though insoluble in ether. It is used also as a dye-stuff, as "cutch-brown."

**Therapy.**—Gambir is a valuable astringent. It may be used as a mouth-wash for spongy gums, a gargle in pharyngitis, or as an injection in gonorrhoea or leucorrhoea; but is most frequently employed in diarrhoeas of relaxation.

As the yield of gambir has become insufficient to supply the demand, the Colonial Ministry of France has entered upon the cultivation, in Fochin China, of a tree, the **Brugniera gymnorhiza** (a variety of mangrove used as a dyestuff), the bark of which yields an extract which has been found to answer all the purposes of catechu.<sup>1</sup>

**CATHA.—African Tea.** A small shrub of Northwestern Africa, used by the natives as a stimulant and temporary substitute for food. Forskall gave it the name of *Catha edulis* (Celastraceæ). The leaves are chewed like those of the *Erythroxylon coca*, and are invigorating and restorative; the decoction infusion acts like that of tea, maté, or coffee. The plant has been analyzed without detecting caffeine. Flückiger has isolated a liquid alkaloid, **Celastrine**. An alkaloid, which seems to be the active principle, has been obtained by Prof. Ugolino Mosso, of Genoa.<sup>2</sup> To this substance the discoverer has given the name of **Celastrine**. It is present in the plant in such small quantities that its exact chemical composition has not yet been determined, but it is probably related to caffeine. During a primary stage and in small doses, celastrine is stimulant to the nervous system of frogs; during a secondary stage, and in large doses it is depressant. It produces an excitant effect upon the heart of the same animal. In dogs and rabbits blood-pressure and respiration were not notably influenced, but the activity of the sympathetic nerve was modified. In his experiments Professor Mosso found celastrine fatal in amounts in which cocaine is merely excitant. In intoxication from celastrine, sensibility is preserved to the last, and convulsions are wanting. The stimulant effect of celastrine is essentially manifested upon the brain, without leaving a trace of depression or visible disturbance of function. The spinal cord, vagi nerves, and heart may share the stimulant effect, but are less powerfully affected.

In medicine, catha might be useful as an arterial and nervous stimulant in debility, and probably would afford a cheap substitute at the table for the expensive tea so largely used, if once introduced in this country.

#### **CAULOPHYLLUM.—Caulophyllum, Blue Cohosh.**

**Dose.** 1 to 2.60 Gm. (or gr. xv-xl).

#### *Preparation.*

**Fluidextractum Caulophylli.**—Fluid Extract of Caulophyllum. Dose, 1 to 2.50 Gm. (or gr. xv-xl).

<sup>1</sup> See *Journal of Chemistry and Pharmacy*, 1890, p. 313; *American Journal of Pharmacy*, 1900, p. 178.

<sup>2</sup> See *Medical Bulletin*, Aug., 1891.

**Pharmacology.**—The dried rhizome and roots of *Caulophyllum thalictroides* (Berberidaceæ), or squaw-root, a plant indigenous to this country. It contains a saponin-like glucoside, **Leontine**, and two resins. It also contains a small proportion of a feeble alkaloid, known as **Caulophyllin**.

**Therapy.**—*Caulophyllum* is emmenagogue, parturifacient, and diuretic. It has some reputation in the treatment of rheumatism. It probably has some value as an expectorant, owing to the presence of **Leontine**, which is analogous to senegin found in *Polygala senega*, and might be valuable in bronchitis and catarrhal pneumonia.

**CEDRON.**—**Cedron-seed.** The *Simaba cedron* and *S. ferruginea* (Simarubaceæ), small trees of South America, contain two bitter principles: **Cedrine** and **Cedronine**. The seeds are also known as "rattlesnake-beans."

**Therapy.**—Cedron-seed has a reputation in South America for curing malarial affections, and is largely used in derangements of the digestive organs, diarrhœa, cholera morbus, etc. It is also claimed to have decided influence over the course of hydrophobia, and is said to be of value in treating poisoned wounds, bites of venomous snakes, insects, etc. The remedy is used both topically and internally, the usual dose being 0.065 to 0.13 Gm. (or gr. i-ij); but Dr. Purple gave it in doses of 1.30 to 2 Gm. (or gr. xx-xxx) every four hours, in intermittent fever, with satisfactory results.

#### **CERA.**—Wax.

##### *Preparations.*

**Cera Alba** (U. S. P., B. P.).—White Wax (yellow wax, bleached).

**Cera Flava** (U. S. P., B. P.).—Yellow Wax.

**Ceratum** (U. S. P.).—Cerate (white wax, 30; petrolatum, 20; lard, 50).

Also enters into cerates of camphor, cantharides, spermaceti, resin, and compound resin.

**Pharmacology and Therapy.**—Yellow wax is a solid substance, prepared from the honeycomb of the bee, *Apis mellifica* (Hymenoptera). It is insoluble in water and cold alcohol, but soluble in boiling alcohol, ether, chloroform, and oils. It is a soft solid, liquefying a little above the body-temperature, and is unirritating, except mechanically, to the skin and mucous membranes. White wax is yellow wax, bleached. It is largely used to give consistency to ointments and suppositories.

**Epidermin.**—This name has been given to a new ointment base, prepared by S. Kohn by melting 15.5 Gm. (or ̄jss) of white wax and triturating it in a warm mortar with an equal quantity of powdered gum arabic until an homogeneous paste is produced. To this mass is then added a boiling mixture of 15 c.cm. (or ̄jss) each of water and glycerin, and the whole is stirred together until cold. The result is a semifluid, creamy substance which, when applied to the surface in a thin layer, forms an adherent and flexible coating. Drugs which are to be incorporated with epidermin should be previously rubbed up with glycerin.

**Cearin** is a white, rather soft ointment-base, consisting of 1 part of Carnauba wax and 4 parts of liquid paraffin. According to Issleib, it is chemically unchangeable, ointments of potassium iodide (without sodium hyposulphite) and of red mercuric oxide remaining unaltered for eight months. It will take up about 15 per cent. of water.

**CERII OXALAS** (U. S. P., B. P.).—**Cerium Oxalate** ( $\text{Ce}_2(\text{C}_2\text{O}_4)_3 + 9\text{H}_2\text{O}$ ).

**Dose,** 0.065 to 0.65 Gm. (or gr. i-x).

**Pharmacology.**—Cerium oxalate consists chiefly of a mixture of cerium, cerium, praseodymium, and lanthanum oxalates, and other rare earths of the group (U. S. P.). It is a white, granular powder, odorless and tasteless, insoluble in water or alcohol.

**Therapy.**—Sir J. Y. Simpson brought forward this remedy as one of great value in treating the vomiting of pregnancy, in which it is sometimes successful, but often fails. It is useful in controlling excessive cough in phthisis or chronic bronchitis, and in nervous disorders, chorea, epilepsy, and dysmenorrhœa. This salt occasionally proves useful in vomiting depending upon uterine disease, or even in cancer of the stomach. Cerium oxalate has been successfully employed to relieve obstinate vomiting occurring during the course of typhoid fever and phthisis. Dr. Busey prescribed it for the purpose of relieving nausea and headache produced by opium. It is a sedative to the gastric mucous membrane, and may allay the pain of gastralgia. It is beneficial in dyspepsia occasioned by depressed or deranged innervation of the stomach. The following prescriptions, containing cerium oxalate, have been employed with benefit:—

- R** Cerii oxalatis ..... 6 Gm. or ʒiiss.  
 Bismuth subnit. .... 10 Gm. or ʒiiss.  
 Spiritus chloroformi ..... 7½ c.cm. or fʒij.  
 Liquor calcis,  
 Syrup. acacie ..... aa 60 c.cm. or fʒij.  
**M** Sig.: Two teaspoonfuls in water when necessary for nausea and diarrhœa.
- R** Cerii oxalatis ..... 2.60 Gm. or gr. xl.  
 Ext. hyoseyami ..... 20 Gm. or gr. ij.  
 Ext. conii ..... 38 Gm. or gr. vj.  
 Ext. gentiane ..... 13 Gm. or gr. ij.  
**M** et ft. pil. no. xij.  
**Sig.**: A pill every four hours for nausea and vomiting, especially of pregnancy.

Cerium oxalate is also occasionally efficacious in chronic diarrhœa. It is known to be contaminated with other metals, such as arsenic, lanthanum, etc., to which some of its therapeutic effects have been attributed.

If the remedy be pure, it may be given in doses of 0.65 Gm. (or gr. x) every four hours. Failure from its use has been ascribed to the smallness of the dose which is generally prescribed. Cerium nitrate was also employed by Simpson, who regarded it as useful in irritable dyspepsia with gastrodynia and pyrosis, as well as in chronic vomiting. The dose is the same as that of the oxalate.

## CETACEUM (U. S. P., B. P.)—Spermaceti.

### Preparations.

- Unguentum Aquæ Rosæ (U. S. P., B. P.).—Rose-water Ointment.  
 Unguentum Cetacei (B. P.).—Spermaceti Ointment (spermaceti, 20 per cent.; with white wax, benzoin, and almond-oil).  
 Ceratum Cetacei.—Spermaceti Cerate (10 per cent.).

**Pharmacology.**—Spermaceti is a peculiar, concrete, fatty substance obtained from the head of *Physeter macrocephalus* (class, Mammalia; order, Cetacea), or sperm-whale. It has very little taste or odor, and can be reduced to a powder by the addition of a little alcohol. Unlike ordinary fats, it does not yield glycerin when saponified, but **Ethol**. It is almost pure

**Cetin**, or palmitate of cetyl. It is not acted upon by a boiling dilute solution of soda, and leaves no grease-spot on paper. Melting point, 50° C. (or 122° F.).

**Therapy.**—Used almost exclusively as an ingredient in ointments, although an emulsion with wax and yolk of egg is recommended as a demulcent in irritation of the bowels. The unguentum aquæ rosæ, or "cold cream," is an elegant application for excoriated surfaces and chapped hands and lips.

### **CETRARIA.**—Iceland Moss.

#### *Preparation.*

**Decoction Cetrarie.**—Decoction of Iceland Moss (5 per cent.). Dose, 30 to 120 c.cm. (or ℥i-iv).

**Pharmacology.**—The sea-weed, *Cetraria islandica* (Lichenes), is found in northern latitudes. It contains **Lichenin**, or lichen-starch (70 per cent.), which forms a mucilage when hot water is added. Lichenin is a yellowish-white powder which swells up in cold water and dissolves after eight hours' digestion in hot water. There is also cetrarin or cetraric acid, a bitter principle (about 2 per cent.), which can be removed by washing with a weak alkali. Cetrarin occurs in the form of snow-white acicular crystals. It combines with alkalies to form salts. *Cetraria* also contains small quantities of lichstearic acid. The dried plant was formerly official (U. S. P., 1890).

**Therapy.**—It has some value as a food, and its demulcent qualities have led to its use in pulmonary affections and bowel disorders in the form of decoction. In such disorders Iceland-moss jelly is an agreeable demulcent. It is made by adding to a quart of boiling water a handful of well-washed moss, the juice of two lemons, one glass of wine, and a quarter of a teaspoon of cinnamon. The moss is first soaked for an hour in a little cold water, then placed in the boiling water and allowed to simmer until dissolved. It is then sweetened, flavored, and strained into molds.

Kobert has ascertained that cetrarin increases intestinal peristalsis, augments the number of red and white blood-corpuscles, especially when they have been reduced by disease, and is a mild stimulant to the central nervous system. It may, therefore, prove of service in chlorosis attended by loss of appetite and constipation. The dose is given as 0.10 to 0.13 Gm. (or gr. iss-ij). Cetrarin, when injected into a vein, causes an increased secretion of saliva, bile, and pancreatic juice. In accordance with this action it has been beneficially employed in dyspepsia.

In Iceland, *cetraria* is esteemed prophylactic against a prevalent form of elephantiasis. Dr. Eckfeldt states that *cetraria* possesses antihæmorrhagic power and has been recommended in hæmoptysis. The powder, blown into the nostrils, will arrest epistaxis. A tincture of *cetraria* is a good application to spongy gums. The therapeutical properties of the lichens have been studied by Dr. Eckfeldt. *Rocella tinctoria* is astringent, diuretic, and a demulcent expectorant. Species of the genera *Usnea* and *Alectoria* are useful, locally and systemically, in hæmorrhoids. Among the *Parmelias*, several exert an antiperiodic influence. Reindeer-moss is a demulcent tonic, diuretic, astringent, and alterative.

**CHAULMOOGRA-OIL.**—**Chaulmoogra-oil.** The expressed oil from the seeds of *Hydnocarpus Kurzii*, and perhaps also of *Gynocardia odorata*

*Fabaceae*). The seeds contain **gynocardic acid**, also hydrocyanic acid. The oil is soluble in ether, chloroform, and alcohol.

Gynocardic acid is a yellowish, oily substance, of an acid, burning taste and distinct odor. In leprosy, chaulmoogra-oil has been used with remarkable good results, both locally and internally. When unable to cure the disease, it has in most cases delayed the progress and mitigated the symptoms. It has been positively demonstrated that, under the combined internal and external administration of chaulmoogra-oil, the bacilli present in the blood have diminished in number or actually disappeared. The remedy is given in gradually-increasing doses, but is apt to excite intolerance. Recently experiments have been made with chaulmoogra-oil in leprosy by subcutaneous injections. Tourtoulis Bey, of Cairo,<sup>1</sup> relates the case of a Copt, in whom the leprous macules appeared some three months after an attack of fever (evidently leprous fever) at the age of 15. There was no leprosy in the family history, but there were lepers in his native village. He first came under observation at the age of 35, when he presented a characteristic leprous appearance. The patient was given subcutaneous injections of chaulmoogra-oil. Tubes containing 5 c.cm. (or  $\text{f}\text{3j } \frac{1}{4}$ ) of the sterilized oil were prepared in Paris. The improvement was marked after 50 injections. Further injections of 5 c.cm. (or  $\text{f}\text{3i } \frac{1}{4}$ ) each followed, in all during 1895, 106 injections; 106 in 1896, 87 in 1897, 50 in 1898, when the patient refused to have any more, as he considered himself cured. Tourtoulis persuaded the patient to submit to 33 more injections in 1899 (first five months), so that altogether in six years he was injected 584 times, amounting to a total of 292 c.cm. (or 680 fluidrachms) of the oil. The injections were made on the outer sides of the upper and lower limbs, with a long needle introduced subcutaneously. They gave rise to but slight pain. With the usual antiseptic precautions, Tourtoulis never saw abscesses follow. The author does not wish to conclude from this single case that chaulmoogra subcutaneously will cure leprosy, as there is always the possibility of spontaneous retrogression of symptoms to be borne in mind. In the discussion on Tourtoulis's remarks (*Bull. de Derm. et de Syph.*, Paris, July 13, 1899) Hallopeau pointed out that Jeannele and he had injected chaulmoogra-oil, 10 c.cm. (or  $\text{f}\text{3ii } \frac{2}{3}$ ) a week, into the buttocks, but in one case there was a severe outbreak of nodules, and this led them to give up this mode of treatment. Du Castel had tried the subcutaneous method at Saint-Louis. Locally, it may be serviceable, combined with other ointments, in treating other skin diseases. Chronic eczema, psoriasis, and lupus are benefited by the application of an ointment containing chaulmoogra-oil. Chaulmoogra-oil has been applied with success in cases of scabies and pediculosis. The ointment has likewise been used upon the enlarged glands of scrofula and in chronic rheumatic arthritis. From 1.20 to 2 c.cm. (or  $\text{mxx-xxx}$ ) of the oil to the same of excipient is the average strength of the ointment.

<b>R</b> Zinci carbonat.		
Pulv. marante	ss	4   Gm. or 3j.
Oil chaulmoogre ( <i>tri acid. gynocardici</i> )		2   c.cm. or $\text{f}\text{3ss}$ .
Ungt. hydrarg. ammoniat.		8   Gm. or 3ij.
Aq. linae hydrosol.		15   Gm. or 3ss.

**M** et ft. ungt.

For chronic eczema, psoriasis, scrofuloderma, lupus, and lepra.

<sup>1</sup> *Annales de Derm. et de Syph.*, July, 1899.

Gynocardic acid has been used both externally and internally in leprosy, syphilis, and rheumatic affections. Its dose for internal use is from 0.03 to 0.20 Gm. (or gr. ss-ij), and externally as a local application with oil (10 per cent.).

**CHEKAN.**—Cheken. The leaves of *Myrtus chekan*, or *Eugenia chekan* (Myrtaceæ), a shrub or small tree of South America. It contains tannin and an ethereal oil; also chekenon, chekenic acid, cheken bitter, chekenetin. Of these the ethereal oil alone offers medicinal interest (Weiss). This is antiseptic, diuretic, and expectorant.

**Therapy.**—Cheken was introduced from Chili through the enterprise of Messrs. Parke, Davis & Co., as a remedy in chronic catarrhal inflammation of the respiratory passages. Dr. Murrell, of London, extols it in the winter-cough of elderly people, and in other forms of chronic bronchitis. In Chili it also enjoys a reputation in the treatment of rheumatism. The dose of the fluid extract is 4 to 11 c.cm. (or fʒi-ij).

**CHELIDONIUM.**—Chelidonium, Celandine.

**Dose,** 0.65 to 2.60 Gm. (or gr. x-xl).

**Pharmacology.**—Celandine is the dried plant of *Chelidonium majus* (Papaveraceæ), found both in Europe and North America. It contains two alkaloids, *Chelidonine* and *Sanguinarine*, in combination with *Chelidonic Acid*. A bitter, yellow, crystalline principle, *Chelidoxanthine* (Probst), is also present, besides tannic acid, starch, cellulose, etc.

**Physiological Action.**—It has a bitter, acid taste, and stimulates the secretions of the glands along the intestinal tract, including the liver. In considerable doses it causes vomiting and purging, diaphoresis, and increases the urinary secretion and also the secretions of the bronchial mucous membrane.

**Therapy.**—The fresh, milky juice may be used as a local irritant, and has been applied upon warts and corns. Internally, in doses of 0.65 Gm. (or gr. x) of the extract, it acts as a drastic purgative, and has been used in jaundice due to catarrhal swelling of the bile-ducts. Dr. Joseph Redmond claims to have had good results from chelidonium in epithelioma of the tongue and of the lip, and also in cases diagnosticated as cancer of the œsophagus and of the liver. It may also be given as a fluid extract, and a recent infusion (an ounce to the pint). Dose, 15 to 30 c.cm. (or ʒss-j).

**CHENOPODIUM.**—Chenopodium, American Wormseed.

**Dose,** 0.65 to 2.60 Gm. (or gr. x-xl).

#### *Preparation.*

*Oleum Chenopodii* (U. S. P.).—Oil of Chenopodium. Dose, 0.30 to 1.20 c.cm. (or mv-xx).

**Pharmacology.**—American wormseed is the dried ripe fruit of *Chenopodium ambrosioides*, variety *Anthelminticum* (Chenopodiaceæ), a plant of North America and Europe. It has a peculiar aromatic odor and a warm, bitter taste. Its properties are due to the presence of a peculiar volatile oil, a thin, yellowish, offensively aromatic liquid, which, when distilled, is the official oil.

**Physiological Action and Therapy.**—The volatile oil acts as a stimulant to the circulation and nervous system, making it serviceable in chorea and neurasthenia. The oil of chenopodium has been employed in hysteria. In China, chenopodium is esteemed as an aid to digestion and as an emmenagogue. Dr. Murillo regards it as an excellent carminative in the treatment of infantile colic. Its common use is for the expulsion of lumbricoid worms, and it is best given in doses of 0.60 c.cm. (or *mx*), in capsules or emulsion, three times a day, castor-oil being administered the following day; or the remedy may be administered night and morning for several days, and followed by a brisk cathartic.

*Chenopodium album*, white goose-foot, lamb's quarter, or hog-weed, a plant common in cultivated ground, and flowering in July and August, is said to possess hæmostatic properties. A tincture made from the leaves and flowers by absolute alcohol is given in the dose of 1 or 2 drops frequently repeated in acute hæmorrhage, and in the same dose, two or three times a day, for the purpose of preventing recurrence of bleeding.

**CHIMAPHILA** (U. S. P.).—*Chimaphila, Pipsissewa.* (Prince's Pine.)

*Preparation.*

*Fluidextractum Chimaphilæ* (U. S. P.).—Fluid Extract of Chimaphila. Dose, 1.25 to 8 c.cm. (or *xxx-f3ij*).

**Pharmacology.**—The dried leaves of *Chimaphila umbellata* (Ericacæ) contain tannin and a colorless, bitter, crystalline, neutral principle, *Arbutin*, and a colorless and tasteless substance, in yellow crystals, *Chimaphilin*. The dried leaves are also slightly irritating.

**Physiological Action and Therapy.**—*Pipsissewa* is diuretic and alterative. The urine is darkened by the use of this remedy. It has very little effect upon the heart or circulation. Upon the digestive organs it is tonic and astringent. As it is not an irritating diuretic, it can be used in Bright's disease and nephritis; also in hæmaturia. In lithæmia, gout, rheumatism, and kindred disorders this is a valuable remedy. As it favors elimination, it has produced good results in scrofula, skin diseases, gleet, leucorrhœa, and intermittent fever. A decoction (62 Gm. to 473 c.cm., or *ʒii-Oj*) may be used, but a good fluid extract is better.

**CHINA-ROOT.**—The rhizome of *Smilax glabra* and *Smilax China* (*Smilax*, *cn*) of China and Japan has the same constituents and properties as *Sapindus*, but is more active. It is best given in the form of fluid extract of China-root, in doses of 2 to 4 c.cm. (or *f5ss-j*), several times a day.

**CHINOIDINUM.**—*Chinoidin, Quinoidin*, is a mixture of alkaloids, mostly amorphous, obtained as a by-product in the manufacture of the crystallizable alkaloids of cinchona. (See *Cinchona*.)

*Chinoidin* possesses tonic and antiperiodic properties. It is a dark-colored substance, and is active in about double the dose of quinine, but is apt to disorder the stomach.

**CHINOLINA.**—*Chinoline, or Quinoline*, a colorless, oily liquid, darkening on exposure to light, is a constituent of coal-tar. It is prepared commercially by treating aniline or nitrobenzol with glycerin in the presence of a dehydrating agent. It may also be obtained by the distillation of qui-

nine, cinchonine, and strychnine with potassium. The odor recalls that of nitrobenzol. It is slightly soluble in water, and the solution possesses a pungent taste. Chinoline is readily soluble in alcohol, ether, and chloroform. It is a hygroscopic substance.

In its chemical characters it is so closely related to quinine as to lead to its substitution in medicine. Dr. Julius Donath claims that its physiological and therapeutic effects are also identical with the natural alkaloid. The tartrate is the salt chiefly used, which is in shining, silky crystals, with penetrating odor and pungent taste, permanent in air, and soluble in water. It is slightly soluble in alcohol; insoluble in ether and chloroform. The free base is highly irritant to the gastric mucous membrane. A salicylate has also been prepared.

**Physiological Action and Therapy.**—Chinoline is a valuable antiseptic, but its offensive odor has prevented its application in this direction in medicine; however, it is believed that much of this objection can be removed by better modes of preparation. If it could be obtained without odor or taste, it would be a valuable agent for the preservation of food. The tartrate and salicylate are also powerful antizymotics. Internally, these salts are antipyretic and antiperiodic, in doses rather larger than those given of quinine (2 Gm., or 3ss, daily, for adults).

It may be given to children in peppermint-water, or syrup and distilled water, or to adults in capsules or wafers. Neuralgia dependent upon a malarial taint is often relieved by chinoline tartrate. In zymotic diseases, other than malarial, chinoline has not proved satisfactory as an antipyretic, because it has been found to be too depressing in its effects upon the heart. As a topical application in diphtheria, it may be diluted with alcohol (2 per cent.) and used with a spray, or painted on with a brush, to the affected part. A solution of the tartrate ( $\frac{1}{2}$  to 1 per cent.) has been used as an injection for gonorrhœa.

**Analgen, or Labordin,** is a derivative of chinoline. It is a white, crystalline powder, insoluble in water, soluble in hot alcohol and in acids. It is ortho-ethoxy-*ana*-mono-benzoyl-amido-quinoline. It has been used with success in neuralgia and has alleviated rheumatic pains. In some cases it causes the urine to assume a dark-red color. This tint is due to a change which analgen undergoes in the organism. The molecule may be entirely destroyed or the benzoyl group which enters into its composition may be separated with complete oxidation of the residue. In the latter event the urine is reddened by the action of the free amido produced in the uric acid. Dose is from 0.50 to 1 Gm. (or gr. viii-xv).

**CHINOSOL.**—Chinosol is described by the manufacturers as a neutral compound of oxychinoline. It is a bright-yellow, crystalline powder, readily soluble in water, not caustic or corrosive, and is said to be non-toxic. It does not coagulate albumin. It is very readily precipitated by alkalis. It has a slightly-aromatic odor and an astringent taste like carbolic acid. It stains the hands yellow; but the color is readily removed by fresh water. It is reported to be forty times more active in checking fermentation than carbolic acid. Chemically, it is oxy-quinoline-potassium sulphate. ( $C_9H_7N,OSO_3K + H_2O$ ).

**Physiological Action and Therapy.**—Chinosol is antiseptic, disinfectant, deodorant, and bactericide. Professors Emmerich and Kossmann, of

Mannich, have used it in surgical work, and prefer it to corrosive sublimate or carbolic acid. Bonnema<sup>1</sup> says that chinisol combines large antiseptic powers with a relatively small power of doing harm. In frogs chinisol showed itself to be a central poison; but he administered to a rabbit 1 Gm. (or gr. xv) by the mouth and one and one-quarter hours later another dose of 5 Gm. (or gr. xxx) without any bad effect. It has a deterrent action upon the coagulation of albumin, and hinders the conversion of albuminoids into peptones. Internally, it has been used with some success in pulmonary tuberculosis. Dr. Alexander MacGregor, of London, reports clinically on six cases, and states that, from the observations which he has been able to make, he is convinced that it is a valuable drug in the treatment of this affection.<sup>2</sup>

**CHIRATA** (U. S. P., B. P.).—**Chirata** (*Chiretta*).

**Dose.** 1 to 2 Gm. (or gr. xv-xxx).

*Preparations.*

**Fluidextractum Chiratæ** (U. S. P.).—Fluid Extract of Chirata. Dose, 0.60 to 2 ccm. (or ℥ss-xxx).

**Tinctura Chiratæ** (B. P.).—Tincture of Chirata (10 per cent.). Dose, 4 to 7.5 ccm. (or ℥iij).

**Liquor Chiratæ Concentratus** (B. P.).—Concentrated Solution of Chiretta. Dose, 2 to 4 ccm. (or ℥ss-j).

**Infusum Chiratæ** (B. P.).—Infusion of Chiretta (5 per cent.). Dose, 15 to 30 ccm. (or ℥ss-j).

**Pharmacology.**—The entire plant, *Swertia Chirata* (*Gentianæ*), of India, is used as a bitter aromatic tonic in the East, but rarely prescribed in this country or England. It contains two amorphous principles, **Ophelio Acid** and **Chiratin** (Höhn), but no tannin.

**Therapy.**—Chirata resembles gentian very closely, to which it is allied botanically, but it is more bitter. It has similar therapeutic applications in atonic dyspepsia, etc. Chirata may often be very serviceably combined with camoth subnitrate, or with hydrochloric acid, for the relief of the sick stomach of drunkards. It is useful in functional inactivity of the liver. By its action on the liver it indirectly overcomes constipation. As it contains no tannic acid, chirata can be prescribed in combination with iron, if desired.

**CHLORALFORMAMIDUM** (U. S. P.), or **Chloralformamide**, or **Chloral-amide**, formula  $\text{CCl}_3\text{CH}(\text{OH})\text{NH}(\text{HCO})$ , is formed by the direct union of formamide, and anhydrous chloral. It is made up of white, granular crystals, which melt at 230° F., and are soluble in water and alcohol. Hot water must not be used in making solutions, as the substance is destroyed above 140° F. It is decomposed by caustic alkalies and alkaline carbonates. Its melting-point is 114° F.; at higher temperatures chloral is liberated. The dose of chloralformamide is 1 to 2.6 Gm. (or gr. xv-xl). It may be given in capsules or cachets, but a much better method of administration is to dissolve it in a portion of wine, whisky, or brandy. Its best effects are obtained when exhibited an hour or an hour and a half before bed-time.

**Physiological Action.**—Chloralformamide is free from local irritant properties. It has but a slight taste and exerts little or no deleterious influ-

<sup>1</sup> *Therapeutische Monatshefte*, Dec., 1896.

<sup>2</sup> *London Lancet*, vol. ii for 1899, p. 90.

ence upon digestion. It has been given for months continuously without causing any decrease of the bodily weight. The compound has no action upon the bowels or kidneys. According to the testimony of most observers, it exerts little or no depressant influence upon the circulation. Langgaard and Mairat and Bosc, however, state that it reduces blood-pressure, and enjoin caution in its use when organic heart disease exists. Chloralformamide is thought to have a stimulating effect upon the respiratory centre. The chief physiological action of this agent is that of an hypnotic. Sleep is often produced within half an hour after its administration. Sometimes drowsiness continues upon the following day. Large doses have occasionally produced headache, vertigo, sickness of the stomach, thirst, incoherence, and cardiac depression.

Dr. Pye-Smith has reported a case in which 5.20 Gm. (or gr. lxxx) of chloralformamide given in two equal portions at eight hours' interval, gave rise to severe universal dermatitis followed by profuse desquamation. There was fever which lasted a week, and the urine was slightly albuminous.

**Therapy.**—Chloralformamide is principally employed in the treatment of insomnia, especially when due to nervousness, neurasthenia, hysteria, or chronic alcoholism. It has been beneficially used as an adjuvant in epilepsy, and is of value in relieving the paroxysms of cardiac asthma. So far as has yet been observed, the existence of organic disease of the heart is no positive contra-indication to its employment. The effects of chloralformamide, like those of every active drug, require to be carefully watched. Dr. W. Hale White has given it with advantage in several cases of cardiac valvular disease. As a rule, chloralformamide will not overcome sleeplessness caused by pain, though in a number of instances it has succeeded in carcinoma, rheumatism, neuralgia, alcoholic neuritis, herpes zoster, and dysmenorrhœa.

Chloralformamide is efficacious in bronchial asthma, emphysema, pleurisy, and pulmonary tuberculosis by causing sleep, and, consequently, preserving strength. It has, moreover, been successful in overcoming wakefulness attendant upon cirrhosis of the liver, ulcer of the stomach, nephritis, and pelvic disorders. It has likewise, in the same manner, been of service in typhoid fever, erysipelas, and diabetes. This remedy has also a sphere of usefulness in nervous and mental disorders. It is most useful in melancholia and chronic mania. In acute mania, and progressive paralysis, it often fails. It is of service in idiocy with hallucinations, acute and chronic paranoia, periodic psychoses, and multiple neuritis. Chloralformamide is of service in senile dementia, but is useless in cases where excitement is a prominent feature.

In the cerebral disturbances of children it answers a very good purpose, and it has been given with good effect in acute simple meningitis. Dr. Alt, of Halle, has obtained satisfactory results from using chloralformamide in chorea, and Dr. Hexamer, of Stamford, Conn., employed it successfully in alcoholic tremor. As an hypnotic and sedative it is beneficial in whooping-cough, influenza, laryngismus stridulus, and persistent tinnitus aurium. A solution containing 2 Gm. (or gr. xxx) each of chloralformamide and potassium bromide to the ounce is known under the name of **chlorobrom** and is highly recommended by Professor Charteris and others as serviceable in cases of seasickness. It has also been found of value in obstinate vomiting from other causes.

**CHLORALUM HYDRATUM.**—Hydrated Chloral.**CHLORAL HYDRAS** (B. P.).—Chloral Hydrate ( $C_2HCl_3O + H_2O$ ).**Dose**, 0.13 to 1.30 Gm. (or gr. ii-xx).*Preparation.***Syrupus Chloral** (B. P.).—Syrup of Chloral (0.65 Gm. in 4 c.cm., or gr. x in f3j).  
*Dose*, 2 to 7.5 c.cm. (or f3ss-ij).

**Pharmacology.**—Chloral hydrate is a crystalline solid, composed of chloraldehyde, or chloral, with one molecule of water. It is in colorless, transparent crystals; of bitterish, caustic taste; of ethereal, but slightly-acrid odor; soluble in water and in alcohol. Pure hydrate of chloral should be of a neutral reaction. The crystals volatilize slowly at ordinary temperatures, and should be kept in a tightly-stoppered bottle; they melt at  $135^{\circ}$  F. and boil at  $208^{\circ}$  F., and are at the same time decomposed into anhydrous chloral and water. Chloral for medical purposes should be recrystallized, and the crystals should be dry, and not readily attract moisture from the air. If concentrated sulphuric acid be added to chloral it is converted into a white, solid substance having the same composition as chloral, but not soluble in water. Chloral also combines with alcohol to form crystals of alcoholate of chloral, which are less soluble than hydrate of chloral. When triturated with camphor, menthol, thymol, or crystals of carbolic acid, hydrate of chloral forms a permanent, oily liquid. In contact with iron, even in small quantities, crystals of chloral-hydrate acquire a peculiar yellow discoloration in consequence of the liberation of free hydrochloric acid.

**Physiological Action and Poisoning.**—Chloral hydrate is antiseptic and sedative, although slight irritation may occur at first. It is an hypnotic, causing sleep by producing an anæmic condition of the brain, the patient waking after several hours as from natural sleep. Unpleasant after-effects are occasionally observed. The reflex activity of the spinal centres is weakened, and this, extending to the medulla, causes paralysis of the respiratory centre. No effect is seen upon the sensory nerves, but the motor nerves are gradually affected, muscular weakness being one of the prominent phenomena attending chronic chloral poisoning. Chloral acts powerfully upon the heart, lowering and weakening its rate of movement through a local influence upon the ganglion and muscle. With this there is lowering of arterial pressure, aided by dilatation of the superficial vessels. When death is caused by chloral, the heart is arrested in diastole. The decided fall in the bodily temperature is probably secondary to the cooling of the blood by dilatation of the cutaneous blood-vessels. Dyspnoea may be produced by engorgement of the lungs, due to the weakened cardiac action and to the local enlargement of the pulmonary vessels. Death is produced by respiratory failure usually, although it occurs sometimes with such suddenness as to lead to the supposition that it is due to syncope from direct action upon the heart.

In a few cases, death appears to be due to some deleterious action upon the blood, resembling scurvy, as purpuric and scorbutic eruptions occur, with hæmorrhage, ulcerated gums, great prostration, and collapse. We treat the first cases of cases of gradual respiratory failure, by artificial respiration and the administration of stimulants externally, by friction, local warmth, and sinapisms, and internally by hot coffee, and artificial respiration, galvanism, etc.,

and also physiological antidotes, such as atropine and strychnine. Dr. Colenso recently reported to the London Clinical Society, a case of recovery from chloral poisoning in consequence of the use of atropine and strychnine hypodermically. In the second class of cases, unfortunately, death occurs too quickly for the action of remedies; but hypodermic injections of ether, atropine, or strychnine, with evacuation of the stomach by the pump and the introduction of hot alcoholic stimulants, might be serviceable in saving life. In the third class of cases transfusion of blood might be required, or the administration of large doses of the tincture of ferric chloride. There is a remarkable variation as regards the quantity capable of producing a fatal effect. Cases are on record in which from 15.5 Gm. (or  $\text{℥ss}$ ) to 31 Gm. (or  $\text{℥j}$ ) produced alarming symptoms, though recovery took place. On the contrary, death has been caused by a single dose of 2 Gm. (or gr. xxx). Chronic chloralism—presenting symptoms of muscular weakness or paralysis, moral perversion, feeble heart, epileptiform convulsions, and delirium tremens—is relieved by prompt removal of the drug and the administration of tonics, especially *nux vomica* or strychnine. Animals poisoned with chloral hydrate recover if they are kept warm. In some cases an erythematous rash follows the administration of chloral, and desquamation of skin from the fingers around the extremities has been noticed. Other cutaneous manifestations which have been noticed in consequence of the administration of chloral are wheals, papules, vesicles, pustules, petechiæ, and ulceration. Toxic doses have been followed by symptoms of purpura hæmorrhagica.

An eruption from chloral is especially apt to occur in children, in weak and cachectic patients, and in those who suffer from disease of the nervous system, as hysteria, chorea, myelitis, or general paralysis. The commonest cause of such a rash, however, is the ingestion of alcohol at the same time with chloral.

This substance is removed from the system principally by the kidneys; it also escapes by the breath, to which it gives a peculiar odor. In large amounts chloral is irritant to the kidneys, may excite nephritis, and cause the passage of bloody urine.

It is probable that some of the serious effects following the administration of chloral are properly attributable to impurities in the drug. If the crystals have a pungent, acrid odor, they should not be used; recrystallized chloral hydrate should be preferred for medical use. Where the heart is seriously affected and its walls are thin and weak, chloral, as a rule, should not be given. It is also dangerous to use it freely in alcoholic subjects. According to the experiments of MM. Cadéac and Malet upon dogs, morphine administered by the stomach and soon followed by a rectal injection of chloral produces complete anæsthesia, which continues for more than half an hour.

**Therapy.**—The antiseptic action of chloral is utilized in surgery, where 5-per-cent. solutions are used as stimulating dressings for suppurating wounds and foul ulcers. This solution also may be applied to parasitic skin affections (*tinea versicolor*). It is also used to check itching in eczema and prurigo. In urticaria Quinquaud uses a lotion containing 30 parts of boric acid, 5 parts of chloral hydrate, and 180 parts of distilled water. Dr. Marc Sée is in the habit of using an ounce of a 10-per-cent. solution for injection into the sac of an hydrocele after the fluid has been evacuated. In two or three days a large effusion takes place, but is soon absorbed. The same solu-

can may be advantageously injected into the neighborhood of varicose veins. The blood gradually coagulates and the vessels contract. Dr. J. Palvy, from his experience in fifteen cases, believes that the injection per rectum of a solution containing from 1 to 1.60 Gm. (or gr. xv-xxv) of chloral-hydrate is an efficient remedy in hæmoptysis. In combination with other remedies, it is used as an anodyne and counter-irritant in neuralgia and rheumatism:—

R Chlorali hydrati	8	Gm. or 3ij.
Lin. saponis	120	c.cm. or fʒiv.—M.

For application to pleurodynia, lumbago, etc., the combination of chloral and camphor may be used:—

R Camphoræ,		
Chloral hydrati	aa 4	Gm. or 3j.
Misc et adde:—		
Adipis lane hydrosi	3i	Gm. or ʒj.
M. For neuralgia.		

Mr. Lennox Browne praises the virtue of a mixture of equal parts of chloral hydrate and camphor as an application in neuralgia. The mixture forms a clear fluid, which is applied over the affected part. He has found it of great service in neuralgia of the larynx and in relieving spasmodic cough and toothache. Chloral is useful in trismus nascentium, the cramps to which pregnant women are often subject, singultus, and spasmodic and nocturnal epuresis. Dr. Lyon Playfair recommends chloral for the purpose of relieving the pain of parturition. It may be administered either by the mouth or rectum, and it is asserted that two or at most four doses of 1 Gm. (or gr. xv) each at intervals of twenty minutes minimize suffering without weakening the energy of the uterine contractions. This remedy has also been used in cases of rigidity of the os uteri. In spasmodic croup Holt advises:—

R Chlorali hydrati	5	Gm. or gr lxxv.
Potassii bromidi	3	Gm. or gr. xlv.
Anemonii bromidi	2	Gm. or ʒss.
Aque cinnamomi	60	c.cm. or fʒij.

M. Sig.: Of this the dose for a child about seven years of age is one teaspoonful, to be repeated in twenty minutes if not relieved.

In diphtheria a gargle of 2-per-cent., followed by application of a 20-per-cent. solution is said to cause prompt disappearance of the false membranes.

Two or three grains of chloral to the ounce of water (0.13 to 0.20 Gm. or 30 c.cm.) has been successfully used as an injection in gonorrhœa. Garretson employed the following combination, containing chloral, with good effect, as an injection in gonorrhœa:—

R Chlorali hydrati		
Plumbi acetatis	aa 150	Gm. or gr. viij.
Aque dest.	240	c.cm. or fʒviij.—M.

The principal symptom for which chloral is prescribed is insomnia from mental overwork, or occurring during the course of typhus or typhoid, or delirium tremens, in phthisis, or in the aged. In acute mania, especially that caused by alcohol, very large doses have been followed by the best effects.

When injected (4 to 8 Gm., or 5i-ij) into a vein, general anæsthesia is produced; but this method has no special advantage, and presents some decided disadvantages. The restlessness and insomnia present in general paralysis of the insane are allayed by the administration of this remedy, and it is also beneficial in spasmodic affections, chorea, whooping-cough, asthma, uterine pains, and tetanus. A dose of chloral at bed-time is useful in paralysis agitans, and may be able to ward off an attack of nocturnal epilepsy. Chloral affords relief in laryngismus stridulus. The hypodermic injection of 0.32 to 0.65 Gm. (or gr. v-x) of chloral-hydrate, in combination with 0.008 to 0.015 Gm. (or gr.  $\frac{1}{8}$ - $\frac{1}{4}$ ) of morphine sulphate, is highly recommended in cholera morbus attended with collapse, and in the algid stage of Asiatic cholera. If the patient cannot be made to swallow, an emulsion may be prepared with egg containing 4 to 8 Gm. (or 5i-ij) of chloral, and given per enema. This drug also acts as an antidote in cases of poisoning from physostigma, picrotoxin, and strychnine. If, on account of spasm, the patient cannot swallow, the antidote may be serviceably administered by the rectum.

In cases of undue arterial excitement, during the early stage of pneumonia, in overaction of an hypertrophied heart, or in the increased arterial tension of Bright's disease, chloral judiciously used may be of service. It is given with much benefit to allay the discomfort of seasickness. In congestive headache with insomnia a combination like the following is advantageous:—

R Chlorali hydrati	4	Gm. or 3j.
Morphinæ hydrobromat.	0.065	Gm. or gr. j.
Aquæ camphoræ	60	c.cm. or f℥ij.

M. Sig.: A dessertspoonful every two hours until relieved.

It has been found useful in scarlet fever by Wilson, who gives 0.065 to 0.13 Gm. (or gr. i-ij) in a little syrup of lactucarium and water every two or three hours for a child five years of age. Sir Benjamin Ward Richardson esteems chloral as a valuable antipyretic in typhoid fever. In tetanus 0.65 to 1.30 Gm. (or gr. x-xx) should be given every hour or two, according to the gravity of the case, gradually lengthening the intervals and afterward reducing the dose. In convulsions after labor, an enema containing 4 Gm. (or 5j) of chloral should be thrown into the rectum, or 2 to 2.60 Gm. (or gr. xxx-xl) given by the mouth. Dr. Deshages, of Orleans, advocates the hypodermic injection of chloral in puerperal eclampsia and also in convulsions from other causes. In the convulsions of children it is a very prompt and efficient remedy. For restlessness and insomnia chloral may be very advantageously prescribed with potassium bromide, as:—

R Chlorali hydrati	12	Gm. or 3iij.
Potassii bromidi	19.5	Gm. or 3v.
Syrupi lactucarii,		
Syrupi aurantii	aa 60	c.cm. or f℥ij.

M. Sig.: A dessertspoonful at bed-time.

Gioffredi recommends chloral hydrate to be used as an antidote in cocaine poisoning, giving doses of 3 to 4 Gm. (or gr. xlv-5j).

For the relief of night-sweats of phthisis, 4 Gm. (or 5j) may be dissolved in 90 c.cm. (or f℥ij) of dilute bathing-whisky and the patient's skin bathed with it. This is also a good application to prevent bed-sores.

The compounds of chloral with camphor, salicylic acid, and with car-

lactic acid are useful as antiseptics, especially the latter, which is free from unpleasant odor and is anodyne as well as antiseptic.

The unpleasant taste of chloral hydrate may be overcome by mixing its solution with lemonade.

**Butyl-chloral-hydrate** (B. P.), chloral-butylieum, or croton-chloral (dose, 0.13 to 1.30 Gm., or gr. ii-xx), is obtained by the action of chlorine upon acetic aldehyde and collected by distillation. It is the hydrate of trichlorobutyraldehyde, and is in the form of white, shining, crystalline scales, having a pungent smell and a disagreeable, acrid taste. Butyl-chloral-hydrate is soluble in alcohol, ether, glycerin, and hot water. The action is like that of chloral, but said to be less depressing to the circulation and heart. It is more anodyne, and is especially useful in neuralgia. In neuralgia of the face 0.32 Gm. (or gr. v) is given every half-hour. Liebreich, who was the discoverer of this drug, praises it as an hypnotic in doses of 1 to 2 Gm. (or gr. ix-xxx). Croton-chloral gives relief in headache due to eyestrain, and Ringer has found it very beneficial in migraine. It has also proved serviceable in dysmenorrhœa.

The following combination is recommended in neuralgia:—

R Butyl-chloral hydrat. ....	8	Gm. or 3ij.
Alcoholis .....	7½	c.cm. or f3ij.
Elix. guaranæ .....	90	c.cm. or f3iij.

M Sig.: A teaspoonful every half-hour or hour.

A mixture of butyl-chloral and tincture of camphor is recommended as a topical application in neuralgia.

The following formula has been published as of service in migraine:—

R Butyl-chloral hydrat. ....	1	Gm. or gr. xv.
Tr. gelsemii .....	2	c.cm. or mxxx.
Tr. cannabis Ind .....	1	c.cm. or mxxv.
Glycerin .....	15	c.cm. or f3ss.
Aque .....	q. s. ad 90	c.cm. or f3iij.

M Sig.: A third to be taken at once. The dose to be repeated in half an hour.

It may also be administered in the form of a solution containing 10 parts of butyl-chloral and 20 parts of glycerin to 120 parts of distilled water.

From experiments upon frogs Grigorescu states that butyl-chloral is an energetic physiological antidote to strychnine.

**Chloral-caffeine.**—A molecular combination of chloral with caffeine presents itself in the form of white, shining crystalline scales, easily soluble in cold water. Professor Ewald, of Berlin, has used chloral-caffeine subcutaneously in single doses of 0.20 to 0.28 Gm. (or gr. iii-ivss), or in daily doses of 0.38 to 0.87 Gm. (or gr. vi-xxiiss). The injections ordinarily occasion but little pain. Relief was afforded by this method of treatment in inflammatory rheumatism, sciatica, emphysema, and nephritis. It was also found of service in chronic constipation.

**Dormiol** is a combination of chloral hydrate with amylene hydrate in equal molecular proportion. It is a colorless oily fluid of a camphoraceous odor, and of a peculiar, though not unpleasantly, pungent taste. Dr. G. Sachs, the originator of this combination, finds it less liable to cause toxic effects than chloral by itself, "about 24 per cent. more of chloral in the form of dormiol being borne than when taken as uncombined chloral hydrate." He draws the conclusion that the lesser toxicity of the combination is referable to the gradual occurrence and slow progress of disunion of the prepa-

ration. Dr. J. Arnold Goldmann, of Vienna,<sup>1</sup> reports the use of dormiol in twenty-four cases, principally for its hypnotic effect. He found it to have a prompt and reliable hypnotic action and also an undeniable sedative effect, that it can be depended upon to manifest its action in relatively small initial doses of 0.37 c.cm. (or *mvj*); that larger doses, often up to 2 to 3 c.cm. (or *mxxx-xlv*), employed occasionally in individual cases, have no evil consequences. It is said to have no cumulative action, and its long-continued use gives rise to no tolerance. He also found that 0.75 c.cm. (or *mxij*) of dormiol, given with 60 c.cm. (or *f̄ij*) of gum mixture, as an enema, produced a perfectly satisfactory hypnotic action, the sleep lasting between five and seven hours in a case of a man, 54 years of age, suffering with cancer of the stomach. By the mouth it may be given in capsules of 0.5 c.cm. (or *mvij*) each. One capsule at night is usually sufficient, but in cases of much excitement, such as hysteria, he gave 3 capsules three times a day with only good results.

**CHLORALOSE.**—Chloralose (Anhydro-gluco-chloral) is produced by the action of anhydrous chloral on glucose. It crystallizes in fine needles, is very bitter to the taste, readily soluble in hot water, but dissolves with difficulty in cold water. In the process of manufacture a second substance results. This is known as **Parachloralose**, and crystallizes in the form of fine, pearly lamellæ, which melt at 229° C. (412.2° F.). The melting-point of chloralose is given as 184° to 186° C. (363.2° to 366.8° F.).

**Physiological Action.**—According to the experiments of Prof. Ch. Richet and Dr. Hanriot, chloralose has a marked hypnotic effect upon dogs, when given in small doses. In large quantities it is toxic. Chloralose stimulates the spinal cord. Reflex action is not diminished, but may even be exaggerated. It is claimed that, even in large doses, chloralose causes no diminution of arterial pressure. Temperature is reduced from one-fifth to three-quarters of a degree. Chloralose is said to produce an increased excretion of urea and chlorides.

**Therapy.**—From 0.20 to 0.38 Gm. (or gr. iii-vj) occasioned a dreamless and refreshing sleep, which was not followed by nausea or headache. It was administered advantageously in some cases where chloral and morphine had been badly borne. Sleep is generally produced in half an hour after administration of the drug, is tranquil, and unaccompanied by perspiration. Féré has given chloralose in doses from 0.75 to 1.50 Gm. (or gr. xii-xxiv) without ill effects. The effect is maintained from four to ten hours. Large doses have been known to cause flushing of the face, tremors, epileptiform convulsions, headache, uncertainty of speech, and urticaria. A number of cases, however, have occurred in which doses of 0.20 to 0.38 Gm. (or gr. iii-vj) occasioned convulsions or cataleptic symptoms, while cyanosis with collapse has also been observed as the result of moderate amounts. Hysterical individuals are particularly susceptible to its influence. According to Flemming, chloralose is of benefit in functional insomnia and in that due to psychical excitement, hysteria, neurasthenia, overwork, and functional cardiac irritability. He found it of service also in attacks of epilepsy and somnambulism, but states that it fails in wakefulness dependent upon alco-

<sup>1</sup> *Merck's Archives*, Oct., 1900.

boke excitement, multiple neuritis, and any painful organic lesion or peripheral irritation.

In cases of insanity, without excitement, it produces sleep; when excitement is present it will usually act as a sedative, and, at least in some instances, is capable of banishing hallucinations. Dr. J. Sacaze has observed a suppression of night-sweats produced by the administration of chloralose in phthisis. In hectic fever he has used with advantage a combination of quinine and chloralose. This writer has also found chloralose of service in other chronic pulmonary affections, such as chronic bronchitis with bronchiectasis and fetid secretion, accompanied by copious perspiration.

**Parachloralose** has been thought to possess hypnotic properties, but, according to the experiments of M. Richet, it is an almost inactive body with neither toxic nor therapeutic effect.

**CHLORETONE.**—This is the trade designation of tri-chlor-butyl alcohol (arcton-chloroform). It is formed by slowly adding equal weights of chloroform and acetone to caustic potash, and is isolated by distillation. It is a white, crystalline solid having a camphoraceous odor. It is sparingly soluble in cold water (1 per cent.), but freely soluble in strong alcohol, chloroform, ether, and glacial acetic acid. Its solutions are antiseptic. Chloretone is a local anæsthetic, resembling cocaine, especially as a substitute in infiltration anæsthesia. On the central nervous system it acts as an anæsthetic and hypnotic, without depressing the nerve-centres. Doses of 0.20 to 0.65 Gm. (or gr. iii-x) in tablet, capsule, or elixir, given at night, quiet nervousness and induce sleep. Dr. Freeman F. Ward has also found it to be of great service in quieting the irritation caused by hyperacidity of the stomach of nervous origin. He stated that it also acted well in whooping-cough, giving one or two doses during the night, of 0.13 Gm. (or gr. ij) dissolved in a little brandy. It is also used in acute alcoholism and in seasickness. In cerebrospinal fever, it has been used for spinal injection. Dr. L. S. De Forest, of New Haven, Conn., after withdrawing from 30 to 50 ccm. of spinal fluid, introduced 15 to 35 c.cm. of chloretone solution (5 grains in 2 pints).<sup>1</sup>

**CHLOROFORMUM** (U. S. P., B. P.).—Chloroform, Trichloromethane ( $\text{CHCl}_3$ ).

#### *Preparations.*

**Emulsio Chloroformi** (U. S. P.).—Emulsion of Chloroform (chloroform, 4 c.cm.; expressed oil of almond, 6 c.cm.; tragacanth, 1.5 Gm.; water q. s. ad 100 c.cm.). Dose, 4 to 7.5 c.cm. (or f3i-ij).

**Spiritus Chloroformi** (U. S. P., B. P.).—Spirit of Chloroform (6 per cent., U. S. P.; 4 per cent., B. P.). Dose, 2 to 4 c.cm. (or f3ss-j). (For repeated administration, 0.30 to 1.20 c.cm., or mv-xx, B. P.)

**Linimentum Chloroformi** (U. S. P., B. P.).—Chloroform Liniment (U. S. P. contains chloroform, 30 c.cm.; soap-liniment, 70 c.cm.; B. P. contains chloroform, 50 c.cm.; tincture of camphor, 50 c.cm.).

**Aqua Chloroformi** (U. S. P., B. P.).—Chloroform-water. Dose, 4 to 15 c.cm. (or G℥iv).

**Tinctura Chloroformi et Morphine Composita** (B. P.).—Compound Tincture of Chloroform and Morphine (chloroform, 75; morphine hydrochloride, 10; diluted hydrocyanic acid, 50; tincture of capsicum, 25; tincture of Indian hemp, 100; oil of pepper-mint, 1 $\frac{1}{2}$ ; glycerin, 250; alcohol q. s. ad 1000). Dose, 0.30 to 1 c.cm. (or mv-xvi). In each 0.60 c.cm. (or mx) there is 0.05 c.cm. (or m $\frac{1}{2}$ %) of chloroform, 0.03 c.cm. (or

<sup>1</sup> *Journal American Medical Association*, Dec. 16, 1905.

mas) of diluted hydrocyanic acid, and 0.0055 c.cm. (or gr.  $\frac{1}{11}$ ) of morphine hydrochloride.

*Mistura Chloroformi et Cannabis Indicæ Composita* (N. F.).—Compound Mixture of Chloroform and Cannabis Indica (chloroform anodyne) (chloroform, 125 c.cm. [or  $\mathfrak{J}\text{iv}$ ]; ether, 35 c.cm. [or  $\mathfrak{J}\text{ix}$ ]; tincture of cannabis Indica, 125 c.cm. [or  $\mathfrak{J}\text{iv}$ ]; tincture of capsicum, 65 c.cm. [or  $\mathfrak{J}\text{ij}$ ]; morphine sulphatis, 2.5 Gm. [or gr. xxxvii]; oil of peppermint, 2 c.cm. [or mxxx]; glycerin, 125 c.cm. [or  $\mathfrak{J}\text{iv}$ ]; water, 65 c.cm. [or  $\mathfrak{J}\text{ijmxxl}$ ]; alcohol, q. s. ad 1000 (or 2 pints).) Each fluid drachm represents about  $7\frac{1}{2}$  minims of chloroform,  $7\frac{1}{2}$  minims of tincture of cannabis Indica,  $3\frac{1}{2}$  minims of tincture of capsicum, and  $\frac{1}{4}$  of a grain of morphine sulphate. This preparation is sometimes called "Chlorodyne" (a trade name).

**Pharmacology.**—Commercial chloroform is impure, only containing 98 per cent. of chloroform, and is used solely for pharmaceutical purposes, as a solvent, or for external application. Official chloroform is a purified chloroform, prepared especially for medical purposes. It is "a liquid consisting of 99 to 99.4 per cent., by weight, of absolute chloroform and 0.6 to 1 per cent. of alcohol." It is a heavy, clear, colorless, diffusive liquid; of a characteristic, pleasant, ethereal odor; a burning, sweet taste; and a neutral reaction. It is obtained by adding chloral hydrate to an alkaline solution, or by the action of chlorinated lime upon ethyl-oxide, or alcohol, and distillation. It is afterward purified by the addition of sulphuric acid, sodium carbonate, and lime, and redistillation. Chloroform is only sparingly soluble in water, but mixes with alcohol and ether in all proportions. It is itself a remarkable solvent, dissolving most alkaloids, resins, gutta-percha, caoutchouc, paraffin, iodine, bromine, fixed and volatile oils, etc. Chloroform is not inflammable, but when mixed with alcohol it may be burned, and chlorine-gas will be evolved. Richardson, of London, has shown that chloroform-vapor, in the presence of a naked flame, is decomposed, forming irritant compounds largely of hydrochloric acid. The accumulation of the fumes in the atmosphere may be sufficient to produce bronchial inflammation. Chloroform-vapor is much denser than atmospheric air, and diffuses slowly. Chloroform is unfit for anæsthetic purposes unless it be absolutely pure and fulfills the tests of the pharmacopœias. "If 5 cubic centimetres (mlxxx) of purified chloroform be thoroughly agitated with 10 cubic centimetres (mcl) of distilled water, the latter, when separated, should not affect blue litmus-paper (absence of acids), nor test-solution of silver nitrate (absence of chlorides), nor test-solution of potassium iodide (absence of free chlorine). If a portion be digested, warm, with solution of potassa, the latter should not become dark colored (absence of aldehyde). On shaking 10 cubic centimetres (mcl) of the chloroform with 5 cubic centimetres (mlxxx) of sulphuric acid in a glass-stoppered bottle, and allowing them to remain in contact for twenty-four hours, no color should be imparted to either liquid. If a few cubic centimetres be permitted to evaporate from blotting-paper, no foreign odor should be perceptible after the odor of the chloroform ceases to be recognized." The purified chloroform contains about 0.6 to 1 per cent. of alcohol. It must be kept in glass-stoppered bottles in a cool and dark place.

At the suggestion of Professor Liebreich, M. Pictet, of Geneva, has applied his process for the liquefaction of gases to the production of absolute chloroform. At 70° C. (158° F.) a crystalline body separates from liquid chloroform. The fluid, from which the crystals have been removed, re-crystallizes somewhat below 100° C. (212° F.) and the second crystallization represents absolute chloroform. At 15° C. (59° F.) the purified compound

has a specific gravity of 1.51 and is said to be perfectly stable without the addition of alcohol. It has not yet been demonstrated as certain, however, that the Pictet process is superior to the methods of purification heretofore employed. The decomposition of chloroform under the influence of light and air is regarded by some chemists as a natural characteristic of the fluid, and not due to the presence of impurities. It has, in fact, been demonstrated that, without the addition of 1 per cent. of alcohol, Pictet's chloroform undergoes decomposition, and that no sensible difference exists between this and any other well-purified product.

Chloroform was discovered in 1831 by Mr. Samuel Guthrie, of Sackett's Harbor, N. Y., and about the same time by Soubeiran in France, and Liebig in Germany. It was first used as an anæsthetic by Sir James Y. Simpson, of Edinburgh, in 1847.

**Physiological Action.**—When kept in contact with the skin for some time, it causes irritation and, finally, vesication. After absorption it exerts a sedative effect. Internally, it produces a feeling of warmth in the stomach and acts as a carminative, antispasmodic, and sedative; large doses are irritant. When introduced into the circulation, whether by absorption from the broncho-pulmonary mucous membrane during inhalation or by that of the stomach, the effects are the same. After a brief period of stimulation the depressing effect of the drug is manifested, and in overdoses it is a cardiac poison, acting by destroying the contractility of the heart-muscle.<sup>1</sup> Prof. John A. MacWilliam, of Aberdeen, has demonstrated that, even when gently administered in moderate quantities and with due admixture of air, chloroform causes an appreciable dilatation of the heart. This dilatation may precede the loss of the conjunctival reflex, and affects both sides of the heart. It frequently occurs before any fall of blood-pressure. Artificial respiration, therefore, often fails to revive the patient because the enfeebled and distended heart is unable to maintain the circulation. The dilatation is not produced through the pneumogastries, but is the direct effect of the drug upon the cardiac mechanism. In a later series of experiments this writer has shown that the primary stage of cardiac acceleration is due to a more or less complete paralysis of the vagi produced by the chloroform. The subsequent retardation occurs "through a depressing or retarding influence exerted on the intrinsic rhythmical mechanism of the organ." The occurrence of anæsthesia is announced by complete muscular relaxation and abolition of the conjunctival and cremasteric reflexes. Dilatation of the pupils while the subject is fully under the influence of chloroform is an ominous sign. Chloroform is eliminated by the lungs and the kidneys. It proves irritant to the kidneys as it escapes from the system, and may set up nephritis.

The administration of chloroform, especially if prolonged, is often followed by the appearance of albumin and casts in the urine: a fact which suggests that the renal secretion should be examined before the patient is placed under the influence of the anæsthetic. It generally kills in Europe and America by heart-paralysis, though, according to the recent report of the Hyderabad Commission to the *British Medical Journal*, in India it kills dogs by failure of respiration. According to Binz, death under chloroform-anæsthesia is generally due to sudden paralysis of the respiratory centre. Sometimes, however, the heart stops before the respiration and again, in

<sup>1</sup> Report of Special Chloroform Committee, *British Medical Journal*, July 22,

other cases, paralysis of both systems takes place simultaneously. Hare has demonstrated, in the administration of both chloroform and ether, that there is a sudden fall of blood-pressure, during which sudden death may occur from syncope, or heart-paralysis, at an early stage of the anæsthesia. It has no special effect upon the blood, unless the decided lowering of bodily temperature is to be attributed to its action upon the red blood-corpuscles, interfering with their function as oxygen-carriers to the tissues. The absorption of chloroform by different tissues of the body has been studied by Pohl. In the blood of dogs profoundly influenced by the anæsthetic the blood contained much less than it is capable of dissolving, but the red corpuscles held about two and a half times more than the serum. The chloroform is not combined with the hæmoglobin, but with the lecithin and cholesterin of the corpuscles. A larger proportion was found in the brain than in the blood, and Pohl believes that the chloroform is retained by the cholesterin, lecithin, cerebrin, and other substances very soluble in chloroform. The liver contained less than the blood, and only traces were found in the urine. A less quantity was present in the fat than in the blood, which may be attributed to the scanty blood-supply of adipose tissue. Chloroform appears to be absorbed most rapidly and abundantly by tissues rich in substances which are soluble in that liquid. After administration has ceased, the chloroform is reabsorbed by the blood and eliminated by the kidneys. Upon the nervous system the effects are very positive. Chloroform first affects the brain, then the sensory part of the spinal cord, then the motor tract, then the sensory parts of the medulla oblongata, and finally the motor portion of the medulla, thereby producing death from failure of respiration unless the heart has already succumbed to the drug.

Death from syncope, as already pointed out, not infrequently happens from chloroform before complete anæsthesia has been produced. Such accidents are from three to four times more common from chloroform than from ether. According to Sir Benjamin Ward Richardson, chloroform causes death in one of four ways: by apnoæal syncope, by epileptiform syncope, by cardiac paralysis, and by shock. That the toxic action of chloroform depends largely upon the presence of impurities is shown by the experiments of du Bois-Reymond. The residue left after the separation of pure chloroform by Pietet's process was found to exert a much more powerful influence upon the circulation and respiration than the purified product.

Attention has been recently directed to the effect of chloroform and ether narcosis on the liver. Bandler, of Prague, performed a herniotomy on an hitherto strong, healthy man, who was, however, a hard drinker, using chloroform as the anæsthetic. A few days afterward icterus developed, and the patient died with cholæmic symptoms. As leucin and tyrosin were found in the urine, *intra vitam*, the diagnosis of acute yellow atrophy of the liver had been made, and it was confirmed by the necropsy. Bandler has been since studying the literature on the subject and experimenting on animals, to determine the exact effect of chloroform narcosis on the parenchymatous organs. He states that every case of chloroform narcosis showed degeneration of the liver-cells afterward, while this degeneration was absent or very slight after ether narcosis. He therefore urges the importance of avoiding the use of chloroform in cases where there is reason to suspect that the liver is not perfectly normal, and using ether instead.<sup>1</sup>

<sup>1</sup> *Journal of the American Medical Association*, Feb. 20, 1899.

At the recent meeting at Nancy, of the Congrès des Sociétés Savantes,<sup>1</sup> Professor Garnier reported the result of a number of experiments made by Dr Lambert and himself. After the inhalation of chloroform, the glycogen in the liver decreases, while the reductive power of the blood increases. The action of chloroform upon the blood *in vitro* confirmed the results obtained *in vivo*. Garnier believes that under these conditions hydrolysis of the glucose occurs, with the formation of a fermentable sugar belonging to the hexose group.

**Therapy.**—Chloroform is used as a local sedative, antiseptic, and counter-irritant, and, owing to its solvent action upon the alkaloids, it is a useful vehicle for anodynes. The solution of gutta-percha in chloroform (Liquor gutta-perchæ) is sometimes used as a protective in small-pox and erysipelas. This is likewise a useful application in psoriasis, herpes zoster, superficial burns, furuncles, and fissured nipples. Chloroform is an excellent hæmostatic and promptly checks superficial hæmorrhage when applied upon lint or absorbent cotton. A lotion containing chloroform is often of service in urticaria, and a liniment made with chloroform, aconite, and camphor soothes the pain of neuralgia and chronic rheumatism:—

R Chloroformi,		
Tinct. opii,		
Tinct. aconit. ....	aa 15	c.cm. or f3ss.
Liniment. saponis .....	75	c.cm. or f3iiss.

M. Sig.: For external application.

Another good formula for a local anæsthetic is that devised by Dr. Parsons:—

R Chloroformi,		
Tinct. aconit. ....	aa 11	c.cm. or f3iij.
Tinct. capsici .....	4	c.cm. or f3j.
Tinct. pyrethri,		
Ol. caryophylli .....	aa 2	c.cm. or f3ss.
Camphoræ .....	2	Gm. or 3as.

M. Sig.: For external use. The camphor is first dissolved in the chloroform and the oil of cloves and the tinctures are then added.

Chloroform may also be used, as suggested by Southworth, in the following combination to overcome a rigid perineum in labor:—

R Chloroformi .....	60	c.cm. or f3ij.
Etheris .....	30	c.cm. or f3j.
Spiritus odorat. ....	473	c.cm. or Oj.

M. Sig.: Apply locally.

This mixture acts quickly and well, large heads safely passing the perineum, which had previously seemed to threaten an extensive rupture. Applied upon a small compress, chloroform hastens suppuration in boils.

Dubisch<sup>2</sup> recommends a combination containing pure chloroform as a spray for its local anæsthetic effect in minor surgical operations, incision of a paronychia, evacuation of a glandular abscess, extirpation of a superficial epithelioma, as follows:—

<sup>1</sup> *Revue Médicale de l'Est*, 1901, No. 8.

<sup>2</sup> *Allgemeine Medicinische Central-Zeitung*, No. 14, 1890.

R	Mentholi .....	4	Gm. or 3j.
	Chloroformi .....	37	c.cm. or f3x.
	Ætheris .....	56	c.cm. or f3xv.—M.

The local anæsthesia lasts from two to six minutes.

Internally it is useful in gastralgia as chloroform-water, or in combination with anodynes, as in chlorodyne. It has also been given in hysteria, asthma, irritable cough, and seasickness.

Chloroform-water has been found serviceable in spasmodic croup. A few drops of chloroform, taken in water or upon sugar, will often relieve vomiting when not due to inflammation of the stomach. Chloroform-water is often of service in alleviating the vomiting of pregnancy. Chloroform, in 0.75 to 1.20 c.cm. (or *mxii-xx*) doses, is said to promote a rapid disappearance of the albuminuria and anasarca of pregnancy. Small doses of chloroform mitigate the pain and check the vomiting caused by gastric ulcer. In this condition it is beneficially combined with bismuth. Chloroform, internally administered, relieves the paroxysms of whooping-cough. In diarrhœa, spirit of chloroform is beneficially added to a mixture containing astringents and opium. The chill of intermittent fever may often be averted by the administration of a drachm of the spirit of chloroform. The same preparation, given alone or in combination with morphine, allays hicough.

The microbicide action of chloroform makes it serviceable in some cases of flatulent and fermentative or infectious dyspepsia. It has even been claimed to be useful in cholera in this way.

Dr. Werner has used chloroform in 130 cases of typhoid fever. It had a favorable influence upon the diarrhœa and tympanites and lessened the nervous manifestations. None of the patients died or suffered a relapse. He employed a 1-per-cent. aqueous solution, of which he gave 4 to 7.5 c.cm. (or f3i-ij) every hour or second hour, increasing the intervals as improvement occurred. Steep also reports good results from its use in typhoid fever.

The spirit of chloroform is used with especial advantage in the treatment of cholera morbus, and often for its sedative action upon the system.

The spirit of chloroform can be advantageously combined and used with aromatics and other remedies:—

R	Spiritus chloroformi .....	15	c.cm. or f3ss.
	Aquæ camphoræ,		
	Spiritus ætheris comp. ....	aa 60	c.cm. or f3ij.
	Tinct. capsici .....	7	5 c.cm. or f3ij.

M. Sig.: A dessertspoonful in water, whenever necessary, for cholera morbus or in stomachache or intestinal pains or flatulence.

R	Spiritus chloroformi .....	18	56 c.cm. or f3v.
	Creosoti .....	37	c.cm. or <i>mvj</i> .
	Spiritus ammon. arom. ....	7	5 c.cm. or f3ij.
	Aquæ menth. pip. ....	q. s. ad 150	c.cm. or f3v.

M. Sig.: A teaspoonful or two before meals for nausea or vomiting.

R	Spiritus chloroformi .....	15	c.cm. or f3ss.
	Morphinæ sulphatis .....	065	Gm. or gr. j.
	Aquæ cinnamomi .....	q. s. ad 120	c.cm. or f3iv.

M. Sig.: From one to two teaspoonfuls every half-hour for after-pains or in nervous or hysterical attacks.

In fevers the spirit of chloroform is useful to relieve restlessness and

irritative cough in pneumonia, bronchitis, or pleurisy, usually given in a "fever-mixture" combination.

**Special Application.**—The important application of this remedy is for producing anæsthesia during surgical operations. It is the most pleasant, the most active, and the most convenient anæsthetic. Unfortunately, its death-record is so much higher than that of its great rival, ether, that most surgeons in this country prefer to use the latter, although its odor is not agreeable, and it requires a much larger quantity to produce unconsciousness, and it has a preliminary state of excitement or intoxication. (Remarks upon the state of anæsthesia and the choice of anæsthetics may be found under the head of *Æther*.)

**The Administration for Anæsthetic Effect.**—The administration of chloroform for surgical operations requires skill, intelligence, and experience. The greater number of fatal cases, by far, have occurred in the hands of those who do not appreciate the responsibility they assume in using this powerful agent. The method to be followed is, first, to eliminate all cases of weak or diseased heart; and, if the operation is to be a long one, requiring prolonged administration of the anæsthetic, cases of kidney disease must also be excluded. The patient should not be in a sitting posture, nor should the chloroform be administered soon after a full meal. The clothing about the neck and waist should be loose enough to allow respiratory movements, but the patient should not be too much exposed, on account of the lowering of temperature and the possibility of congestion of the lungs or kidneys subsequent to the administration. The chloroform should be pure, and about 2.40 cc. (or *mxl-fj*), poured upon a napkin or towel and held a little distance above the patient's nose or mouth, so that the dense vapor in falling shall mix with air.

According to Clover, the chloroform-vapor should be diluted with 20 volumes of air, and he has devised a special inhaler designed to accomplish this dilution. An improved apparatus, now in use, is known as Dr. Junker's inhaler. In many cases full anæsthesia, or coma, is not needed for small operations, parturition, passage of gall-stones, etc.; consciousness may be preserved while the sense of pain is temporarily abolished. Dr. Sayre, of New York, uses a much smaller amount of chloroform (0.30 to 1.20 c.cm., or *gtt. v-xx*), but administers the vapor in as concentrated a form as he can, excluding the admission of air as far as possible, and speaks very confidently of the efficiency and safety of this method. If the patient struggles violently during the inhalation, he is liable to get an overdose, and under such circumstances the administration of the anæsthetic should be entirely discontinued until the breathing becomes normal and it is seen that the anæsthesia is becoming fainter. The experienced anæsthetizer will devote his entire attention to his patient, and carefully note any change in the respiration, pupil of the eye, or color of the skin. The patient's pulse also should be watched during the administration of chloroform, and, if it suddenly stops or becomes fluttering, Nélaton's method should be at once employed, in which the patient is placed in a vertical position, with the head downward, and artificial respiration is employed, which is usually successful. Laënnec's method of rhythmical tongue-traction is very useful in restoring the respiration. Tracheotomy may be required, and inflation of the lungs with bellows has been successfully performed. Sir Benjamin Ward Richardson regards artificial respiration as the most important measure for the

relief of chloroform narcosis. Mouth-to-mouth insufflation may be practiced in the absence of a convenient apparatus. Amyl nitrite or ammonia inhalations should also be practiced, or ether, digitalis, or whisky injected hypodermically. Efforts at resuscitation should not be discontinued in less than one hour, as patients have recovered after artificial respiration had been continued for this length of time. The faradic current is likely to do more harm than good, as it interferes with other measures, and if applied to the phrenic nerve may cause stoppage of the heart by inhibitory action. Slapping the chest and nates with the fringe of a towel wet with cold water was the favorite resource of Professor S. D. Gross. If vomiting occurs after the administration of chloroform, Lewin has found that by wetting a towel with vinegar and placing it on the face of the patient the vomiting will be checked.

Digitalis, hypodermically injected, is a valuable agent in combating the depressant effect of chloroform upon the heart. The conjoined use of strychnine has been practiced on account of its stimulant influence upon the circulation and respiration. Small amounts of alcohol are valueless in this emergency, while large quantities only assist the paralyzing action upon the heart. When danger threatens, the angle of the jaw should be raised and the tongue drawn forward, so that no mechanical impediment shall be offered to free respiration. In the Göttingen clinic, König's method of intermittent compression is practiced in a modified form. The præcordium is rapidly and forcibly compressed at the rate of 120 or more per minute. The air-passages must, at the same time, be sedulously kept free from mucus and open.

Dr. David R. Fly<sup>1</sup> prefers chloroform over ether for general anæsthesia, the one great disadvantage of the former being the care required in the administration. The principal contra-indications to chloroform are heart troubles; emphysema, with dilated right heart; fatty degeneration of the heart-muscle, and uncompensated valvular disease. Ether is also contra-indicated in all these conditions. Neither ether nor chloroform should be administered by artificial light from an open flame, the first because it is inflammable and the second because it becomes decomposed and produces highly irritating vapors, which cause spasm of the larynx, or inflammation of the air-passages. In administering chloroform, it is important to gain the confidence and co-operation of the patient, because struggling and resistance often disturb the judgment and lead to the employment of a larger quantity than is desired. Chloroform ought never to be administered rapidly, for the sudden entrance of a small quantity into the circulation is more dangerous than the gradual absorption of a larger quantity. In major operations, before the administration of the chloroform, it is customary with surgeons to give the patient 15 to 30 c.cm. (or fʒss-j) of whisky as an arterial and cardiac stimulant. The administration of a dose of *nux vomica* in the form of tincture or of strychnine as a guard against accident is recommended by Milne and Wigglesworth. Chloroform is also often administered by inhalation for the relief of infantile and puerperal convulsions. In puerperal tetanus the inhalation of chloroform is a valuable measure. A combination of chloroform, given in this manner, and chloral, administered by the mouth in large doses, has been especially praised. Augustus D. Waller, on account of the acknowledged dangers of chloroform, considers it unjustifiable to employ it

<sup>1</sup> *New York Medical Journal*, Nov. 5, 1898.

for minor surgical operations. He condemns the open method of administration on account of the uncertainty of the dosage and its increased risk. This uncertainty of quantity administered can be most easily avoided by following the principles of Junker's method, in which the quantity is accurately measured and its dosage regulated accordingly.<sup>1</sup>

The paroxysms of whooping-cough are checked or moderated by this agent. About 2 c.cm. (or f5ss) may be poured upon the hand of the mother and held near the child's nose, or it may be vaporized by means of hot water, 0.12 to 0.18 c.cm. (or gtt. ii-iii) being used for each year of the child's age. Used in the latter manner, four times daily, it is said to shorten the paroxysmal stage. In severe cases of chorea, in which the convulsive movements interfere with deglutition and rest, chloroform inhalations answer a very good purpose by inducing sleep, which is followed by notable improvement. Administered at first three times a day, and less often as the symptoms improve, this plan is said to cure the disease, on an average, in twenty-eight days. Chloroform is of value in painful delivery, not given so as to produce unconsciousness, but merely to blunt the sensibility. Used in this way, the uterine contractions are not weakened nor the danger of post-partum hæmorrhage increased. Chloroform is better borne by women in labor than by any other class of subjects. But if pushed to anæsthesia the contractions become less vigorous and hæmorrhage is favored. It is asserted that the inhalation of chloroform for a few minutes at a time, several times a day, is beneficial in phthisis, relieving the cough and reducing the temperature. For this purpose, Fraser recommends also the hypodermic injections of atropine ( $\frac{1}{2}$  to 1 mg., or gr.  $\frac{1}{120}$  to  $\frac{1}{60}$ ) with morphine hydrochloride (0.005 to 0.008 Gm., or gr.  $\frac{1}{200}$  to  $\frac{1}{100}$ ); for the latter Dr. Laborde substitutes narcaine.<sup>2</sup> In sciatica Bartholow has given deep injections of 0.60 to 1.20 c.cm. (or mx-xx) of chloroform, near the sheath of the nerve. In some cases this method has also afforded marked relief in facial neuralgia.

## CHLORUM.—Chlorine.

### Preparations.

Liquor Chlori Compositus (U. S. P.).—Compound Solution of Chlorine. Dose, 4 to 8 c.cm. (or 3ss-j), well diluted.

Aqua Chlorata.—Chlorine-water (0.4 to 0.5 per cent. chlorine. Dose, largely diluted, 4 to 18.5 c.cm. (or f3i-v).

Calx Chlorinata (U. S. P.).—Chlorinated Lime (30 per cent. of available chlorine). Dose, 0.20 to 0.38 Gm. (or gr. iii-vj).

Liquor Soda Chlorinata (U. S. P., B. P.).—Solution of Chlorinated Soda, Labarraque's Solution (2.4 per cent. available chlorine). Dose, 0.60 to 2.6 c.cm. (or ss-j), largely diluted.

Calx Chlorinata (B. P.).—Chlorinated Lime (contains 33 per cent. of available chlorine).

Liquor Calcia Chlorinata (B. P.).—Solution of Chlorinated Lime (about 3 per cent. of available chlorine when fresh).

Labarraque water is a French preparation of the above solution, made with potassium instead of sodium. It is also used for disinfection.

**Pharmacology.**—Chlorine is not itself official. It is a gaseous element, much more than twice the density of air, of a greenish color, strong and suffocating odor, irrespirable, and, even in a state of dilution, very irritating

<sup>1</sup> *The British Medical Journal*, April 23, 1898.

<sup>2</sup> *Therapeutic Gazette*, Sept., 1890, p. 4830.

to the air-passages. For disinfecting purposes, it may be disengaged by adding hydrochloric acid to manganese dioxide. Chlorine is soluble in water, and under the influence of sunlight slowly decomposes that liquid, combining with the hydrogen and setting the oxygen at liberty. Owing to the affinity for hydrogen, chlorine acts energetically upon organic substances, and often destroys them. Coloring matters of organic origin are bleached when exposed to its action. Chlorine is an efficacious disinfectant, decomposing hydrogen sulphide and destroying putrefying material. It also destroys the infectious miasms in the air, but should be in excess and in a closed room in order to be very effective. The generation of chlorine in the same room with patients is of very little use so far as disinfection is concerned. The combination with lime (chlorinated lime, or bleaching powder) is largely used for disinfecting drains and cess-pools.

For the sick-room, the solution of chlorinated soda (Labarraque's solution) is more convenient and less offensive, for use in commodes, bed-pans, etc., or for internal administration. The inhalation of ammonia-gas is antidotal to chlorine when absorbed by the air-passages, ammonium chloride resulting from their combination. In cases of accidental poisoning from swallowing a chlorine solution, albumin, in the form of milk, eggs, or flour, is the best remedy at our command, followed by an emetic.

**Physiological Action.**—Chlorine-gas, in concentrated form, when directed upon the skin, causes smarting and redness, followed by erythematous or pustular inflammation. It is a disinfectant, destroying parasitic vegetable growths. The inhalation of dilute chlorine is irritating to the lungs and stimulates the end-organs of the pneumogastric nerve, causing coughing and strangling sensations. Internally, chlorine was formerly given in various infectious diseases, but this is rarely done at the present day, although Labarraque's solution, or the compound solution of chlorine, has decided influence in maintaining the stomach in an aseptic state during low forms of fever.

**Therapy.**—Chlorine solution is used to clean offensive ulcers and to remove patches of pityriasis. This liquid is also an excellent disinfectant to sloughing wounds, and may be injected into abscess-cavities, sinuses, or fistulae, for the purpose of removing and neutralizing unhealthy or decomposing pus.

Schmidt-Rimpler praises the action of chlorine-water as an antiseptic in operations upon the eye. He has found it especially useful in cases of dacryocystitis. In plastic operations upon the lids, traumatism of the eye, corneal suppuration, and serpiginous ulcer, irrigations with chlorine-water, several times a day, have given satisfactory results. This liquid has the advantage that it does not, like corrosive sublimate, produce corneal infiltrations after the installation of cocaine, but prevents suppuration without injuring the cornea. Chlorine-water was found to be less irritant to the conjunctiva than the mercuric chloride, and, when kept in closely stoppered bottles, excluded as much as possible from the influence of the air and light, remains stable and active for some weeks. It is fit for use as long as it presents the characteristic odor of chlorine. Prior to the operation the conjunctival *cul-de-sac* and globe are washed with chlorine-water, and when completed the lids are covered with muslin compresses wet with chlorine-water and cotton sterilized with corrosive chloride, the whole being fixed by a sterilized bandage.<sup>1</sup> As an antiseptic wash, it may be employed in puerperal

<sup>1</sup> See *Buffalo Medical and Surgical Journal*, May, 1892.

**EMERSON.** One part of Labarraque's solution to 10 or 12 of water is a useful application in vaginitis. The same solution may be used as a prophylactic against poison from bites of serpents or insects. Chlorinated oil<sup>1</sup>—that is, oil saturated with chlorine—is a very efficient remedy in scabies. It acts without irritating the skin.

A compound known as **Chlorophenol** (trichlor-phenol) has been employed as a local application in erysipelas, in the form of a 1-, 2-, or 3-per-cent. ointment. The results are said to have been excellent. It is thought that the remedy would be more efficacious if given by subcutaneous injection.

A combination of chlorine and phenol is highly praised by Dr. J. E. Chambers, of Saint Louis, as a valuable lotion to ulcerated mucous surfaces, in the mouth, nose, and throat, or as an injection into the vagina, uterus, bladder, or rectum, in an inflammatory or ulcerated condition of those organs. A 10- or 20-per-cent. solution was employed. The evaporation of the solution likewise renders the fluid a serviceable disinfectant. Dr. Burney Yeo has had good results from the use of chlorine-water in typhoid fever. Labarraque's solution may be similarly used, much diluted with water. The sore throat of scarlet fever is also benefited by the same methods. Gangrene of the mouth or tongue is likewise amenable to the same influence. According to some observers, chlorine-water has an action upon the liver and is useful in chronic disease of that organ.

The solution of chlorinated lime<sup>2</sup> of the present pharmacopœia is one of the best antidotes to hydrosulphuric acid, ammonium sulphhydrate, potassium sulphide, and hydrocyanic acid (given in doses of 1.20 to 4 c.cm., or  $\text{ss-}\frac{1}{2}\text{ss}$ ). Sheets wrung out of this solution may be wrapped around the body of a person dead of infectious disease or in a decomposing condition. Chlorine-gas has been utilized by Dr. Diver in the treatment of chronic ulcers of the leg. A piece of absorbent cotton was charged with the gas by being placed in a bottle containing about 8 Gm. (or  $\text{ʒij}$ ) of potassium chlorate, and a drachm or more of hydrochloric acid. The cotton was laid upon the ulcer, covered with gutta-percha tissue, and secured by a bandage. The Shurley-Gibbes plan of treating pulmonary tuberculosis consists in the inhalation of chlorine-gas and the hypodermic injection of gold and sodium chloride. The gas may be evolved from chlorinated lime, from 2 to 23.3 Gm. (or  $\text{ʒss-vj}$ ) being spread out in a shallow dish and from 1 to 3 drachms of diluted hydrochloric acid added, stirring with a wooden spoon or spatula. It is best to begin with 16 Gm. (or  $\text{ʒss}$ ) of chlorinated lime, increasing the quantity each day until 12 or 13.5 Gm. (or  $\text{ʒiij-iv}$ ) are used. During the inhalation of the gas the atmosphere of the room should be charged with a spray of saturated solution of sodium chloride. The patient should breathe through the nose, as cough is thus less likely to be excited. The time during which the gas is respired is at first about two minutes. This period is gradually lengthened to twenty or thirty minutes. In mild cases and in laryngeal phthisis the inhalation of chlorine-water suffices.

At the Harper Hospital, Detroit, Mich., a face-inhaler is employed. Chlorine inhalations seem to be of value in arresting the progress of caseation. Hypodermic injections are used in the Shurley-Gibbes method, which is begun by the preliminary administration of iodine. (See **Iodum**.) The

<sup>1</sup>Chlorinated Oil." See paper by the author, *Medical Bulletin*, 1884, p. 271.

<sup>2</sup>The strength of this solution in the British Pharmacopœia is one avoirdupois pound of chlorinated lime to the imperial gallon.

gluteal region is selected as the proper site of operation. The dose of iodine generally used at first is  $\frac{1}{2}$  cg. (or gr.  $\frac{1}{12}$ ) daily, increasing gradually until 0.03 Gm. (or gr. ss) and in some cases 0.065 Gm. (or gr. j) is reached. The gold-and-sodium solution is then injected daily, beginning with 2 or 3 mg. (or gr.  $\frac{1}{30}$  or  $\frac{1}{20}$ ) and ascending until a dose of 0.012 or 0.02 Gm. (or gr.  $\frac{1}{8}$  or  $\frac{1}{5}$ ) is attained. At this point the quantity should be diminished to 6 mg. (or gr.  $\frac{1}{10}$ ) daily if the treatment is to be continued. At this stage it is considered better to alternate the injections. If albuminuria occur, the iodine should be suspended. Little or no tendency to hæmoptysis has been observed. Catarrhal manifestations and fever may, in the beginning of the course, be temporarily aggravated, but improvement is said to follow. In some instances, anorexia, listlessness, diarrhoea, and asthmatic symptoms result. Iodine alone cannot be long continued. The alternate use of the remedies prolongs the effect of the iodine. It is recommended that, as a rule, the alternate use should begin in the second or third week of the course, gradually decreasing their use to once or twice a week.<sup>1</sup> The authors of this therapeutical method have, in a number of cases, witnessed improvement as regards symptoms with diminution of physical signs and disappearance of bacilli from the sputum.

**CHONDROS** (U. S. P.).—**Chondrus**. (Irish Moss.)

**Pharmacology and Therapy.**—Chondrus, Irish moss, or carragheen, is the dried plant of *Chondrus crispus* (Gigartinaceæ), which has been bleached and dried by exposure to the sun. It is in hard, translucent, yellowish-white fragments of sea-weed, with characteristic odor and saline, mucilaginous taste. It contains iodine and bromine in small quantities; its principal constituent is mucilage, but it contains no starch.

Irish moss contains a peculiar principle called **carragheenin**, which is distinguished from gum by not being precipitated from its watery solution by alcohol, and from starch by not turning blue upon the addition of tincture of iodine. Boiled with milk and water (1 to 16) and properly sweetened with white sugar and flavored, it makes *blanc-mange*; or, in more dilute decoction (1 to 100), a demulcent drink for the sick. It has not much food-value, but is deemed useful in bronchial affections.

**CHOPPARO AMARGOSO** is a small, thorny bush (Simarubaceæ) which grows in southwestern Texas. It bears pink flowers and red fruit. All parts of the plant have an intensely-bitter taste. It seldom creates nausea, has no effect upon the bowels, and seems to be eliminated principally by the kidneys, as its odor is perceptible in the urine. It possesses also some anti-periodic virtues. In large doses it causes flushing of the face and a sense of fullness in the head. Dr. J. W. Mixon, of Wrightsboro, Texas, reports that he has obtained excellent results from the administration of chopparo in dysentery, and suggests that it might prove useful in typhoid fever as an intestinal antiseptic and tonic. A fluid extract of chopparo amargoso has been prepared by Sharpe & Dohme, of Baltimore, the dose of which, as a tonic, is from 0.60 to 15 c.cm. (or *mx-f̄ss*), and as a stimulant from 11 to 30 c.cm. (or *f̄iii-f̄j*). The plant yields its virtues to boiling water, and is frequently given in the form of a decoction.

<sup>1</sup> *Therapeutic Gazette*, April 15, 1891.

**CHROMII TRIOXIDUM** (U. S. P.).—Chromium Trioxide. See *Acidum Chromicum*.

**CHRYSAROBINUM** (U. S. P.).—Chrysarobin.

**ARAROA** (B. P.).—Crude Chrysarobin.

**Dose**, 0.008 Gm. (or gr.  $\frac{1}{9}$ ).

*Preparation.*

**Unguentum Chrysarobini** (U. S. P., B. P.).—Ointment of Chrysarobin (5 per cent., with benedicated lard). (The British ointment is not so strong, being 1 to 24, or only a little over 4 per cent.)

**Pharmacology.**—Chrysarobin in its commercial, somewhat impure, form is a neutral principle extracted from Goa powder, a substance found deposited in the wood of *Vouacapoua araroba* (Leguminosae), which is a native of the East Indies and Brazil. It is an orange-yellow powder, odorless and without taste, nearly insoluble in water and in alcohol, but soluble in sulphuric acid, and solutions of alkalies. It is not identical with benzoic acid, as was formerly supposed.

**Physiological Action.**—In comparatively large doses (2 Gm., or 3ss) it causes irritation of the intestinal mucous membrane, and gives rise to vomiting and purging, with large, bilious stools.

It excites inflammation of the skin from its local application, and produces a yellowish-brown stain of the skin and clothing. (The stain is removable with a weak solution of chlorinated lime or soda.) It is said that hot benzol will remove the discoloration from hair and clothing, provided that no soap or alkali has been used. A yellowish hue is communicated to the urine by chrysarobin. This color turns red upon the addition of alkalies. The dermatitis may be diffuse, or expressed by follicular eruptions. Chrysarobin is parasiticide, and destructive to epiphytic organisms.

**Therapy.**—The principal internal use of chrysarobin is for its cathartic action. It has been administered internally, in doses of 0.008 Gm. (or gr.  $\frac{1}{9}$ ), several times daily in psoriasis. But its extremely-irritant effect upon the intestinal mucous membrane so soon compels its abandonment that it is practically valueless as a systemic remedy. When applied externally for a considerable period, a small portion may probably act by absorption. Chrysarobin ointment should not be allowed to come in contact with the healthy skin, but, in psoriasis, the disease for which it has been principally employed, should be carefully rubbed into the affected area. The parts should then be covered by a bandage in order to protect the linen. Another method of applying chrysarobin is by making a paste of it by means of water, rubbing the paste upon the patches after the scales have been removed, allowing the mixture to harden, and, finally, pencilling collodion over the surface.

Chrysarobin is curative by its stimulating action on psoriasis, chronic urticaria, and vegetable parasitic skin diseases; but the official ointment should be diluted several times before application, for fear of exciting too much inflammatory reaction. Chronic eczema and the second stage of rosacea also receive benefit from chrysarobin ointment. The same preparation has sometimes proved of service in lupus vulgaris.

A very good combination in chronic eczema and psoriasis is the follow-

<b>B</b> Olei cadini .....	2	c.cm. or f3ss.
Chrysarobini .....	130	Gm. or gr. xx.
Unguent. zinci oxidi .....	31	Gm. or ʒj.—M.

A 5-per-cent. solution in liquor guttæ-perchæ has been used with advantage in chronic eczema and a 10-per-cent. solution in psoriasis. Dr. Dale James writes that the most cleanly manner of employing chrysarobin is by dissolving 1 part in 7 parts of chloroform, and stirring about an equal quantity of soft petroleum into the mass. The preparation is applied by means of a brush. Chrysarobin has been recommended by Dr. Robinson, of New York, as an excellent application in alopecia circumscripta. It may be conveniently used in the form of a stick, made up according to the following formula slightly modified from that given by Dr. Leistikow, of Hamburg:—

<b>B</b> Chrysarobini .....	31	Gm. or ʒj.
Colophonii (vel resinæ) .....	4	Gm. or ʒj.
Ceræ flav. ....	31	Gm. or ʒj.
Ol. olivæ .....	30	c.cm. or f3j.—M.

**Euroben**, or chrysarobin tannate, soluble in chloroform, acetone, and ether, is used as a *succedaneum* for chrysarobin, especially as a skin varnish for chronic scaly skin eruptions.

**CIMICIFUGA** (U. S. P.).—*Cimicifuga*, Black Snake-root, Black Cohosh.

**CIMICIFUGÆ RHIZOMA** (B. P.).—*Cimicifuga*, *Actææ Racemosæ* Radix.

Dose, 1.30 to 2 Gm. (or gr. xx-xxx).

#### Preparations.

Fluidextractum *Cimicifugæ* (U. S. P.).—Fluid Extract of *Cimicifuga*. Dose, 0.30 to 2 c.cm. (or mv-f3ss).

Extractum *Cimicifugæ* (U. S. P.).—Extract of *Cimicifuga*. Dose, 0.065 to 0.32 Gm. (or gr. i-v).

Tinctura *Cimicifugæ* (U. S. P., B. P.).—Tincture of *Cimicifuga* (20 per cent.; the British tincture is only 10 per cent.). Dose, 4 to 7.5 c.cm. (or f3i-ij). B. P., 2 to 4 c.cm. (or f3ss-j).

Extractum *Cimicifugæ* Liquidum (B. P.).—Liquid Extract of *Cimicifuga*. Dose, 0.30 to 2 c.cm. (or mv-xxx).

**Pharmacology.**—The dried rhizome and roots of *Cimicifuga racemosa* (Ranunculaceæ), a plant common in woods in northern United States, contain a neutral principle of acrid taste, soluble in dilute alcohol, water, chloroform, or ether. Its chemical nature is not known positively. Mr. George H. Davis has discovered a volatile oil in the recently-gathered roots; and Prof. George B. Wood thought that this might be the active principle, since the drug deteriorates upon keeping. It also contains two resins. So-called **cimicifugin**, or **macrotin**, is an impure resin, deposited from the concentrated tincture upon the addition of water. There is also in the recent drug, besides the volatile oil, some tannic and gallic acids. The odor of the plant is rather fetid.

**Physiological Action.**—*Cimicifuga* has decided effects upon the human system. Small doses stimulate the digestive function and increase secretions along the alimentary canal. The secretions of the bronchial mucous membrane are also increased, the action of the heart stimulated, and the urine

is augmented in quantity. The menstrual flow is increased, and some aphrodisiac qualities have been ascribed to the drug. Upon the heart and circulation an effect is noticed resembling that of digitalis, though less marked. Full doses slow the pulse and increase its force, raise arterial tension, and stimulate uterine contraction; the latter action recalls that of ergot, though it is less powerful. Cimicifuga lowers the reflex activity of the spinal cord. The pupils are dilated; dimness of vision, vertigo, intense headache, nausea, and vomiting result from large doses. Even soporific effects have been observed, with relief from pain or spasm. Death may be caused by failure of respiration.

**Therapy.**—The applications of cimicifuga are in accordance with its physiological activity. Externally, a saturated tincture is said to relieve pain in rheumatism and neuralgia. In chorea it is of decided value, especially in weak anæmic children. It is, moreover, very applicable to those cases which manifestly depend upon rheumatism, or to those which develop in girls at the age of puberty and are associated with menstrual irregularity. In neuralgia, especially when the consequence of rheumatism, cimicifuga is of undoubted benefit. In certain cases of sciatica improvement follows the administration of this agent.

A formula of Dr. Metcalf for sciatica is:—

R Tr. aconit.,  
Tr. colchic. sem.,  
Tr. belladonn. fol.,  
Tr. cimicifuge ..... aa ʒi/50 c.cm. or fʒij.

M. Sig.: Six drops every six hours.

Cimicifuga was introduced into England by Sir J. Y. Simpson, as a remedy for chronic rheumatism, myalgia, and hypochondriasis with depression. It is beneficial in melancholia, especially when that condition is associated with functional or organic uterine or ovarian disorder. Cimicifuga is likewise serviceable in some cases of acute rheumatism, and Ringer has found it useful in rheumatoid arthritis. The fluid extract is the best and most reliable preparation. In uterine subinvolution, ovarian neuralgia, and amenorrhœa it is highly commended. It has a good effect, also, in other constitutional manifestations dependent upon disorder of the female generative system, as, for instance, convulsions caused by disturbance of the catamenial function, and in puerperal mania. Congestive dysmenorrhœa is likewise relieved by this remedy. Cimicifuga is often beneficial in menorrhagia and metrorrhagia. By reason of its action upon the womb, cimicifuga may be employed during parturition as a substitute for ergot. Though not so powerful as the latter drug, it strengthens the normal uterine contractions. For its tonic effects, it is used in treating gastric catarrh and irritable stomach of melancholia; also in delirium tremens and functional impotence. In weak and fatty heart it is safer than digitalis. On account of its stimulating effects upon the uterus, it should not be given during pregnancy.

In headache from eyestrain cimicifuga has been given with benefit, and is especially useful in acute bronchitis as an expectorant. Cimicifuga is likewise valuable in chronic bronchitis attended by profuse muco-purulent secretion. It may even be serviceably prescribed in phthisis, as it facilitates expectoration, sustains the appetite and digestion, and reduces fever.

Cimicifuga may be administered as in the appended formulæ:—

R Fluidext. cinicifugæ .....	45	c.cm. or fʒias.
Tinct. nucis vomicæ .....	4	c.cm. or fʒj.
Tinct. cinchonæ comp. ....q. s. ad	150	c.cm. or fʒv.

M. Sig.: A teaspoonful or two in water every three or four hours. For ovarian and uterine neuralgia and amenorrhœa.

R Fluidext. cinicifugæ .....	30	c.cm. or fʒj.
Morphinæ sulphatis .....	0.065	Gm. or gr. j.
Spiritus ætheris nitrosi,		
Liquor ammonii acetatis .....	aa 60	c.cm. or fʒij.

M. Sig.: Two teaspoonfuls in water every three or four hours. For neuralgia, acute rheumatism, and acute bronchitis.

R Ext. cinicifugæ .....	1	55 Gm. or gr. xxiv.
Ext. belladonnæ folior. ....	0.065	Gm. or gr. j.
Pulv. capsici .....	75	Gm. or gr. xij.

M. et ft. pil. no. xij.

Sig.: From one to two pills three times a day. For gastric catarrh, delirium tremens, and functional impotence.

**CINCHONA (U. S. P.).—Cinchona, Peruvian Bark.**

**CINCHONA RUBRA (U. S. P.).—Red Cinchona.**

**CINCHONÆ RUBRÆ CORTEX (B. P.).—Red Cinchona-bark.**

*U. S. P. Preparations, Alkaloids, and Salts.*

Fluidextractum Cinchonæ.—Fluid Extract of Cinchona. Dose, 0.60 to 7.5 c.cm. (or mx-fʒij).

Tinctura Cinchonæ.—Tincture of Cinchona (20 per cent.). Dose, 2 to 7.5 c.cm. (or mxxx-fʒij).

Tinctura Cinchonæ Composita.—Compound Tincture of Cinchona (red cinchona, 10; bitter orange-peel, 8; serpentaria, 2; glycerin, 7.5; alcohol and water, q. s. ad 100 parts). Dose, 4 to 15 c.cm. (or fʒi-iv).

Quinina.—Quinine. A white, amorphous powder, soluble in 1670 parts of water and in 6 parts of alcohol. Dose, 0.065 to 0.65 Gm. (or gr. i-x).

Oleum Quininae.—Oleate of Quinine (25 per cent.).

Quinina Sulphas.—Quinine Sulphate. Dose, 0.065 to 0.65 Gm. (or gr. i-x). In snow-white, loose, filiform crystals, fragile, and in a light, easily-compressible mass; lustreless (owing to superficial efflorescence), odorless, having a persistent bitter taste and neutral reaction. Soluble in 740 parts of water, and in 65 parts of alcohol at 15° C. (59° F.), in small proportions of acidulated water. Very slightly soluble in ether. Aqueous solution, especially if acidulated with sulphuric acid, has a vivid, blue fluorescence. When treated first with fresh bromine-water, and then with slight excess of water of ammonia, the salt produces an emerald-green color (*thalleoquin*). Crystals are formed of the same color by treating an acidulated solution of quinine sulphate with saturated alcoholic solution of iodine (*herapathites*).

Quinina Bisulphas.—Quinine Bisulphate. Dose, 0.065 to 1 Gm. (or gr. i-xv). Similar to the sulphate, but much more soluble, dissolving in 10 parts of water or 32 parts of alcohol at 59° F.

Quinine Hydrobromidum.—Quinine Hydrobromide. Dose, 0.065 to 1.30 Gm. (or gr. i-xx).

Quinine Hydrochloridum.—Quinine Hydrochloride. Dose, 0.065 to 1 Gm. (or gr. i-xv). Soluble in 34 parts of water.

Quinine Salicylas.—Salicylate of Quinine. Dose, 0.065 to 1 Gm. (or gr. j-xv).

Cinchonina Sulphas.—Cinchonine Sulphate. Dose, 0.32 to 2 Gm. (or gr. v-xxx). In white needles, soluble in 66 parts of water and in 10 parts of alcohol. Very bitter.

Cinchonidina Sulphas.—Cinchonidine Sulphate. Dose, 0.32 to 2.60 Gm. (or gr. v-xl).

Ferri et Quinina Citras.—Iron and Quinine Citrate (contains 12 per cent. of quinine, 85 of ferri citrate). Dose, 0.13 to 0.65 Gm. (or gr. ii-x).

Ferri et Quinina Citras Solubilis.—Soluble Iron and Quinine Citrate. Dose, 0.20 to 0.65 Gm. (or gr. iii-x).

**Elixir Ferri, Quininae, et Strychninae Phosphatum.**—Elixir of Iron, Quinine, and Strychnine Phosphate. Dose, 4 to 8 c.cm. (or ʒj-ij).

**Glyceritum Ferri, Quininae, et Strychninae Phosphatum.**—Glycerite of the Phosphates of Iron, Quinine, and Strychnine (used in making the syrup). Dose, 1 to 4 c.cm. (or max-ʒj).

**Syrupus Ferri, Quininae, et Strychninae Phosphatum.**—(See *Ferrum*.) Dose, 4 c.cm. (or ʒj).

**Vinum Ferri Amarum.**—Bitter Wine of Iron. Dose, 4 to 7.5 c.cm. (or fʒi-ij).

### *B. P. Preparations, Alkaloids, and Salts.*

**Extractum Cinchonae Liquidum.**—Liquid Extract of Cinchona (5 per cent. of alkaloids). Dose, 0.30 to 1 c.cm. (or mv-xv).

**Infusum Cinchonae Acidum.**—Acid Infusion of Cinchona (red cinchona-bark, 50 Gm.; aromatic sulphuric acid, 12.5 c.cm.; distilled water, 1000 c.cm.). Dose, 15 to 20 c.cm. (or fʒss-j).

**Tinctura Cinchonae.**—Tincture of Cinchona (1 Gm. of alkaloids to 100 c.cm., made with red cinchona-bark). Dose, 2 to 4 c.cm. (or fʒss-j).

**Tinctura Cinchonae Composita.**—Compound Tincture of Cinchona (bitter orange-peel, 50; serpentry, 25; cochineal, 3.2; saffron, 6.3; tincture of cinchona, 500 c.cm.; alcohol, q. s. ad 1000). Dose, 2 to 4 c.cm. (or fʒss-j).

**Quininae Sulphas.**—Quinine Sulphate. Dose 0.065 to 0.65 Gm. (or gr. i-x). In milky-white filiform crystals, taste very bitter. Soluble in about 800 parts of water, the solution having a bluish fluorescence; when water is acidulated with a mineral acid the salt is entirely soluble. When solution of ammonia is added to aqueous solutions of quinine salts, it forms a white precipitate soluble in ether and in excess of the solution of ammonia. Quinine sulphate when exposed to dry air, the 15 molecules of water are reduced to 4, due to efflorescence.

**Quininae Hydrochloridum.**—Quinine Hydrochloride. Dose, 0.065 to 0.65 Gm. (or gr. i-x).

**Quininae Hydrochloridum Acidum.**—Acid Quinine Hydrochloride. Dose, 0.065 to 0.65 Gm. (or gr. i-x).

**Tinctura Quininae.**—Tincture of Quinine (quinine hydrochloride, 2; tincture of orange, 1000). Dose, 2 to 4 c.cm. (or fʒss-j).

**Tinctura Quininae Ammoniata.**—Ammoniated Tincture of Quinine (quinine sulphate, 2; solution of ammonia, 10; alcohol, 90 c.cm.). Dose, 2 to 4 c.cm. (or fʒss-j).

**Syrupus Ferri Phosphatis cum Quinina et Strychnina.** (See *Ferrum*.)

**Vinum Quininae.**—Quinine-wine (quinine hydrochloride, 2 Gm.; orange-wine, 475 c.cm.). Dose, 15 to 30 c.cm. (or fʒss-j).

**Pilula Quininae Sulphatis.**—Pill of Quinine Sulphate (quinine sulphate, 30; tartaric acid, 1; glycerin, 4; tragacanth, 1; to make a pill-mass). Dose, 0.13 to 0.50 Gm. (or gr. ii-vij).

**Ferri et Quininae Citras.**—Iron and Quinine Citrate. Dose, 0.32 to 0.65 Gm. (or gr. v-x).

### *Some Unofficial Preparations.*

**Extractum Cinchonae.**—Extract of Cinchona. Dose, 0.06 to 0.65 Gm. (or gr. i-x).

**Quininae Valerianatis.**—Valerianate of Quinine. Dose, same as sulphate.

**Cinchonina**—Cinchonine. Dose, 0.32 to 2 Gm. (or gr. v-xxx).

**Quinidina Sulphas.**—Sulphate of Quinidine. Dose, 0.32 to 2 Gm. (or gr. v-xxx).

**Chinoidinum.**—Chinoidine. Dose, 0.20 to 2 Gm. (or gr. iii-xxx). A mixture of the alkaloids, in an amorphous form, and dark colored; obtained from the residue left from the manufacture of the crystallizable salts.

**Quininae Hydrochloras Carbamidata.**—Double Salt of Quinine and Urea. Soluble in an equal part of water, and used hypodermically in congestive chills. Dose, 0.065 to 0.65 Gm. (or gr. i-x).

**Quinetum**, or Hospital Quinine, is the mixed alkaloids precipitated by an alkali; largely used as a febrifuge in India. Dose, about the same as quinine.

**Cinchonidine Salicylas.**—Cinchonidine Salicylate. Dose, 0.13 to 0.65 Gm. (or gr. i-x).

**Cinchoninae Iodosulphas.**—Cinchonine Iodosulphate (50 per cent. iodine). A substitute for iodoform.

**Pharmacology.**—The *Cinchona* of the United States Pharmacopœia is the dried bark of *Cinchona Ledgeriana* (Molus); *Cinchona Calisaya* (Wed-

dell); *Cinchona officinalis* (Linné); and of hybrids of these and of other species of cinchona (family, Rubiaceæ), yielding, when assayed by the official process, not less than 5 per cent. of anhydrous cinchona alkaloids, of which at least four-fifths should be soluble in ether. **Cinchona rubra** (U. S. P.), is the dried bark of *Cinchona succirubra* (Rubiaceæ), yielding not less than 5 per cent. of anhydrous cinchona alkaloid. **Cinchona Rubra Cortex** (B. P.) is the dried bark of the stem and branches of cultivated plants of *Cinchona succirubra*; "when used for purposes other than that of obtaining alkaloids or their salts, it should yield between 5 and 6 per cent. of total alkaloids, of which not less than half should consist of quinine and cinchonidine." *Cinchona flava* (non-official), which is the bark of the trunk of *Cinchona Calisaya*, contains at least 2 per cent. of quinine. There have been isolated from cinchona-bark about twenty alkaloids, differing slightly in physical qualities, solubility, reaction, and affinities, but all possessing, to greater or less degree, the characteristic physiological actions of quinine. They may be divided into two groups: (1) **quinine, quinidine, and quinicine**; (2) **cinchonine, cinchonidine, and cinchonidine**. These exist in the bark combined with cincho-tannic, kinic, and kinovic acids, with a tasteless, inactive substance,—cinchona-red. While South America remains the principal source of cinchona, yet the cultivation of the tree has been so successfully carried on in India and Java that a considerable portion of the supply is now derived from this source. The constantly-growing demand for quinine has stimulated chemical investigation; and laboratory products, chiefly of the coal-tar series, are now offered in great variety, which closely approach the cinchona alkaloids in physical and chemical characters, and which also have been proved valuable as antipyretics. Prominent among these are chinoline, antipyrin, acetanilide, resorcin, kryofin, and naphthalin, which will be considered separately under their individual titles. Thus far, however, no synthetically-prepared salt rivals quinine and cinchonine in their control of malarial manifestations, or in their tonic effects upon the system when given for a length of time in small doses.

By chemical modification of cupreine, a base found in the *Remijia pedunculata*, MM. Grimaux and Arnaud have, by synthesis, obtained a substance absolutely analogous to, and perhaps identical with, quinine. They have also derived other bodies similar to quinine, which are ethers of cupreine and are endowed with decided physiological properties. Quinine is chemically the methylic ether of cupreine. By following a similar process to that by which cupreine is transformed into quinine, two new alkaloids have been discovered. Ethylic cupreine has been denominated quinethyline and propylic cupreine has been given the name of quinopropyline.

With regard to the comparative alkaloidal value of the different barks, the *C. Calisaya* contains the greatest proportion of quinine, the *C. succirubra* the greatest amount of tannin and coloring matter. Under the name of pale barks, the *C. micrantha* and *C. condaminea* were formerly official; they are intermediate between the two just named, in their alkaloidal value. The *C. pitayensis*, cuprea-bark, and other quinine-yielding barks are employed in manufacturing the alkaloids, but are not specifically named by the pharmacopœias; all are official which contain at least 5 per cent. of the total alkaloids of cinchona and 2.5 per cent. of quinine.

Quinine sulphate is a snow-white crystalline substance of a silky lustre,

which becomes somewhat opaque in dry air from efflorescence. It becomes yellowish on exposure to sunlight, is phosphorescent on trituration at 320° F. At a red heat it decomposes and burns slowly without any residue. This salt is soluble in 740 parts of cold and 30 parts of boiling water, is readily soluble in alcohol and acidulated solutions, and in glycerin. It dissolves sparingly in chloroform and is nearly insoluble in ether. A delicate test for quinine is the production of an emerald-green color when a solution of one of its salts is treated with bromine-water followed by the addition of aqua ammonia in excess.

**Physiological Action.**—The preparations of the bark are not fully represented by the salts of the alkaloids, because they possess astringency, which is absent from the latter, and because the physiological action is increased by the association of different principles in accordance with the well-known rule of combination of synergistic remedies. For internal administration, however, the bulk of the powdered bark is inconveniently large. In 1820 Pelletier and Caventou first isolated quinine, which has since taken the leading place in therapeutics of fever, and is second only to morphine in importance. As the other salts approximate more or less closely to this, we may omit consideration of their physiological action and simply take quinine as the type. Quinine is a powerful antiseptic, and is very destructive to infusorial and vegetable life. A solution of  $\frac{1}{10}$  of 1 per cent., 0.065 Gm. to 30 c.cm. (or gr. 1-15j), destroys micro-organisms, and double this strength prevents fermentation and putrefaction. Upon the basis of his numerous experiments, Binz concludes that the remedial action of quinine in malaria is due to its direct action upon the specific micro-organism of the disease. Upon the sound skin very little effect is, as a rule, produced, but upon a part denuded of epidermis, or upon mucous membranes, it is a decided irritant. Rashes, however, may be caused by the direct action of cinchona. Workmen employed in making quinine are not infrequently attacked by erythema, vesicles, or pustules. It causes muscular contractions when applied directly to the muscle, but not when applied to a nerve (Eulenberg). It is therefore a muscle-irritant, and not a nerve-irritant. Taken into the stomach, it exercises a local effect upon its contents, checking abnormal fermentation and destroying infectious micro-organisms. For this purpose it should be given in solution or in powder (capsule), so as to insure its solution in the stomach. In moderate doses it stimulates the muscular fibres of the stomach, increasing its motor power, and also, by its irritant action, increases the secretion of gastric juice and, as a bitter tonic, improves the appetite. In large quantities, hunger is abolished, and the excess of irritant action causes arrest of gastric secretion.

In excessive doses it may cause nausea and vomiting. Its prolonged use in large amounts has been known to cause gastritis. No influence has been noticed upon respiration, and very little upon temperature of a person in health. In conditions of fever, the administration of several full doses reduces the temperature nearly to the normal; and there appears to be a tolerance during this condition, for the system can stand a much larger quantity of a dose than it can in health, without producing toxic effects. This may, in part, be due to the fact that absorption is checked by the fever. The effect upon the nervous system of small doses is best seen in cases of debility, where the agent acts as a tonic, invigorating the vital functions and aiding the digestion and assimilation of food. In larger doses, symptoms referable to the

brain are noticed, such as fullness, frontal headache, deafness, ringing in the ears, and mental dullness. These symptoms are attributed to partial anæmia of the brain, owing to contraction of blood-vessels and lowered heart-action, possibly to direct action upon the multipolar cells, analogous to the action of morphine. There is stimulation of the sympathetic and auditory nerves (Gubler). With deafness there is associated disturbance of vision or temporary blindness, due to extreme contraction of the arterioles and anæmia of the retina, the optic nerve being perfectly white, resembling white atrophy. This condition of the eye-ground is more or less permanent, but the function of vision is restored. Amblyopia has been produced in an extremely-susceptible individual by so small a dose as 0.13 Gm. (or gr. ij).

Large doses lower or abolish the reflex excitability of the spinal cord. Soon after being introduced into the stomach it diffuses into the blood and may be detected in the urine, elimination taking place slowly and lasting for several days. The quantity of urine is slightly increased in persons unaccustomed to its effects; the uric acid is decreased and urea not constantly affected. Medicinal, and especially massive, doses of quinine have, however, been observed to cause a marked decrease in urea, and it is thought that the diminished elimination of nitrogenous waste depends upon a depressant influence exerted by this drug upon tissue-changes within the body. Full doses of quinine may cause congestion of the genito-urinary tract.

Quinine probably escapes from the system by other routes, as it has been detected in the sweat, tears, and milk of nursing women. It has been found also in bile and in dropsical effusions. In the blood, quinine arrests the migration of the white corpuscles and checks their amœboid movements; the red cells are rendered less adhesive and their oxygen-carrying function is impaired. The experiments of Sokoloff upon rabbits show that quinine exerts a favorable influence upon the healing of wounds. Inflammatory degeneration of tissue is notably decreased. It probably tends to destroy infectious micro-organisms in the blood and tissues. The pulse-rate is increased by moderate doses, but larger ones (4 to 6 Gm., or ̄i-iss) cause lowering of the pulse and of arterial tension. In animals death results from paralysis of respiration after large doses of quinine. In the human subject very few well-attested cases of death following the ingestion of quinine are on record. Recovery has followed the use of such enormous quantities as 15.5 or 46.5 Gm. (or ̄jss-iss), though it is very probable that in such cases the entire amount was not absorbed. In Bazire's case death was caused by 155.5 Gm. (or ̄v) taken in the course of ten days. In some patients various forms of eruption have been noticed upon the skin, even purpura.<sup>1</sup> A scarlatiniform eruption occasionally follows the ingestion of a small dose of quinine. In other instances the eruption has resembled that of measles or erysipelas. Desquamation is a sequence, and may be prolonged. The rash is often attended by severe burning and itching sensations.

The artificial alkaloids derived from the cinchona bases generally exert a more decided influence upon temperature than does quinine, causing a reduction of several degrees even in healthy individuals. When injected subcutaneously these substances also produce total anæsthesia of the neighborhood into which they are thrown. Cupreine is slightly toxic, and does not occasion convulsions. Quinethyline produces tremor and the symptoms

<sup>1</sup> Cases by Dr. Frank Woodbury reported to State Medical Society of Pennsylvania, *Philadelphia Medical Times*, Sept. 18, 1886.

of quinine intoxication. Quinopropylamine is the most toxic member of the series, and causes a profound stupor.

**Poisoning.**—The toxic symptoms produced by quinine and allied salts are spoken of collectively as **Cinchonism**, which ordinarily is not allowed to go further than tinnitus aurium. Where these symptoms are annoying, or the patient is suffering from an overdose, the alimentary tract should be cleared by a purge, and brandy and a cup of hot coffee administered, or a dose of ergot. Where there is much irritation of the skin, urticaria, or erythema, a warm bath containing sodium bicarbonate is useful; an hypodermic injection of morphine may be necessary. Dilute hydrobromic acid (2 to 7.50 c.cm., or f3ss-ij), given with ordinary doses of quinine, prevents the occurrence of ringing in the ears or headache. Some patients show idiosyncrasy to the effects of quinine; urinary irritation, even congestion of the kidneys and hæmorrhages, may follow quite a small dose. Some, indeed, cannot take a single grain without great inconvenience from cinchonism. It must, therefore, be given with caution when cystitis is present. Quinine will also, in some individuals, occasion decided irritation of the gastro-intestinal mucous membrane.

A case has been reported by Dr. Krannhals in which the administration of 0.90 Gm. (or gr. iij) of quinine to a young woman was followed by high fever, bloody vomiting, and bloody diarrhœa. Erlenmeyer has recently described a case in which the nervous reflexes were greatly exaggerated after the administration of a single dose of 1 Gm. (or gr. xv) of quinine, followed by 2 Gm. (or gr. xxx) in broken doses on the succeeding day. Examination of the patellar reflex at that time occasioned a series of general convulsions, with violent contraction of the arms and the entire body. Quinine is eliminated rather slowly and principally by the kidneys.

**Therapy.**—The application of powdered bark was formerly one of the accepted methods of treatment of ulcers, but is now obsolete. A 1-per-cent. solution of quinine sulphate is recommended as a topical treatment of sluggish, unhealthy, infected wounds. The powdered salt, dusted upon chancre, has been found to promote rapid healing.

In hay fever a spray of cocaine, followed by a spray of quinine hydrochlorate (0.38 Gm. to 30 c.cm., or gr. vi-f3j), used frequently, is highly recommended. A solution of quinine, sprayed into the throat, is attended with good results in diphtheria. Quinine has also been used as an injection in gonorrhœa for its antiseptic action.

In cystitis, irrigation of the bladder with a 2-per-cent. solution prevents decomposition of the urine. The hypodermic injection of quinine is of great value in pernicious malarial attacks and in sun-stroke. The best salts for this purpose are the neutral hydrochlorate, the hydrobromate, or the carbamid-hydrochlorate (hydrochlorate of quinine with urea). Injections have also been made directly into a vein, in order to obtain prompt results. Dr. J. R. Gilbert, of Dallas, Texas, suggests that life may be saved, in desperate cases of malarial poisoning, by injecting 2 Gm. (or 5ss) of quinine into the circulation, administering cardiac stimulants by the mouth simultaneously. The solution should be freshly made and filtered and a perfectly-aseptic syringe used, as otherwise abscess or septicæmia, or even tetanus, may follow. The crystallized bisulphate may also be similarly employed. Freshly-prepared quinine lactate, which is soluble in four times its weight of water, is well adapted to hypodermic use, giving rise to little pain. The crystallized salt, however, is soluble only in 16 to 20 parts of water.

As an ordinary tonic, in conditions of debility or convalescence, the tincture of the bark, either simple or compound (the latter being more astringent), is more useful than the alkaloids, for reasons already stated, and because the alcohol in the tincture is synergistic. In cases of diarrhoea the antiseptic action of cinchona is very valuable, and quinine is of service in typhoid fever, especially during the second week; but it does not approach the character of a specific, as it does in malarial attacks.

Some writers praise the action of quinine in summer diarrhoea and cholera morbus, and suggest that it would prove efficacious in Asiatic cholera. Professor Fullerton has strongly recommended its use in cholera, giving it in doses of 1 to 1.30 Gm. (or gr. xv-xx) in the course of two hours at the beginning of the attack. He values it likewise as a prophylactic remedy.

In ordinary chills and fever 1 Gm. (or gr. xv) daily of the sulphate, or bisulphate, or 0.75 Gm. (or gr. xij) of the hydrochlorate or hydrobromate, given in two or three doses, at least five hours before the time of the expected paroxysm, will generally prevent its appearance, or greatly modify it. The treatment should be continued for a week or ten days, diminishing the dose, or suspending it, if cinchonism appear, but resuming the full dose at septenary periods, after the appearance of the last chill, for a month or more. The following prescriptions may be used in malaria:—

R Quininae sulphatis .....	8	Gm. or 3ij.
Acidi sulphurici arom. ....	4	c.cm. or f3j.
Ol. menth. pip. ....	30	c.cm. or mv.
Fluidext. glycyrrhizae .....	30	c.cm. or f3j.
Glycerini .....	120	c.cm. or f3iv.

M. Sig.: A teaspoonful or two every three or four hours.

R Quininae sulphatis,		
Ferri pyrophos. .... aa	260	Gm. or gr. xl.
Arsenii trioxidi .....	065	Gm. or gr. j.
Pulveris capsici .....	130	Gm. or gr. xx.
Aloini .....	13	Gm. or gr. ij.

M. et ft. pil. no. xx.

Sig.: A pill three or four times a day.

R Tinct. cinchonae comp. ....	120	c.cm. or f3iv.
Tinct. nucis vomicae .....	4	c.cm. or f3j.
Fluidext. taraxaci,		
Fluidext. rhamnus purshianae .....	aa 60	c.cm. or f3ij.

M. Sig.: A half to a tablespoonful in water three or four times a day.

A patient once poisoned by malaria may find it necessary to take a course of quinine for several weeks each year, at the season when the attack first appeared; and if unacclimated persons, wishing to stay in a malarious locality, or traveling through one at certain seasons of the year, will make use of the prophylactic action of quinine they may escape infection by taking from 0.25 to 0.38 Gm. (or gr. iv-vj) daily. In somewhat larger dose cinchonine is considered preferable to quinine for this purpose. In children, as well as in adults having a weak or irritable stomach, it is more convenient to administer the remedy in suppositories of cacao-butter, on account of the bitter taste and unpleasant effects on the digestion. The taste of quinine is tolerably well disguised by sweet or vanilla chocolate, or by coffee prepared with milk and sugar, the dose to be followed by a sip of coffee which contains no quinine. Ringer states that an equal portion of powdered ginger conceals the taste of quinine. Boiled or mashed potatoes will also re-

remove the taste from the mouth. In enlargement of the spleen (ague-cake) quinine is very efficient. In intermittent fever it should not, as a rule, be given during the paroxysm, because its irritant action may increase the nervous disturbance; but in other fevers pyrexia is no contra-indication to its moderate use. In infectious diseases, hæmorrhagic measles, small-pox, diphtheria, and pyæmia, quinine, combined with alcohol, is the chief resource.

This drug quite favorably influences the broncho-pneumonia of measles and counteracts the tendency to caseous degeneration. It is a serviceable remedy in children in lobular pneumonia dependent upon other causes. Combined with iron, quinine is very serviceable in erysipelas. Sixty-five cg. (or gr.  $\text{x}$ ) of quinine, given with Dover's powder, opium, or morphine, are efficient in averting an attack of acute catarrh. The same quantity of quinine, given at the beginning, will sometimes abort acute tonsillitis and prevent the formation of pus. As quinine checks the principal phenomenon in inflammation and suppuration, which is the escape of the white blood-cell, and, by preventing the exchange of oxygen by the red blood-cells, reduces inflammation, it is especially serviceable in pneumonia and other localized inflammations, and also in reducing discharge from abscesses and preventing æpræmia or pyæmia. Bartholow considers that a larger dose (1.30 to 2.60 Gm., or gr.  $\text{xx}$ - $\text{xl}$ ) has the power, if administered during the congestive stage, before exudation has occurred, of suppressing or modifying a croupous pneumonia, pleurisy, or endocarditis.

In this country quinine is rarely, if ever, given in such large doses as it has been in Germany for the purpose of reducing high temperature in erysipelas, scarlatina, or rheumatism, although Liebermeister regards it as being a better antipyretic than the cold bath. It is not considered advisable to use such large amounts in typhoid, on account of the inflammation of the patches in the small intestine, quinine being a gastro-intestinal irritant. In typhoid and other fevers it may be administered in the following manner, especially if the action of the heart be weak:—

R Fluidextract. cinchonæ .....	22	c.cm. or f3vj.
Tinct. cardamom. comp. ....	15	c.cm. or f3iv.
Spiritus ætheris comp. ....	30	c.cm. or f3j.
Tinct. digitalis .....	7½	c.cm. or f3ij.
Aquæ chloroformi .....	ad 300	c.cm. or f3x.

M. Sig.: A half to a tablespoonful every three or four hours.

In whooping-cough, which is regarded by some as a parasitic infection, its use has been attended by much benefit in comparatively large doses, conjoined with the local use of a spray of quinine solution (Henke).

In many disorders of atonic character, such as neuralgia, dyspepsia, night-sweats of phthisis, general debility, neurasthenia, quinine is highly serviceable. It is particularly valuable in those manifestations of neuralgia which result from anemia or malaria, and is well combined in the former case with iron, and in the latter with arsenic, thus:—

R Quinins sulphatis.		
Massæ ferri carbonatis .....	aa	2
Ext. nucis vomicæ .....		20
Ext. belladonnæ folior. ....		005
		Gm. or gr. iij.
		Gm. or gr. j.

M et ft. pil. no. xij.

Sig.: A pill three or four times a day.

℞ Quinins sulphatis ..... 4℥ Gm. or 3j.  
 Sodii arsenatis,  
 Ext. ignatiæ alc. .... aa | 13 Gm. or gr. ij.  
 M. et ft. pil. no. xx.  
 Sig.: A pill three times a day.

Dr. St. John Roosa has called attention to the dangers of quinine, on account of its causing serious disturbances of the ear, even when taken in small, though long-continued, doses. Professor Charcot, however, recommended the administration of quinine in Ménière's disease. His method was to give 0.38 Gm. (or gr. vj) twice daily, at meal-time, for fifteen days. The drug is then discontinued for eight days, when it is resumed in the same manner. The noises in the ear and the vertigo may be aggravated at first, but this effect soon subsides. Four or five such periods of alternate exhibition and discontinuance generally result in a cure. Many skin disorders and eruptions are due to malaria, in which quinine produces good effect, as pointed out by the late Dr. L. P. Yandell. In old malarial cases, the sulphate of cinchonine or cinchonidine may be substituted for the more expensive quinine salts:—

℞ Chloroformi ..... 2℥ c.cm. or ℥xxx.  
 Cinchonidins sulphas ..... 3℥10 Gm. or gr. xlviij.  
 Tinct. cardamom. comp. .... 7℥5 c.cm. or f3ij.  
 Mucilaginis acaciæ ..... q. s. ad 120℥ c.cm. or f3iv.

M. Sig.: Take a dessertspoonful every four hours for malarial toxæmia.

℞ Chinoidini ..... 4℥ Gm. or 3j.  
 Cinchonidins sulph. .... 2℥60 Gm. or gr. xl.  
 Piperins ..... 38 Gm. or gr. vj.  
 Cupri sulphat. .... 13 Gm. or gr. ij.

M. et ft. pil. vel capsulæ no. xxx.

Sig.: One or two every three or four hours in severe malarial chills.

Other evidences of chronic malarial intoxication—as diarrhoea, dysentery, jaundice, and chorea—disappear under the administration of quinine. Intermittent hæmaturia, when due to this cause, is cured by the judicious administration of quinine. In view of its irritant effect upon the genito-urinary system, quinine will sometimes excite or aggravate hæmaturia in those suffering from malaria. This fact should be remembered in the management of malarial hæmaturia; in fact, it has been claimed that the hæmaturia is really produced by large doses of this drug administered in the treatment of the disease. Alexander Haig points out the fact that ordinary acid sulphate of quinine contains 20 per cent. of xanthin, which is physiologically and pathologically equivalent to uric acid, and which may therefore aid in the destruction of red blood-cells and liberation of hæmoglobin, which is the cause of black water. Small doses of quinine, temporarily employed, are useful in cases of catarrh of the stomach, whether due or not to alcoholic excess. Its action is aided by association with a mineral acid. Quinine is an excellent remedy in aphthous ulceration consecutive to enterocolitis, and in the yeasty vomiting produced by the growth of *sarcina ventriculi*. The same agent is of utility in the treatment of ascarides and tænia, not so much, perhaps, by virtue of a direct toxic influence upon the parasites, as correcting the unhealthy condition of the intestinal mucous membrane, which favors development. Tonic doses of quinine render excellent service in *dém-tremens*. The laryngismus stridulus to which rickety children are

subject is ameliorated by quinine hydrobromide. This salt is preferred by Huchard<sup>1</sup> in the treatment of grip, in which he gives from 1 to 1.40 Gm. (or gr. xv-xxij) *per diem*, for the first few days, or:—

R Quininae hydrobromidi,  
 Extracti ergotae ..... aa    | 10 Gm. or gr. iss.  
 M. et ft. pil. Mitte tales no. xxx.  
 Sig.: Six to ten in the course of the day.

In many skin diseases dependent upon lowered nutrition,—as, for instance, acne, impetigo, or ecthyma,—small, daily doses of quinine are beneficial. This remedy is of value as a support to the system during the course of a prolonged suppuration; and a full dose is prudently given before the use of a catheter or bougie, in order to prevent the occurrence of a chill. It is an excellent tonic in bronchorrhœa. Good results have been claimed by certain French physicians from the use of quinine in acute rheumatism, but the experience of most observers is unable to confirm these reports. It is of more decided benefit in chronic rheumatism, especially when occurring in aged or debilitated subjects. In these cases it is best given in conjunction with the tincture of iron, or in the form of salicylate, or with potassium iodide:—

R Quininae sulphatis ..... 4 | Gm. or 3j.  
 Tinct. ferri chloridi ..... 30 | c.cm. or f3j.  
 Elix. gentianae ..... 120 | c.cm. or f3iv.

M. Sig.: Two teaspoonfuls three or four times a day.

R Potassii Iodidi ..... 27 | Gm. or 5viij.  
 Spiritus chloroformi ..... 75 | c.cm. or f3ij.  
 Tinct. cinchonae comp. .... 300 | c.cm. or f3x.

M. Sig.: A half to a tablespoonful in water three or four times a day.

**Special Applications.**—In obstetrics, quinine is valued as an oxytocic, increasing the energy of the uterine contractions, though not capable of inciting them. The late Dr. Ellerslie Wallace approved of quinine in uterine inertia during labor when it accompanies general muscular atony. In such cases it increases the expulsive force of the uterus and greatly reduces the danger from sepsis. Abortion has been produced by the administration of quinine and strychnine as a tonic, the accident being attributable to the latter agent. Quinine is also useful in aiding in preventing putrid infection from the uterine discharges, in the treatment of so-called milk-fever (a mild septicæmia) or milk-leg, and also in cases of uterine subinvolution after parturition. In small doses it stimulates the menstrual flow and acts as an emmenagogue. In anæmic patients, it may be given combined with iron:—

R Ferri et quininae citratis ..... 4 | Gm. or 3j.  
 Ol. tanacetii ..... 60 | c.cm. or ℥x.

M. et div. in pil. no. xx.

Sig.: One four times daily, or two morning and night.

Warburg's tincture is highly prized in England in fevers, and in shock or collapse. Thirty c.cm. (or f3j) contain 0.65 Gm. (or gr. x) of quinine, in combination with aromatics, half of this quantity being given at a dose and

<sup>1</sup> *Bulletin de l'Académie de Médecine*, Paris, Feb. 27, 1900.

the remainder in three or four hours.<sup>1</sup> Its administration is to be preceded by a brisk purgative. In severe cases of poisoning by malaria, large doses are absolutely necessary to save life when given by itself, but when given in the above combination much smaller quantities are found to answer the purpose.

Cinchonidine is useful in malaria. The *Therapeutische Wochenschrift* (Jan. 12, 1900) gives the following formula for internal use:—

R Cinchonidine sulph. ....	1	Gm. or gr. xv.
Acid. tartarici .....	75	Gm. or gr. xij.
Mist. acaciae .....	120	c.cm. or ℥iv.

M. Take in the course of the day, in three or four doses.

For subcutaneous injections the formula is:—

R Cinchonidine sulph. ....	1	Gm. or gr. xv.
Acid. tartarici .....	80	Gm. or gr. xij.
Aq. destill. ....	3	c.cm. or mxlv.

M. Each c.cm. of this solution contains 0.25 Gm. of cinchonidine. A daily dose of 1 Gm. (or gr. xv) cinchonidine by the mouth is usually sufficient, but 1.20 to 1.40 Gm. (or gr. xviii-xxij) can be taken without detriment.

**Cinchonine Iodosulphate** is the precipitate resulting from the addition of a solution of iodated potassium iodide (Bouchardat's reagent) to a watery solution of the cinchonine sulphate. It is collected and washed free from iodine, and dried. The resulting product is an amorphous, impalpable powder, of a brownish color, without odor, insoluble in water, though soluble in alcohol or chloroform. The dose of this preparation is from 0.065 to 0.32 Gm. (or gr. i-v). The interesting point in connection with it is that it contains 50 per cent. of iodine. M. Ivon<sup>2</sup> has recently completed some studies upon the antiseptic qualities, made with this agent, which, on account of its effects, he styles **Antiseptol**, and recommends as a substitute for iodoform on account of the low price and superiority as a surgical dressing.

Cinchonine iodosulphate, or antiseptol, has the action of the two substances that enter into its combination, being at the same time free from the toxic effect, which follows sometimes from the use of iodoform. Externally, it has been used by the writer for its antiseptic action with excellent results,

<sup>1</sup> The National Formulary has the following formula for Warburg's tincture (without aloes), under the name of *Tinctura Antiperiodica* (N. F.):—

R Rhubarb.		
Angelica-seed. ....	aa 3℥	Gm. or ℥j av. gr. lxxxviii.
Elecampane.		
Saffron.		
Fennel. ....	aa 1℥	Gm. or gr. celsiv.
Gentian.		
Zedoary.		
Cubeb.		
Myrrh.		
White agaric.		
Camphor. ....	aa 9	Gm. or gr. cxxxii.
Quinine sulphate ...	100	Gm. or ℥ij av. gr. cxlviii.
Diluted alcohol .....	to make 5000	c.cm. or 10 pints.

This preparation, made without aloes, is intended to serve as a stock tincture from which regular Warburg's tincture is to be made, when required, by adding 1½ per cent. of tincture of aloes, to the preceding formula. "Warburg's tincture without aloes" is often prescribed.

<sup>2</sup> *Le Progrès Médical*, July 12, 1890.

especially in the treatment of chronic ulcers, sinuses, abrasions, lupus vulgaris, abscesses, chronic acne, and various inflammatory thickenings of the integument. The following formulæ may be recommended:—

<b>R</b> Cinchoninæ iodosulphatis .....	4	Gm. or 3j.
Ungt. zinci oxidi .....	31	Gm. or ʒj.
<b>M.</b> For chronic acne, eczema, and psoriasis.		
<b>R</b> Cinchoninæ iodosulphatis .....	4	Gm. or 3j.
Oil eucalypti .....	60	c.cm. or <i>mx.</i>
Adipis lævis hydrosi .....	31	Gm. or ʒj.
<b>M.</b> For syphilis, chronic ulcers, and eczema.		

**Contra-indications** to the use of quinine consist in:—

1. Idiosyncrasy, where severe tinnitus aurium, headache, skin eruptions, or purpura, are caused by small doses, and where this cannot be overcome by the use of bromides, ergot, or arsenic.
2. Acute inflammation of the genito-urinary tract, or congestion of the kidneys.
3. Acute inflammations of the gastro-intestinal tract.
4. Inflammation of the middle ear and dullness of hearing (nervous deafness).
5. Infants suffering with eczema.

It is stated on the authority of Brown-Séguard and Albertoni that quinine and cinchonidine increase the frequency of epileptic convulsions.

The comparative antiperiodic value of the alkaloids was thus estimated by Bartholow: "Quinidine is first as an antiperiodic; quinine comes next. Cinchonine requires about twice the dose in order to equal quinine. Cinchonidine is a little stronger than cinchonine. Amorphous chinoidine is about one-fourth the strength of quinine." In the United States army, the hydrochloride is generally given the preference over the sulphate on account of its greater solubility. The hydrobromide and valerianate are supposed to cause less nervous irritation in susceptible subjects than the other salts. The addition of a few drops of dilute sulphuric acid to quinine sulphate, when in solution, makes it much more soluble; or the bisulphate may be prescribed in pill form. The acid hydrochloride (B. P.) is useful for hypodermic injection; but contains one-tenth less of the alkaloid than the hydrochloride. The borate, carbolate, and salicylate have been introduced as especially serviceable in neuralgia. Quinine sulphovinate is a very soluble salt, requiring only twice its weight in water to dissolve it, and may be used hypodermically. M. Grimaux has recently succeeded in producing some new double salts of quinine, the hydrochlorosulphate, the hydriodosulphate, and the corresponding phosphates.

The hydrochlorosulphate is a granular, grayish-white, amorphous powder and has an extremely bitter taste, is soluble in its own weight of water, is equal in strength to the sulphate, than which it is more rapid in its action on account of being more readily absorbed. The physiological and therapeutic effects are the same as those of the sulphate. Its solubility renders it particularly serviceable for hypodermic use.

**Cinchonamine**, a new derivative of quinine, has been studied by M. Arnaud, who finds that it has as marked an effect and is more soluble than quinine. Cinchonamine is obtained from cuprea-bark. It is said to be six

times more toxic than quinine, is endowed with only slight antiseptic power; but reduces abnormal temperature, and may be serviceable in malaria. It is said to exert a decided sialogogic influence.

Clinical experiments with the salts of the synthetical alkaloids have been carried on by Professor Bourru, of Rochefort. The hydrochloride of cupreine is efficient in malaria, but must be given from the beginning in doses of 1 to 2 Gm. (or gr. xv-xxx). This salt produced no ill effects. It was without influence upon the pulse. The sulphate of quinethyline appears to be superior as an antiperiodic to quinine. It was employed in maximum doses of 0.75 Gm. (or gr. xij). The sulphate of quinopropyline is the most energetic member of the series. In a case of typhoid fever it produced a marked reduction of temperature. A dose of 0.50 Gm. (or gr. viij) gave rise to buzzing in the ears, vertigo, nausea, and general malaise. It is active in about half the dose of quinine.<sup>1</sup>

**Quinine Tannas.**—The tannate is sometimes called "tasteless quinine," because the bitterness is almost entirely overcome by the combination, and, also, largely because of insolubility of the salt. Although insoluble in water, it is soluble in the acid gastric juice, and when administered with food, or soon afterward, it answers equally well with the other salts. In the combination with sweet chocolate, all objectionable taste is overcome, and, made into troches, or compressed tablets, each containing 0.065 Gm. (or gr. j), we have a sort of confection: probably the very best form in which to administer quinine to children. It may be made extemporaneously:—

R Quininae .....	1	55 Gm. or gr. xxiv.
Acidi tannici .....		75 Gm. or gr. xij.
Syrupi cinnamomi .....	90	c.cm. or f3iij.

M. Each teaspoonful contains 0.065 Gm. (or gr. j) of quinine. If the quinine sulphate is used, the tannic acid must be doubled.

R Quininae hydrochloridi .....	1	55 Gm. or gr. xxiv.
Acidi tannici,		
Glycyrrhizin. ammoniat. ....	aa	75 Gm. or gr. xij.

M. et div. in chartulæ no. xij.

Sig.: Three daily.

Regarding the method of administration of this very bitter agent, several devices are adopted to enable patients to take it, among the best of them is the gelatin- or sugar- coated pill, the hard capsule, *cachêts de pain*, or con-seals. The following mixture is an agreeable method of administration in solution:—

R Quininae sulphatis .....	1	3 Gm. or gr. ij.
Acid. citric. ....		38 Gm. or gr. vj.
Syrupi aurantii florum .....	4	c.cm. or f3j.—M.

This is to be placed in a wine-glass containing sodium bicarbonate, 0.20 to 0.32 Gm. (or gr. iii-v), in saturated solution, and then drunk during effervescence. The National Formulary provides a good vehicle in compound taraxacum elixir:—

R Quininae sulphatis .....	1	55 Gm. or gr. xxiv.
Elixir taraxaci comp. (N. F.) .....	90	c.cm. or f3iij.

M. Sig.: A teaspoonful to a tablespoonful, according to circumstances.

<sup>1</sup> *La Tribune Médicale*, July 5, 1894; *The Medical Bulletin*, Sept., 1894, p. 349.

An adult can take a powder of quinine in a dessertspoonful of syrup of red orange, or syrup of wild cherry, without experiencing much unpleasant taste. Some prefer to take it in a little whisky and water. Other preparations which may be used with more or less success in order to disguise the taste of quinine are cascara cordial and the aromatic syrup of yerba santa. When given in powder, quinine may be rendered nearly tasteless by rubbing up with one-fourth its weight of ammoniated glycyrrhizin. The ammoniated elixir of glycyrrhizin is also a good excipient for the sulphate, which is suspended in the mixture. No acid should be added when the extract is used. The sugar-coated or gelatin-coated pills are most commonly used, and, if properly made (and if they contain the full amount of the drug), they answer, if not too dry and hard. In cases of irritability of the stomach and diarrhoea it is better to use the drug in the form of a solution. Cinchonine sulphate may be serviceably employed instead of quinine, especially in the treatment of children. Cinchonine is effectual in malaria and does not occasion buzzing in the ears, though it gives rise to a sensation of dryness in the nose and mouth and may cause paresis of accommodation with alteration in the size of the pupil.

The tannate of quinine is also almost tasteless and may be used with advantage in dyspepsia, diarrhoea, and nephritis.

**Euquinine.**—By the action of ethyl-chlorocarbonate on quinine, according to von Noorden,<sup>1</sup> quinine carbonic ether is formed, which possesses the operative properties of quinine without its bitterness, or producing nausea, buzzing in the ears, depression of spirits, etc. It has been therefore called **Euquinine**. It is a crystallizable substance, sparingly soluble in water, but easily soluble in alcohol, ether, or chloroform. The chloride of Euquinine, however, is easily soluble in water. Euquinine may be given in sherry-wine, milk, or cocoa. The dose is 0.12 to 1 Gm. (or gr. ij-xv), which in healthy people produces no effect. Beneficial results have been reported in febrile states and in whooping-cough. It reduces temperature in pyrexia. In supra-orbital neuralgia, the effects were especially good. It is given usually in powder form. St. George Gray,<sup>2</sup> of St. Lucia, West Indies, has found very good results in malarial fevers. He denies the statement made by others that it will not cause cinchonism, as he had experienced tinnitus aurium, deafness, and other phenomena, just as from quinine. He considers it a more powerful antipyretic and antimalarial agent than quinine itself.

**CINNAMOMUM (U. S. P.).—Cinnamon.**—Two kinds of cinnamon are officially recognized by the United States Pharmacopœia: *Cinnamomum Saigonicum* (U. S. P.), Saigon Cinnamon, the dried bark of an undetermined species of *Cinnamomum* (Lauraceæ), and *Cinnamomum Zeylanicum* (U. S. P.), Ceylon Cinnamon, the inner bark of the shoots of *Cinnamomum zeylanicum* (Lauraceæ).

**CINNAMOMI CORTEX (B. P.). — Cinnamon-bark.** The dried inner bark of shoots from the truncated stocks of *Cinnamomum zeylanicum*. Obtained from cultivated trees. Imported from Ceylon and distinguished in commerce as *Ceylon cinnamon*.

<sup>1</sup> *Centralblatt für innere Medizin*, Nov. 28, 1897.

<sup>2</sup> *The British Medical Journal*, Feb. 26, 1898, p. 551.

*Preparations.*

**Pulvis Aromaticus** (U. S. P.).—Aromatic Powder (cinnamon, ginger, aa 35 parts; cardamom and nutmeg, aa 15 parts). Dose, 0.32 to 2 Gm. (or gr. v-xxx).

**Fluidextractum Aromaticum** (U. S. P.).—Aromatic Fluid Extract (aromatic powder exhausted with alcohol, 1 Gm. = 1 c.cm.). Dose, 1 to 4 c.cm. (or *mxv-f3j*).

**Oleum Cinnamomi** (U. S. P., B. P.).—Oil of Cinnamon. Oil of Cassia. Dose, 0.00 to 0.18 c.cm. (or *mi-iiij*).

**Cinnaldehydum** (U. S. P.).—Cinnamic Aldehyde (obtained from oil of cinnamon, or prepared synthetically, contains not less than 95 per cent. of pure cinnamic aldehyde). Dose, about the same as the oil.

**Tinctura Cinnamomi** (U. S. P., B. P.).—Tincture of Cinnamon. Dose, 4 to 15 c.cm. (or *f3i-iv*). B. P., 2 to 4 c.cm. (or *f3ss-j*).

**Aqua Cinnamomi** (U. S. P., B. P.).—Cinnamon-water. Dose, 15 to 120 c.cm. (or *f3ss-iv*).

**Spiritus Cinnamomi** (U. S. P., B. P.).—Spirit of Cinnamon (10 per cent. of oil). Dose, 0.06 to 4 c.cm. (or *mx-f3j*). B. P., 0.30 to 1.20 c.cm. (or *mv-xx*).

**Pulvis Cinnamomi Compositus** (B. P.).—Compound Powder of Cinnamon (cinnamon, cardamom, and ginger, equal parts). Dose, 0.65 to 2.60 Gm. (or gr. x-xl).

**Syrupus Aromaticus** (B. P.).—Aromatic Syrup (tincture of orange and cinnamon-water, each, 250 c.cm.; syrup, 500 c.cm.). Dose, 2 to 4 c.cm. (or *f3ss-j*).

The following U. S. P. preparations contain cinnamon as a constituent: Aromatic sulphuric acid, compound tincture of catechu, compound tincture of lavender, syrup of rhubarb, aromatic tincture of rhubarb, aromatic syrup of rhubarb, compound tincture of cardamom, chalk mixture, and wine of opium.

(For Cinnamic Acid see *Styrax*.)

**Pharmacology.**—Cinnamon is the inner bark of the shoots of *Cinnamomum zeylanicum* (Ceylon cinnamon), or the bark of an undetermined species of *Cinnamomum* (Saigon cinnamon). The bark of several undetermined species of *Cinnamomum* grown in China (*Cinnamomum cassia*, *Cassia cinnamon*, or Chinese cinnamon) is also used, but is not now official. The British Pharmacopœia specifies the source as cultivated trees from Ceylon. Besides the volatile oil, which is used for flavoring purposes, cinnamon contains tannic acid, mucilage, coloring matter, an acid, and lignin. The oil consists almost entirely of cinnaldehyde.

The Ceylon cinnamon is the choice variety, but the greater portion of this valued spice brought to this country is the cassia cinnamon, the flavor of which is less sweet and more pungent and astringent. The physiological properties are the same.

**Physiological Action.**—Cinnamon is an aromatic, with considerable astringency. It acts as an hæmostatic, not so much through its astringent constituents as by virtue of the volatile oil, which may be used efficiently alone.

**Therapy.**—In cases, especially among children, where counter-irritation is needed, the use of spice plasters is recommended, as in croup, colic, neuralgia, etc. They can be obtained already prepared for use, or may be prepared extemporaneously by placing aromatic powder between two layers of flannel and moistening it with hot whisky. As a stomachic, in flatulence and feeble digestion, cinnamon is of some value, but its carminative effect is most frequently utilized in combination with other remedies, especially purgatives, to prevent griping. It is of service in diarrhœa, as in the chalk mixture, to which other agents may be added:—

R Bismuthi salicylat. ....	065 to	20 Gm. or gr. i-iiij.
Misturæ cretæ .....	4	c.cm. or f3j.
M. pro dosi.		

For irritative diarrhœa of infants, especially summer diarrhœa, this dose to be repeated according to urgency every hour or more.

Finely-powdered cinnamon, given in doses of 4 to 6 Gm. (or  $\text{ʒi-ias}$ ), morning and evening, is said to be an efficient remedy in acute dysentery. It will at times be found capable of allaying nausea and vomiting, or even of relieving seasickness. In passive uterine hæmorrhage we may give an extemporaneous infusion in milk, or give the oil upon sugar. The oil may also be utilized, at least as an adjuvant, in pulmonary hæmorrhage.

Dr. J. C. Ross claims that large doses of cinnamon, internally administered, are of value in the palliative treatment of carcinoma of various internal organs. He states that pain is alleviated, the odor decreased, and the general condition improved. Dr. Ross directs that from 11 to 13 ounces of Ceylon cinnamon be placed in 3 quarts of water, boiled down to a quart, and decanted without filtering. Of the mixture a pint is to be taken every twenty-four hours.

Various vegetable essences have been shown by M. Chamberland to possess very marked antiseptic power. The oil of cinnamon has been utilized by M. Lucas-Championnière as a surgical dressing. Employed in full strength it is very irritant, but dissolved in retinol to form a pomade it constitutes an excellent application to sutured wounds after operations. Dr. J. Chalmers La Costa, of Philadelphia, recommends the oil of cinnamon as an injection in gonorrhœa. He first cleanses the urethra by diluted hydrogen dioxide, after which he injects the oil of cinnamon dissolved in one of the liquid-petroleum preparations. The solution is made of the strength of 0.06 c.cm. to 30 c.cm. (or  $\text{mi-fʒj}$ ) on the first day, 0.12 c.cm. to 30 c.cm. (or  $\text{mii-fʒj}$ ) on the second day, and thenceforward 0.18 c.cm. (or  $\text{miiij}$ ) to the same quantity of menstruum. Inhalation of a spray containing the spirit of cinnamon is said by Dr. Capsus to be of decided service in all forms of malaria, cases which had proved unamenable to quinine and arsenic improving within a few days. The following are useful formulæ for antiseptic ointments:—

R Retinol.....	70	Gm. or $\text{ʒiʒij}$ .

J. Hilton Thompson claims that the oil of cinnamon is of great value in the treatment of pulmonary tuberculosis when administered by inhalation. The patients like the odor of the oil, and will wear the inhaler almost constantly. In addition he gives tonic remedies, and continues the treatment for months. Under this method of administration the bacilli become less

numerous and all the symptoms improve. Several cases showing marked benefit are reported.<sup>1</sup>

**COCA** (U. S. P.).—Coca.

**COCÆ FOLIA** (B. P.).—Coca-leaves.

#### *Preparations.*

**Fluidextractum Cocæ** (U. S. P.).—Fluid Extract of Coca. Dose, 0.30 to 4 c.cm. (or *mx-f3j*).

**Cocainæ Hydrochloridum** (U. S. P., B. P.).—Cocaine Hydrochloride. Dose, 0.015 to 0.065 Gm. (or gr.  $\frac{1}{4}$ -j).

**Extractum Cocæ Liquidum** (B. P.).—Liquid Extract of Coca. Dose, 2 to 4 c.cm. (or *f3ss-j*).

**Cocaina** (U. S. P., B. P.).—Cocaine. Dose, 0.015 to 0.03 Gm. (or gr.  $\frac{1}{4}$  to  $\frac{1}{2}$ ).

**Oleatum Cocainæ** (U. S. P.).—Oleate of Cocaine (contains 5 per cent. of cocaine oleate in olive oil). Used as a local anæsthetic.

**Vinum Cocæ** (U. S. P.).—Wine of Coca (contains fluid extract of coca,  $\frac{6}{10}$  per cent., in red wine). Dose, 30 to 60 c.cm. (or *f3j-ij*).

**Unguentum Cocainæ** (B. P.).—Ointment of Cocaine (4 per cent.).

**Lamellæ Cocainæ** (B. P.).—Discs of Cocaine (each contains, of cocaine hydrochloride, 0.0013 Gm., or gr.  $\frac{1}{100}$ ).

**Injectio Cocainæ Hypodermica** (B. P.).—Hypodermic Injection of Cocaine (10 per cent.). Dose, by subcutaneous injection, 0.12 to 0.30 c.cm. (or *mii-v*).

**Trochiscus Kramerie et Cocainæ** (B. P.).—Krameria and Cocaine Lozenge (contains of krameria extract, 0.065 Gm., or gr. j; cocaine hydrochloride, 0.003 Gm., or gr.  $\frac{1}{100}$ ).

**Pharmacology.**—Cocoa is the dried leaves of *Erythroxylon Coca*, Lamarck (*Erythroxylonæ*), a small tree of Peru and Bolivia, known commercially as Huanuco coca, or of *E. Truxillense* (Rusby), known commercially as Truxillo coca, yielding, when assayed by official process, not less than 0.5 per cent. of the ether-soluble alkaloids of coca. It contains a crystallizable alkaloid, **Cocaine** (which has been ascertained by Lossen to be methyl-benzoyl-ecgonine), besides other alkaloidal derivatives of ecgonine. It also contains wax, **Coca-tannic acid**, and a concrete, volatile, odorous substance. **Tropacocaine**, an analogous alkaloidal compound, has been found by Giesel in the small-leaved coca-plant of Java. It is probable that the fresh leaves contain a volatile principle of considerable physiological activity, which is lost after a sea-voyage, by partial fermentation and drying, as maintained by Dr. H. H. Rusby. They also contain coca-tannic acid and some oil, aromatic and coloring matters, etc.; but cocaine, after all, is the most important constituent. As cocaine is decomposed into benzoic acid and ecgonine by the action of mineral acids, these should not be prescribed with the fluid preparations made from coca-leaves. A precipitate also results from a mixture of the solutions of sodium bromide and cocaine hydrochloride. The salts of cocaine are incompatible with those of mercury. A mixture of cocaine and menthol is said to form a very irritant combination. Cocaine and silver nitrate are incompatible.

**Physiological Action.**—Coca and to a marked degree cocaine cause local numbness or anæsthesia when applied to mucous membranes and when injected hypodermically. When cocaine is applied to the conjunctivæ, sensibility is reduced, the pupils become dilated, and the accommodation impaired; it constricts the blood-vessels, diminishes the intra-ocular tension,

<sup>1</sup> *British Medical Journal*, Nov. 7, 1896, p. 1374.

causes enlargement of the palpebral fissure and protrusion of the eyeball. It occasions an irregularity of the corneal surface, or haziness, which does not appear, however, to depend upon loss of epithelium. When applied to the tongue, it causes numbness and loss of tactile sensibility without affecting the movements. The application of cocaine to the pharynx, or larynx, and nasal chambers, reduces the sensibility so as to permit manipulation or operation, and also by its effect upon blood-vessels reduces congestion and inflammation. Taken in small doses frequently repeated, coca acts as a general tonic and prevents waste. In somewhat larger doses it is a nerve-stimulant, increasing the blood-supply to the nerve-centres, improves the digestive powers, increases the force of the heart's action and arterial tension by its influence upon the vasomotor centres and cardiomotor ganglia. It also gives a sense of well-being that enables the organism to bear more fatigue and to sustain the powers of the body with less food or less sleep than usual. Coca increases the flow of urine, but the quantity of urea is lessened; it thus acts as an indirect food by preventing waste. After an overdose the pulse becomes rapid and weak, respiration is labored and shallow, and oppression of the chest is complained of, with threatening collapse, clammy skin, hallucinations, and delirium. Clonic convulsions of cerebral origin are occasioned and the bodily temperature markedly increased. Death is due to the paralysis of the heart, the spinal centres, or the centres in the medulla. Diarrhoea is produced by large doses, with headache (Hammond). According to the studies of M. Maurel, coca has an action upon the leucocytes, causing them to become globular and rigid and to lose their property of adhering to the walls of the vessels. In this manner thrombi and emboli are formed and death is apt to result from pulmonary embolism. Gley has experimentally determined that the liver diminishes the toxicity of cocaine. In some cases of poisoning from cocaine, albumin has been found in the urine.

**Poisoning.**—The treatment is the same, generally speaking, as for toxic doses of caffeine. Morphine, atropine, chloral-hydrate, paraldehyde, sulpho-carburethane, amyl nitrite, chloroform, alcohol, and ether are physiological antidotes. Strophanthin, or strychnine, may be given hypodermically, for heart weakness.

Ammonia and digitalis may likewise be made use of in order to counteract the milder toxic manifestations of cocaine. In severe cases Dr. S. Marshall has employed with service a large teacupful of clear coffee, which can be administered cold or hot.<sup>1</sup> In some cases toxic effects have apparently been produced, with great depression and imminent collapse, by extremely minute doses, as where cocaine is used as a mydriatic, or applied to the throat, nose, or urethra. They can only be explained by idiosyncrasy, and the symptoms usually promptly disappear after the administration of stimulants, or the inhalation of ammonia or ether. A form of protracted acute neurasthenia has been lately described by Hallopeau, who has, in several instances, observed the injection of a single small dose to produce distressing symptoms, which may endure for several months. The symptoms bear much resemblance to those which immediately follow the injection, and consist, above all, of persistent headache, accompanied by profound malaise, insomnia, numbness of the limbs, vertigo, syncope, mental excitement, and loquacity.<sup>2</sup> It occasionally happens that the application of cocaine solution to

<sup>1</sup> *Western Medical Reporter*, Sept., 1892.

<sup>2</sup> *La Tribune Medicale*, Dec. 4, 1890; *Medical Bulletin*, Jan., 1891.

certain portions of the mucous membrane is followed by great muscular relaxation, a weak pulse, dysphagia, and pharyngeal paralysis without loss of consciousness. This condition has terminated fatally in a few cases when the amount of drug absorbed could have been only a fraction of a grain, and, therefore, the result was in some manner caused by reflex action and possibly was partly psychical in its nature. The parts most susceptible to the action of cocaine appear to be the middle turbinate bone and upper fossa of the nose, and the male urethra. A case of serious poisoning following the injection of cocaine solution into the urethra for dilatation of a stricture is reported by Brennan,<sup>1</sup> when morphine, nitroglycerin, and ammonia were used as antidotes with success. Magnan has called attention<sup>2</sup> to a peculiar disorder of sensation attending chronic cocaine poisoning. It is a feeling as of foreign bodies, grains of sand, worms, or microbes under the skin in any part of the body. This has been called Magnan's symptom. There is a generally recognized danger of forming the cocaine habit, and examples are not wanting of unfortunate cases of this kind among members of the medical profession. **Cocainism**, the result of constant use of this drug as a stimulant, is met with, especially among neurotics and degenerates; possibly the addiction may be, in some cases at least, the first manifestation of insanity. In a large number of cases, moreover, those who fall victims to the cocaine habit are also addicted to the use of morphine, the double intoxication leading to the most serious deterioration of health. Appetite and strength decrease, tremors and hallucinations occur, and insanity may finally supervene. Medicinally, cocaine addiction is most successfully treated by large doses of chloral-hydrate, or potassium bromide in combination with chloral. Cocaine is eliminated by the kidneys, much of it, however, being oxidized within the system.

**Therapy.**—The introduction of cocaine as a local anæsthetic is due to Dr. Koller, who first called attention to its usefulness in eye-surgery in 1884. Its influence in causing local anæmia and dilatation of the pupil having been discovered, it has become one of the necessary drugs in eye-practice (a 4-per-cent. solution being the usual strength employed, as first recommended by Koller). Anæsthesia of the conjunctiva results in from one to five minutes after instillation of cocaine. The completed dilatation of the pupil does not occur until ten or twenty minutes after the instillation; it continues for about an hour, and then gradually disappears. Though impaired, the accommodation is not entirely paralyzed, and it returns even while the pupils remain dilated. The conditions of the eye in which cocaine is particularly applicable are diseases of the conjunctiva and cornea, accompanied by pain and photophobia. By its local anæsthetic properties it facilitates many of the operations upon the eye. The removal of foreign bodies imbedded in the cornea, the excision of pterygium, the cauterization of corneal ulcers, dilatation of the lacrymal canal; the operation for strabismus, staphyloma, or chalazion; iridectomy, and extraction of the lens are now all accomplished by the aid of cocaine anæsthesia. When used too freely, it produces a steamy condition of the cornea.

According to Dr. Arthur G. Hobbs, of Atlanta,<sup>3</sup> cocaine should never be

<sup>1</sup> *New York Medical Journal*, Nov. 19, 1898.

<sup>2</sup> *Münchener medicinische Wochenschrift*, 1896, p. 1175.

<sup>3</sup> "The Uses and Abuses of Cocaine, with Reference to Mucous Membranes Especially." *The Southern Medical Record*, Nov., 1892.

used when an abrasion of the cornea exists. He regards it as contra-indicated also in any corneal inflammation, and thinks that it should not be prescribed beyond the acute stage of any form of conjunctivitis. It is not so well adapted for use when enucleation of the eyeball is to be performed, though this operation may be done when the alkaloidal solution is injected deeply around the orbit. Mr. Leahy has found cocaine serviceable in gonorrhœal ophthalmia. He incorporates 0.03 Gm. (or gr. ss) of atropine sulphate and 0.25 Gm. (or gr. iv) of cocaine sulphate in 6.50 Gm. (or gr. c) of petrolatum (oleic acid or lanolin is perhaps a better vehicle to favor the absorption of the drugs incorporated), and applies the mixture beneath the upper lids. Dr. P. Richard Taylor, of Louisville, esteems cocaine as superior to the mydriatics usually employed in the treatment of iritis. He advises its use in a concentrated form, as its effects in contracting the vessels limit its absorption. He is accustomed to employ a 25-per-cent. watery solution, or an ointment composed of 25 parts of cocaine to 100 parts of petrolatum. The tablets or discoids of cocaine now supplied by manufacturers are useful in making extemporaneous and perfectly sterile solutions of any desired strength.

In aural surgery, a solution of cocaine may be introduced within the auditory canal for the relief of acute and chronic purulent otitis, ulcers of the canal, or to facilitate operative procedures within the tympanic cavity. Albert Gray, previous to paracentesis of the membrana tympani, uses a 5- or 10-per-cent. solution, in equal parts of alcohol and anilin oil. Cocaine applied to the lower nasal passages and the orifice of the Eustachian tube is a valuable assistance in catheterization of the tube through the nose. Dr. Ticanno has reported a case in which a few drops of a 5-per-cent. solution of cocaine introduced through a catheter into the middle ear soon excited vomiting and diarrhœa, which continued for several hours. By application of this remedy to the mouth of the tube, the inflation and injection of remedial liquids into the tube and the middle ear are rendered much easier of performance. Bonain's local anæsthesia comprises the anæsthesia of the external surface of the tympanic membrane with a mixture of phenol, menthol, and cocaine hydrochloride, aa 1 Gm. (or gr. xv) ; or 2 Gm. (or 3ss) of the phenol to 0.5 or 1 Gm. (or gr. viiss-xv) of the other ingredients. The internal surface of the membrane and the mucosa of the tympanum are anesthetized with 2 or 3 drops of a one-tenth solution of cocaine, instilled, through an incision or incisions made in the membrane, with a Hartman cannula, mounted on a small syringe.

In chronic laryngeal tuberculosis, Professor Moure makes use of the following combination applied by means of an atomizer:—

R. Cocain. hydrochlorid. ....	25 to	65 Gm.	or gr. iv-x.
Chloral hydrati.			
Potass. bromid. .... an	2	to 3	Gm. or gr. xxx-xlv.
Glycerin. ....		45	c.cm. or f℥iiss.
Aq. destillat. ....	180		c.cm. or f℥vj.

M. ft. sol.

Sig.: To be used three or four times a day, from three to five minutes on each occasion.

In dental and nasal surgery, this substance fulfills numerous indications. The local anæsthesia produced by cocaine permits operation for ingrown nails and the removal of intralaryngeal tumors.

Cocaine is best applied on a compress, or in wafers with gelatin, in the throat or nose, for simple catarrh, pharyngitis, laryngitis, and for the relief of hay fever (4- to 20-per-cent. solution). Dr. Isidore Gluck avoids the toxic effect that sometimes ensues by using the following local application:—

R	Phenolis liquefact. ....	12 c.cm. or mij.
	Aquæ destill. ....	4   c.cm. or f3j.
M et adde:—		
	Cocainæ hydrochloridi .....	[65 Gm. or gr. x.
M.	Phenol renders the solution aseptic and increases the analgesic effect of the cocaine.	

A chemical combination, cocaine phenate, has been more recently introduced, and has been employed with advantage in most of the conditions where the hydrochloride has proved useful. Cocaine phenate is a yellowish substance, of the consistency of honey. It melts readily when heated. It is soluble in alcohol. The dose is from 0.005 to 0.01 Gm. (or gr.  $\frac{1}{12}$ - $\frac{1}{8}$ ). It may be applied locally in solutions varying in strength from 1 to 10 per cent. When placed upon the tongue it obtunds both taste and tactile sensibility. It produces profound anæsthesia of the conjunctiva, with dilatation of the pupil, partial paralysis of accommodation, slight lacrymation, and often temporary ptosis. Anæsthesia is of rather slower development than from the use of the hydrochloride, but is of longer duration. The phenate, also, is much less apt to be absorbed and produce systemic effects. Cocaine phenate has been used in operations upon the throat and nose with advantage by Dr. D. B. Kyle.<sup>1</sup>

Good results have likewise been reported from the use of this salt by Dr. C. A. Veasey and by German observers.

The following combinations are recommended<sup>2</sup>:—

R	Cocain. phenat. ....	10 Gm. or gr. iss.
	Menthol. ....	25 Gm. or gr. iv.
	Alcohol. dilut. ....	9   25 c.cm. or f3iiss.
M.	Sig.: For inhalation in diseases of the larynx and bronchial tubes.	
R	Cocain. phenat. ....	20 Gm. or gr. liij.
	Pulveris acidi borici. ....	2   Gm. or gr. xxx.
M.	Sig.: For insufflation in rhinitis and chronic nasal catarrh.	

Parker advocates a combination with resorcin, in order to overcome the unpleasant or toxic effects which sometimes follow the application of strong solutions of cocaine to the nose or throat. The association of these drugs seems to add to the antiseptic and astringent action of the cocaine. Dr. Gauthier is accustomed to conjoin with the cocaine solution prepared for injection 1 drop of a 1-per-cent. solution of nitroglycerin, or the official spirit of glyceryl nitrate. In this manner he aims to antagonize the influence of the cocaine upon the cerebral blood-vessels. Bignor asserts that acid solutions produce but little anæsthetic effect, and advises that the ordinary solutions should be rendered neutral. When an excess of sodium carbonate is added to such a solution, the alkaloid is liberated and forms a

<sup>1</sup> "Phenate or Carbolate of Cocaine as a Local Anæsthetic." *Therapeutic Gazette*, Jan. 16, 1903.

<sup>2</sup> *Journal de Médecine de Paris*.

finely-divided mixture. He terms this suspension "milk of cocaine," and states that, when freshly made, it produces an excellent anæsthetic effect.

Dr. John Edwin Rhodes, of Chicago, makes use of a combination, which he thinks intensifies the anæsthetic property of cocaine and perhaps hastens the anæsthesia. His formula is as follows:—

R Atropin sulphatis .....	103	Gm. or gr. ss.
Strophanthini .....	012	Gm. or gr. $\frac{1}{16}$ .
Cocain. hydrochloridi.....	130	Gm. or gr. xx.
Phenolis liquefact. ....	32	Gm. or gr. v.
Aq. destillat. .... q. s. ad	30	c cm. or f3j.

M. For hypodermic use.

This solution has, injected in doses of 0.12 to 0.50 c.cm. (or mii-viii), produced almost complete local anæsthesia without constitutional disturbance. It has also been used by means of an atomizer in the pharynx, larynx, and nasal cavity.

Professor Schleich has devised a method of producing local anæsthesia for surgical operations by marking out the line of incision by a succession of subcutaneous injections of weak solutions of cocaine and morphine.

The following are the formulæ for the solutions used by Schleich for producing local anæsthesia:—

No. 1 Strong:—

R Cocaine hydrochloridi.....	2	Gm. or gr. iij.
Morphine hydrochloridi .....	025	Gm. or gr. $\frac{1}{4}$ .
Sodii chloridi (sterilized).....	2	Gm. or gr. iij.
Aque destillatæ (sterilized).....	q. s. ad 100	c cm. or f3iiss.—M.

No. 2 Normal:—

R Cocaine hydrochloridi.....	1	Gm. or gr. iss.
Morphine hydrochloridi.....	025	Gm. or gr. $\frac{1}{4}$ .
Sodii chloridi (sterilized) .....	2	Gm. or gr. iij.
Aque destillatæ (sterilized) .....	q. s. ad 100	c cm. or f3iiss.—M.

No. 3 Weak:—

R Cocaine hydrochloridi .....	01	Gm. or gr. $\frac{1}{16}$ .
Morphine hydrochloridi.....	005	Gm. or gr. $\frac{1}{32}$ .
Sodii chloridi (sterilized) .....	2	Gm. or gr. iij.
Aque destillatæ (sterilized) .....	q. s. ad 100	c cm. or f3iiss.—M.

One drop of a 40-per-cent solution of formalin should be added to each of these solutions to preserve them. The fluid is injected in such a manner that the part to be operated upon is completely surrounded by wheals of the injected fluid. These wheals may be carried into the deep tissues. The area for the primary needle puncture may be anæsthetized by a drop of 95-per-cent solution of carbolic acid.

In order to avoid throwing the cocaine into a vein, Magitot advises that it be injected into the substance of and not beneath the skin or mucous membrane. Except in the case of operations upon the head, the patient should be in a recumbent position when the injection is made. The dose should be in proportion to the extent of surface to be anæsthetized, but should never exceed 0.08 to 0.10 Gm. (or gr. i  $\frac{1}{4}$ -iss). It is well to divide the dose into several portions, leaving an interval of several minutes between each injection. If toxic manifestations follow the first portion, further injection must be abandoned.

Bagot<sup>1</sup> combines sparteine with cocaine, which obviates the depressing effect of the cocaine on the heart, while rendering the anæsthesia more lasting. He has a powder prepared beforehand: cocaine hydrochloride, 0.036 Gm. (or gr.  $\frac{2}{3}$ ), and sparteine sulphate, 0.048 Gm. (or gr.  $\frac{3}{4}$ ). When ready to use, the powder is dissolved in 1 or 2 c.cm. (or *mxv-xxx*) of boiled water. As much as 8 to 12 eg. (or gr.  $i\frac{1}{4}$ - $i\frac{3}{4}$ ) of cocaine can thus be injected, in fractional injections, without accident. In operating on a tumor, he injects 1 c.cm. (or *mxv*) of the weaker solution on one side, and waits seven or eight minutes before injecting the other side. He can then commence the operation in a few minutes on the side first injected. If the operation requires over twenty minutes, a third injection can be made, which keeps up the anæsthesia for three-quarters of an hour.

An ointment or solution of cocaine has been employed for the purpose of relieving the pain of cracked nipples, but it has been found to have the further effect of diminishing the secretion of the milk. For the suppression of lactation, Dr. Joire, of Lille, recommends the application of a solution of 1 Gm. (or gr. *xv*) of cocaine in 9.50 c.cm. (or *f3iiss*) each of water and glycerin.

An ointment containing coca or cocaine hydrochloride is an admirable local remedy in affections characterized by severe pain or distressing itching. The extract of coca (2 to 4 Gm., or gr. *xxx-3j*) may be incorporated in 31 Gm. (or *3j*) of lard, or the salt of the alkaloid may be used in the proportion of 0.25 to 0.50 or 0.65 Gm. (or gr. *iv-viii* or *x*) to 31 Gm. (or *3j*), or as follows:—

R	Extracti cocæ .....	2	Gm. or 3ss.
	Creosoti .....	30	c.cm. or <i>mv</i> .
	Ungt. zinci oxidi .....	31	Gm. or 3j.
	Ungt. plumbi subacetatis .....	15	5 Gm. or 3ss.

M. For subacute eczema or psoriasis.

R	Cocainæ hydrochloridi .....	65	Gm. or gr. <i>x</i> .
	Plumbi carbonatis .....	4	Gm. or 3j.
	Pulveris marantæ .....	4	Gm. or 3j.

Hydrarg. chloridi mitis.....	aa	65	Gm. or gr. x.
Zinci carbonatis .....	4		Gm. or 3j.
Resorcinol.			
Camphoræ .....	aa	32	Gm. or gr. v.
Ungt. zinci oxidi .....	31		Gm. or 3j.
M. Valuable in infantile eczema.			

These ointments are serviceable in dermatitis, acute eczema, dermatalgia, herpes zoster, paræsthesia, urticaria, burns, and irritable and painful ulcers. Bieuler recommends the use of a 1-per-cent. cocaine salve made up with equal parts of lanolin and vaselin, in cases of herpes zoster. The tendency to spread is removed immediately, and pain at once disappears, with a resultant cure in from eight to ten days. Cocaine ointment allays the pain of ulcerated carcinoma and is beneficially applied to painful hæmorrhoids. On account of its astringent and slightly-stimulant action, coca ointment is sometimes an efficient application in acne and rosacea. An anodyne ointment may be thus composed:—

R Cocainæ hydrochloridi.....	65	Gm. or gr. x.
Morphinæ sulphatis .....	13	Gm. or gr. ij.
Atropinæ sulphatis .....	065	Gm. or gr. j.
Pulveris marantæ .....	4	Gm. or 3j.
Unguenti zinci oxidi.....	31	Gm. or 3j.—M.

In the treatment of burns, cocaine hydrochloride should be preferably mixed with hydrated wool-fat, since the latter substance possesses unlimited efficacy in the treatment of this form of lesion.

R Cocainæ hydrochloridi.....	1	Gm. or gr. xv.
Adipis lænæ hyd. ....	406	Gm. or 3iss.
Sodii bicarbonatis .....	8	Gm. or 3ij.

Bismuthi subnit. vel plumbi carbonatis.....	8	Gm. or 3ij.
Ol. olivæ .....	q. s.	

M et ft. ungt. mollis.

Cocaine is a valuable remedy in pruritus ani or vulvæ and in some cases of eczema. In rhus poisoning and erythema, a solution of cocaine promptly relieves the burning pain. Cocaine can be employed in the form of a solution according to the following formulæ:—

R Cocainæ hydrochloridi.....	20	Gm. or gr. iij.
Plumbi acetatis .....	65	Gm. or gr. x.
Glycerini .....	45	c.cm. or f3iss.
Aquæ destillatæ .....	135	c.cm. or f3ivæ.

M Sig.: Use as an injection in the urethra in subacute and chronic gonorrhœa.

R Cocainæ hydrochloridi.....	13	Gm. or gr. ij.
Crescoti .....	50	c.cm. or mvij.
Glycerini .....	30	c.cm. or f3j.
Aquæ hamamelidis dest. ....	90	c.cm. or f3iij.

M Sig.: Spray into the nose or throat in simple catarrh, pharyngitis, laryngitis, and in hay fever.

- R Cocainæ hydrochloridi..... [25 Gm. or gr. iv.  
 Glycerit plumbi subacetat  
 Aquæ hamamelidis dest. ....aa 60, c.cm. or f3ij.

M. Sig.: Apply over the surface on soft linen, for burning and itching of erysipelas, poisoning of the skin from various plants, and in sunburn and superficial heat-burns.

- R Cocainæ hydrochloridi,  
 Hydrastini hydrochloridi.....aa [20 Gm. or gr. iij.  
 Aquæ rosæ .....120, c.cm. or f3iv.

M. Sig.: Mop upon the skin or apply with old muslin or cotton, for seborrhæa oleosa, urticaria, acne, and rosacea.

Brushing the surface with a 10-per-cent. cocaine solution to which 1 per cent. of carbolic acid has been added is recommended for relieving pain in acute tonsillitis.

In gastralgia, the use of cocaine, or of a hot infusion of coca-leaves, is often highly serviceable and yields prompt relief. Cocaine hydrochloride is an efficient remedy in nausea and vomiting. In the hands of Dr. Manassein it yielded excellent results in the incessant vomiting and collapse of cholera morbus. Prompt relief often follows its use in migraine. In seasickness and the vomiting of pregnancy, the alkaloid is often useful. In the latter condition it has been used by the mouth, by injection into the epigastrium, or applied in ointment form to the os uteri. Mr. John Phillips afforded permanent relief by administration of the following mixture:—

- R Cocainæ hydrochloridi ..... 006 Gm. or gr.  $\frac{1}{10}$ .  
 Tinct. aurantii ..... 90 c.cm. or mxx.  
 Mist. chloroformi ..... 2' c.cm. or f5ss.  
 Aquæ ..... q. s. ad 4' c.cm. or f5j.

M. Pro dosi.

A. Pozzi reported<sup>1</sup> that, at the Obstetrical Clinic at Turin, five cases of pregnant vomiting, which persisted in spite of the hypodermic injection of morphine and the internal administration of cocaine, were rapidly cured by Tibone by subcutaneous injections of 0.01 Gm. (or gr.  $\frac{1}{100}$ ) of the cocaine hydrochloride in the epigastrium, repeated once or twice a day before meals. Food was retained, and neither pulse, respiration, nor temperature was injuriously affected. The general condition gradually improved, the patients gained weight, and the vomiting did not return when the injections were omitted. Pozzi suggests that this treatment may prove useful in other forms of vomiting.

Dr. Carlson has reported a severe case of ptyalism accompanying pregnancy, in which rapid and complete relief was obtained by a few hypodermic injections of cocaine.

As an analgesic mixture which may replace an opiate, Portier recommends:—

- R Cocainæ hydrochloridi..... [50 Gm. or gr. viiss.  
 Acetphenetidini ..... 1/50 Gm. or gr. xxviss.  
 Methylacetanilidi ..... [50 Gm. or gr. viiss.  
 Acid. salicylic. ....1; Gm. or gr. xv.

M. et div. in chart. no. x.

Sig.: One powder every three hours until pain has disappeared.

<sup>1</sup> Arch. d' Ost. e Gyn., 1898.

When coca is used as a tonic in cases of debility, slow convalescence after fever, weak digestion, etc., it is usually in the form of an elixir or wine, the alcohol in these cases being synergistic, and possibly in many instances the more active agent in the combination. In these conditions the dangers of the formation of an alcohol habit must be borne in mind, and a change made to the solid extract or an infusion. In laryngeal tuberculosis associated with dysphagia, the use of cocaine has been found of marked benefit. In the treatment of secondary syphilis, Dr. R. W. Taylor often makes use of coca, especially in the case of debilitated subjects, as a tonic adjuvant to specific medication. He employs the fluid extract and may combine it with the compound tinctures of cinchona and gentian. The weak heart of typhoid fever is supported by 0.015 Gm. (or gr.  $\frac{1}{4}$ ) doses, every two hours, of cocaine dissolved in oil, as recommended by J. M. DaCosta. According to Thorington, cocaine is of decided efficacy in yellow fever, as it quiets the stomach and stimulates the heart.

A decided aphrodisiac effect has sometimes been ascribed to cocaine, but in two cases Dr. Arthur G. Hobbs has observed a contrary influence. In consequence of an application to the throat and nose a rapid and permanent relief of priapism followed after the usual remedies had been employed in vain. The cocaine had, in each instance, been employed on account of persistent nasal and pharyngeal inflammation. Wells has likewise observed the same effect follow applications to the nasal and pharyngeal mucous membranes. This writer has satisfied himself experimentally that cocaine increases sexual excitability in men. He has likewise observed the same effect follow the internal administration of the remedy.

In various nervous disorders—hiccough, asthma, chorea, paralysis agitans, alcoholic tremors, senile tremor—Bartholow declared that cocaine produces more favorable effects than any other remedy. In asthma, Dieulafoy has even afforded relief by the application of a 5-per-cent. solution to the nasal chambers. Dr. J. K. Bauduy, of St. Louis, has found the alkaloid of decided service in melancholia, though in the experience of most neurologists it is of no permanent avail in this affection.

Murrell, of London, recommends the local use in neuralgia of a 20-per-cent. solution of the cocaine hydrochloride dissolved in oil of cloves. Of this solution 0.30 to 0.60 c.cm. (or *mv-x*) is rubbed in with the finger over the seat of pain. The pain of gouty joints may also be diminished by local application of this combination.

Several writers have testified to the efficacy of cocaine in small-pox. A solution is given internally in doses proportionate to the age of the patient. Dr. E. Pepper, of Algiers, states that a marked tolerance for the remedy exists in this disease. He states that the evolution of the pustules is arrested and that the course of the fever is shortened.

Waugh has used coca largely in the treatment of alcoholism. For acute cases he temporarily employs the following:—

R Tinct. capsici .....	30	c.cm. or ℥j.
Vini cocæ .....	210	c.cm. or ℥viij.

M Sig: A tablespoonful every two to four hours.

To assist in overcoming the habit of alcohol drinking, he gives cocaine in the form of a masticatory, which can be easily carried and taken without attracting notice. He believes that the source of the longing for

drink is often to be found in the mouth, and that coca when chewed exerts a local anæsthetic effect, as well as a general systemic action. The wine of coca is useful in giving tone to the vocal cords and preventing hoarseness in professional speakers and singers.

The rectal injection of a cocaine solution relieves the tenesmus and pain of hæmorrhoids. Used as an injection, or applied upon a pledget of cotton, cocaine allows many gynæcological operations to be painlessly performed. Vesico-vaginal fistulæ, laceration of the cervix uteri, and urethral caruncles have been successfully treated in this way without a resort to general anæsthesia. Cocaine likewise affords relief in vaginismus. Dilatation and curetting of the uterus, trachelorrhaphy, colporrhaphy, and perineorrhaphy can likewise be performed in the same manner. A solution applied, by means of a gauze compress, to the uterine neck may relieve rigidity during labor.

Shortly after the introduction of cocaine as a local anæsthetic Dr. Leonard Corning, of New York, demonstrated that it was possible under its influence to remove large tumors and perform amputations. Continuing his researches, he developed, in 1885, a method of injecting the drug into the vertebral canal between the spinous processes. Professor Bier, of Kiel, put Corning's suggestion to further clinical trial by means of the lumbar puncture,<sup>1</sup> and his example was speedily followed by many of the distinguished surgeons, notably Tuffier, Réclus, Oberst, Murphy, and Marx. The method employed is to introduce a suitable needle between the fourth and fifth lumbar vertebræ into the subarachnoid space, allowing a small quantity of the cerebro-spinal fluid to escape, and injecting with a hypodermic syringe a solution containing 0.005 to 0.01 Gm. (or gr.  $\frac{1}{12}$ - $\frac{1}{8}$ ) of cocaine. Analgesia of lower half of the body follows in a few minutes and persists for several hours. Tuffier<sup>2</sup> published 125 cases, including 58 laparotomies, of lumbar puncture with five deaths, though he states that only one death is directly attributable to this treatment. Spinal cocainization has also been used by Kreis and Marx<sup>3</sup> in obstetrical practice, who found that the cocainization did not interfere with the functions of the uterus. These injections are often attended with more or less severe after-effect: headache, vomiting, depression, and rising temperature. In a number of cases observed by the author a series of most alarming symptoms followed the use of this method, so that it is not without danger.<sup>4</sup> Six deaths have been recently reported by P. Réclus in his statistics of less than 2000 applications. Intrarachidian injections of cocaine as a therapeutic method have been tried recently by Dr. Achard in cases of sciatica. Marie and Guillian<sup>5</sup> report its use in one case of sciatica, when 5 milligrammes (or gr.  $\frac{1}{12}$ ) were injected, with an immediate noticeable improvement, the man being able to get up and walk about without any appreciable pain. When a small dose is given there is no associated cutaneous anæsthesia, nor are there any constitutional symptoms occasioned, while the relief is as prompt as in the larger quantity.

Anæsthesia of the lower extremities and of the lower part of the abdomen, by the injection of a very minute quantity of  $\frac{1}{2}$ -per-cent. solution of cocaine hydrochloride into the spinal canal, is now a well-established surgi-

<sup>1</sup> *Deutsche Zeitschrift für Chirurgie*, vol. ii, p. 361, 1899.

<sup>2</sup> *La Semaine Médicale*, May 16, 1900.

<sup>3</sup> *Medical News*, August 25, 1900, and *Medical Record*, Oct. 6, 1900.

<sup>4</sup> *Journal of the American Medical Association*, Nov. 24, 1900.

<sup>5</sup> *Lancet*, April 13, 1901.

procedure. No injurious effects were observed in the six major surgical operations done under this form of anaesthesia by Bier, of Kiel.<sup>1</sup> The average amount of the drug administered was 0.005 Gm. (or gr.  $\frac{1}{12}$ ). Anaesthesia of both the lower extremities is usually produced in about eight or ten minutes after the injection of the drug into the lumbar region of the spinal canal. Seldowitsch has also reported<sup>2</sup> four cases in which he had successfully employed this method for major operations, such as a Pirogoff amputation of the foot, extirpation of inguinal glands for melanosarcoma, and a resection of the knee. Sensation returned in every case within a short time, and there were no serious after-effects observed. The patients suffered only from a slight chill and elevation of temperature and pulse. One had vomiting preceded by vertigo and headache, though in the more recent investigations these after-effects have been more prominent.

Neural infiltration is practiced by injecting a solution of cocaine directly into the sheath, or areolar tissue around the nerves supplying a part. The cocaine acts upon the nerve-trunks at the level of the injection, and the entire part distal to the injection-level is rendered anaesthetic. This, which was suggested by Oberst, is easy of performance, and is free from danger. It is especially applicable to the digits. In anaesthetizing a finger, a soft-ether tube is first tied around its base, to arrest the circulation. Then 7 or 10 minims of sterilized 1-per-cent. solution of cocaine is injected around each digital nerve, distal to the tourniquet. In about ten minutes, the entire finger is anaesthetic and can be subjected to operation, without pain. By the addition of a small quantity of adrenalin the action is intensified.

Cocaine is used as an injection into the urethra in gleet and previous to passage of instruments or surgical operations. The injection of a few drops of a 4-per-cent. solution into the urethra in case of stricture of large calibre may succeed in relieving retention of urine. In such procedures, however, it must be borne in mind that the urethral and rectal mucous membranes absorb with great rapidity, and a strong solution must, therefore, be avoided. Berger has reported a case of death from injection of 0.5 Gm. (or gr. viij) of cocaine dissolved in a spoonful of water, the fluid being allowed to escape immediately and the entire quantity being apparently recovered. Death has followed the injection of a 5-per-cent. solution of cocaine into the urethra, apparently from shock.

Cocaine, or the fluid extract of coca, in conjunction with other remedies, is a physiological antidote to narcotic poisoning by opiates or picrotoxin, and may be used hypodermically. The subcutaneous injection of cocaine has been found useful in cases of scorpion-bite. The treatment rapidly relieves pain and restricts it to the part stung.

### COCCULUS—COCCULUS INDICUS.—Indian Berry, Fish-berry.

#### Preparation.

Picrotoxinum (U. S. P., B. P.).—Picrotoxin (the active principle). Dose,  $\frac{1}{2}$  to 1 mg. (or gr.  $\frac{1}{125}$  to  $\frac{1}{60}$ ). B. P., 0.00065 to 0.0027 Gm. (or gr.  $\frac{1}{150}$  to  $\frac{1}{25}$ ).

**Pharmacology.**—Cocculus Indicus is not official, but its active principle

<sup>1</sup> *Deut. Zeit. für Chirurgie*, vol. II, p. 344.

*Centralblatt für Chirurgie*, B. 26, 1899, p. 1110.

is. It is the fruit of *Anamirta paniculata* (Menispermaceæ), a native of the Malabar coast and of India. In 1812, Boullay discovered and isolated a peculiar bitter principle, which he denominated **Picrotoxin**,—a white, crystallizable, neutral substance, soluble in 150 parts of cold water, or in 25 of boiling, and very soluble in alcohol and ether, but not soluble in oils. Picrotoxin does not form salts. Like digitalin, picrotoxin appears to be made up of several bodies, which vary in their chemical properties and effects. Barth and Kretschy assert that it contains at least three: (1) picrotoxin, a bitter, poisonous principle; (2) picrotin, a bitter, non-poisonous principle; and (3) anamirtin. To these has been added cocculin (which is said to be identical with anamirtin). These pharmaceutical bodies may have scientific interest, but, practically, the prescriber is confined to the picrotoxin of Boullay, which is official in the United States Pharmacopœia. In the pericarp have been found menispermia, paramenispermia, hypopicrotoxic acid, resin, fat, and gum, which do not possess much medical interest.

**Physiological Action.**—Cocculin, or picrotoxin, is very destructive to lower forms of life, and to many acts as an acrid, narcotic poison. In lower animals death is preceded by convulsions, and in a fatal case of a child six years old, poisoned by absorption of a strong alcoholic solution of the fruit applied to the scalp, tetanic spasms occurred. Where this agent has been swallowed, the usual treatment, by evacuating the stomach, should be practiced, with inhalation of ether or ammonia and the internal administration of chloral or bromides. There is an antagonism between chloral and picrotoxin, and this can be utilized when poisoning has occurred from absorption through the integument. Tannic acid and stimulants are also useful.

In an article by William Murrell, of London, on "Picrotoxin and its Properties,"<sup>1</sup> this able authority states that the peculiar convulsions produced by this agent "differ essentially from the tetanic condition caused by strychnine, and are due to stimulation of the motor centres in the cerebrum, or in the medulla and cord. They assume various forms, the swimming, running backward, and moving round in a circle being the most common. Picrotoxin raises the temperature, stimulates the respiratory centre, and in large doses produces salivation." It acts as an anhydrotic by stimulation of the respiratory centre. "It is allied to **Cicutoxin**—the active principle of the water-hemlock—and to **Coriamyrtin**, derived from *Coriaria myrtifolia*. These drugs stimulate the origins of the inhibitory fibres of the vagus, the vascular and respiratory centres, and the motor areas of the medulla oblongata. In its action on the secretions picrotoxin is allied to **Pilocarpine** and **Muscarine**, and is antagonized by atropine and other members of that group. The best antidotes to picrotoxin are chloral hydrate and bromide of potassium." On account of its poisonous effects, cocculus has been used, from ancient times, made up into paste and thrown into the water, where the fish are stupefied by it, and are easily captured. Death has occurred in a boy from eating a small quantity (40 grains) of such paste, but it is said that the flesh of the fish so taken is edible. This unsportsmanlike method of fishing in most parts of this country is illegal. On account of its bitterness, cocculus, or "fish-berry," is sometimes added to malt liquor to save hops and check fermentation. Possibly this may enter into the solution of the problem of what is the matter with a man when he is drunk, and still further emphasize

<sup>1</sup> *The Medical Bulletin*, Nov., 1890, p. 402.

the importance of regarding intoxication as a condition of poisoning, demanding prompt, intelligent, and skillful treatment.

**Therapy.**—Cocculus is an ancient remedy for phtheiriasis, or lousiness, but care should be exercised in the case of children, or where there are eruptions on the scalp, not to use strong solutions, nor to leave them for many minutes in contact with the skin. The hairy scalp, after being thoroughly washed with soap and water, is wet with a solution (15 to 120 c.cm., or 1/5ss of the tincture to f3iv water), or decoction (1 to 16), and after a few minutes washed off with an abundance of warm water. Two or three daily applications are sufficient, especially in cases where the hair can be cut short, as in charitable institutions and asylums. It has been claimed that an ointment of picrotoxin is equally efficient with the decoction, but it cannot be regarded as being as safe. For the same reason, cocculus is not advised in the treatment of tinea and other skin affections, although still used for this purpose in India. A small quantity, however, of picrotoxin—not exceeding 1 per cent—may be usefully prescribed, in combination with ointment of mercuric oleate, for the relief of animal and vegetable parasitic diseases, as scabies, pediculi, trichophytosis, and tinea versicolor.

Picrotoxin in small doses appears to act as a bitter tonic to the digestive tract, and has therefore been advised in atonic conditions of the stomach and intestinal indigestion attended by torpor of the intestinal walls, and constipation. Flatulence and colic are relieved by the use of picrotoxin. The remedy has likewise been successfully used in painful dyspepsia, vomiting, vertigo, and other reflex manifestations dependent upon imperfect digestion.

In epilepsy, chorea, alcoholic tremor, paralysis agitans, and functional nervous disorders (migraine, dysmenorrhœa) picrotoxin has been used successfully by Planat and Hammond, Gubler, Phillips, and others. It has been found beneficial in epilepsy, especially when the attacks occur by night or are due to anemia. According to the experience of Dr. d'Amore, picrotoxin of special benefit in advanced cases of the disease. In a number of cases reported by d'Amore its effect was more permanent than that of atropine. Semmler and Gioffredi have recently reported a case in which picrotoxin succeeded in checking profuse hyperidrosis which developed consecutive to an attack of influenza. There is good evidence in support of the statement made by Murrell as to its value in controlling night-sweating in phthisis in doses of 1 mg. (or gr. 1/100), in a pill with sugar and tragacanth (a single dose, at bed-time, or given three times a day). It does not have the disagreeable action upon the throat and skin that atropine has, and frequently succeeds where that fails; but it is slower in producing its anhydrotic effect, requiring several days. Bókai regards picrotoxin as an excellent antidote to opium by reason of the stimulant action of the former substance upon the respiratory and vasomotor centres.

### COCCUS (U. S. P., B. P.)—Cochineal.

#### Preparation.

**Tinctura Cocci (B. P.).**—Tincture of Cochineal (1 to 10). Dose, 0.30 to 1 c.cm.

**Pharmacology.**—The dried female insects of *Pseudococcus cacti* (Insecta, order, Hemiptera), when crushed, produce a very brilliant-red color-

ing matter, which consists principally of carminic acid, various salts, tyrosin, urea, fatty matters, etc. The British Pharmacopœia defines *coccus* as "the dried fecundated female insect *Coccus cacti*, reared on *Nopalea cochinellifera* and on other species of *Nopalea*." The pigment called **Carmin** is the coloring matter precipitated from the decoction by acids, and the salts of tin, or by gelatin; and other colors—such as lake, purple, and lilac—may be obtained by various reagents. It is highly prized in the arts as a coloring agent. As such it is also used in pharmacy, and is an ingredient in the compound tincture of cardamom.

**Physiological Action.**—The physiological actions of cochineal are not very evident, but it is believed to have antispasmodic and anodyne qualities.

**Therapy.**—Cochineal was used by a preceding generation of physicians for whooping-cough and in neuralgia. Its brilliant color possibly might have led to its use under the old doctrine of signatures.

**COCHLEARIA.**—**Scurvy-grass.** *Cochlearia officinalis* (Cruciferae), an annual or biennial plant of northern Europe and United States, contains tannin, a bitter principle, salts, and a volatile oil. It is stimulant, diuretic, and laxative. *Cochlearia* is popularly eaten as a salad, and is efficacious in scorbutus, chronic rheumatism, and chronic malaria. The juice has been used externally for the purpose of stimulating indolent ulcers, and, diluted with water, as a mouth-wash for spongy gums and ulcers of the mouth.

**COCILLANA.**—**Cocillana.** The *Cocillana* of Bolivia, a *Guarea* of undetermined species, is a large tree belonging to the *Meliaceae*. The name *Sycocarpus Rusbyi*, bestowed upon the tree by Professor Britton, has been generally accepted. It was discovered and brought to this country by the American botanist, Dr. H. H. Rusby, who also introduced *picchi*, another valuable South-American remedy. The constituents of the bark have not been determined, but it is probable that it owes its effects to an active principle, resinous in character, soluble in chloroform (Schrenk), or perhaps an alkaloid (Rusby). The odor of the resinous principle is peculiar and characteristic: its taste is bitter, mawkish, and slightly astringent.

**Physiological Action and Therapy.**—The bark is used as an expectorant, having an influence upon the respiratory organs similar to *ipecac*, but "superior to it in certain diseases of the air-passages, in which the latter is often used," in the opinion of D. D. Stewart.<sup>1</sup> It also has a tonic effect upon the digestive organs, and gives promise of usefulness as a laxative. In native medicine *cocillana* is used as an emetic and cathartic. A free discharge of mucus, nausea, and gagging, with some tendency to perspiration, also dizziness and lassitude, were caused in one case where 1.30 Gm. (or gr. xx) were given. Larger doses (2 to 3.25 Gm., or gr. xxx-l) caused vomiting at the end of an hour, evacuations of the bowels, sneezing, and prostration, the effects resembling those of emetine. The active principle is excreted chiefly by the mucous membrane of the respiratory tract, upon which it acts as a stimulant.

Small doses improve the appetite and digestion. The alvine discharges under its use contain mucus and bile. This drug stimulates the sudoriparous

<sup>1</sup> *Medical News*, Aug. 24, 1889.

glands. When given in considerable quantities it causes copious perspiration, accompanied by prostration of muscular strength. Excessive quantities excite severe gastro-intestinal irritation, and have, in some reported cases, caused death.

This drug finds its special usefulness in bronchitis, particularly the sub-acute and chronic forms. The fluid extract is preferable to the tincture in acute bronchial attacks. Cocillana is an effective remedy in coryza, spasmodic croup, persistent hoarseness and cough after measles, the cough of influenza, asthma, hay fever, and in the declining stage of pneumonia. It relieves the cough of pulmonary tuberculosis.<sup>1</sup> Small doses of cocillana have likewise been used with success in atonic dyspepsia. The fluid extract diluted with water and used as a spray has been recommended as a useful application in acute and chronic coryza.

**CODEINA** (U. S. P., B. P.).—Codeine ( $C_{18}H_{21}NO_2 + H_2O$ ).

**Dose**, 0.015 to 0.13 Gm. (or gr.  $\frac{1}{4}$ -ij).

#### *Preparations.*

**Codeine Phosphus** (U. S. P., B. P.).—Phosphate of Codeine. Dose, 0.015 to 0.13 Gm. (or gr.  $\frac{1}{4}$ -ij).

**Codeine Sulphas** (U. S. P.).—Sulphate of Codeine. Dose, the same.

**Syrupus Codeine** (B. P.).—Syrup of Codeine (codeine phosphate, 4.57 Gm.; distilled water, 12.5 c.cm.; syrup, 987.5 c.cm.; 4 c.cm., or f3j, = 0.015 Gm., or gr.  $\frac{1}{4}$ ). Dose, 2 to 7.5 c.cm. (or f5ss-ij).

An alkaloid contained in opium (0.1 to 2 per cent.). It is prepared from opium, and also artificially from morphine. Codeine does not disorder the stomach or bowels, and does not give rise to sweating or eruptions upon the skin. A few cases have been reported in which dizziness, nausea, vomiting, and prostration were caused by codeine in medicinal doses. Behier has reported a case of chronic codeinism; but these untoward effects are exceptional. It is more antispasmodic than morphine and has less narcotic effect (L. Loewenmyer<sup>2</sup>). It is used preferably in the treatment of cough, cramps in the stomach or bowels, and in neuralgia and painful affections of the genito-urinary organs. In diabetes it checks the formation of sugar, and in some cases permanently arrests it. In these cases it is borne well in larger amounts, as much as 0.65 to 1 Gm. (or gr. x-xv) daily having been taken with benefit. Fraser claims, however, that equally good effects may be obtained in smaller doses from morphine hydrochloride, which is also very much cheaper.

In the treatment of mental disorders, such as melancholia, psychic disturbance associated with change in general sensibility, anxiety, and moral suffering, codeine has been found useful by Jules Clausse (Paris Thesis). It is valuable as a hypnotic in the insomnia of melancholia. It is positively contraindicated in intense excitement and in maniacal conditions. Dr. Penzinger finds codeine of value in pulmonary tuberculosis with insufficient expectoration, troublesome cough and chest-pains. In bronchitis it also proved of service, caused no disorder of the stomach, and even seemed to arrest some cases of dyspepsia. In pertussis its use was attended with good results.

<sup>1</sup> See paper by author on "The Therapeutical Applications of Cocillana" in *Medical Bulletin* Feb., 1893.

<sup>2</sup> *Deut. med. Woch. and Weekly Med. Review*, Nov. 29, 1890.

**COFFEA.**—**Coffee.** The dried seeds of *Coffea Arabica* (Rubiaceæ) are only officially recognized as one of the sources of **caffeine**: its most important constituent. Before roasting, coffee contains **Caffeine** and caffeotannic acid. Dr. Palladine has isolated a new alkaloid which he terms **caffearine**, and which occurs in the form of crystalline needles, soluble in water and alcohol. Caffeine hydrochloride is very soluble in water, but does not dissolve in absolute alcohol. During roasting a volatile oil is developed and several substances formed, which give to coffee its aroma and flavor, these empyreumatic substances being known collectively as **Caffeone**. It is suggested, therefore, that the use of coffee may prove of some prophylactic value during epidemics of those infectious diseases which are commonly transmitted through the medium of drinking-water. Strong infusions of coffee, as Luderitz has shown, are destructive to the organisms of typhoid fever, erysipelas, and cholera. (See also **Caffeina**.)

**Physiological Action.**—Coffee differs from caffeine in being more stimulating to the intestinal tract, especially increasing the peristaltic movements, which are not affected by caffeine. Taken in the morning, before rising, coffee will often produce a laxative effect. It produces a general feeling of warmth and well-being, dilates the superficial blood-vessels, and lowers arterial pressure. It also stimulates the nervous system, in some persons causing exhilarating effects upon the cerebrum and increasing capacity for intellectual labor, and frequently is the cause of headaches in persons who take it habitually or in excess. A case has been reported<sup>1</sup> in which about 77.6 Gm. (or 3½ lb.) of the ground berries were made into a strong infusion and swallowed by a vigorous man. Two and a half hours later he was attacked by dizziness, severe cardiac pains, palpitation, nausea, vomiting, and generalized tremors. The tremors persisted for twelve hours after all other symptoms had disappeared.

The habitual use of coffee is one of the causes of pruritus ani. Over-indulgence in its use is also apt to disturb the liver and cause the familiar manifestations known as "biliousness," or even slight jaundice.

**Therapy.**—It is valuable as a stimulant in cases of narcotic poisoning, especially by opium. In some cases it produces fullness of the portal circulation, interfering with the activity of the hepatic functions and causing hæmorrhoids. Its laxative effects are useful in persons leading sedentary lives, in preventing constipation. It has some astringent and antiseptic qualities, and is believed to have some effect in preventing malaria. According to the observation of Dr. Alice McLean, the use of coffee by nursing women diminishes the secretion of milk. The fluid extract of the unroasted coffee contains caffeine, but no caffeone. It is used in anæmic headaches, and in cases of low fever as a cardiac stimulant where collapse is threatened.

**COLA.**—(See **Kola**).

**COLCHICI SEMEN** (U. S. P., B. P.).—**Colchicum-seed.**

**COLCHICI CORMUS** (U. S. P., B. P.).—**Colchicum-corm.**

**Dose,** 0.13 to 0.32 Gm. (or gr. ii-v).

**COLCHICINA** (U. S. P.).—**Colchicine.** An alkaloid obtained from *Colchicum*.

<sup>1</sup> *Therapeutische Monatshefte*, March, 1890.

*Preparations from the Root.*

*Extractum Colchici Cormi* (U. S. P.).—Extract of Colchicum-corm. Dose, 0.015 to 0.065 Gm. (or gr.  $\frac{1}{4}$  to  $\frac{1}{2}$ ).

*Fluidextractum Colchici Radicis*.—Fluid Extract of Colchicum-root. Dose, 0.12 to 0.24 c.cm. (or mii-iv).

*Vinum Colchici Radicis*.—Wine of Colchicum-root (40 per cent.). Dose, 0.30 to 2 c.cm. (or mv-f3ss).

*Preparations from the Seed.*

*Fluidextractum Colchici Seminis* (U. S. P.).—Fluid Extract of Colchicum-seed. Dose, 0.12 to 0.30 c.cm. (or mii-v).

*Tinctura Colchici Seminis* (U. S. P.).—Tincture of Colchicum-seed (10 per cent.). Dose, 0.30 to 4 c.cm. (or mv-f3j).

*Vinum Colchici Seminis* (U. S. P.).—Wine of Colchicum-seed (10 per cent.). Dose, 0.60 to 4 c.cm. (or mx-f3j).

*Tinctura Colchici Seminum* (B. P.).—Tincture of Colchicum-seeds (20 per cent.). Dose, 0.30 to 1 c.cm. (or mv-xv).

*Colchicina* (non-official).—Colchicine (the active principle). Dose,  $\frac{1}{4}$  to 1 mg. (or gr.  $\frac{1}{4000}$  to  $\frac{1}{1000}$ ).

**Pharmacology.**—Colchicum-corm is the dried corm of *Colchicum autumnale* (Liliaceæ), or meadow-saffron, yielding 0.35 per cent. of colchicine. Colchicum is native to the temperate parts of both Europe and northern Africa. The seed is also official. It contains **Colchicine** (55 per cent., or rather more in the seeds than in the root); and traces of **Veratrine** in combination with gallic acid and a fixed oil are found. The value of colchicum is tested by its bitterness, due to the presence of colchicine, an alkaloid, appearing in small crystals (Geiger and Hesse), which is soluble in water and alcohol, but is changed by most acids into **Colchiceine**, a neutral substance, and a resin, both isomeric with colchicine. Wine and vinegar extract the medicinal principles from the drug, and the official extract is made with the aid of acetic acid. Probably each of them contains a small amount of colchiceine. In ordering the wine it is necessary to designate which preparation is required, as the wine of the seeds differs in effects from that of the root, on account of the difference in content of colchicine, which is not entirely equalized by the pharmacopœial expedient of altering the proportion of crude drug in each. The fresh seed contains a small portion of volatile, but very active, oil, and the best preparation would be a tincture made from the fresh seeds in alcohol; but colchicine, when administered in granules, pill, or by hypodermic injection, is said to secure the full therapeutic effect.

**Physiological Action.**—When applied to the skin, colchicum acts as an irritant, causing hyperæmia and smarting, and the dust inhaled causes sneezing and conjunctival injection. In small doses it occasions an acrid taste in the mouth, increased secretions from the salivary glands due to reflex action, and gastro-intestinal disturbance, which increases with the quantity taken. The pulse-rate is decidedly reduced, and in some cases a diaphoretic effect is observed. A single large dose or small ones long continued cause violent vomiting and purging (first serous, then mucous, then bloody), or acute gastro-intestinal irritation. Marked symptoms of collapse supervene: the pulse becomes small, rapid, and thready; the skin cold and bedewed with

sweat; respiration slow and painful. Death ensues from collapse, the brain remaining clear to the last. Sometimes nervous symptoms, flying pains, and numbness may appear, and occasionally, though rarely, convulsions (Brunton). Pains in the joints and urinary passages also may be produced by colchicum.

In some instances the action of the kidneys is but slightly affected, in other cases it is increased, and again it may be diminished or suppressed. In fatal cases of colchicum poisoning the blood has been found of a dark color and impaired coagulability. The intestinal mucous membrane is highly inflamed, and this effect is equally produced even when the alkaloid has been given by the hypodermic method. A very large dose does not cause a more marked effect than a moderately large one. The action upon the alimentary canal is the same, whether the drug be swallowed or hypodermically injected. When, during the administration of colchicum, there appear irritation of the fauces, loaded tongue, loss of appetite, flatulence, uneasiness, or pain in the stomach and diarrhoea, the drug is beginning to exercise toxic effects, and should be discontinued or suspended for a time. Colchicum has a selective action upon the sensory nerves and spinal cord, which are more or less paralyzed; the brain, motor nerves, and muscles are not affected. The inhibitory fibres of the vagus are paralyzed only by very large doses. The discharge of bile and of urine is largely increased; Rutherford claims that it is a true cholagogue, and Christian and others assert that it is diuretic, increasing the quantity of salts as well as the water, both of which have been denied by Gubler, who simply regards it as cathartic, only exercising good effects when three or four discharges from the bowels are obtained daily through its action. When symptoms of poisoning make their appearance, the patient should be kept in a recumbent posture, encouraged to vomit, and allowed to drink freely of infusion of tea or coffee, on account of the tannin they contain as well as their action as arterial stimulants. Morphine and atropine may be administered hypodermically in small doses. The administration of oil is of service on account of its emollient effect upon the mucous membrane. If collapse occurs, heat and cardiac stimulants are required. If there is much distress, sinapisms should be applied to the abdomen and the patient kept warm. Poisoning may occur in refilling prescriptions, as the preparations vary greatly in their activity; some samples of fluid extract contain very little, if any, of colchicine, while others are of standard strength. Fatal cases have been reported from taking 9.25 to 13 c.c.m. (or f5iiss-iiiss) of the wine of colchicum-root. Dangerous symptoms have been caused by doses of 0.01 to 0.02 Gm. (or gr.  $\frac{1}{6}$ - $\frac{1}{3}$ ) of colchicine, and 0.03 Gm. (or gr. ss) of the alkaloid has caused death.

**Therapy.**—Colchicum may be used in small doses as an ingredient in cholagogic pills, but its chief use is in the treatment of attacks of gout and in the relief of symptoms more or less directly attributable to gout, as dyspepsia, bronchitis, asthma, etc. In rheumatic arthritis or rheumatic gout we may give:—

<b>R</b> Tincture colchici sem. ....	60 c.c.m. or <i>mx.</i>
Potassii iodidi .....	65 Gm. or gr. x.
Syr. sarsaparillæ comp. ....	6 c.c.m. or f3iiss.
Aquæ destillatæ .....	2 c.c.m. or f3ss.

**M.** Pro dosi. Take every three or four hours, well diluted.

R Vini colchici seminis .....	15	c.cm. or f3iv.
Sodii salicylatis .....	12	Gm. or 3iij.
Sodii iodidi .....	4	Gm. or 3j.
Spiritus chloroformi .....	11	c.cm. or f3iij.
Inf. buchu .....	ad 240	c.cm. or f3viij.

M Sig.: A teaspoonful every three or four hours.

Scudamore's gout mixture is also very efficient:—

R Magnesii sulph. ....	62	Gm. or 3ij.
Magnesii carbonatis .....	8	Gm. or 3ij.
Vini colchici seminis .....	22	c.cm. or f3vj.
Aque menth. pip. ....	ad 360	c.cm. or f3xiij.

M Sig.: A tablespoonful every four hours.

Colchicum is generally given in acute attacks of gout, in combination with an alkali:—

R Magnesii sulphat. ....	15½	Gm. or 3ss.
Magnesie .....	8	Gm. or 3ij.
Tinct colchici sem. ....	7½	c.cm. or f3ij.
Syrupi zingiberis .....	30	c.cm. or f3j.
Aque menthæ pip. ....	150	c.cm. or f3v.

M Sig.: Take a tablespoonful every two hours, until the bowels are freely moved from four to six times in twenty-four hours.

Or the extract of the root may be given (0.065 to 0.13 Gm., or gr. i-ij) several times daily, or the wine of the seeds in 2-c.cm. (or f3ss) doses:—

B Colchicine .....	103	Gm. or gr. ss.
Codeine .....	65	Gm. or gr. x.
Quinine hydrobromidi. ....	4	Gm. or 3j.

M et ft. pil. no. xl.

Sig.: Take one every two hours for gouty neuralgia.

The wine of the seeds is, perhaps, the preparation most frequently prescribed, and in an acute paroxysm of gout is best given in a moderately large dose (2 to 4 c.cm., or f3ss-j). Within a few hours the pain is allayed and the heat and swelling begin to subside. In order to secure relief it is not necessary that the drug should manifest its diuretic or purgative effects. In chronic gout, small doses (1 to 1.20 c.cm., or mxx-xx) three or four times a day are appropriate. Though colchicum exerts an action which may be termed specific, it is nevertheless but palliative, since attacks recur. Of little or no value in acute rheumatism, colchicum is sometimes of service in the chronic form of this disease. Neuralgia dependent upon a gouty or rheumatic condition is often effectually treated by means of colchicum, a drachm of the wine being given at bed-time, together with a dose of morphine sulphate. The same preparation is not infrequently serviceable in gonorrhœa, and 2 c.cm. (or mxxx) at bed-time is an old treatment for chordee.

Ch. Abadie has found very minute doses of colchicine (0.001 gramme =  $\frac{1}{1000}$  grain) two to four times a day to be of great value in scleritis, whether due to gout or rheumatism.

F. Woodbury recommends its hypodermic injection in sciatica, into the sheath of the nerves, also in muscular rheumatism.<sup>1</sup> A combination of colchicine with the natural salicylate of methyl is of value in subacute and

<sup>1</sup> Philadelphia Medical Times, vol. xlii, p. 154.

chronic rheumatism. In gouty neuritis, Dr. C. D. F. Phillips has found the following combination beneficial:—

R Colchicin. ....	001 Gm. or gr. $\frac{1}{100}$ .
Quinin. sulphat. ....	065 Gm. or gr. j.
Ext. colocynthidis ....	065 Gm. or gr. j.
M. et ft. pil. no. j. Mitte tales no. xx.	
Sig.: One pill three times a day.	

Colchicum has also given good results in the treatment of ascites, gonorrhœa, and chordee.

#### COLLARGOLUM. (See Argentum.)

**COLLINSONIA CANADENSIS.**<sup>1</sup>—This indigenous plant, belonging to the natural order Labiatae, and popularly known as stone-root, or knob-root, grows from April to October in richly-wooded soils throughout the United States. All parts of the plant may be used, but its virtues reside chiefly in the root, and depend principally upon the presence of a volatile oil. It possesses a rank, aromatic odor, and a warm, somewhat pungent taste.

**Physiological Action.**—Collinsonia is a local astringent. It exerts a sedative effect upon mucous membranes, and produces a sensation of warmth in the stomach and bowels. Large doses give rise to diaphoresis, nausea, and, perhaps, vomiting.

**Therapy.**—Collinsonia is a good local application to incised or contused wounds. Four Gm. (or 3j) of the powdered root to 31 Gm. (or 3j) of lard constitutes a stimulant application to indolent ulcers. The fluid extract, diluted with 4 parts of water and used as a rectal injection, effectually destroys ascarides.

This remedy, given internally, acts as an astringent tonic, antispasmodic, and sedative. It increases the appetite, promotes digestion and elimination, and is therefore useful in anæmia, chlorosis, the early stage of phthisis, and in convalescence from the eruptive fevers. Relaxed uvula, chronic pharyngitis, and hoarseness due to impaired tonicity of the vocal cords are benefited by the local action of collinsonia. A cup of hot infusion at bed-time will abort an ordinary cold, or mild lumbago. The fluid extract is very beneficial in gastro-intestinal catarrh, whether dependent upon alcoholism or other causes. The remedy is especially useful in the former case, since it seems to lessen the desire for liquor.

Various spasmodic affections are relieved by collinsonia. The hot infusion is a useful remedy in spasmodic croup. In whooping-cough the paroxysms are ameliorated, and it is valuable in nervous cough and the irritative cough of pharyngitis. It is sometimes of service in chorea. Spasmodic contraction of the sphincter ani not uncommonly gives rise to constipation, hæmorrhoids, neuralgia of the rectum, with vague pelvic and abdominal symptoms. This spasm and the train of disorders dependent upon it may often be relieved by the employment every night of a suppository containing from 0.65 to 4 Gm. (or gr. x-3j) of powdered collinsonia-root. Some cases of dysmenorrhœa are markedly benefited by the administration of the fluid extract for a week preceding and during the period. It is probable that vaginal suppositories containing this remedy would be

<sup>1</sup> See paper by author, in "Transactions of the Ninth International Medical Congress," vol. iii, p. 76. Washington, D. C., U. S. A.

of service in vaginismus. Excellent results are obtained from collinsonia in renal and biliary colic. Spasm of the ducts is relaxed, and the irritation of the mucous membranes soothed. The increased flow of urine induced facilitates the expulsion of small calculi. Infantile colic and flatulent colic in adults are also amenable to the influence of this drug. In combination with aconite and morphine it is more rapidly efficacious than any other treatment of acute cystitis, and should be tried in chronic cystitis.

Incontinence of urine in children and the dripping of a few drops of urine in adults after the act of micturition is apparently completed, due to hyperaesthesia of the prostatic urethra or neck of the bladder, may be effectually relieved by the fluid extract. The writer has seen it arrest the discharge of chronic gonorrhœa after the customary blennorrhætics had been exhausted in vain. It has likewise been found very beneficial in leucorrhœa and prostatorrhœa.

### COLLODIUM (U. S. P., B. P.).—Collodion.

#### *Preparations.*

Collodium Stypticum (U. S. P.).—Styptic Collodion. External use.

Collodium Cantharidatum (U. S. P.).—Cantharidal Collodion. External use.

Collodium Flexile (U. S. P., B. P.).—Flexible Collodion. External use.

Collodium Vesicans (B. P.).—Blistering Collodion. External use.

**Pharmacology.**—Collodion is pyroxylin, or gun-cotton (4 parts), dissolved in ether (75 parts) and alcohol (25 parts). The British Pharmacopœia gives the proportions as pyroxylin, 10 Gm. (or 3iiss); ether, 360 c.cm. (or 5vj), and alcohol, 120 c.cm. (or f3iv). **Blistering collodion** (U. S. P.) has cantharides (60 parts), exhausted by chloroform and evaporated (to 15 parts), to which is then added flexible collodion (85 parts). **Flexible collodion** (U. S. P.) is collodion (92 parts), to which Canada turpentine (5 parts) and castor-oil (3 parts) have been added. **Styptic collodion** (U. S. P.) contains tannic acid (20 parts) dissolved in alcohol (5 parts), ether (25 parts), and collodion (q. s. to make 100). Collodion is a clear, syrupy fluid, smelling strongly of ether; and should be kept in a glass-stoppered bottle, tightly corked, remote from lights and fire. When painted upon a surface, the ether quickly evaporates, leaving a film of pyroxylin, which is adhesive and tends to contract or pucker up.

**Therapy.**—Collodion is used to cover excoriated surfaces and to seal small wounds. Larger wounds may be drawn together and kept in position by strips of gauze, the ends of which are made to adhere to the skin by several coats of collodion painted on with a camel's-hair pencil. Sometimes it gives rise to pain, irritation, and even blistering when a comparatively large area is thus covered. The contraction caused by the drying of collodion is made use of in the treatment of the early stages of boils and styes, and the papules in small-pox, to prevent pitting. Where several coats are to be applied, the flexible collodion is preferable. It has also been used in herpes zoster and erysipelas, and the compression exerted by it has been utilized in the treatment of epididymitis, painting freely over the testicle and cord. A coating of collodion is likewise beneficial in the superficial variety of burns. This substance is an exceedingly useful application to scalp-wounds, in which, besides approximating the edges and excluding the air, it does away with the necessity for a bandage. The pressure produced by the con-

traction of collodion has been successfully utilized in the treatment of umbilical hernia, varicocele, and spina bifida. In pruritus ani, if collodion be applied, after antiseptic cleansing with solution of carbolic acid, marked relief will be afforded.

Several cases have been reported by French physicians in which the repeated application of collodion to the entire surface of the abdomen in tuberculous peritonitis was followed by recovery. In the nocturnal incontinence of urine in male children it is often advantageous to seal the orifice of the urethra or the end of the prepuce with collodion. This method will not infrequently break up the habit within a few weeks. The styptic collodion may be used on cracked nipples, or for small wounds where an astringent may be desired. Extract of cannabis Indica (2 parts), with salicylic acid (11 parts) in flexible collodion (87 parts), is a popular remedy for soft corns, under the name of the green solution for corns (collodium salicylatum compositum, N. F.), which, however, would probably be quite as efficient without the cannabis Indica. Iodine and iodoform have been used, dissolved in collodion, as an application to gouty or rheumatic joints, but the former sometimes has been followed by sloughing. Iodized collodion (contains 5 per cent. iodine in flexible collodion) is useful for chilblains.

Numerous collodion preparations have been suggested and employed for various purposes. Among these may be mentioned a 10-per-cent. chrysarobin collodion; a cocaine styptic collodion, containing 5 per cent. of cocaine hydrochlorate, 15 per cent. of tannic acid and 30 per cent. of alcohol; diachylon, 10 per cent., each of lead plaster and alcohol with 20 per cent. of ether; a collodion for freckles, containing 2 per cent. of sulphophenyl-zinc; collodions in which oleate of mercury, zinc, or other oleates are incorporated; a 10-per-cent. salol collodion for chapped hands, etc.

**Crystalline.**—A solution of pyroxylin in methylic alcohol has been introduced under the name of crystalline. The preparation is similar to collodion, but the solvent evaporates more slowly and the resultant pellicle is perfectly translucent. An elastic crystalline, corresponding to elastic collodion, has been made by Dr. Phillips, according to the following formula:—

R Crystallin. ....	18	5	c.cm. or f3v.
Ol. ricini .....	5		c.cm. or f3i 1/4.
Terebinth. Canadensis .....	9	25	c.cm. or f3iias.—M.

An excellent white varnish is made by mixing:—

R Crystallin. ....	30		c.cm. or f3j.
Ol. ricini .....	4		c.cm. or f3j.
Zinc. oxid. ....	8		Gm. or 3ij.—M.

Pyrogallic acid, salicylic acid, chrysarobin, corrosive sublimate, and many other medicinal substances are readily soluble in crystalline, which may, therefore, be used with advantage as a vehicle for various substances in the treatment of tinea tonsurans, warts, eczema, acne, lupus erythematosus, etc.

**COLOCYNTHIS (U. S. P.).—Colocynth.**

**COLOCYNTHIDIS PULPA (B. P.).—Colocynth-pulp.**

Dose, 0.13 to 0.32 Gm. (or gr. ii-v).

#### Preparations.

Extractum Colocynthidis (U. S. P.).—Extract of Colocynth. Dose, 0.13 to 0.20 Gm. (or gr. ii-iiij).

**Pilule Cathartice Composite (U. S. P.).**—Compound Cathartic Pills (compound extract of colocynth, 80 Gm.; calomel, 60 Gm.; resin of jalap, 20 Gm.; and gamboge, 15 Gm., to make 1000 pills). Dose, 1 to 3 pills.

**Pilule Cathartice Vegetabiles (U. S. P.).**—Vegetable Cathartic Pills (compound extract of colocynth, 60 Gm.; extract of hyoscyamus, 30 Gm.; resin of jalap, 20 Gm.; extract of leptandra and resin of podophyllum, each 15 Gm.; oil of peppermint, 8 ccm., to make 1000 pills). Dose, 1 to 3 pills.

**Extractum Colocynthis Compositum (U. S. P., B. P.).**—Compound Extract of Colocynth. Dose, 0.25 to 0.85 Gm. (or gr. iv-x).

**Pilule Colocynthis Composita (B. P.).**—Compound Pill of Colocynth (colocynth pulp, 20 Gm.; Barbadoes aloes, 40 Gm.; scammony resin, 40 Gm.; potassium sulphate, 5 Gm.; oil of cloves, 5 ccm.; and distilled water, q. s.). Dose, 0.25 to 0.50 Gm. (or gr. iv-viii).

**Pilule Colocynthis et Hyoscyami (B. P.).**—Pill of Colocynth and Hyoscyamus (compound pill of colocynth, 50 Gm.; extract of hyoscyamus, 25 Gm.). Dose, 0.25 to 0.50 Gm. (or gr. iv-viii).

**Pharmacology.**—The peeled, dried fruit of *Citrullus colocynthis* (Cucurbitaceæ). Colocynth is gathered when full grown, but still immature, dried and deprived of its rind, the seeds being rejected before using. The plant is a native of western Asia, but cultivated in various portions of the world. The pulp of the fruit after separation of the seeds, which are inert, contains, in proportion of about 2 per cent. of the pulp, a yellow, rather amorphous or crystalline, bitter, alkaloidal principle, **Colocynthin**, soluble in water and in alcohol; yielding a resin, **Colocynthein**, when treated by acids, also **Colocynthitin**, insoluble in water and not possessed of purgative effects, a tasteless crystalline body, probably a resin. The seeds contain a fixed oil.

**Physiological Action.**—In small doses, colocynth acts as a simple bitter, increasing the secretions and improving appetite. In larger doses, it augments the flow of bile and acts powerfully as a drastic and hydragogic cathartic. Overdoses cause gastro-intestinal irritation, griping, and purging. It is generally combined with other drugs to avoid this unpleasant action. Colocynth has some diuretic properties and indirectly acts as an emmenagogue. In excessive doses colocynth has caused death. Less than 4 Gm. (or 5j) has been known to produce a fatal result, though recovery has occurred in other cases after a considerably larger quantity.

**Therapy.**—Colocynth is a valuable purgative in chronic constipation or torpidity of the bowels. It produces soft, pulpy stools by stimulating peristalsis. Its griping tendency may be overcome by combining it with aromatics or a small proportion of hyoscyamus or belladonna:—

R. Extracti colocynth. comp. ....	4	Gm. or 3j.
Ext. belladonnæ folior. ....	13	Gm. or gr. ij.
Saponis ....	65	Gm. or gr. x.
Ol. cajuputi ....	30	ccm. or ℥ss.

M. et ft. pil. no. xx.

Sig.: Take one or two at night for habitual constipation.

In chronic dropsy of serous cavities, or cerebral congestion, the compound extract may be given with compound licorice-powder. The compound cathartic pills are excellent for cases of *embarras gastrique*, or so-called *biliousness*. In chlorosis, colocynth is useful with iron. A principle known as **Citrullin**, extracted from colocynth, exercises a stimulant effect upon the abdominal organs and especially upon the intestinal glands. It also acts upon the abdominal and pelvic vessels and nerves and quickens peristaltic

movements. Given in the form of a suppository, citrullin is successful in relieving persistent constipation and, according to G. Archie Stockwell, is of value in hernia when strangulation is threatened. In solution citrullin has also been used as an enema, and Kohlstock reports from the clinic of Professor Senator, of Berlin, that it yielded excellent results. Colocynthin has likewise proved of service, used in the same manner. These substances produce no local irritant effect nor occasion any tendency to constipation. Small doses of colocynth are said to be useful in sciatica, ovaralgia, and other forms of neuralgia.

**CONDURANGO CORTEX.**—**Condurango-bark.** Several plants are known as condurango; but the Condurango blanco, or *Marsdenia Condurango* (Aselepiadaceæ), is that which has the greatest medical interest. The bark is separated from the stem by beating with a wooden mallet, and afterward dried in the sun. It is from one-tenth to one-sixth inch in thickness; its external surface is smooth and of an ashy-gray color. It contains a yellow resin, extractive, tannin, etc. The root contains 2 per cent. of a glucoside, named **Condurangin**, which may be separated into two parts, one of which is soluble and the other insoluble in water. According to Kohert, condurangin is a mixture of at least two glucosides, and Carrara claims to have isolated another glucoside differing from condurangin in solubility. Flückiger also found a small quantity of an alkaloid in condurango-bark. Hager distinguished two principles: (a) condurangin, and (b) conduranzin, both insoluble in water; also conduransterin, cinnamic acid, and a small proportion of an alkaloid resembling strychnine. A fluid extract may be used, in dose of 4 c.cm. (or 15j), or a wine, 16 c.cm. (f5iv).

**Physiological Action.**—To the resin the effect of the bark is ascribed, as it yields its virtues to alcohol. In the form of a decoction representing 8 or 12 Gm. (or 3ii-iiij), however, it also produces decided therapeutic effect. It has caused diaphoresis, increased secretion of urine, and even vertigo and disturbance of vision, with increased activity of the circulation. Brunton failed to find any therapeutic value in a specimen examined by him.

**Therapy.**—About a generation ago condurango was brought to the notice of the profession as a specific for cancer, and especially gastric cancer, and reports were published of its wonderful cures in its native habitat. Having failed to fulfill the extravagant claims that were made in its favor, and no other use being then proposed for it, condurango for a time was allowed to retire into obscurity. Some years ago, however, several prominent German clinicians—Ruhle, Binz, Immermann, and Riess—again directed attention to it, claiming that it was a good stomachic tonic; and in a large number of cases presenting symptoms of cancer of the stomach, in which the drug was used, the result was favorable. The remedy was not without success in a single one out of over a hundred cases. This remedy seems to allay the digestive disturbance and pain which accompany organic disease of the stomach. Immermann advises the use of a wine of condurango as a good preparation. The tincture appears to be a valuable remedy in gastric catarrh.

**CONFECTIO ROSÆ** (U. S. P.).—**Confection of Rose.** (See *Rosa Gallica*.)

**CONIUM** (U. S. P.).—Hemlock.

**CONII FRUCTUS** (B. P.).—Conium-fruit.

**CONII FOLIA** (B. P.).—Conium-leaves.

#### Preparations.

**Fluidextractum Conii** (U. S. P.).—Fluid Extract of Conium. Dose, 0.06 to 0.20 c.cm. (or *mi-v*).

**Extractum Conii**.—Extract of Conium. Dose, 0.03 to 0.12 c.cm. (or gr. *ss-ij*).

**Tinctura Conii** (B. P.).—Tincture of Conium (20 per cent.). Dose, 1 to 4 c.cm. (or *max-℥j*).

**Succus Conii** (B. P.).—Conium-juice expressed from fresh leaves and alcohol added (one third of the volume) to preserve it. Dose, 2 to 7.5 c.cm. (or *℥ss-ij*).

**Unguentum Conii** (B. P.).—Conium Ointment (conium-juice evaporated to one-eighth of its volume and three times its weight of wool-fat triturated with it).

**Coniina**.—Coniine (the active principle). Dose, 0.006 to 0.06 c.cm. (or *m<sup>1</sup>/<sub>100</sub>-j*).

**Coniine Hydrobromidum**.—Coniine Hydrobromide. Dose, 0.005 to 0.05 Gm. (or *gr. i-℥*).

**Coniine Hydrochloridum**.—Coniine Hydrochloride.—Dose, the same.

**Pharmacology**.—The full-grown but unripe fruit of *Conium maculatum* (*Umbellifera*), carefully dried and preserved, and yielding, when assayed as United States Pharmacopoeia process, not less than 0.5 per cent. of coniine. After being kept for two years conium is unfit for use. The British Pharmacopoeia also recognizes the fresh leaves and young branches of *Conium maculatum* collected when the fruit begins to form. By bruising these, pressing out the juice, and adding  $\frac{1}{2}$  as much alcohol we obtain *Succus Conii* (B. P.). A tincture of the leaves (12  $\frac{1}{2}$  per cent.) was formerly official (dose, 2 to 4 c.cm., or *℥ss-j*), but, like conium-juice, it is unreliable in strength, and should be abandoned in favor of preparations from the seeds. The habitat of hemlock is Europe and North America. It contains three alkaloids and both volatile and fixed oils. The most important is **Coniine** (or **Cynapine**), a colorless, oily liquid, alkaline in reaction, with an acid, tobacco-like taste and a characteristic odor resembling the urine of mice. Coniine is soluble in alcohol; very slightly in water. It is unstable, and is decomposed by light or heat. It is most abundant in the nearly-ripe fruit of the plant in its second year. **Methyl-coniine**, another alkaloid, is associated with the preceding, and also **Conhydrine**, or **Oxyconiin**, a crystallizable alkaloid, convertible into coniine by abstraction of the elements of one molecule of water. **Paraconiine** has also been isolated.

Another alkaloid has been isolated by Merck. It is believed to be of similar composition to conhydrine, and has, therefore, been termed **pseudo-conhydrine**. It forms easily-soluble salts. Their medicinal effects are less evident than those of coniine.

**Physiological Action**.—The local effects are sedative in painful conditions. No influence upon secretion has been noticed. Gastric disturbance results from a full dose of conium; nausea and vomiting appear early. Following this, there are staggering gait, weakness of the limbs, numbness, fatigue, ptosis, double vision, pupils slightly dilated, vertigo, lowered respiration, and labored speech. After poisonous doses, there are loss of power of muscles, commencing in the lower extremities; loss of sight and of speech, and, finally, death from paralysis of respiration. Coniine causes paralysis of the phrenic nerve; the motor nerves of the accessory respiratory muscles

become paralyzed later. Very large doses cause general paralysis; but ordinarily the heart's movements seem to be unaffected, and the mind remains clear, until the brain is overcome by accumulation of carbonic-acid gas in the blood.

In a case of hemlock poisoning, the stomach should be emptied and coffee promptly given, with hypodermic injections of atropine. Muscular exercise delays the action of the poison. Free counter-irritation by mustard would doubtless be serviceable. The physiological antagonists are strychnine, physostigmine, and atropine; tannic acid is incompatible. Upon the nervous system methyl-coniine acts slightly differently from coniine; the latter paralyzes the motor nerves from the extremities, gradually extending up to the motor centres; the former affects first the motor columns of the spinal cord. The sensory nerves and muscular irritability remain unaffected. The excretion from the system of coniine is chiefly by the breath and the urine. The use of conium is sometimes followed by an erythematous or papular eruption.

**Therapy.**—Poultices of the leaves of hemlock and flaxseed (2 parts of the former to 6 of the latter), with boiling water, have been used as a soothing dressing to painful swellings; they should be applied with caution where there are abrasions or ulcers. Conium possesses both anodyne and antispasmodic virtues, and has long been reputed to exercise a deobstruent influence upon glandular and other enlargements. A hemlock ointment, made by bruising the leaves with sufficient water, extracting and incorporating the juice with lard or other excipient, is an efficacious local remedy in painful maladies. It assuages the pain of cancer and may be beneficially spread upon irritable or painful ulcers and painful hemorrhoids. It likewise affords relief when applied over the seat of pain in neuralgia, herpes zoster, chronic rheumatism, gout, or synovitis. The ointment is appropriately used in order to reduce the volume of enlarged scrofulous glands, enlarged mammary glands, liver, or spleen, and goitre. It may be spread upon the breast when the secretion of milk is excessive or requires suppression. In whooping-cough and asthma hemlock ointment may be applied to the chest to assist the action of other remedies. Conium may be prescribed in form of ointment as follows:—

R	Extracti conii .....	4		Gm. or 3j.
	Cocainæ Hydrochloridi .....	32		Gm. or gr. v.
	Atropinæ sulphatis .....	005		Gm. or gr. j.
	Veratrinæ oleatis .....	130		Gm. or gr. xx.
	Ungt. aquæ rosæ .....	31		Gm. or 3j.

M. For neuralgia, chronic rheumatism, gout, and synovitis, a small piece the size of a pea being used for each application.

R	Extracti conii .....	4		Gm. or 3j.
	Mentholi .....	32		Gm. or gr. v.
	Ext. belladonnæ folior .....	65		Gm. or gr. x.
	Ungt. zinci oxidi .....			
	Adipis lænæ hyd. ....	aa 15		Gm. or 3ss.

M. For painful cancer, scrofulous glands, herpes zoster, and enlarged mammary glands.

The vapor of coniine, or the fluid extract with hot water in an inhaler, yields good results in catarrh, laryngitis, irritative cough, and acute bronchitis, or the persistent cough of phthisis. The local hypodermic injection of coniine has been employed in order to quiet the intercostal muscles in

pleurisy and pneumonia; but the hydrobromate, being more permanent, is a better preparation. Other painful and spasmodic diseases have been benefited by the same method. Among these may be instanced angina pectoris, emphysema, asthma, acute mania, and tetanus. Dr. Harley warmly advocates the use of conium in chorea; also in nervous twitchings, blepharospasm, and post-hemiplegic tremor. In various spasmodic affections of children, convulsions, spasm of the larynx, trismus, spasmodic wryneck, and whooping-cough it has also been much approved. In ovaritis and in dysmenorrhœa its administration in the following prescription is frequently followed with great relief from the pain:—

R Succi conii .....	22	c.cm. or f5vj.
Potassii bromidi .....	12	Gm. or 3iij.
Spiritus chloroformi .....	75	c.cm. or f5ij.
Aquæ camphoræ .....	ad 240	c.cm. or f5viij.

M. Sig.: From a half to a tablespoonful every two or three hours.

Conium has been highly recommended in paralysis agitans and hysteria. In acute mania, mania a potu, and active delirium tremens it quiets motor excitement, finding, as it does, its principal usefulness in diseases attended by excessive motor activity. In some cases it is well to combine it with a little morphine for its effect upon the brain, and in others with potassium bromide. Conium has been employed in epilepsy, but here it is inferior to the bromides. It may, however, prove of benefit in those cases marked by vertigo and disturbance of the cerebral functions. Walshe has known it to relieve the pain of gastric cancer. For the latter disease, as well as gastric ulcer, it may be used in this combination:—

R Tincturæ conii .....	2	c.cm. or f3ss.
Morphinæ sulph. ....	0.65	Gm. or gr. j.
Phenolis liquefacti .....	24	c.cm. or miv.
Syrupi acaciæ .....	90	c.cm. or f3iij.

M. Sig.: A teaspoonful whenever in pain.

Dr. Seguin, of New York, recommended rapid increase of the dose until physiological effects are noted. He gave 4 c.cm. (or f5j) of the fluid extract at a dose, and never less than 1.20 c.cm. (or mxx). Owing to the very volatile character of the coniine, it is possible to administer large doses of some old fluid extracts without getting any effects whatever. If the strong mousey odor is missing, the preparation will have very little therapeutic value. It is also said that preparations from cultivated plants, such as the succus, or tincture of the leaves, are apt to be inert. This explains the enormous doses used by Dr. Harley (15 to 90 or 120 c.cm., or f3ss to f3lii or f3liv) of the juice. It has been likewise noticed that children bear conium-juice well. Dr. Squibb calls attention to the possible danger following dilution of the fluid extract, by which a precipitate is formed, so that toward the end a poisonous dose may be accidentally taken. Death has been caused by the administration of 9.25 c.cm. (or mcl) of the fluid extract. The poison administered to Socrates was apparently a strong, recent infusion of conium.

### CONVALLARIA MAJALIS (U. S. P.).—Lily of the Valley.

#### Preparations.

Fluidextractum Convallariæ (U. S. P.).—Fluid Extract of Convallaria. Dose, ʒi℥ to 0.30 c.cm. (or miii-v).

The National Formulary also has a fluid extract of the flowers.

**Pharmacology.**—The official definition is the dried rhizome and roots of *Convallaria majalis* (Liliaceæ). This plant is a native of Europe, northern Asia, and our Allegheny Mountains. Its rhizome is the size of a quill, its flowers bell-shaped and six-lobed. The flowers possess a fragrant odor and a bitter, acrid taste. All parts of the plant possess medicinal value; but its virtues reside principally in the rhizome. **Convallamarin** is the most important active principle of the plant. It is a bitter-sweet, white, crystalline glucoside ( $C_{23}H_{24}O_{12}$ ), soluble in water and alcohol, but not in ether and chloroform. It is precipitated by tannin, and, by acids, is split up into glucose and **Convallamaretin**. There is also an acrid glucoside, **Convallarin** ( $C_{34}H_{42}O_{11}$ ), which similarly splits up into glucose and **Convallaretin**. The dose of *Convallamarin* is .03 Gm. (or gr.  $\frac{1}{2}$ ).

**Physiological Action.**—*Convallarin*, in doses of 0.20 to 0.25 Gm. (or gr. iii-iv), acts as a purgative, but has no marked toxic effect. *Convallamarin*, in small doses, excites vomiting and manifests a special influence upon the action of the heart. At first the contractions are suddenly retarded and the blood-pressure increased; subsequently the cardiac pulsations are quickened and arterial pressure further augmented. Finally, the beat is arrested. Death may take place within a few minutes after introduction of the poison. The reflex function of the cord is abolished; otherwise the action of the nervous system seems but slightly affected.

**Therapy.**—In small doses this drug strengthens the heart's action; in larger quantities it restrains excessive cardiac activity. It has been found of especial value in mitral insufficiency. It quickly relieves the dyspnoea and palpitation, and, after having been given for two or three days, may be discontinued for a week or more without recurrence of the symptoms. *Convallaria* seldom disagrees with the stomach, and no cumulative action has been observed. As a rule, the appetite and digestion seem to improve under its use and a regular action of the bowels is promoted.

*Convallaria*, and especially *convallamarin*, have, however, in some instances, been known to cause hæmoptysis, dyspnoea, and other disagreeable symptoms. It increases the secretion of urine, and, when compensation has failed, invigorates the heart and reduces oedema. In disease of the aortic valve, though of some service, the value of *convallaria* is less marked. In angina pectoris and various forms of functional heart disease this remedy has proved beneficial. The favorable action of *convallaria majalis* in dropsy of renal or hepatic origin has been announced by Janowski, who prescribes it in an infusion of 4 Gm. (or 5j) of the plant to 180 c.cm. (or f℥vj) of water, a tablespoonful every two hours, changing later to a 1-to-12 alcoholic tincture, of which 45 to 80 drops are taken during the day. It also favorably influences the diuresis in hepatic cirrhosis. In chronic Bright's disease, it strengthens the circulation, relieves dyspnoea, increases the flow of urine, reduces dropsy, and lessens the albuminuria. Good results have also followed its administration in cardiac debility, due to pneumonia or typhoid fever. In some cases of idiopathic asthma it relaxes the spasm of the arterioles. It sometimes is serviceable in tic douloureux and other forms of neuralgia, insomnia, and in the restlessness of fever. The palpitation and dyspnoea of phthisis are mitigated by the use of *convallaria*. It is of utility, likewise, in the irregularity of the heart dependent upon acute pneumonia, bronchitis, or emphysema, but is ineffective in fatty degeneration of the heart.

R Fluidext. convallariæ ..... 7½ c.cm. or f3ij.  
 Syrupi aurantii ..... q. s. ad 60 c.cm. or f3ij.

M. Sig.: A teaspoonful to a tablespoonful three times a day. Useful in mitral insufficiency and functional heart disease.

R Potassii bitartratis ..... 15½ Gm. or 3ss.  
 Fluidext. convallariæ ..... 0 c.cm. or f3iss.  
 Syr. simplicis ..... q. s. ad 120 c.cm. or f3iv.

M. Sig.: From one-half to one tablespoonful, in water, three or four times a day. Valuable in general dropsy from heart or kidney disease.

### **COPAIBA (U. S. P., B. P.).—Copaiba.**

Dose, 2 to 4 c.cm. (or f5ss-j).

#### *Preparations.*

Oleum Copaibæ (U. S. P., B. P.).—Oil of Copaiba. Dose, 0.30 to 1.20 c.cm. (or ʒv-xx).

Massa Copaibæ.—Mass of Copaiba (copaiba, 94; magnesias, 6 parts). Dose, 0.35 to 2 Gm. (or gr. x-3ss.).

Resina Copaibæ.—Resin of Copaiba. Dose, 0.50 to 1 Gm. (or gr. viii-xv).

**Pharmacology.**—Copaiba is "the oleoresin of one or more South American species of *Copaiba* (Leguminosæ)" (U. S. P.), coming principally from Brazil. "The oleoresin obtained from the trunk of *Copaifera lancifolia* and other species of *Copaifera*" (B. P.). It is not, properly speaking, a balsam. In physical character it is a clear, transparent, oily liquid, of a pale-straw color and a characteristic unpleasant odor and taste. Copaiba is insoluble in water, soluble in alcohol, ether, volatile and fixed oils. It contains a large quantity of volatile oil (the best specimens, 70 to 85 per cent.), in which two resins are dissolved. **Copaivic acid**, the principal one of the resins, is crystallizable, with faint odor and bitter taste; insoluble in water, easily soluble in absolute alcohol and in ammonia. Both the oil and the resin are medicinally active. It gradually thickens on keeping, owing to the conversion of the volatile oil into resin, and crystals of copaivic acid are deposited.

A new substance, termed *copaiba-red*, has been found by Professor Quincke in the urine of persons taking copaiba. A rose-red, changing to a deeper shade, is produced by heating the urine with concentrated sulphuric acid. The substance upon which this reaction depends is a colorless acid.

**Physiological Action.**—Locally applied, copaiba is slightly stimulating to the skin and mucous membrane. The taste of copaiba is peculiarly disagreeable, and it imparts its odor to the breath, being partly excreted by the bronchial mucous membrane. It is heating and irritating to the stomach, causing offensive eructations and frequently exciting vomiting and purging. Taken in medicinal doses, it soon interferes with the digestion, causing loss of appetite, disordered bowels, and diarrhœa. Copaiba is very diffusive, and stimulates secretion at its points of elimination by the kidneys, bronchial mucous membrane, and skin. Its special action is upon the mucous membrane of the genito-urinary tract, and in large amounts it gives rise to irritation or inflammation of the kidneys, in its discharge through these organs. Bloody urine, pain in the bladder, and stranguary are occasional results of the administration of copaiba. It acts locally upon the genito-urinary tract, at first stimulating and subsequently checking secretions. The resin has a

decided diuretic action and is also expectorant. Georginewski, however, who made numerous experiments upon dogs and rabbits, states that enormous doses of copaiba occasioned, in these animals, only renal congestion, but no inflammation or degeneration. The resin is preferable to the oleoresin, since it is less apt to cause digestive disturbance. Its diuretic effects are powerful, constant, and long continued. The urine gives a precipitate, when treated with nitric acid, which may be mistaken for albumin; but it clears up when heated.

During the administration of copaiba, a coarse, measly rash sometimes breaks out over the body, especially in persons with a delicate skin; it also causes annoying itching. In other cases, urticaria, erythema, or a bullous eruption is caused. The author has observed a rash resembling that of small-pox appear upon all portions of the body. Dr. Frederic Tresillian has observed a case in which a purpuric eruption, accompanied by febrile action, was apparently caused by the administration of copaiba.

The administration with an alkali renders this accident less likely to occur. The mass of copaiba (*pilulæ copaibæ*, U. S. P. 1870) was introduced to the Pharmacopœia of 1880, but it is less efficient therapeutically than the other preparations, and has been omitted from the present revision.

**Therapy.**—Copaiba has been used for its stimulating and antiseptic effects in chronic skin diseases, psoriasis, lupus, and leprosy, being in its action very much like gurjun-oil.

Copaiba has been used, with reported advantage, as a local remedy in frost-bites. It can be used with benefit in old ulcers. A mixture of equal parts of copaiba and resin cerate is recommended by Dr. T. G. Stephens, of Sidney, Iowa, as an efficient application to the surface of indolent ulcers.

In thickened and irritable conditions of the tongue, mouth, rectum, vagina, uterus, and the urethra it is also useful. Copaiba, applied to the urethra in gleet, is sometimes followed by a complete removal of the discharge:—

**R** *Copaibæ*,

Glycerit boroglycerini.....aa 2| c.c.m. or f3ss.

**M.** Sig.: For application to the urethra with bougie or camel's-hair brush.

Internally, it is also given in the treatment of psoriasis, and for this purpose it is best administered in capsules, one or two hours after meals. For bronchitis, given as an expectorant, and in dropsy, for its diuretic effect, it is better to use the resin, which is nearly free from the objection, to the volatile oil, of causing offensive excretations. In bronchitis its effects are more decided after subsidence of the acute stage, and it is particularly valuable in chronic bronchitis associated with dilatations of the tubes and marked by a profuse purulent discharge. In ascites and some kidney disorders the resin is a valuable means of increasing the urine. Copaiba is of service also in cardiac dropsy. The remedy is not, however, invariably successful in removing these transudations, even when the conditions are apparently the same. Ringer concludes that this difference depends upon individual peculiarity, and adds that, whereas copaiba may cause bloody urine, he has seen a large amount of blood in the urine quickly disappear when copaiba was administered. The oleoresin is principally used as an antiblemnorrhetic in gonorrhœa, after the acute stage has passed, and in cystitis and prelititis. It may be given in combination with cubebs, or in the well-known **Lafayette Mixture** (*mist. copaibæ comp.*, N. F.):—

R Copaibæ .....	60	c.cm. or f3ij.
Tr. lavandulæ co. ....	60	c.cm. or f3ij.
Liq. potassæ .....	15	c.cm. or f3iv.
Spiritus ætheris nitrosi .....	60	c.cm. or f3ij.
Syrupi .....	150	c.cm. or f3v.
Mucilaginis acaciæ .....q. s. ad	473	c.cm. or Oj.

M. To be well agitated when used (4 c.cm. = 0.50 c.cm., or f3 = mviiss). Dose, a tablespoonful taken after meals.

To each dose of the above, 0.18 to 0.30 c.cm. (or miii-v) of oil of sandal-wood may often be added, with good results.

Copahin dragees consist of copaiba, 0.32 Gm. (or gr. v); cubeb, 0.65 Gm. (or gr. x); calcined magnesia and sodium carbonate, of each, 0.065 Gm. (or gr. j); made into rather large pills, which are sugar-coated. They have been largely used in the treatment of chronic gonorrhœa.

Among the many combinations of copaiba found of service in gonorrhœa and gleet, the author suggests the following:—

R Resinæ copaibæ .....	14	Gm. or 3iiss.
Oleoresinæ cubebæ .....	4	c.cm. or f3j.
Phenylis salicylate .....	12	Gm. or 3iij.
Pepsinæ pur. ....	260	Gm. or gr. xl.

M. et ft. capsulæ no. xl.

Sig: From six to ten a day.

R Resinæ copaibæ .....	15½	Gm. or 3iv.
Acidi sulphurici arom. ....	7½	c.cm. or f3ij.
Acaciæ .....	q. s.	
Infus. rosæ .....	240	c.cm. or f3viij.

M. Sig.: A tablespoonful three or four times a day.

R Resinæ copaiba .....	15½	Gm. or 3ss.
Fluidextracti glycyrrhizæ .....	30	c.cm. or f3j.
Spiritus ætheris nitrosi .....	15	c.cm. or f3ss.
Acaciæ .....	q. s.	
Aquæ cinnamomi .....	ad 240	c.cm. or f3viij.

M. Sig.: A tablespoonful three or four times a day.

R Olei copaibæ.		
Oleoresinæ cubebæ .....	aa 460	c.cm. or mxxx
Alcini,		
Extracti belladonnæ folior. ....	aa	065 Gm. or gr. j.
Ol. menth. pip. ....		06 c.cm. or mʒ.

M. et ft. pilulæ no. xij.

Sig: From three to six pills a day.

It is safe to begin the administration of copaiba in gonorrhœa as soon as the initial severity of the attack has subsided and the bowels have been freely opened. In the chronic cystitis of women Dr. Whittle has derived great benefit from injection into the bladder of equal parts of copaiba and warm castor-oil. One ounce of this mixture is injected and allowed to remain until expelled. Small doses internally administered often prove serviceable in cystitis, and will also often allay irritability of the bladder dependent upon prior attacks of gonorrhœa or excessive venery.

In the gonorrhœa of females an emulsion of copaiba is sometimes used as an injection. In certain affections of the intestinal tract this remedy is

sometimes of service. Chronic diarrhœa and dysentery may improve under the administration of copaiba after other agents have failed. It may prove beneficial in chronic intestinal catarrh accompanied by ulceration, and is recommended by Allingham in chronic proctitis. Clark and others have found it useful in pseudomembranous enteritis, given in the intervals between paroxysms. It has been used successfully in the treatment of hæmorrhoids, 1.20 c.cm. (or gtt. xx) being administered in capsules four times a day, or 2 c.cm. (or f3ss) in combination with 1 c.cm. (or gtt. xv) of liquor potassæ, taken three times a day. Copaiba has been advantageously given by the mouth in certain inflammatory diseases of the eye, especially iritis and scleritis. In purulent ophthalmia it has been applied upon the skin around the orbit and instilled between the lids with good effect.

**COPTIS.**—The *Coptis trifolia*, or gold thread (*Ranunculacæ*), is a native of the temperate portions of North America and the Old World. The entire plant is used, and was formerly official. The rhizome is thread-like, and of a bright-yellow color. It is bitter to the taste, without odor. Its constituents are **Berberine**, a yellow alkaloid; **Coptine**, a resin; but no tannin.

**Physiological Action and Therapy.**—Principally on account of the berberine, coptis is a pure, bitter tonic, agreeing well with the stomach, and without astringency. It is used to increase appetite, and as a general tonic. Locally, the infusion has been employed in aphthous ulceration of the mouth, and is a good gargle in ulcerative tonsillitis. The effects of berberine are discussed below.

The East Indian variety, *Coptis tecta*, of which the root only is employed in medicine, contains a very large proportion of berberine,—more than any other plant known.

A prescription containing gold thread, of much value in the treatment of dyspepsia, especially when attended with diarrhœa alternating with constipation, is:—

R. Fluidextracti coptidis.....	60	c.cm. or f3ij.
Tinct. nucis vomicæ .....	4	c.cm. or f3j.
Aquæ cinnamomi .....	240	c.cm. or f3viij.

M. Sig.: From one-half to a tablespoonful before meals.

**Berberine** is an alkaloid found in numerous plants (*berberis*, *coptis*, *calumba*, *hydrastis*, *menispermum*, *podophyllum*, *xanthorrhiza*, *xanthoxylum*, etc.), belonging to the natural orders *Berberidacæ*, *Menispermacæ*, and *Ranunculacæ*. It occurs in yellow, prismatic crystals, soluble in hot water and alcohol, but insoluble in ether. It yields bright-yellow, crystallizable salts, of which the hydrochlorate and sulphate are employed in medicinal doses of 0.13 to 0.65 Gm. (or gr. ii-x). It is a bitter tonic, antipyretic, and antiperiodic; also cholagogue. It is useful in dyspepsia, malaria, and diarrhœa. (See also **Berberis**.)

**CORIANDRUM** (U. S. P.).—**Coriander.**

**CORIANDRI FRUCTUS** (B. P.).

**Dose**, 0.32 to 2 Gm. (or gr. v-xxx).

*Preparations.*

**Oilum Coriandri** (U. S. P., B. P.).—Oil of Coriander. Dose, 0.06 to 0.30 c.cm. (or m℥v).

**Confectio Sennæ** (U. S. P., B. P.).—Confection of Senna.

**Pharmacology.**—Coriander is the dried, ripe fruit of *Coriandrum sativum* (Umbelliferae). It is a native of Asia. The fruit, or seed, has an agreeable, spicy odor, the chief constituent of which is **Coriandrol**, which is isomeric with borneol. The fruit also contains fixed oil.

**Therapy.**—This agent is used as an aromatic and stomachic, and is usually employed to prevent griping from other remedies, or as a flavoring excipient. A few drops of the oil may be given upon sugar for the relief of flatulence or colic.

**CORNUS.**—**Dogwood.** The bark of the root of *Cornus Florida* (Cornaceae), a small tree indigenous to the United States, has decided physiological properties. It contains a crystallizable, bitter principle, **Cornin**, or **corinic acid**; also tannic acid, resin, etc. As the active principle is altered by air and heat, a decoction or aqueous fluid extract is not an eligible preparation in order to obtain the effect of the drug. Cornin is found also in other species of dogwood: *Cornus circinata*, *Cornus sericea*, etc.

**Physiological Action and Therapy.**—*Cornus* belongs to the class of vegetable bitters, and is used as a stomachic tonic to increase appetite, etc. It has also considerable reputation for control over malarial manifestations, and is considered the best substitute for cinchona among the native astringent bitters.

**CORONILLA.**—*Coronilla varia* (Leguminosae) is a shrubby plant, the flowers of which are arranged in little tufts resembling coronets. The active principle is a glucoside, which has been termed **Coronillin**.

**Physiological Action.**—The drug possesses an unpleasant, bitter taste, but it increases the appetite and never excites gastro-intestinal disorders even when given in large doses. Spillmann and Haushalter have studied the effects of coronillin upon the human subject. As a result of their investigations they concluded that coronilla is a cardiac tonic, the beneficial effects of which are manifested within twenty-four to thirty-six hours after ingestion.

**Therapy.**—In organic affections of the heart coronilla increases the volume of the pulse, augments diuresis, diminishes œdema, and relieves dyspnoea. Coronilla is generally applicable to the same cases in which digitalis also succeeds, and is powerless in those conditions of degeneration in which digitalis fails. It regulates and reduces the action of the heart in tachycardia and abolishes painful reflex manifestations. In lesions of the mitral and aortic valves it is especially beneficial. The paroxysms of dyspnoea dependent upon organic disease of the heart are mitigated by this remedy. A tincture has been used in doses of 2 to 4 c.cm. (or f̄ss-j). Coronilla has no cumulative effect and does not disturb the digestive functions. Coronillin has been given in doses of 0.065 to 0.58 Gm. (or gr. i-ix).

**CORYDALIS.**—*Corydalis*, Turkey Corn, the *Dicentra Canadensis* (Fumariaceae), a native of the northern part of this country, has some reputation as an alterative, especially used as a tonic in syphilis and other condi-

tions of debility. The tubers are the part of the plant used; they contain an alkaloid, **Corydaline**, combined with **Fumaric Acid**; also an acrid resin and bitter extractive. An alcoholic extract, made by precipitating the resin with water, is incorrectly termed **Corydalia**, or **Corydaline**, by the botanic physicians, and has been given in doses of 0.065 to 0.32 Gm. (or gr. i-v).

### COTARNINE HYDROCHLORIDE. (See Stypticin.)

**COTO CORTEX.**—**Coto-bark.** This bark is obtained from a large tree (fam. Lauraceæ) of Bolivia, but its exact botanical origin is unknown. It is received in the form of flat or curved pieces a foot or more in length and  $\frac{3}{4}$  inch broad. Externally it is of a cinnamon-brown color, but when broken it appears studded with numerous scattered golden-yellow spots. It has an aromatic odor, which is more perceptible when the bark is bruised. The powder is very irritant to the Schneiderian mucous membrane. The taste is sharp and slightly bitter, but not astringent. The active principle is a crystallizable substance termed **Cotoine**, of a pale-yellow color, slightly soluble in cold water, but soluble in hot water, alcohol, ether, chloroform, and alkaline solutions. Cotoine is precipitated by hydrochloric acid with a clear, yellow color. It is colored blood-red by nitric acid, brownish yellow by sulphuric acid, and black by ferric chloride. Cotoine possesses a rather acrid taste. A bark differing in external appearance from coto, and probably derived from an allied species, has been designated **paracoto**. **Paracoto** contains an active principle called **Paracotoine**, analogous to cotoine in composition and effects, but feebler. Powdered paracoto is unirritant to the nasal mucous membrane. Paracotoine is of a bluish color, but slightly soluble in boiling water, and is soluble in alcohol, ether, and particularly in chloroform.

**Physiological Action.**—Applied to the unbroken skin, powdered coto causes heat and redness. Taken internally, it gives rise to a sensation of warmth in the stomach, and in large doses to nausea and vomiting. It stimulates the secretion of saliva. Small doses may increase the appetite. It is eliminated in the urine. Coto retards the development of bacteria and the occurrence of putrefaction. It causes active dilatation of the intestinal blood-vessels. Coto does not produce constipation in healthy individuals.

**Therapy.**—Coto and paracoto are remarkably efficient remedies in diarrhœa. They are applicable to all varieties of the disorder, except that dependent upon ulcers of the bowel, in which they have generally failed. Abundant testimony exists as to its worth in functional diarrhœa, acute and chronic gastro-intestinal catarrh, cholera infantum, the diarrhœa of typhoid fever, of rachitis, insanity, and in that form resulting from reduced nutrition. It is exceedingly valuable in the treatment of tuberculous diarrhœa.

The author has employed the following prescription in chronic and in tuberculous diarrhœa, the effect being complete cessation of all discharge:—

R	Fluidextracti coto cort.	7½	c.cm. or f3ij.
	Fluidextracti hamamelidis	15	c.cm. or f3ss.
	Aquæ cinnamomi	300	c.cm. or f3x.
M.	Sig.: A dessertspoonful every three or four hours.		

Professor Albertoni, to whom we owe the most comprehensive study of the physiological action of coto, observed no favorable results in drunkards

or where the portal circulation was embarrassed, as in cirrhosis. He considers it contra-indicated when there is hyperæmia of the bowel and a tendency to intestinal hæmorrhage.

**CRATÆGUS OXYACANTHA.**—The English Hawthorn (*Rosaceæ*) has been introduced into this country from Europe, where it is mostly cultivated for hedges. It has fragrant corymbs of white or purple flowers, and its large thorns make it protective as well as ornamental. The red berries contain tannin, and if gathered before ripening, are astringent. The flowers contain a small proportion of **trimethylamine** (or a substance yielding this principle, and **amygdaline** exists in all parts of the plant. The bark contains **oxyacanthine**, which is not identical with that in *Berberis*. A normal tincture (dose 0.65 to 1.30 (gm., or *mx-xx*), well diluted with water, has been used principally by botanic physicians in angina pectoris, precordial oppression, and valvular insufficiency.

**CREOLINUM.**—Creolin is obtained from English coal by dry distillation, the carbolic acid being removed, and the residue emulsified by soap or caustic soda, or sulphonated by the action of sulphuric acid. It is a sticky, dark-brown, or blackish fluid of a tar-like odor. It mixes with water in all proportions, forming an opaque, whitish emulsion. It is soluble in alcohol. The exact chemical constitution of creolin has not been determined, but it seems to consist largely of hydrocarbons joined with cresols free from any trace of carbolic acid, together with a small proportion of organic bases of the pyridin order, and alkaline ash.

**Physiological Action.**—A 3-per-cent. aqueous dilution excites no irritation when applied to the skin. When the skin is subjected to the action of a 5-per-cent. dilution for a considerable time, a slightly burning sensation results, but soon disappears. Creolin is irritant to mucous membranes. It is an efficient germicide, in some respects more powerful than carbolic acid. It is more destructive than carbolic acid to the micro-organisms of typhoid fever, Asiatic cholera, and suppuration; while, upon dried spores of the anthrax bacillus, carbolic acid exerts a more powerful inhibitory influence than creolin. Carbolic acid is likewise the more efficacious and permanent disinfectant of putrefaction. Creolin possesses the advantage of being much less toxic. It was at first, in fact, supposed to be entirely devoid of toxicity. This claim can be no longer upheld, since several patients, especially among the 2000 midwifery cases reported by Dr. Bitter,<sup>1</sup> of Breslau, showed symptoms of nausea, chill, fever, dyspnœa, collapse, and albuminous urine following its use. In one case, scarlatiniform rash—with thirst, fever, and itching of the skin—was produced.

The application of creolin has also been known to produce eczema, erythema, vesicular eruptions, and desquamation of the skin in large patches, together with more or less severe constitutional disturbance. Dr. Fliesburg has reported a fatal case in a babe, three weeks of age, to whom 2 c.cm. (or *℥iij*) of undiluted creolin had been given by mistake. Death occurred twenty-seven hours after ingestion of the liquid.

**Therapy.**—It is almost exclusively as a local application that creolin

<sup>1</sup> *British Medical Journal*, Dec. 13, 1890.

has been used, though it has been administered internally in a few instances with the view of preventing gastro-intestinal fermentative processes. As an efficient and safe antiseptic, it is very advantageously employed in a 1- or 2-per-cent. solution to irrigate accidental or surgical wounds. A 2-per-cent. dilution in olive- or linseed- oil, applied upon absorbent cotton, is an excellent dressing to abscess-cavities, sinuses, to wounds left after resection of bone, removal of a sequestrum, to compound fracture, sloughing ulcers of the leg, etc. In addition to its parasiticide virtues, it is additionally serviceable as a dressing to fresh wounds from its hæmostatic properties, promptly arresting the oozing from divided capillaries. A weak dilution of creolin in water or alcohol makes a good wash in ozæna. Five or 6 drops may be added to a pint of water, or we may follow the method of Moure and prescribe:—

R Creolini .....	1	c.cm. or <i>mxv.</i>
Spt. vini rect. ....	105	c.cm. or <i>f̄ssiiiss.</i>

M. A teaspoonful of this solution is added to a quart of tepid water.

Schnitzler has used creolin in diseases of the larynx, especially tubercular, by inhalation (1 part in 1000 of water), by insufflation (from 1 to 5 parts to 100 of sugar of milk), or 1 to 5 parts to 100 of water directly to the diseased parts by mopping. Schnitzler and Kortüm likewise recommend it as a gargle in diphtheria. Applied in the same manner, creolin is useful in tonsillitis. A 1-per-cent. solution has been found curative in thrush and aphthæ. The injection, two or three times a day, of 2 to 4 pints of a  $\frac{1}{2}$ -per-cent. solution has yielded excellent results in dysentery. The same injection is efficacious in serous diarrhœa, colitis, and enterocolitis. In the summer diarrhœa of children and in cholera infantum the solution may be advantageously employed in half strength or less, according to the age of the patient. Given internally, it is reported to have given good results in flatulence and to have succeeded in cases of tænia and oxyuris vermicularis. The offensive odor of cancer is removed by creolin. A 5- to 10-per-cent. creolin-oil is efficient in pediculosis and scabies, or prescribed thus:—

R Creolini .....	2	c.cm. or <i>f̄ss.</i>
Balsam. Peruviani .....	75	c.cm. or <i>f̄ssij.</i>
Adipis .....	31	Gm. or <i>ſj.</i>

M. Sig.: Apply well over the surface. Use in scabies.

A 1 to 1000 aqueous solution has been used in gonorrhœa. It has seemed much more beneficial in gonorrhœa of women than of men. A 1-per-cent. solution is a very efficacious injection in the cystitis of women.

As a wash in puerperal septicæmia and as an antiseptic vaginal injection before or after labor, a creolin solution is of value. Five or 6 drops to a pint of water have been successfully used in otorrhœa. In extensive burns and in bed-sores Kortüm recommends a 5 to 1000 aqueous solution. A 1- or 2-per-cent. solution is an excellent deodorant and stimulant dressing to leg-ulcers. Rothe<sup>1</sup> has used creolin in the form of an ointment with marked success in the treatment of erysipelas, tinea versicolor, eczema, and in scabies. Obstinate cases of pustular eczema have been cured by the application of creolin-water.

<sup>1</sup> *British Journal of Dermatology*, Nov., 1890.

A 2-per-cent. solution is an admirable disinfectant to the hands of the surgeon. A creolin-soap is also made. The opacity of its watery solution renders creolin inferior to carbolic acid as an immersion fluid for instruments. Moreover, resinous particles are soon deposited upon the instruments, though this drawback has been overcome by the manufacture of vessels having a perforated false bottom upon which the instruments may rest. In the acute gastro-enteritis of children Schwing has obtained satisfactory results from doses of 0.12 to 0.18 c.cm. (or *mii-iiij*) of creolin administered in some demulcent vehicle. The internal administration of creolin has, however, been followed in several instances by decided choleric form manifestations.

The addition of 1 to 2 per cent. of creolin deodorizes iodoform to a very large degree, forming a compound with faint aromatic odor. The creolin may be removed by washing with water.

**CREOSOTUM** (U. S. P., B. P.).—**Creosote.**

**Dose.** 0.13 to 1 Gm. (gr. ii-xv).

**GUAIACOL** (U. S. P.).—**Guaiacol.**

**GUAIACOL CARBONAS** (U. S. P.).—**Carbonate of Guaiacol.**

**Dose.** 0.13 to 1 Gm. (gr. ii-xv).

*Preparations.*

**Aqua Creosoti** (U. S. P.).—**Creosote-water** (1 per cent.). **Dose,** 2 to 15 c.cm. (or *f3ss-iv*).

**Mistura Creosoti** (B. P.).—**Creosote Mixture** (creosote, spirit of juniper, aa 1 c.cm., or *mxvi*; syrup, 30 c.cm., or *f5j*; water, q. s. ad 473 c.cm., or *f3xvj*). **Dose,** 15 to 30 c.cm. (or *f3ss-j*).

**Unguentum Creosoti** (B. P.).—**Ointment of Creosote** (1 to 9).

**Pharmacology.**—Creosote is a mixture of phenols and phenol derivatives, chiefly guaiacol and creosol, obtained during the distillation of wood-tar, preferably that derived from the beech, *Fagus sylvatica*, or *Fagus ferruginea*. The British Pharmacopœia describes it as "a mixture of guaiacol, creosol, and other phenols, obtained in the distillation of wood-tar." Creosote, therefore, is one of the products of the distillation of wood, separated from tar by fractional distillation. It was discovered in 1830 by Reichenbach. It is largely contaminated or substituted in commerce by a substance obtained from the distillation of bituminous coal, made up of carbolic and cresylic acids principally. Wood-tar creosote is chiefly composed of the following phenols: **Guaiacol**, **Creosol**, **Methyl-creosol**, and **Phloral**. The creosote made from beech-wood is of a reddish-amber color, it is the best for medicinal use. It is an oily liquid, nearly colorless; of smoky odor, caustic taste, and neutral reaction; soluble in 150 parts of water, and in all proportions of alcohol, ether, etc. Pure creosote should have a specific gravity of 1067 and distill at a temperature of 200° to 210° C. (392° to 410° F.). It differs from carbolic acid in being less caustic and in not coagulating collodion or albumin and in gelatinizing without crystallizing at a low temperature. It has probably equal, if not superior, antiseptic effects, as seen in its power of preserving meat, from which it derives its name. With the tincture of the chloride of iron, an

alcoholic solution of creosote develops a deep, greenish-blue color; but carbolic acid produces a light brown.

**Physiological Action.**—Creosote is a local sedative. A strong solution applied to the integument may give rise to erythema, œdema, itching, and pain. Internally, it very closely resembles the effects of carbolic acid as an anæsthetic, antiseptic, and astringent. It escapes from the body by the bronchial mucous membrane in part, and has expectorant powers; it is principally excreted by the kidneys. Both absorption and elimination of creosote occur with marked rapidity. It has been found in the sputum of tuberculous subjects, to whom it had been administered medicinally.

Creosote has a special sedative action upon the nerves of the stomach and allays irritability and nausea. It has a similar effect upon the bronchial mucous membrane when its vapor is inhaled with the vaporizer or steam-atomizer. Dr. Irsai, of Budapest, has demonstrated by experiment that inhalation of creosote and guaiacol gave rise to decided hyperæmia of the lungs. In overdoses creosote causes giddiness, depressed action of the heart, faintness, convulsions, or coma. The antidotes are probably the same as those to carbolic acid, as Hare has announced that the soluble sulphates are efficacious antidotes to creosote poisoning.

**Therapy.**—As a local anæsthetic, creosote is largely used by dentists in aching teeth with sensitive dentine, and as an application to an exposed nerve-pulp, the remedy being taken upon a little absorbent cotton, and excess removed by allowing it to rest upon blotting-paper before being inserted into the cavity of a tooth, from which *débris* of food or other material should first be removed, by syringing with warm water. Creosote-water has some hæmostatic qualities, and is an antiseptic dressing of value in sloughing ulcers, or for injection into sinuses. In gleet and other catarrhal diseases creosote often acts well when used as follows:—

R Creosoti .....	30	c.cm. or <i>mv.</i>
Fluidext. geranii.....	2	c.cm. or <i>f3ss.</i>
Aque rosæ .....	120	c.cm. or <i>f3iv.</i>

M. Sig.: Inject night and morning into the urethra,—alone or slightly diluted with warm water.

Creosote is believed to have special value in the treatment of burns and in chilblains. In skin diseases of a scaly character and pruritus creosote is a useful application; and in erysipelas the ointment is of benefit in relieving the pain and reducing the inflammation. This ointment relieves the itching and burning of erythema multiforme and eczema, and is beneficially applied to ulcerated surfaces and psoriasis. Creosote ointment is very advantageously prescribed in connection with lead carbonate, as:—

R Plumbi carbonatis .....	4	Gm. or 3j.
Unguenti creosoti (20 per cent.).....	31	Gm. or 3j.

M. For erysipelas, erythema, acute eczema, and burns.

A gargle containing creosote, in ulceration with sloughing of the mouth or throat, purifies the breath and stimulates the ulcer to repair.

In laryngeal diphtheria, coincidently with the administration of antitoxin, Dr. William Ewart, of London,<sup>1</sup> advocated the use of creosoted oil (1 to 20, olive-oil) for the expulsion of tracheal false membranes. He prac-

<sup>1</sup> *British Medical Journal*, May 28, 1898, p. 1381.

does early tracheotomy for laryngeal diphtheria, and then, in order to promote loosening, separation, and expulsion of the membranes, he injects into the trachea 1 c.cm. (or *mxv*) of the creosoted oil every two hours, but on the third day every four hours. After recovery from diphtheria, the systematic use of a spray of creosote in liquid petrolatum-oil (1 to 60) to limit infection, is a valuable expedient. This is also used with advantage in various chronic forms of rhinitis, ozæna, etc.

For catarrhal laryngitis and tubercular disease of the air-passages, creosote can be sprayed over the surface as in this prescription:—

R Creosoti .....	4	c.cm. or f3j.
Tinct. benzoin. co. ....	7½	c.cm. or f3ij.
Aque hamamelidis dest.,		
Glycerini .....	aa 45	c.cm. or f3iss.

M. Sig.: Use in an atomizer. Spray over the surface three or four times a day.

It is inadvisable to make use of the spray if a tendency to pulmonary hæmorrhage is present. Dr. John Dunn, of Richmond, Va., uses in atrophic rhinitis:—

R Ol. anisi.		
Creosoti .....	an 120	c.cm. or <i>mxv</i> .
Petrolati .....	3	Gm. or f3j.

M. Sig.: Introduce a small piece within the nostril.

Taken into the stomach, it checks fermentation and reduces irritability, allaying nausea and correcting the causes productive of diarrhœa. In fermentative dyspepsia the following combination is recommended by Dr. B. W. Richardson:—

R Creosoti pur. ....	75	c.cm. or <i>mxij</i> .
Alcohol. dilut. ....	75	c.cm. or f3iiss.
Ammon. benzoat. ....	8	Gm. or f3ij.
Glycerin. pur. ....	22	c.cm. or f3vj.
Infus. caryophylli .....	180	c.cm. or f3vj.

M. Sig.: Tablespoonful two or three times a day, between meals, in water.

Vladimiro de Holstein<sup>1</sup> finds in creosote an excellent means of combating chronic constipation, without exercising any purgative action properly so called. The creosote should not be prescribed in pills, capsules, or alcoholic solutions, but pure and in drops. The effective dose is about 7 or 8 drops taken twice daily, immediately after breakfast and after dinner, in a glass of milk, beer, wine and water, or pure water. To begin with, 1 drop of creosote is administered, and that amount increased by 1 drop daily until the desired effect is obtained. In this way the necessary dose is determined for each case individually. This treatment has to be continued for some time, some months in fact, and not only overcomes the chronic constipation, but at the same time restores the appetite and braces up the system. Under its influence the stools become regular, bland, and copious, and free from pain or any sign of intestinal irritation.

It is a useful remedy in seasickness and the vomiting of pregnancy, and in the summer diarrhœa of adults as well as of infants.

In obstinate vomiting of pregnancy Kaatzer prescribes:—

<sup>1</sup> *Cronica Médica*, May 15, 1899.

- R Creosoti pur. .... 2| c.cm. or f3ss.  
 Alcoholis ..... 30| c.cm. or f3j.  
 Tr. gentian. co.,  
 Fluidext. coffeæ viridis ..... aa 9|25 c.cm. or f3iiss.  
 Aq. destillat. .... 90| c.cm. or f3iij.  
 M. Sig.: To be well shaken. Dose, teaspoonful two or three times a day in milk.

Creosote has given good results in the treatment of intestinal hæmorrhage, gonorrhœa, and gleet. In seasickness the nausea and vomiting may be overcome by this combination of creosote:—

- R Creosoti ..... |30 c.cm. or mv.  
 Morphine sulphatis ..... |005 Gm. or gr. j.  
 Aquæ menth. pip. .... 90| c.cm. or f3iij.  
 M. Sig.: A teaspoonful every two or three hours until relieved.

In chronic bronchitis, bronchorrhœa, and phthisis creosote has been given with marked benefit, especially where cavities have formed, as in the following combinations:—

- R Creosoti ..... |00 to |18 c.cm. or mi iij.  
 Tr. gentiæ comp. .... 2| c.cm. or mxxx.  
 Spiritus frumenti ..... q. s. ad 7½ c.cm. or f3ij.  
 M. Sig.: Take four times daily.

- R Creosoti,  
 Tinct. capsici ..... aa 4| c.cm. or f3j.  
 Syrup. acaciæ ..... 30 c.cm. or f3j.  
 Syrup. limonis ..... 120| c.cm. or f3iv.  
 M. Sig.: A teaspoonful with water after meals.

- R Creosoti ..... 2| c.cm. or f3ss.  
 Syrup. ferri iod.,  
 Glycerini ..... aa 90| c.cm. or f3iij.  
 M. Sig.: A teaspoonful in water three or four times a day.

A combination employed by Professor Bouchard in the treatment of pulmonary tuberculosis is:—

- R Creosoti ..... 4| c.cm. or f3j.  
 Balsam Tolutani ..... 7| c.cm. or f3i ⅜.  
 Terebinthine ..... 1| Gm. or gr. xv.  
 Acid. benzoici ..... q. s.  
 M. et ft. pil. no. lxxx.  
 Sig.: Ten pills to be taken daily.

Creosote may be given in a pill, or the prescribed number of drops added to a teaspoonful of old Jamaica rum, diluted with water. In a considerable proportion of cases, cough and expectoration are diminished and fever and night-sweats are lessened. It is also given in tuberculosis by hypodermic injection. P. Carles recommends for hypodermic injection a mixture consisting of 10 parts of beech-wood creosote, 80 parts of tincture of quillaja, and 60 parts of distilled water. The creosote is said to be dissolved by aid of the saponin, and not merely suspended. The liquid is thought to be better adapted to the purpose than the ordinary emulsions of creosote. It can be diluted to any extent with either cold or warm water. Dr. G. Bell is in the habit of prescribing creosote with compound fluid extract of cinchona and administering it diluted with milk. Creosote has also been administered with some success to consumptives in the form of a rectal

injection. It is stated to have been well tolerated by the bowel, that it reduced fever, and in some cases arrested diarrhoea. The taste of creosote was perceived in the mouth in a few minutes after the injection had been made. Another evidence of rapid absorption was the occasional occurrence of green or dark-colored urine.

In the treatment of tuberculosis, creosote is, according to Jacobi, the most valuable drug which we possess. Sommerbrodt, who introduced this method of therapy, was accustomed to increase the dose rapidly until the point of tolerance had been attained. He generally gave the remedy mixed with codliver-oil or olive-oil, and inclosed in a capsule. Under the influence of creosote the bacilli may disappear from the sputum and the physical signs improve. In conjunction with its internal employment, Dr. Beverley Robinson, of New York, recommends frequent and prolonged inhalation of the drug. Inhalations often improve the condition of the larynx and relieve an obstinate cough. The administration of creosote by inhalation in combination with oil of peppermint, according to Carasso, causes disappearance of tubercle bacilli from the sputum. According to Sommerbrodt, the earlier the creosote treatment is adopted in tuberculosis, the more favorable are the results. He has used it also with advantage in scrofula. M. Burlureaux ascribes prognostic value to creosote in tuberculosis. The cases in which it is not well borne are, as a rule, beyond hope. Patients by whom it is tolerated are generally improved. Dr. F. Velten reports excellent results from the use of creosote in tubercular pleurisy with effusion. The effusion, fever, and other symptoms of pleurisy gradually disappeared.

Mr. Charles Lamplough<sup>1</sup> thus sums up the results of his observations on one hundred cases of pulmonary tuberculosis treated with large doses of beech-wood creosote:—

1. The best beech-wood creosote can be given with benefit, in amounts varying from 7.5 to 15 c.cm. (or *mxxx-cxxl*) daily, in cases of pulmonary tuberculosis.
2. The drug is best administered in codliver-oil or in a spirituous solution, and in some cases the "creosote chamber" or oro-nasal inhaler may be ordered in addition, with advantage.
3. The dose should be small at first, but it can be rapidly increased to 2.50 c.cm. (or *mxl*) three times daily for an adult. In three cases doses of 2 c.cm. (or *mxxx*) three times a day were well borne by children.
4. Large doses rarely cause any gastric disturbance; on the contrary, the appetite is frequently increased, symptoms of dyspepsia disappear, and codliver-oil is more easily assimilated. The cough, expectoration, and night-sweats are diminished, and the physical signs improved.
5. Owing to its disinfectant action in the alimentary canal, the drug probably diminishes the risk of tuberculous enteritis by self-infection when patients swallow their sputa; but, owing to the increased peristalsis which is created by creosote, it is usually contra-indicated in cases where the ulceration is already advanced.
6. The drug does not tend to cause hæmoptysis, but rather to prevent its recurrence.
7. Creosote does not irritate the normal mucous membrane of the genito-urinary tract.

<sup>1</sup> *British Medical Journal*, May 28, 1899.

8. Owing to its extremely small cost, pure creosote can be given to a much larger number of patients than the carbonates of creosote and guaiacol, which, respectively, cost four times and twelve times as much as the older drug.

Dr. G. Bell derived decided benefit from the administration of creosote in a severe case of perinephritis. In cases of suppurating glands, also, he has witnessed good results from its use, and suggests that it may act as a preventive of possible tubercular infection. This writer believes, moreover, that it is of advantage in pyæmia.

Dr. Charles Eloy, of Paris, recommends creosote to be given in emulsion, as follows:—

R	Ol. amygdal. dulc. ....	150		c.cm. or ℥v.
	Creosoti .....	7	5	c.cm. or ℥ij.
Misce et adde:—				
	Pulv. acaciæ .....	81	5	Gm. or ℥iij.
	Aq. menth. pip. ....	473		c.cm. or ℥xvj.
M.	Sig.: From two to five tablespoonfuls a day.			

Seitz prefers to combine creosote with codliver-oil, and makes an emulsion with the aid of saccharin. Both creosote and guaiacol have been injected beneath the skin or into the lung. Creosote affords relief in flatulent dyspepsia, sarcina ventriculi, and gastralgia. It can be prescribed, in the diseases just referred to, as follows:—

R	Creosoti .....	30		c.cm. or mv.
	Tinct. capsici .....	2		c.cm. or ℥ss.
	Aquæ sodæ menth. ....	q. s.	ad 90	c.cm. or ℥iij.
M.	Sig.: A teaspoonful in water at meals.			
R	Creosoti .....	37		c.cm. or mvj.
	Glycerini, .....			
	Syr. acaciæ .....	na 45		c.cm. or ℥iiss.
M.	Sig.: A teaspoonful before meals.			

Creosote has been successfully employed in diabetes mellitus by P. Valentin, who gave it in daily doses of 4 drops, increased gradually to 10 drops. The sugar soon disappeared, and did not return even when a diet containing starch and sugar was allowed. Similar results have been reported by Audubert. Good effects have been obtained from creosote in typhoid fever, diphtheria, scarlet fever, and erysipelas. A. Atkinson has found it efficacious in the treatment of tape-worm. A mixture of creosote, spirit of chloroform, and tincture of lavender may be used in an inhaler in diseases attended with profuse, bad-smelling expectoration. This mixture, or those of similar composition, all prove of great value in removing the offensive odor of gangrene of the lung in phthisis, laryngitis, chronic bronchitis, and also in asthma:—

R	Creosoti,			
	Ethyl iodidi,			
	Terebeni. ....	aa 4		c.cm. or ℥j.
M.	Sig.: For inhalation. Ten to twenty drops in an inhaler when necessary.			
R	Creosoti,			
	Eucalyptolis,			
	Terebeni. ....	aa 4		c.cm. or ℥j.
M.	Sig.: For inhalation. Ten to twenty drops, as necessary.			

**R** Creosoti,  
Thymoli,  
Alcoholis ..... aa 4| c.cm. or f3j.

**M.** Sig.: For inhalation. Ten to twenty drops.

Koch's method of treating erysipelas, consists in applying the following ointment, spread evenly with a camel's-hair pencil, in a thin layer over the affected part:—

**R** Creosoti vel creolini..... 4| c.cm. or f3j.  
Iodoformi ..... 15|5 Gm. or 3iv.  
Adipis lane hyd. .... 38|8 Gm. or 3x.

**M.** After applying the ointment as directed, cover the surface with a thin sheet of gutta percha or rubber cloth.

Dr. Soupault recommends the administration of creosote in full doses after tracheotomy in diphtheria, and also the application externally over the tube of a 1-to-30 solution in alcohol and glycerin. Dujardin-Beaumetz speaks of a patient who was at once tuberculous and leprous, and in whom rapid amelioration was produced by hypodermic injections of creosote. The anæsthetic patches of lepra, which had been utilized in inserting the needle, had almost entirely disappeared. Creosote, in doses of 0.03 c.cm. (or *mss*) and upward three or four times a day, has been recommended in the treatment of whooping-cough, and has been employed in the laryngeal and bronchial manifestations of influenza. Vehsmeyer made use of creosote in a case of typical leukæmia in a nine-month-old child. The spleen diminished in volume and the mucous membrane gained some color and, after some months, the blood had become almost normal. The child subsequently died of convulsions, but, in view of the general amelioration, it is suggested that further experiment should be made with the drug in the case of adults.

**Guaiacol** (U. S. P.).—Creosote contains from 60 to 90 per cent. of **Guaiacol**, which is a colorless liquid, sparingly soluble in water, but very soluble in ether, alcohol, and fatty oils. It is more agreeable in odor and taste than creosote, and is said to be better borne. It improves the appetite and digestion and prevents or relieves flatulence. It is probably eliminated by the lungs, exerting a directly local beneficial action. Guaiacol is usually given in single doses of 5 drops, or in daily quantities of 20 to 40 drops. Sobli has proposed that it should be employed instead of creosote in the treatment of phthisis. It indirectly reduces hectic fever and checks night-sweats. When given at an early stage of the disease, the bacilli diminish remarkably in number and may even entirely disappear. Labadie-Lagrave has advantageously prescribed guaiacol in the form of pearls or capsules. Bourget, of Geneva, prescribes it dissolved in wine or codliver-oil.

Continued experiment in the laboratory, however, has shown that ordinary liquid guaiacol is not a chemically-pure product, but a mixture, in varying proportions, of guaiacol, creosote, and cresylol. The actual proportion of guaiacol present in different samples varied from 10 to 50 per cent. The variation in composition may explain the untoward results which have been reported, where prostration or collapse followed the application to the surface of the skin of 1.20 to 2 c.cm. (or gtt. xx-xxx), of guaiacol. M. Ferriand said that he had seen accidents produced with a cubic centimetre of guaiacol. Local anæsthesia may be produced sufficient for small surgical

operations by injecting 0.045 c.cm. (or  $m \frac{1}{4}$ ) dissolved in olive-oil (1-20) hypodermically, although a much larger quantity might be used without danger. Pure guaiacol has been synthetically prepared, and occurs in the form of colorless rhomboidal crystals, almost insoluble in water, soluble in alcohol, oil, and anhydrous glycerin. Its taste is somewhat sweet, but is followed by a pungent and burning after-taste. MM. Gilbert and Maurat observed that the principal effects of poisoning with pure guaiacol were enfeeblement and retardation of the heart's action and the breathing. Most of the secretions were augmented, and especially that of the lacrimal gland. At the moment of death, which takes place under coma, the temperature may fall as low as 68° F.

Liquid guaiacol has been given in enema, and its vapor has been inhaled. It has also been introduced into the system by subcutaneous injection in the daily dose of 0.50 to 1 c.cm. (or *mviii-xv*). Professor Peter speaks favorably of the use of the drug hypodermically, but adds the caution that its effects must be carefully watched, as it is capable of causing hæmoptysis, pneumonia, acute phthisis, and fat-embolism. Signs of evil import are the production of a persistent bad taste in the mouth, a dark-colored urine, and a marked rise or fall of temperature. Injections of guaiacol have yielded good results in fetid bronchitis, chronic bronchitis, and bronchial dilatation. In lupus, Dr. Moreau, of Tours, advises the hypodermic injection twice weekly of a solution of guaiacol and thymol in sterilized olive-oil. The mixture which he employs contains 2 Gm. (or *gr. xxx*) of thymol in 45 c.cm. (or *fʒiss*) each of guaiacol and sterilized oil. Of this preparation 1 c.cm. (or *mxv*) are at first injected and the quantity is gradually increased to 3 c.cm. (or *mxlv*). The injections are followed by considerable local and general reaction. After six or seven injections had been given, the nodules generally underwent retrocession and ulcers cicatrized. The treatment may produce serious symptoms, and is scarcely suitable for use when pulmonary or cardiac lesions are present. The injections are painful. A combination of guaiacol and thymol iodide was also used, but was abandoned as being more painful than the mixture with thymol. In fistula of the anus, Dr. Charles C. Allison recommends injection of guaiacol with sweet almond-oil.

Guaiacol is readily absorbed by the skin, and it has been found that a local application has the power of reducing febrile temperature. The remedy is painted upon an area varying in size from 4 to 20 square inches and prevented from evaporating by being covered with an impermeable dressing. This method has been made use of in tuberculosis, erysipelas, pneumonia, articular rheumatism, scarlatina, and typhoid fever. The reduction of temperature is accompanied by free perspiration. The quantity employed was, as a rule, 2 c.cm. (or *mxxx*). The application gave rise to no depression of the circulation or respiration, albuminuria, or other evidence of renal irritation, although it is advised to watch the kidneys. Prof. J. M. Da Costa believed that the local application of guaiacol is of advantage where the cold-bath treatment is impracticable or where there is a tendency to intestinal hæmorrhage. The applications have been made upon various portions of the integument without any noticeable difference of result. They occasioned increased diuresis.

Drs. Friedenwald and Hayden reported<sup>1</sup> a series of seventeen cases in

<sup>1</sup> *New York Medical Journal*, April 14, 1894.

which guaiacol was thus applied; among which were pneumonia, typhoid fever, pulmonary tuberculosis, malarial fever, influenza, rheumatism, and erysipelas. A powerful antipyretic action was observed in these cases. Dr. Ferrand uses equal parts of guaiacol and glycerin in allaying the pain of neuritis and the chest-pains of tuberculosis. Compresses wet with guaiacol (15 to 30 drops) will give almost immediate relief in neuralgia. Sabatini (Practitioner, February, 1896) recommends:—

R Mentholis, ..... aa 1| Gm. or gr. xv.  
Guaiacol, .....  
Alcoholis (abs.) ..... 20 c.cm. or 3v.  
M. To be painted on the skin; not more than a drachm to be used at one time.

Malderesoo uses applications of guaiacol to the thorax posteriorly, corresponding to the area of lung involved, with good results, in pulmonary tuberculosis. In bronchiectasis the employment of guaiacol-vapor baths has produced remarkable improvement, greatly diminishing the quantity of the greenish expectoration and causing the breath to become odorless, as in a case reported by G. H. Parry.<sup>1</sup> Professor J. M. Anders has used it hypodermically in sciatica and supra-orbital neuralgia, 2 drops of guaiacol being mixed with 10 drops of chloroform. He has given it internally with benefit in gastralgia. The absorption of pleural effusions is, according to Sædén, promoted by painting upon the surface once daily for several days a mixture thus composed:—

R Guaiacol, ..... 3| c.cm. or mxxiv.  
Glycerin, .....  
Tr. iodi ..... aa 18|5 c.cm. or f3v.—M.

Paintings of guaiacol have been found by Balzer and Lacour to be beneficial in orchitis, relieving pain and reducing temperature. The drug was used undiluted upon the inguinal region, but upon the scrotum it was applied in the form of an ointment containing from 2 to 5 c.cm. (or mxxx-lxxv) to the ounce. Commercial guaiacol is often contaminated with cresylol and cresol, and for this reason Drs. A. Gilbert and L. Maurat prefer the chemically-pure, synthetic guaiacol, which is in white, rhombohedral crystals, insoluble in water, but soluble in glycerin, alcohol, and oils. Allen McLane Hamilton administers guaiacol in insanity, as an intestinal antiseptic, to prevent the formation of toxins. In cystitis the use of a 20-per-cent. solution of guaiacol, in sweet oil (0.06 to 0.12 c.cm., or mi-ij, being injected daily), is advocated by Cohn as being more of a local anæsthetic than pure guaiacol.

Dr. S. Solis-Cohen believes that the application of guaiacol to the throat has a prophylactic power against diphtheria. He employs a mixture of 10 parts of guaiacol, 1 part of menthol, and 10 parts of olive-oil.

In tubercular ulceration of the larynx, P. Watson Williams advocates garglement, followed by the application of lactic acid, followed by pure guaiacol, and the use of a 20-per-cent. spray.

Professor Schueller administers guaiacol stirred into some salt water, milk, or soup, or, for adults, in a glass of wine, preferring this method to the exhibition in pills or capsules. In many instances he gives it by inhalation, weak aqueous solutions (5 to 3000 or 5 to 5000) being employed. He has

<sup>1</sup> *The Lancet*, July 22, 1890.

obtained good results from guaiacol, not only in pulmonary tuberculosis, but in lupus, hip-joint, and Pott's disease.

M. Picot has met with very encouraging results from the hypodermic injection of a mixture of guaiacol and iodoform. As an excipient he employs sterilized olive-oil and vaselin, each c.cm. (or *mxv*) of the base containing 1 cg. (or gr.  $\frac{1}{6}$ ) of iodoform and 5 cg. (or  $\frac{m^5}{6}$ ) of guaiacol. This combination is modified by M. Pignol, who adds 14 cg. (or gr.  $\frac{1}{3}$ ) of eucalyptol to each c.cm. and omits the vaselin from the base. Dr. R. Robertson approves of this method of treatment in empyema, provided that free drainage is maintained. Dr. William H. Gregg recommends the administration of guaiacol in the form of an enema.

Dr. Clemens has observed improvement in diabetes mellitus from the use of 1.20 to 2 c.cm. (or *xxx-xxx*) of guaiacol thrice daily, suspended in milk or codliver-oil. The polyuria was markedly restrained, the general condition was improved, and, after four weeks of treatment, the patients could partake of some saccharine foods without increasing the glycosuria.

**Guaiacol Carbonate** (U. S. P.).—This substance is a fine, crystalline powder, devoid of taste or smell, insoluble in water, slightly soluble in cold alcohol; soluble in hot alcohol, ether, and chloroform; slightly soluble in glycerin and fatty oils, the average dose in which this compound is given being 0.65 Gm. (or gr. *x*), which may be gradually increased to 2 to 6 Gm. (or gr. *xxx-xc*) per day. It has been used by Seifert and Koescher in a number of cases of tuberculosis. These authors state that it causes no irritation of the gastro-intestinal mucous membrane, that it passes through the stomach unchanged, and is decomposed in the intestine into guaiacol and carbonic-acid gas. According to de Grazia and Casaretti, this decomposition may take place in the stomach in the presence of fermentation. Seifert and Koescher witnessed improvement as regards cough, appetite, and nutrition in consequence of its employment. They administered 6 Gm. (or *℥iiss*) of the drug in divided doses during the twenty-four hours. Guaiacol carbonate has also been given with advantage in typhoid fever by Dr. F. Hölscher, who remarked that it produced a moistening of the tongue and an improvement in the character of the stools. The remedy had a favorable influence upon the bronchitis which accompanied the fever, disinfected the bowel, and generally prevented extreme prostration and severe cerebral symptoms. He gave the drug in the dose of 1 Gm. (or gr. *xv*) night and morning. In bladder-disease or chronic cystitis, Colin recommends guaiacol carbonate dissolved in olive-oil (20 per cent.); 0.06 to 0.13 Gm. (or gr. *i-ij*) being injected into the bladder twice daily. It acts as a local anæsthetic and antiseptic.<sup>1</sup>

Dr. F. C. Simpson, of Louisville, reports excellent results from the employment of guaiacol carbonate in intestinal troubles due to neurasthenia.

**Guaiacol Phosphite.**—This is a definite chemical combination, first prepared by M. Ballard, and which promises to prove of therapeutical efficacy. It is a white, crystalline powder, of a warm taste, but not caustic. The compound is very soluble in alcohol, ether, water, chloroform, and fatty oils; slightly soluble in turpentine and glycerin. It contains 92.25 per cent. of guaiacol and 7.75 per cent. of phosphorus. Daily doses of 4 to 6 Gm. (or *℥i-iss*) were given to dogs without evil consequences; but 15.5 Gm. (or *℥ss*)

<sup>1</sup> *Journal de Médecine*, Jan. 26, 1906.

caused coma and death a few hours after administration. From 10 to 12 Gm. (or *miss-tij*) for a man seemed to be a maximum safe dose.

**Benzoyl-guaiacol, or Benzosol,** is a crystalline powder, destitute of odor or taste, insoluble in water; soluble in ether, chloroform, and hot alcohol. It is a compound of benzoic acid and guaiacol. It is split up in the bowel into its constituents. It is well borne even in large doses. It diminishes cough, expectoration, and râles; but has no effect upon the bacilli. Benzoyl-guaiacol may be prescribed in the dose of 0.25 Gm. (or gr. iv) three times a day, or daily doses of 1 to 5 Gm. (or gr. xv-lxxv). Benzoyl-guaiacol, known also as benzosol, may be given with chocolate and sugar. According to the clinical experiments of Professor Rummo, corroborated by those of de Grazia and Casaretti, benzoyl-guaiacol is the most efficient *succedaneum* of creosote or guaiacol.

Other salts or compounds of guaiacol have been prepared, as guaiacol cinnamate (cinnamyl-guaiacol, or styracol), guaiacol salicylate (guaiacol salol, or salicyl-guaiacol), etc.

**Guaiacol-di-iodide.**—This compound is obtained from sodium-guaiacol by the action of iodine and potassium iodide. It is a reddish-brown salt and possesses an odor similar to that of iodine. It is soluble in alcohol and fatty oils, but rapidly decomposes. Guaiacol-di-iodide is given in the same doses and for the same purposes as guaiacol.

**Guaiacol Salicylate.**—This salt occurs in the form of white crystals, free from odor, soluble in alcohol, insoluble in water. Its dose and therapeutical applications are the same as those of salol.

**Creosote Carbonate, or creosotal,** is an amber-colored, clear, neutral, oily liquid, of a sweetish taste, without odor. This compound contains 90 per cent. of creosote. At ordinary temperatures it is viscid, but is easily liquefied by moderate heat. It is not irritating to mucous membranes and is stated to be much less toxic than creosote. Creosote carbonate is insoluble in water, glycerin, and weak alcohol. It is soluble in all proportions in 95 per cent. alcohol, in ether, chloroform, and soluble in 4 or 5 parts of cod-liver-oil or olive-oil. In the bowel it is separated into creosote and carbonic acid. It is said to improve the appetite and effect a gain in weight and strength. It can be administered in capsules, dissolved in cod-liver-oil, or made into an emulsion with the yolk of an egg, diluted with water, sweetened, and flavored. Professor van Leyden<sup>1</sup> reports a specific action of creosotal in phthisis, and cases are reported showing complete tolerance of the remedy by the digestive organs and great improvement in the local symptoms and general health. After six to eight months' treatment, in some cases, all the evidence of pulmonary disease disappeared. Very favorable reports of the usefulness of this agent in acute pneumonia have appeared. Leonard Weber, of New York, reported 9 cases, and H. W. Cummings, of Hearne, Texas, 20 cases, without a death. Dujardin-Beaumetz also reported very favorably upon this drug. It has the exceptional advantage of being a remedy of a price within the reach of the poor. The dose is 0.30 c.cm. (or *mv*) three times daily, increasing the dose of 0.18 c.cm. (or *viij*), until 1.65 c.cm. (or *mxxv*) are taken at a dose. When marked improvement has taken place the remedy can be gradually reduced to 0.60

<sup>1</sup> "Charité Annalen," Berlin, 1897.

c.cm. (or *mx*) three times a day. After a few weeks the ascending scale can be again begun.

**Creosote Calcium Hydrochlorophosphate.**—Under this cumbersome designation a mixture of creosote carbonate and dry calcium hydrochlorophosphate has been used in phthisis and scrofula. The mixture is a white, syrupy mass and is administered in emulsion in the dose of 0.03 to 0.12 c.cm. (or *mas-ij*) twice a day.

**Oleocreosote.**—An oleic ether of creosote, obtained by the interaction of oleic acid and creosote, is preferred by some authorities as being tolerated in larger doses than a simple mixture of creosote and oil.

It is of a yellowish color and oily consistence, and contains 33 per cent. of creosote; is insoluble in water, slightly soluble in alcohol; but dissolves in ether, chloroform, and fatty oils. Oleocreosote is comparatively devoid of caustic properties and is well borne by the stomach.

**Styracol** is prepared by heating together guaiacol and cinnamyl chloride and occurs in the form of crystalline needles, without color and practically insoluble in water. Styracol has been used as an intestinal antiseptic and in gonorrhœa, chronic cystitis, and pulmonary tuberculosis. As a local application it has been employed to promote healing of wounds and ulcers.

### **CRESOL (U. S. P.).—Cresol ( $C_7H_7O$ ).**

#### *Preparation.*

**Liquor Cresolis Compositus (U. S. P.).**—Compound Solution of Cresol. (Cresol 5 per cent. in linseed-oil soap).

**Pharmacology.**—Crude carbolic acid consists largely of cresols. These are insoluble in water on account of the admixture of other hydrocarbons. When separated from the latter the cresols present themselves in the form of a clear fluid of a pleasant odor. This liquid is a combination of three isomeric modifications: ortho-, meta-, and para- cresol. Cresol (U. S. P.) is a mixture of the three isomeric cresols obtained from coal-tar, freed from phenol hydrocarbon, oils, and water. It should be preserved in amber bottles, protected from light. It is soluble in 60 parts of water at 77° F. or 25° C. Its specific gravity at 68° F. varies between 1.042 and 1.049, and its boiling-point is between 365° and 401° F. Professor Charteris found that moderately toxic doses produced in guinea-pigs convulsions of the hind-legs. Large doses immediately gave rise to severe convulsions involving the whole body. A lethal dose for the guinea-pig appeared to be from 0.43 to 0.50 c.cm. (or *mvii-viii*). Bacteriological experiments demonstrated that cresol has nearly three times more germicidal power than pure carbolic acid. A 1-per-cent. aqueous solution of cresol has been found an efficient cleansing application to wounds and an excellent fluid for the disinfection of instruments.

**Therapy.**—Dr. Robert Lee observed that cresol, when mixed with water in definite proportion, will, like carbolic acid, yield, on boiling, a vapor of definite and constant strength. By virtue of this property the fluid may be beneficially administered by inhalation in many diseased conditions of the upper air-passages. Dr. Granville Macgowan<sup>1</sup> has found this agent to have especial value in treating alopecia areata, one or two applications being sufficient for a cure. It is also a valuable remedy for the

<sup>1</sup> *Journal of Cutaneous and Nervous Diseases*, May, 1899.

treatment of ring-worm, pityriasis, and other parasitic affections. Cresol has been used as an internal remedy by Dr. H. Kölsch, who reported excellent results from its use in twelve cases of typhoid fever. These were treated by cresol exclusively. Alleviation of the malady was marked. No complications or relapses occurred, and convalescence was rapid. In six of the cases in which cresol was employed from the earliest days, the course of the disease is said to have been shortened.<sup>1</sup>

**Creosal.**—This is a compound of creosote and tannic acid, a brown, hygroscopic powder; soluble in water, alcohol, and glycerin; insoluble in ether; an astringent and antiseptic. It has been given in daily doses of 3 Gm. (or gr. xlv) and is reported as of service in laryngitis and bronchitis.

**Cresol Saponate.**—By melting pure soft soap in a dish on a steam-bath and mixing it with an equal quantity of clear, crude carbolic acid, heating the solution until it remains clear upon cooling, a wine-colored liquid is produced. Cresol saponate has a specific gravity of 1.060, is of neutral reaction, and soluble in all proportions in water, alcohol, or glycerin. The liquid is possessed of useful antiseptic properties.

**Sodium Paraeresotate.**—Paraeresotic acid is obtained by combining carbonic acid with paraeresol in the presence of sodium. It occurs as white, brilliant, acicular crystals; soluble in hot water, ether, alcohol, and chloroform. Sodium paraeresotate is a fine crystalline powder; of a bitter, but not unpleasant, taste; moderately soluble in water. In warm-blooded animals the salt retards the respiratory movements and reduces blood-pressure. It possesses antipyretic and antiseptic virtues. It has been given internally in rheumatism, typhoid fever, and the gastro-intestinal catarrh of nursing infants. This substance checks diarrhoea and acts as an intestinal disinfectant. The maximum doses of sodium paraeresotate for a child two years of age is 0.50 Gm. (gr. viiss) daily; for a child 4 years of age, 1 Gm. (or gr. xv); and for one 10 years of age 3 Gm. (or gr. xlv). Beneficial results have also been reported from the use of this soda salt in the treatment of catarrhal pneumonia.

**Kresin.**—This compound contains 25 per cent. of cresol dissolved by means of an equal quantity of sodium cresoxylacetate. Kresin is a brown liquid, with an odor like that of cresol, and forms a clear neutral solution in water. It is said to be less poisonous and less irritant than carbolic acid, 2 c.cm. (or f5ss) being given internally to a rabbit without deleterious results. It does not render the hands or instruments slippery, nor does it corrode metals. From  $\frac{1}{2}$ - to 1-per-cent. solutions are efficient for disinfectant purposes in surgery. Kresin is likewise very useful in the disinfection of rooms, discharges, water-closets, and waste-pipes. A 5- and 10-per-cent. kresin soap has been prepared and is adapted to use in various forms of skin disease.

**Chlorphenol.**—This name is given to a liquid obtained by the action of chlorine-gas upon carbolic acid. It is a mixture of chlorphenols, and is a dense, volatile fluid of pleasant odor. Chlorphenol is regarded by Passerini as of value in the treatment of pulmonary tuberculosis, chronic bronchitis, bronchorrhoea and gangrene of the lung, ozæna, and laryngitis. It is administered by inhalation, the daily dose being from 1.20 to 2 c.cm. (or mxx-xxx). Chlorphenol has been used as a local application to ulcers, especially those due to tubercular deposit.

<sup>1</sup> Medical Bulletin, Nov., 1894, p. 420.

**Saprol** is a mixture of crude cresols, containing pyridin bases, and used for disinfection purposes.

**Parachlorphenol** is a solid substance, scarcely soluble in water, but readily soluble in alcohol. It possesses decided antiseptic properties. In the treatment of laryngeal tuberculosis the affected surface is first painted with a weak solution. The strength of the solution may be gradually increased to 50 per cent. After an application there is a slight burning sensation. This, however, soon disappears, and gives place to an anæsthesia which continues for several hours. Parachlorphenol is also an advantageous application to enlarged tonsils. It is useful, moreover, in disinfecting tuberculous sputum. Parachlorphenol is likewise of service in otitis media, suppuration of the maxillary sinus, and hypertrophy of the tonsils. This agent was applied in the form of a solution, at first weak and subsequently more concentrated, until it might be employed in the strength of 50 per cent.

**Bromphenol.**—This is a fluid of analogous composition to chlorphenol, bromine taking the place of chlorine. Bromphenol is likewise a mixture, is of a purple color, and has less of the carbolic-acid odor than chlorphenol. Both these substances are freely miscible with water, alcohol, and alkaline fluids. Both have given excellent results in the treatment of erysipelas, as reported by Dr. I. Tchourilow, of St. Petersburg. The remedies were used in the form of a 2-per-cent. ointment.

**Aseptol.**—Sozolic acid, or orthophenolsulphonic acid, is obtained by dissolving carbolic acid in concentrated sulphuric acid. Sozolic acid is an amber-yellow or reddish fluid, readily soluble in water, alcohol, and glycerin, of a caustic taste, and a faint odor of carbolic acid. A solution containing from 30 to 35 per cent. of sozolic acid is commercially known as aseptol.

**Diaphtol.**—An analogous chemical compound (orthoquinolin-metasulphonic acid) is termed diaphtol, and though not an energetic antiseptic under its own form, is efficient when transformed into a diaphtolate by being dissolved in an alkaline solution. Diaphtolate of sodium is a clear, yellow fluid, very destructive to micro-organisms. Diaphtol is but slightly toxic, does not give rise to gastric or intestinal irritation, and seems well adapted to act as a disinfectant to the digestive and genito-urinary tracts. Diaphtol is eliminated unchanged by the kidneys. Urine in which it is present may be kept for several days without alteration.

**Guaialin.**—The benzoic acid ester of methylene diguaiacol has received the name of Guaialin from its discoverer, Dr. S. Lewis Summers, of Philadelphia. It is a green powder representing in combination 7 per cent. of formaldehyde, 30 per cent. of benzoin, and over 60 per cent. of guaiacol. It is soluble in alcohol, but not in water. It is soluble in the gastro-intestinal secretions as it enters the blood and is discharged by the urine. It is claimed to be superior as an antiseptic, to salicylic acid, or the carbonates of creosote or of guaiacol. It is not only bactericidal in the digestive tract, but as it enters the blood it is claimed to act as a general disinfectant, especially to the lungs and kidneys. It reduces fever temperature. As a stimulant to the mucous membrane, it is recommended in the treatment of gastro-intestinal catarrh. It is also useful in chronic bronchitis and in phthisis, reducing the secretions, the fever, and the cough, and increasing the appetite. It is said to have no depressing effect upon the heart. Usual dose is 0.30 to 0.65 Gm. (gr. v to x) several times a day, in capsules (6 to 8 Gm., or 90 to 120 grains in a day).

**Steresol.**—This name has been given by Dr. Berlioz, of Grenoble, to an antiseptic varnish of which the formula is as follows:—

R Pulv. acacie .....	264	Gm. or ʒviiss.
Benzoin .....		
Balsam. Tolutan. ....	an 10	Gm. or ʒiiss.
Acid. carbolic. cryst. ....	101	Gm. or ʒiii 1/4.
Ess. cinnamom. ....	6	c.cm. or fʒiiss.
Saccharin. ....	6	Gm. or ʒiiss.
Alcohol. ....	q. s. ad 946	c.cm. or Oij.—M.

Steresol adheres like a varnish to the skin and mucous membrane, and has been used with advantage in diphtheria and tuberculous ulcers of the ~~skin~~ and tongue. The application produces no pain, the layer remains in position for several hours, and it is stated that the carbolic acid does not entirely evaporate from the compound until after an exposure of twenty-four hours.

**Tolysal.**—The name tolysal has been given to a substance, which in chemical composition is the salicylate of tolypyrin, the latter being a lately-introduced synthetical compound analogous to antipyrin. Tolysal occurs in the form of small, almost colorless crystals, of somewhat bitter taste, slightly soluble in water, soluble with difficulty in ether, easily soluble in alcohol and acetic ether. In doses of 1 Gm. (or gr. xv) every two hours tolysal has no cumulative effect; it has a favorable influence upon sleep, and gives rise to no unpleasant after-effects.

Tolysal is of marked efficacy in acute articular rheumatism, as well as in chronic forms of the disease, and in muscular rheumatism. It has produced improvement in rebellious cases which had remained uninfluenced by salicylic acid as ordinarily administered. Tolysal has also an analgesic effect and proved useful in the treatment of rheumatic neuralgia. In articular rheumatism it has been administered in daily doses of 3 to 6 Gm. (or gr. xv-xx). As an anodyne the dose is 1 to 3 Gm. (or gr. xv-xlv) and in rheumatic neuralgia from 1 to 2 Gm. (or gr. xv-xxx) during the same period. Tolysal exerts a decided antipyretic action in both continued and remittent fevers. It is also useful in influenza.

**Antispasmin.**—A substance upon which this name has been bestowed consists of one molecule of narceine sodium and three molecules of sodium salicylate. Antispasmin is a white powder, slightly hygroscopic, readily soluble in water, of an alkaline reaction, and contains about 50 per cent. of pure narceine. This compound was found serviceable by the late Professor Imme in relieving various spasmodic affections, and was recommended as well adapted for use among children. It was employed with advantage in pertussis and other forms of nervous cough. The dose is from 0.006 to 0.10 Gm. (or gr. 1/10-iss).

**Salaktol.**—This name has been unwisely chosen, since it bears too close a resemblance to that previously given to a different compound, salacetol. Salaktol is a combination of sodium salicylate, sodium lactate, and hydrogen dioxide. It is reported to be an excellent application in diphtheria, being painted upon the throat every two or three hours, and given internally in tablespoonful doses at the same intervals. Salaktol is also utilized as a gargle and by inhalation.

**Borsalyi.**—A compound obtained by the action of 25 parts of boric acid on 32 parts of sodium salicylate in the presence of a small quantity of distilled water is a useful antiseptic for external application.

**Salicylamid.**—This is a yellow crystalline substance, without odor or taste, and soluble in hot water. It is said to be efficient in smaller doses and to possess more analgesic power than salicylic acid.

Commercial salicylic acid may be contaminated by the presence of para- and ortho- cresotic acids, which have remained in the process of manufacture. Both these substances are toxic. Professor Charteris, of Glasgow, found paralysis and death to be caused in rabbits by doses of 0.20 Gm. (or gr. iij) of the former per pound of the body-weight. Orthocresotic acid produced the same symptoms and was fatal to the rabbit in the dose of 0.065 Gm. (or gr. j) per pound weight. The cresotate of sodium has been employed therapeutically as an antipyretic in doses of 6 to 8 Gm. (or 3iiss-ij). Demme used it in acute rheumatism, catarrhal pneumonia, and typhoid fever among children, and in the gastro-intestinal catarrh of nursing women.

**CRETA PREPARATA** (U. S. P., B. P.).—**Prepared Chalk.** (For chalk preparations, see **Calcium**.)

**CROCUS** (B. P.).—**Saffron.**

**Dose,** 0.65 to 1.30 Gm. (or gr. x-xx).

*Preparation.*

**Tinctura Croci** (B. P.).—Tincture of Saffron (5 per cent.). **Dose,** 0.30 to 1 c.cm. (or mxxv).

**Pharmacology.**—The stigmas of *Crocus sativus* (Iridææ) are official under the title of Crocus. "The dried stigmas and tops of the styles of *Crocus sativus*" (B. P.). They are obtained from cultivated plants in the south of Europe. Spanish saffron has a strong, peculiar odor; an aromatic, bitter taste; and imparts a yellow hue to the saliva when chewed. So-called American saffron is a different plant, the *Carthamus tinctorius*, or safflower, of which the flowers are used. Saffron of good quality, however, is cultivated in Pennsylvania. A 10-per-cent. tincture was formerly official.

**Therapy.**—Saffron is slightly aromatic and feebly anodyne and antispasmodic. A hot infusion called saffron-tea is made from the safflower, and not from saffron; it is used in domestic practice to bring out the eruption in measles and scarlet fever and as a diaphoretic. In Europe, the tincture of saffron is employed as an emmenagogue and given in flatulent dyspepsia and colic. Externally it has been used in bruises, rheumatic and neuralgic pains, and in the form of ointment to hæmorrhoids. In this country its only use, as a rule, is that of a coloring agent in pharmacy.

**CUBEBA** (U. S. P.).—**Cubeb.**

**CUBEBAE FRUCTUS** (B. P.).—**Cubebæ.**

**Dose,** 2 to 4 Gm. (or 3ss-j) of the recently-powdered drug.

*Preparations.*

**Fluidextractum Cubebæ** (U. S. P.).—Fluid Extract of Cubeb. **Dose,** 0.60 to 2 c.cm. (or mxx-xxx).

**Oleoresina Cubebæ** (U. S. P.).—Oleoresin of Cubeb. **Dose,** 0.30 to 2 c.cm. (or miv-xxx).

**Trochisci Cubebæ** (U. S. P.).—Troches of Cubeb (0.03 c.cm., or mss, oleoresin).

**Oleum Cubebæ** (U. S. P., B. P.).—Oil of Cubeb. **Dose,** 0.30 to 1.20 c.cm. (or mv-xx).

**Tinctura Cubebæ** (B. P.).—Tincture of Cubeb (20 per cent.). Dose, 2 to 4 c.cm. (or f3ss-j).

**Pharmacology.**—The dried, unripe, but fully-grown fruit of *Piper Cubeba* (Piperacæ). This plant, cultivated in Java, contains a volatile oil (15 per cent.), and an acrid resin, **Cubebic Acid**, with fat, gum, etc. **Cubebene**, a camphoraceous substance, can be separated from the volatile oil, leaving **Cubeben**, a liquid oil, behind. The deposit from the oleoresin consists principally of **Cubebin**, which is inert, medically. The medicinal activity of the drug consists principally in the volatile oil and cubebic acid, which are both present in the oleoresin.

**Physiological Action.**—The effects of cubeb are those of an aromatic stimulant to the stomach, improving the digestion in small doses and increasing appetite, deranging digestion in larger doses and acting as an irritant. Cubeb increases the force and frequency of the heart's action, stimulates the genital organs, and promotes menstruation. It is eliminated by the skin (frequently causing an urticarial or vesicular eruption). Cubeb may likewise produce, especially in young subjects, a bright-red rash, which disappears in the course of a few days after discontinuance of the drug and which may be followed by fine desquamation. It is also removed from the system by the bronchial mucous membrane (acting as an expectorant and antiseptic), but chiefly by the kidneys (increasing the quantity of urine and disinfecting the urinary passages). The addition of nitric acid to the urine of a person taking cubeb produces a precipitate which bears a resemblance to that of albumin.

**Therapy.**—The powder of cubeb is considered a good application in hay fever, chronic nasal catarrh, and follicular pharyngitis. In hay fever, if it does not increase the irritation, it may be useful. In asthma, or sensitive hypertrophies in the nose, cubeb cigarettes are smoked with relief. Cubeb is also sometimes given internally in cases of chronic bronchitis accompanied by free secretion.

Cubeb is principally used in blennorrhœa, cystitis, and purulent affections of the genito-urinary tract. In gonorrhœa it may be given in all stages of the disease, acting best in the acute stage. Some patients, however, appear to be very susceptible to the effect of this drug, small doses causing digestive disturbance, irritability of the bladder, and bloody urine. A mixture of cubeb and alum is an efficacious, though nauseous, remedy in chronic gonorrhœa. It may be thus prescribed:—

R Pulv. aluminis .....	4	Gm. or 3j.
Tinct. cubebæ .....	120	c.cm. or f3iv.

M. Sig.: A teaspoonful every four hours.

By a combination of cubeb and copaiba the effect of each agent in gonorrhœa is increased:—

R Oleoresinæ cubebæ,		
Copaibæ .....	aa 4	c.cm. or f3j.
Pulv. sacch. alb.,		
Pulv. acaciæ .....	aa 15	Gm. or 3ss.
Aquæ menthæ piperitæ .....	q. s. ad 120	c.cm. or f3iv.

M. Sig.: Teaspoonful three times a day.

(Also see formulæ under *Copaiba*.)

Functional irritability of the bladder, so common in women, is often relieved by cubeb. Cubeb is sometimes of service, also, in nocturnal incontinence of urine. In chronic catarrh of the lower bowel and in the interparoxysmal periods of pseudomembranous enteritis cubeb is likewise advantageous. By some writers it is esteemed of value in the treatment of hæmorrhoids.

Atonic dyspepsia may receive benefit from the temporary employment of small doses of cubeb, which are of service also in bronchorrhœa.

The troches of cubeb may be used in the treatment of sore throat and hoarseness, from two to five daily being allowed to slowly dissolve in the mouth.

### CUPRUM.—Copper.

#### *Preparations.*

Cupri Sulphas (U. S. P., B. P.).—Copper Sulphate. Dose, as an astringent, 0.01 to 0.13 Gm. (or gr.  $\frac{1}{4}$ -ij); as an emetic, 0.32 to 0.65 Gm. (or gr. v-x).

Cupri Acetas.—Copper Acetate. Dose, 0.008 Gm. (or gr.  $\frac{1}{10}$ ).

Cuprum Ammoniatum.—Ammoniated Copper. Dose, 0.01 to 0.065 Gm. (or gr.  $\frac{1}{4}$ -j).

Cupri Arsenis.—Copper Arsenite. Dose, 0.0016 to 0.065 Gm. (or gr.  $\frac{1}{100}$ -j).

Cuprum Aluminatum.—Aluminated Copper. Lapis Divinus. External use.

Ceratum Cupri Acetatis.—Cerate of Copper Acetate. (Melt together yellow wax, 50 parts; Burgundy pitch, 25 parts; European turpentine, 15 parts; strain, incorporate thoroughly finely-powdered acetate of copper, 5 parts; pour into molds, to form cakes of about 1 centimetre thickness). Green cerate, for corns, warts, etc.

**Pharmacology.**—Copper has but one official salt—the sulphate—which is an irritating poison, although the metal is inert, because insoluble. Copper was formerly used very much in making cooking utensils for family use, but it was found that, unless kept very bright and clean, they would give rise to poisoning by the formation of verdigris, a basic copper acetate. Copper is sometimes added to pickles to make them of a brighter green color, a fraud which can be detected by placing a blade of a knife, or polished piece of steel, in the liquor; if it contain copper, there will be a deposit of metallic copper upon the iron in the course of a few minutes. It is held that the very small amount of copper that would be introduced into the system by eating such a pickle would be only a mere fraction of a grain, and not enough to cause symptoms. A far more dangerous source of poisoning is found in the wall-paper pigments containing copper arsenite, which is very poisonous. It is not only the green colors that are dangerous, but all vivid colors, such as scarlet, crimson, or lake. It is especially velvet or embossed papers that are likely to be loaded with pigment, and these should never be used for a dwelling-house unless first tested and found to be free from copper or arsenic by the ordinary tests for those poisons.

**Physiological Action.**—When locally applied, copper sulphate is an astringent or a caustic, according to the manner of application. Injected hypodermically, it causes coma and convulsions (in cats) and death from respiratory failure; in overdose by the stomach it causes fatal gastro-enteritis. Copper in very small proportion exists normally in the blood, and in minute doses it exerts a tonic effect upon the organism. This is well shown in some skin diseases of a dry type, due to defective nutrition, and in incipient or threatened phthisis. The secretions along the gastro-intestinal tract are increased, as shown by the salivation, vomiting, and purging. It is a local, and

not a systemic, emetic. Copper is eliminated by the liver, kidneys, salivary and intestinal glands. It may remain, like other metals, stored up for a considerable period within the liver.

When any of the salts of copper have been swallowed in overdose there are nausea, vomiting and retching, purging of blood and mucus, and rapid depression of bodily powers; and the latter may be the more prominent. In chronic poisoning, pharyngeal irritation, bronchial catarrh, colic, diarrhoea, or dysentery, salivation, anæmia, and emaciation occur. There is sometimes a green line upon the gums. Jaundice and fatty degeneration or atrophy of the liver ensue, and pulmonary congestion or consolidation may set in. The effects upon the nervous system are seen in headache, defective co-ordination, and weakness, with nervous vomiting. Toxic symptoms manifest themselves very soon after the metallic salt has been taken. The chemical antidote is potassium ferrocyanide followed by demulcents, eggs, milk, oil, etc., and the stomach should be irrigated with an alkaline solution, counter-irritation applied, and anodynes given. The incompatibles of copper are metallic sulphides, alkalies and alkaline earths, iodides, and vegetable infusions containing tannin.

**Therapy.**—Copper sulphate, in solid stick, is used as a superficial caustic in indolent ulcers, exuberant granulations, and in syphilitic and other sores in the mouth and throat. It may also be lightly applied in cases of granular lids, or a solution ( $\frac{1}{4}$  to  $\frac{1}{2}$  of 1 per cent.) instilled into the eye in subacute conjunctivitis; but for this the acetate is preferred. A crystal of copper sulphate is likewise serviceable as an hæmostatic in checking hæmorrhages from slight wounds, leech-bites, or the surface of irritable ulcers. A solution of this salt is employed locally with benefit in order to suppress excessive and chronic discharges. In the strength of from 0.65 to 1.30 Gm. (or gr. x-xx) to 30 c.cm. (or f̄j) of menstruum it may be thrown into the bowel for the relief of chronic diarrhoea or dysentery. The same method is beneficial in acute diarrhoea of severe form. From 0.32 to 0.65 Gm. (or gr. v-x) of the sulphate dissolved in 30 c.cm. (or f̄j) of glycerin is one of the preparations which may be recommended for use in pseudomembranous enteritis. The fluid should be injected into the bowel during the interparoxysmal period for the purpose of modifying the condition of the mucous membrane. A weak, aqueous solution of copper sulphate is an excellent stimulant dressing to chancres and chancroids, and forms a good injection in leucorrhœa, vaginitis, and gleet.

Copper sulphate, made into the form of a pencil, has been employed in the treatment of endometritis, introduced within the cervical canal and held in place by a tampon of iodoform gauze. Although praised by some writers, Boursier asserts that it may give rise to violent uterine colic, metrorrhagia, a profuse discharge, and vomiting. The application is likewise capable of causing a loss of substance of the mucous membrane, and may be followed by atresia. Pencils or suppositories containing copper sulphate should not be left too long in position. Dr. Tarnier esteems a 5-per-cent. solution of copper sulphate a valuable disinfectant for washing out the uterus and vagina after delivery.

This salt enters into the composition of injections for gonorrhœa, and may be advantageously combined as follows:—

<b>R</b> Cupri sulphatis .....	75 Gm. or gr. xij.
Zinci sulphatis,	
Plumbi acetatis .....	aa 155 Gm. or gr. xxiv.
Fluidext. kramerie .....	4 c.cm. or f3j.
Vini opii .....	75 c.cm. or f3j.
Aquæ rosæ .....	q. s. ad 180 c.cm. or f3vj.—M.
<b>R</b> Cupri sulphatis .....	32 Gm. or gr. v.
Fluidext. geranii .....	15 c.cm. or f3ss.
Glycerini .....	30 c.cm. or f3j.
Aquæ rosæ .....	75 c.cm. or f3iiss.—M.

The oleate of copper is an admirable astringent, antiseptic, and anti-parasitic preparation, especially valuable in the various forms of tinea trichophytosis.

The sulphate is sometimes effective as a local stimulant in an indolent impetigo, and a weak solution is efficacious in ulcerative stomatitis and thrush. Thirty-one Gm. (or 3j) of the sulphate in a half-litre (or f3xviij) of water is a solution which has been found very efficacious in the treatment of scabies. Other cutaneous affections—as psoriasis, chronic eczema, sycosis, favus, acne, hyperidrosis, and bromidrosis—are ameliorated by the topical application of copper sulphate or acetate in the form of an ointment or a lotion, or the oleate made into a 10- or 20-per-cent. ointment. A gargle containing 5 grains of copper sulphate to the ounce of water does good in relaxed sore throat. The sulphate, or other salts of copper, may be employed externally in the following formulæ:—

<b>R</b> Cupri sulphatis .....	32 Gm. or gr. v.
Aquæ hamamelidis dest. ....	150 c.cm. or f3v.
<b>M.</b> For a gargle, or apply over the surface for hyperidrosis or bromidrosis.	
<b>R</b> Cupri sulphatis .....	65 to 2 Gm. or gr. x vel xxx.
Acidi borici .....	4 Gm. or 3j.
Creosoti .....	60 c.cm. or mxx.
Ungt. aquæ rosæ .....	31 Gm. or 3j.
<b>M.</b> Useful in sycosis and parasitic diseases of the skin.	

In summer diarrhœa and cholera infantum copper sulphate is of undoubted efficacy. It is likewise a valuable remedy in the diarrhœa and dysentery of adults. Diarrhœa, whether acute or chronic, will often yield to copper sulphate. It has been found of service in restraining tuberculous diarrhœa, and has been highly praised by some writers for its virtue in the diarrhœa of typhoid fever. Copper sulphate has also been administered with good results in cholera. *Tænia* may be dislodged and passed under the use of small doses of copper sulphate. Phillips begins with about 0.01 Gm. (or gr.  $\frac{1}{n}$ ) and gives it every morning upon an empty stomach, gradually increasing the dose until 0.20 to 0.32 Gm. (or gr. iii-v) can be taken without vomiting. In actinomycosis, A. D. Bevan recommends copper sulphate, 0.015 to 0.06 Gm. (or gr.  $\frac{1}{4}$ -j) three times a day, and locally irrigation with a 1-per-cent. solution.<sup>1</sup>

The same salt is useful in bronchorrhœa. A small dose of the sulphate, 0.003 Gm. (or gr.  $\frac{1}{20}$ ) three times a day, will sometimes allay the vomiting of pregnancy. Small doses of the same salt, given with or after meals, improve nutrition, and have been recommended as of service in ecthyma, scrofula, and tuberculosis.

<sup>1</sup> Jour. Amer. Med. Assoc., Nov. 11, 1905.

Luton makes use in tuberculosis of a "cupric serum," made by dissolving 0.20 Gm. (or gr. iij) of copper acetate in 90 c.cm. (or fʒiij) of his "artificial serum." Of this fluid 5 c.cm. (or fʒi 1/4) is an average dose for an adult.

Dr. A. F. Price, U. S. N., recommends the sulphate as a remedy in syphilis. He states that it is of particular efficacy in syphilitic adenopathies, and, although slow in removing syphilides of the secondary stage, it prevents the development of mucous patches and throat symptoms. He gives it in an average dose of 0.002 Gm. (or gr. 1/50) thrice daily and recommends that its use should be omitted one day in each week.

Its action as a prompt emetic is best utilized in phosphorus poisoning, where it is also antidotal. Copper has a very decided action upon the nervous system, and the ammoniated copper particularly is used and highly praised for its effects in chronic neuroses, epilepsy, chorea, hysteria, and in the treatment of facial neuralgia. It is claimed that the administration of 0.005 Gm. (or gr. 1/12) of copper sulphate every night at bed-time will relieve the cramping pain in the legs from which pregnant women sometimes suffer.

In chorea, especially when connected with the presence of tænia or other worms and in epileptiform convulsions dependent upon intestinal worms, Phillips has witnessed good results from the administration of the sulphate. In asthma, also, he has observed benefit from its use.

Dr. Boardman Reed speaks favorably of the use of copper arsenite in minute doses as an antispasmodic in cases of after-pains.<sup>1</sup> He gives 0.000065 Gm. (or gr. 1/1000) every half-hour with complete relief. It has also been highly extolled in the treatment of diarrhoea of infancy, where it may exert an antiseptic action upon the contents of the intestinal tract, when given in small and frequently-repeated doses, as first suggested by Dr. Reed. A solution prepared in this manner is often of marked benefit in after-pains, diarrhoea, and in cholera morbus:—

℞ Cupri arsenitis ..... ʒ03 Gm. or gr. ss.  
 Aquæ camphoræ,  
 Aquæ cinnamomi ..... ss 120 | c.cm. or fʒiv.

M. Sig.: From one-half to one teaspoonful every half-hour or hour until relieved.

Copper arsenite, in doses of 0.0013 to 0.002 Gm. (or gr. 1/50-1/25) after each meal, is said to be of value in the treatment of functional anæmia. In four cases of epidemic cerebro-spinal meningitis, Kolipinski gave arsenite of copper for the first and second days, every half-hour when the patient was awake; as the symptoms improved the intervals were prolonged to every three or four hours; on the fourth day the remedy was discontinued, when convalescence appeared. With children he used 0.000025 to 0.00005 Gm. (or gr. 1/2400-1/1200) at a dose, with an adult 0.0002 Gm. (or gr. 1/120). In pronounced chlorosis Liégeois has obtained good results from copper, administered in the following form:—

℞ Cupri acetat. neutralis ..... ʒ01 Gm. or gr. 1/4.  
 Sodii phosphat. crystall. .... ʒ045 Gm. or gr. 1/4.  
 Pulv. glycyrrh.,  
 Glycerini ..... ss q. s.

M. et ft. pil. no. j. Mitt. tales no. xxx.

One or two pills were given twice daily before meals. The drug could be taken for three months uninterruptedly without occasioning any derange-

<sup>1</sup> *Times and Register*, Dec. 6, 1890.

Pereira states that *cusparia* is valuable not only in intermittents and remittents, but also in the bilious forms of the latter, such as occur in the tropics. Williams and Wilkinson, and Hancock, corroborate this opinion; while Winterbottom is even more emphatic, and extols the drug in adynamic continued fever.

A convenient tincture may be made in the usual way, by macerating the dried bark in coarse powder in five times its weight of alcohol. It should be put in a well-stoppered bottle; allowed to stand eight days in a cool place, shaking twice daily; then poured off, strained, and filtered. The infusion is incompatible with metallic sulphates, antimony, lead and mercurial salts, silver nitrate, and infusions containing tannin.

**Physiological Action and Therapy.**—In small doses *cusparia* is a bitter tonic, and in large doses of the recent infusion it causes vomiting or purging. In South America it has been largely employed by the natives in the treatment of diarrhoea and dysentery. As a stimulating tonic, it may be given for loss of appetite and weak digestion. The dose of the powder is from 0.32 to 2 Gm. (or gr. v-xxx). Nausea is prevented by combining it with aromatics.

**CUSSO** (U. S. P., B. P.).—**Kouso, Brayera, Red Cusso.**

**Dose,** 15.5 Gm. (or  $\mathfrak{z}\text{ss}$ ).

#### *Preparation.*

**Fluidextractum Cusso.**—Fluid Extract of Kouso. Dose, 15 to 30 c.cm. (or  $\mathfrak{f}\mathfrak{ss}$ -j).

**Pharmacology.**—"The dried flowers of the female inflorescence of *Hagenia Abyssinica* (Rosaceæ)," or "the dried panicles of pistillate flowers of *Brayera anthelmintica*" (B. P.), a tree of Abyssinia. Bedall, of Munich, found **Kosin** a crystalline resinous substance of acid reaction, combined with tannic acid, a volatile oil, and a resinous substance (**Koussein**), which is an impure kosin. In large doses *brayera* is a gastro-intestinal irritant, and is liable to cause vomiting, but no toxic effects have been observed. It is usually administered in infusion, 15.5 Gm. (or  $\mathfrak{z}\text{ss}$ ) of the flowers in a pint of hot water, the whole to be swallowed at once, for the expulsion of tape-worm. It should be followed by a purgative in about two hours, castor-oil being ordinarily used. **Kosin** is said to be less liable to cause nausea than the fluid preparations. *Brayera* should not be given during pregnancy, for fear of causing abortion. **Koussein** is an amorphous, yellowish-brown powder, has a bitter taste, is soluble in alcohol, ether, and chloroform, and but slightly soluble in water. It has been given as an anthelmintic in doses from 1 to 4 Gm. (or gr. xv-lx). According to a more recent authority, Leichsenring, the active principle of the drug is an amorphous substance which he called **Kossotoxine**. It is insoluble in water, but dissolves in alcohol, ether, benzol, or carbon disulphide.

**Therapy.**—In the treatment of tape-worm, it is given as a fluid extract of the fresh flowers, in doses of 16 c.cm. (or  $\mathfrak{f}\mathfrak{ss}\text{iv}$ ) to an adult; below 12 years of age the dose should be one-half of this quantity, or less. If it does not cause evacuation of the bowel in four hours, a cathartic should be given.

**CYDONIUM.**—**Cydonium, Quince-seeds** are the seeds of *Cydonium vulgaris* (Rosaceæ). These seeds, containing about 20 per cent. of vegetable

mucilage, were formerly official in order to provide the **Mucilage of Cydonium**, which is best made with rose-water. It is used locally in inflammation of the skin, or conjunctivitis, or it may be used internally, *ad libitum*, in disorders of the alimentary canal requiring a demulcent.

**CYNOGLOSSUM.**—The root of the *Cynoglossum officinale* (Boraginæ), an indigenous plant, is of interest, because it contains **Cynoglossine**, a brown, amorphous substance, soluble in water and alcohol, having an alkaline reaction, which Buchheim, its discoverer, found to possess narcotic powers. Its physiological action is said to be analogous to that of curare.

**CYPRIPEDIUM** (U. S. P.).—*Cypripedium*, Ladies'-slipper.

Dose, 1 to 2 Gm. (or gr. xv-xxx).

*Preparation.*

**Fluidextractum Cypripedii** (U. S. P.).—Fluid Extract of *Cypripedium*. Dose, 0.80 to 1.20 c.cm. (or *mx-xx*).

**Pharmacology.**—"The dried rhizome and roots of *Cypripedium hirsutum*, or of *Cypripedium parviflorum* (Orchidacæ)." The roots have a heavy, disagreeable odor, and contain a volatile oil, a volatile acid, resins, and a peculiar tannin. *Cypripedin* is an impure oleoresin (dose, 0.13 to 0.20 Gm., or gr. ii-iiij).

**Physiological Action and Therapy.**—In its effects it resembles valerian as an antispasmodic, tonic, stimulant, and diaphoretic. It is given in neurasthenia, nervous hyperæsthesia, neuralgia, nervous headache, hypochondria, insomnia, and epilepsy.

**DAMIANA.**—*Damiana* is a small, mint-like plant (*Turnera diffusa*, microphylla, or aphrodisiaca; natural order, Turneracæ), bearing yellowish-white fragrant flowers, which grow in southwestern Texas, Mexico, and South America. Other plants have been sold under the name of damiana, and it is probable that some of the uncertainty of result has been due to the substitution of some other drug for the *Turnera*. The leaves are the part used; they contain a volatile oil, a resin, and other constituents. The following preparations have been employed: **Extractum damianæ** (extract of damiana); dose, 0.32 to 1 Gm. (or gr. v-xv). **Extractum damianæ fluidum** (fluid extract of damiana); dose, 2 c.cm. (or f3ss). **Glycerol damianæ**, phosphori, et nucis vomicæ (containing in each fluid ounce, damiana, 4 Gm., or 3j; phosphorus, 0.0025 Gm., or gr.  $\frac{1}{25}$ ; nux vomica, 0.25 Gm., or gr. iv); dose, 4 c.cm. (or f3j). **Elixir Turnera** (N. F.), (15 per cent. of damiana); dose, 7.50 to 30 c.cm. (or f3ii-f3j).

**Physiological Action.**—Upon the sexual appetite and function damiana undoubtedly exerts some stimulant effects; but it is also a general tonic. *Damiana* is thought to have a reconstituent effect upon the spinal and medullary centres. Upon the digestive organs it acts as a carminative, and in larger doses as a cathartic laxative. It is slightly cholagogic, and is also a stimulating diuretic.

A case of poisoning from damiana has been reported, the symptoms being closely analogous to those produced by strychnine. Recovery by treatment usual in intoxication from strychnine occurred.

**Therapy.**—In nervous dyspepsia, neuralgia, cerebral exhaustion, neurasthenia, or want of tone in the nervous system, also in sick headache or migraine, damiana has been found to be useful. It has been of service in cases of paraplegia and hemiplegia and atony persisting after prolonged illness. It is especially employed, however, in treating functional impotence from any cause, combined with hygienic and other treatment, especially nuxvomica, iron, and phosphorus.

Damiana relieves irritability of the bladder and urethra, so often associated with prostaticorrhœa or spermatorrhœa. Softness and tenderness of the testes as a result of sexual excess have been benefited by the administration of this drug. In cases of abnormal sexual appetite it has manifested a sedative influence.

**DIGITALIS** (U. S. P.).—*Digitalis*, Fox-glove.

**DIGITALIS FOLIA** (B. P.).—*Digitalis*-leaves.

**Dose**, 0.03 to 0.13 Gm. (or gr. ss-ij).

*Preparations.*

**Extractum Digitalis** (U. S. P.).—*Extract of Digitalis*. **Dose**, 0.015 to 0.03 Gm. (or gr.  $\frac{1}{4}$ - $\frac{1}{2}$ ).

**Fluidextractum Digitalis** (U. S. P.).—*Fluid Extract of Digitalis*. **Dose**, 0.03 to 0.12 c.cm. (or *mas-ij*).

**Infusum Digitalis** (U. S. P., B. P.).—*Infusion of Digitalis* (1  $\frac{1}{2}$  per cent., U. S. P.; or 0.08 per cent., B. P.). **Dose**, 4 to 15 c.cm. (or *f3i-iv*).

**Tinctura Digitalis** (U. S. P., B. P.).—*Tincture of Digitalis* (10 per cent., U. S. P.; or 12  $\frac{1}{2}$  per cent., B. P.). **Dose**, 0.30 to 2 c.cm. (or *mv-xxx*).

**Pharmacology.**—"The dried leaves of *Digitalis purpurea* (Scrophulariaceæ), collected from plants of the second year's growth at the commencement of flowering" (U. S. P.). "The dried leaves of *Digitalis purpurea*, Linné. Collected from plants commencing to flower" (B. P.). It is now recognized that **Digitalin**, which was formerly official, and considered as the active principle, is a mixture of several bodies, the most active of which is crystallizable **Digitoxin** ( $C_{46}H_{54}O_{11}$ ), according to Kiliani, which, with **Digitalinum verum** and **Digitalein**, represents the cardiac, stimulating action of the drug, while **Digitonin** appears to exert a contrary effect, acting like saponin (Schmiedeberg). M. Cloetta<sup>1</sup> finds that the leaves, as well as the seed, contain digitonin, digitalin, digitoxin, and coloring matter common to both. The seed contains much more digitalin than digitoxin, while in the leaves the reverse is the case. A fifth substance, **Digitin**, seems entirely devoid of physiological and therapeutical actions. These are all non-nitrogenous, and are glucosides. No alkaloid is present in digitalis. It also contains tannin, volatile oil, fatty matter, red coloring matter, chlorophyll, albumin, starch, sugar, gum, lignin, and salts. Two acids have been discovered by M. Morine,—digitalic and antirrhinic. The varying solubility of the active principles in the vehicles used explains the difference of therapeutical effect. Digitalin is insoluble in water, but soluble in alcohol; digitoxin is insoluble in water, sparingly soluble in alcohol; digitalein is soluble in ether; digitonin, soluble in water, sparingly in alcohol. According to Orfila, Nativelle's digitalin is principally digi-

<sup>1</sup> *Arch. exp. Pathol. u. Pharm.*, 1898, 41, 421.

begin with a little digitalin; it is a very active preparation. Balfour pronounces it, after twenty years' experience, a thoroughly reliable and active drug. One granule ( $\frac{1}{4}$  mg., or gr.  $\frac{1}{250}$ ), every night at bed-time is a sufficient dose to produce a decided tonic effect on the heart. The **Digitalinum Germanicum** (Merck) appears to be a reliable and active preparation. Dose, 0.003 to 0.015 Gm. (or gr.  $\frac{1}{2}$  to  $\frac{1}{4}$ ). The tincture of digitalis, and alcoholic fluid extract, contain both digitalin and digitoxin; the infusion contains principally digitonin and very little digitoxin. In order to get the full physiological effect it is necessary to use the carefully-selected leaves, according to the pharmacopœial requirements. The seeds, although said by Hitz to contain ten times as much of the active principles as the leaves, are not used in medicine, except possibly pharmaceutically, as a source of digitalin and digitoxin.

**Physiological Action.**—Digitalis is readily absorbed by the skin, and is thought to have some local sedative effects when used on spongiopilin or in a cataplasm. Although it has a bitter taste, digitalis has no tonic action upon the stomach, but, on the contrary, often disorders the digestion, and may cause nausea, vomiting, or diarrhœa when too long continued. Its active principles readily diffuse into the blood, reducing the rate of the heart's action by lengthening the period of rest, or asystole, thus allowing the cavities to receive more blood. At the same time that it increases the contraction it stimulates the motor ganglia and increases the force of the contraction. Moreover, digitalis causes the contraction of the arterioles throughout the body, and thus combines its effects with the preceding, in order to raise arterial tension. François Frank, from a series of experiments with digitalis and digitalin, found that, in mammifera, it slows the beat of the accelerated heart, it regulates the arrhythmical heart, and it greatly augments the systolic power and the diastolic resistance. He holds that these effects are developed equally on the two sides of the heart, contrary to the view of Germain Sée, and contrary to the German physiologists, who hold that the drug's power is manifested on the left heart. In a toxic dose digitalin produces, first, an excessive slowing of the heart movement, but a special arrhythmical beat, manifested by the dicrotic pulse. Afterward the heart accelerates itself, becoming irregular; the contractions are precipitated by a sort of semitetanic, ventricular movement, interrupted by prolonged intermissions, finally causing death, in systole, in both cold- and warm-blooded animals alike.<sup>1</sup> Germain Sée has ascertained that exhausting diseases occasion flaccidity of the cardiac muscle, with consequent dilatation of the organ. In such condition digitalis diminishes the volume of the heart, but acts especially upon the fibres of the right cavities. The temperature is reduced by it in pyretic conditions, though not in health. The slowness of its action (requiring from thirty-six to forty-eight hours) in reducing fever and its likelihood of disturbing the stomach tend to preclude its use for this purpose in acute fevers. Its action upon the circulation may be summed up as being that of a vascular stimulant, raising arterial pressure, lowering abnormal temperature, and steadying the heart. Upon the brain and spinal cord it produces little direct effect. The reflex action of the spinal cord is reduced by large doses, and there is stimulation of the pneumogastric and vasomotor nerves. It is liable to cause headache, delirium, and vertigo, possibly from

<sup>1</sup> *Bulletin de l'Académie de Médecine*, July 2, 1895.

disturbance of the cerebral circulation due to the effects of the volatile oil, or from sick stomach. Syncope may be due to heart-failure from overstimulation after the drug has been used for some time, especially if the patient suddenly sits up in bed or assumes an erect posture. It stimulates the vaso-motor ganglia in the medulla. Large doses excite Setschenow's centre and produce muscular paralysis, the peripheral nerves, both motor and sensory, being also paralyzed. Respiration becomes feeble and more rapid, coma and convulsions follow, and death is attended by systolic arrest of the heart's action, from its tetanizing effect upon the cardiac muscle or from exhaustion of motor ganglia. The general action upon muscular tissue is to lessen contractility and cause lassitude and want of vigor. The sexual functions are depressed. The effect upon the kidneys is peculiar. The increase of arterial tension in the glomeruli accompanying the general effect on the circulation is assisted by a special action, by which the renal arteries are dilated, thus acting as a true diuretic; while the excretion of urea is at first increased, it subsequently diminishes. The greatest effect as a diuretic is obtained in diseased conditions accompanied by oedema and low arterial pressure. Digitalis also has some effect upon the muscular tissue of the uterus, stimulating it to contraction.

Aconite and digitalis are antagonistic. The former slows the heart by expanding the peripheral vessels and lowering blood-pressure; the latter reduces the number of contractions by stimulating the inhibitory fibres of the pneumogastric nerve, and tightens up the arterioles, thus causing increased blood-pressure. Aconite directly lowers the action of the cardiac motor ganglia, and is a cardiac poison; digitalis indirectly exhausts the motor ganglia by permitting overaction and exhaustion; in the former, the heart is found, after death, in a condition of dilatation or asystole; in the latter, it is in a state of contraction or systole. The action of aconite upon the heart is rapid; the action of digitalis is gradual and slow; so that the latter is not a practical antidote for the other. An erythematous, papular, or erysipelatous rash will occasionally follow either the internal or external use of digitalis.

**Poisoning.**—When digitalis or digitalin has been taken by mistake in an overdose, tannin or infusion of tea or coffee should be given at once, the stomach washed out and stimulants given. Saponin is the physiological antagonist, according to Bartholow. The compound tincture of cinchona might be useful, as it contains tannin, alcohol, and quinine. Ferrous sulphate or tincture of ferric chloride should also prove useful. The patient should be kept in a recumbent posture; hot drinks and hot-water bottles should be around him and spirit of ammonia inhaled. As long as the functions of the kidneys are maintained, it has been observed that symptoms of so-called "accumulation" are not apt to arise. As already explained, these are attributed to overstimulation and exhaustion of the heart, but possibly there may be a uræmic element in some cases which would require appropriate treatment.

Poisoning from digitalis seldom has a fatal termination, and the maximum dose of digitalis or digitalin is not at present known. It is important to note that digitalis is more active when given hypodermically than when taken into the stomach. Thus, Piotrowska found that Homolle and Quevenne's digitalin in the frog is three times less toxic by the gastro-intestinal canal

than subcutaneously; Nativelle's digitalin is one and a half times less toxic given by the mouth than under the skin.

**Therapy.**—Locally, digitalis is employed combined with moisture and heat in joint inflammation, acting as a sedative and possibly reducing the calibre of the vessels. Part of it is absorbed and carried to the kidneys, where it produces a diuretic effect, especially when the hot application is made over the loins. A tablespoonful or more of tincture of digitalis may be sprinkled upon spongiopilin, or flannel wrung out of hot water, and applied to the lumbar region; or a cataplasm containing 4 Gm. (or 3j) of the leaves, applied in cases of dysuria or suppression of urine. Bronchial congestion due to heart disease may also be relieved by the local application of digitalis.

Dr. Filatte has found the local application of digitalis serviceable in chilblains. The formula of which he makes use is:—

B Tinct. digitalis .....	6	c.cm. or f3iss.
Thymol. cryst. ....	3	Gm. or gr. xlv.
Alcohol (70°),		
Glycerin .....	aa 135	c.cm. or f3jss.

M. Sig.: Apply with friction.

Internally, it is chiefly prescribed, almost as a routine practice, as a heart-tonic in all cases of failure of circulation due to the feebleness of the heart's action. It should not be used in valvular disease as long as compensating hypertrophy is keeping up the work of the heart; but when this fails and dilatation is commencing, digitalis will not only slow and steady the heart, but improve the nutrition of the heart-walls by increasing the pressure in the coronary arteries and allowing them a longer time in which to be filled. In heart affections where there is absence of dropsy, and when the patient is passing an abundance of urine, digitalis is seldom demanded. In mitral stenosis digitalis is used in order to allow the left auricle a longer time to empty itself into the ventricle; also, in tricuspid regurgitation, with dilated right ventricle. It is not to be used in aortic stenosis, as a rule, although exceptional circumstances may require its use for a time, to regulate the rhythm of the heart, or to relieve dropsy. On account of the opposing action of the different principles contained in digitalis, Lauder Brunton counsels that when, in disease of the heart, there is excessive constriction of the blood-vessels, digitalis should be given in combination with nitrous ether.

In the course of the second of his Lumleian Lectures<sup>1</sup> Sir Richard Douglas Powell, Bart., M.D., remarked that the commonest mistake that one observes in the use of digitalis is that too large a dose is prescribed at first, which tends to premature arterial contraction and cumulative effects. Then with the appearances of these physiological symptoms the use of the drug is stopped and that of some other medicine substituted until the pulse again calls for its administration. In this hap-hazard way of using digitalis the heart is never held in good control. In exceptional cases, where there is urgent need to push the drug, digitalin is best used subcutaneously. In ordinary cases a dose of 0.60 c.cm. (or *mx*) of the tincture every four hours, or 1 c.cm. (or *mxv*) every eight hours, or 0.30 c.cm. (or *mv*) every waking hour is sufficient. Thus given, the patient being at rest, it generally takes about three days before the pulse is under control and the urine begins to increase.

<sup>1</sup> *Lancet*, April 2, 1898.

When its decided effects are thus gradually developed, the use of the drug should be steadily continued in doses calculated to maintain its effect. With ordinary watchfulness there is no risk whatever; timely warning of excess is given by the pulse, which, having become slow, begins to exhibit small intermediate beats and especially a tendency to go in couples. This is always a sign to reduce the dose or to limit them for a few hours. The sickness that occasionally supervenes with digitalis is most troublesome. An occasional mercurial will sometimes prevent it, a change to digitalin in equivalent doses may be tried, or a tumblerful of very hot water may be taken occasionally. In some cases it is not to be overcome except by omitting the use of the drug; the patient is usually well under the influence of the drug before this symptom appears, in which case a small dose of digitalin by the mouth or hypodermically may be sufficient to maintain its effects on the heart.

Cardiac dyspnoea or asthma due to engorgement of the pulmonary circulation is usually relieved by digitalis; and functional weakness, with irritable heart or low arterial tension, with migraine, or delirium tremens, is very promptly benefited by it. Dr. Jules Comby writes that digitalis is beneficial in congenital maladies of the heart, with or without cyanosis, by strengthening the cardiac contractions, which are almost always insufficient, and by promoting diuresis. He does not, however, regard the drug as serviceable in the case of infants or young children attacked by nervous palpitations.

Large doses (15 c.cm., or  $\text{f}\text{ss}$ , or more of the tincture) have been given in mania a potu and acute mania, with success. Isambert records the case of a maniacal child, fourteen years of age, in whom the delirium yielded to the administration of 30 drops of the tincture of digitalis. It is claimed by Gowers that digitalis, associated with belladonna, promotes the efficacy of the bromides in epilepsy.

It is a useful remedy in hæmorrhages, as in menorrhagia or hæmoptysis, and in the first stage of pneumonia. Digitalis is of particular advantage in the metrorrhagia or menorrhagia of plethoric individuals, or when dependent upon mitral disease. For hæmorrhage, the tincture of digitalis may be given in doses of 1.20 to 2 c.cm. (or  $\text{mxx}$ - $\text{xxx}$ ) every three or four hours. Post-partum hæmorrhage may likewise be restrained by the use of digitalis, which may here be appropriately combined with ergot. This remedy is of service in controlling epistaxis, and is a valuable adjunct to the tincture of iron in purpura hæmorrhagica. In the treatment of hæmorrhages digitalis is usually prescribed in combination, as:—

R	Tr. digitalis .....	6	c.cm. or $\text{f}\text{ss}$ .
	Tr. catechu .....	30	c.cm. or $\text{f}\text{ij}$ .
	Fluidext. ergotæ .....	q. s. ad 60	c.cm. or $\text{f}\text{ij}$ .
M.	Sig.: A dessertspoonful every hour or two.		

The infusion, however, is usually the most efficient preparation in hæmorrhage:—

R	Plumbi acetatis .....	2	60	Gm. or gr. xl.
	Morphine acetat. ....	1	065	Gm. or gr. j.
	Infus. digitalis .....	120		c.cm. or $\text{f}\text{iv}$ .
M.	et ft. sol.			
Sig.:	Tablespoonful every three hours.			

Digitalis may also be prescribed for hæmorrhage in phthisis and in the first stage of pneumonia, thus:—

R Extracti digitalis .....	20 Gm. or gr. iij.
Pulveris ipecacuanhæ et opii .....	155 Gm. or gr. xxiv.
M. et ft. pil. no. xij.	
Sig.: A pill every two or three hours.	

In persistent diarrhœa complicating fever of a remittent type, Mr. Harold Henley has obtained good results from a combination of digitalis and strychnine given in spirit of chloroform and water.

In exophthalmic goitre and in congestive headaches it sometimes succeeds remarkably in controlling the symptoms of disease. In the treatment of exophthalmic goitre Rockwell values a combination of digitalis, or strophanthus, with iron, ergot, and zinc bromide.

Besides the special action above referred to, as a cardiac tonic or current-regulator to the circulation, digitalis is the chief reliance in dropsy and serous effusions, owing to its diuretic action. In acute renal dropsy, the best effects are obtained by combination with calomel or other mercurial, and with squill, as in the famous Guy's pills:—

R Pulv. digitalis .....	63 Gm. or gr. ss.
Pulv. scillæ .....	10 Gm. or gr. iiss.
Mass. hydrargyri .....	20 Gm. or gr. iij.
M. et ft. pil.	
Sig.: Take one or two at bed-time.	

In cases of œdema due to Bright's disease, with scanty albuminous urine, the following are useful:—

R Potassii acetatis .....	26	Gm. or 3vi gr. xl.
Spiritus juniperi comp. ....	45	c.cm. or f3iss.
Inf digitalis .....	q. s. ad 150	c.cm. or f3v.
M. Sig.: A dessertspoonful every three hours.		

R Infus. digitalis,		
Infus. scoparii,		
Infus. buchu .....	aa 60	c.cm. or f3ij.
M. Sig.: A dessertspoonful every three hours.		

R Infus. digitalis,		
Infus. taraxaci,		
Spiritus ætheris nitrosi .....	aa 60	c.cm. or f3ij.
M. Sig.: A dessertspoonful every three hours.		

Digitalis is of service, in promoting absorption, in pleurisy and hydrothorax. In the bronchitis and broncho-pneumonia of childhood it is often beneficial. Dr. Broadbent observes that as digitalis increases the elimination of fluids and caffeine that of solids, the two agents should be combined in order to obtain the same effect as that produced by a large single dose of digitalis.

In the hæmorrhagic diathesis, the tincture of digitalis is usually given in doses of 1 to 2 c.cm. (or *mxv-xxx*). The same doses may be given in cases of surgical shock or syncope. When the patient is exsanguined, the remedy should be administered by hypodermic injection, preferably in the form of digitoxin.

Spermatorrhœa with nocturnal emissions is benefited by digitalis in combination with ergot or with potassium bromide, according to circumstances. In this country it is not used for its antipyretic effect, although in

Germany it has been given in the hyperpyrexia of rheumatism and scarlet fever. The infusion of digitalis is employed in the treatment of scarlatina, especially when the urine becomes scanty. The following combinations are very servicable in the latter condition:—

**R** Inf. digitalis,  
 Spiritus ætheris nitrosi ..... aa 15| c.cm. or fʒss.  
 Potassii bitartratis ..... 8| Gm. or ʒij.

**M.** Sig.: A teaspoonful in water every three or four hours.

**R** Inf. digitalis,  
 Liquor potassii citratis..... aa 60| c.cm. or fʒij.

**M.** Sig.: A teaspoonful every two or three hours.

In fibroid lung, digitalis lessens the cough, steadies the heart, and reduces œdema. It has been successfully employed in erysipelas.

Digitalis is the physiological antidote to muscarine and to aconite, but requires the aid of diffusible stimulants on account of its slowness of action, when treating cases of poisoning by these agents. It may be administered hypodermically in such cases as the official tincture in combination with whisky, and in surgical shock as recommended by Dr. Thomas G. Morton, of the Pennsylvania Hospital, where it is also used in the treatment of sun-stroke.

Masius and Van Aubel have used digitoxin with success to fulfill the indications of digitalin. They administered it in the dose of 0.001 to 0.0013 Gm. (or gr.  $\frac{1}{64}$ - $\frac{1}{48}$ ), and observed no ill effects upon the digestive functions. Its action is said to be prompt and decided and its effect upon the circulation is manifested within twelve or twenty-four hours. The influence of the remedy usually persists for eight to ten days. In pneumonia it reduces temperature within twenty-four to forty-eight hours. Digitoxin relieves the cyanosis and dyspnoea of cardiac affections, restores force and regularity to the pulse, and occasions marked diuresis. It was found useful, likewise, in typhoid fever.

**Contraindications.**—M. Lucas Champonnière states that the indications for digitalis being frequency, irregularity, weakness of pulse-beat, and dropsy, it can be said in a general way that any other condition forms a contraindication. Among the special circumstances opposing its use are the following: a slow pulse, due to weakness of the heart-wall; an incompetent aorta, dyspepsia, any form of cachexia, also where digitalis has already been used for some time. Death from digitalis happens chiefly in cases of Bright's disease, arthritism, severe anæmia, aortic incompetency, and delirium tremens. In tricuspid insufficiency, digitalis may indirectly cause pulmonary apoplexy, owing to sudden increase of pressure.

Digitalis should be given with great care, if at all, to persons with fatty degeneration of the heart and dilatation. It should not be given in pericarditis, although passive pericardial effusion may be removed without much danger. In simple hypertrophy, or compensating hypertrophy, or conditions of high arterial tension or vascular excitement, it should rarely, if ever, be given. In any disease accompanied by changes in the heart-muscle or atheroma of the blood-vessels, digitalis should not be prescribed except for a temporary emergency. In simple dilatation of the heart, however, this remedy serves an excellent purpose. In typhoid fever digitalis is liable to in-

crease the diarrhea and cause vomiting. In gastritis or acute nephritis it would also prove injurious.

**Digalen**, or *Digitoxinum solubile* (Cloetta), is a recent introduction, and is claimed to have especial application for subcutaneous injection. It is marketed only in solution, by the manufacturers.

**DIONIN** is a morphine derivative, and, chemically, is ethyl-morphine hydrochloride. It is a white, microcrystalline powder of a somewhat bitter taste. It is soluble in about 7 parts of water and 1.4 of alcohol, and in about 20 parts of syrup. It is neutral, and is precipitated from solution by the usual alkaloidal reagents. Dionin is less narcotic than morphine, and more so than codeine. It has decided analgesic action, and is said to have no noteworthy effect upon the digestive tract and to be free from disagreeable by-effects. It has been used in bronchial asthma and the irritating cough of phthisis, and especially as a substitute for morphine in overcoming the habit. The usual dose is a little larger than that of morphine, and it may be given either by the mouth or hypodermically. Dose, 0.015 to 0.06 Gm. (or gr.  $\frac{1}{4}$ -j) several times daily. For a child, one year of age, give 0.0005 Gm. (or gr.  $\frac{1}{120}$ ).

#### **DISCOREA VILLOSA.<sup>1</sup>—Wild Yam.**

**Pharmacology.**—*Dioscorea villosa* (Dioscoreaceæ), wild yam or colic root, grows abundantly in our Southern States, but less plentifully in the Northern and Western States. The part made use of is the rhizome. This is without odor when intact, but when bruised develops a slightly woody smell. The taste is somewhat pungent and sweetish-bitter. The powdered root is yellowish-gray in color, is soluble both in water and alcohol. The following preparations are used in medicine: *Decoctum dioscoreæ* (decoction of *dioscorea*); dose, 30 to 120 c.cm. (or  $\text{f}\overline{\text{ss}}$ i-iv). *Tinctura dioscoreæ* (tincture of *dioscorea*); dose, 0.60 to 2.50 c.cm. (or  $\text{mx}$ -xl). *Fluidextractum dioscoreæ* (fluid extract of *dioscorea*); dose, 0.30 to 2 c.cm. (or  $\text{mv}$ -xxx).

The root contains an active principle called **Dioscorein**, also a resin and a substance like saponin, which cause its acridity. The physiological action of the drug has never been systematically studied.

**Therapy.**—Wild yam possesses diaphoretic and expectorant properties, but derives its principal value from its effect upon the hepatic functions. In large doses it is emetic. It is of especial service in the treatment of gall-stone. It quickly relieves pain and spasm, and, provided the calculus or calculi are not of extreme size, leads to their prompt expulsion. After the concretions have passed into the bowel this remedy is of service in reducing the congestion or inflammation which they have caused.

Hepatic indigestion, with its train of evil consequences, is effectually relieved by the fluid extract in 1 c.cm. (or  $\text{mxxv}$ ) doses before meals. The same preparation effects a marked improvement and gradual cure in chronic congestion of the liver. In chronic malaria, this agent is of decided advantage and may be combined with arsenic, quinine, or *nuxvomica*.

In chronic gastritis, the result of alcoholic excess, wild yam is very serviceable, and may be prescribed thus:—

<sup>1</sup> See paper by the author, in *Journal of the American Medical Association*, Sept. 21, 1889.

R	Tinct. belladonnæ foliorum . . . . .	1/50	c.cm. or <i>mxiv</i> .
	Tinct. nucis vomicæ . . . . .	4	c.cm. or <i>f3j</i> .
	Tinct. Dioscoreæ villosæ . . . . .	15	c.cm. or <i>f3ss</i> .
	Syrupi zingiberis . . . . .	75	c.cm. or <i>f3iiss</i> .

M. Teaspoonful in water every fourth hour.

**DIPTERYX.**—The prepared ripe seeds of several species of *Coumarou-sea*, or *Dipteryx* (*Leguminosæ*), are also known as Tonka beans, the fruit of a tree of tropical America. The most important constituent is **Coumarin** (1.5 to 2 per cent.), which has a pleasant odor like vanilla. Upon the human subject, it is antispasmodic. In full doses, it depresses the heart after preliminary stimulation.

Coumarin is used as a flavoring agent, and has been added to iodoform to disguise the penetrating odor of this drug. A fluid extract of *dipteryx* has been used in the treatment of whooping cough; dose, 0.3 to 0.6 c.cm. (or *mv-x*). Coumarin may be useful in colic and in disorders of digestion.

**DITA.**—**Dita-bark** (*Apocynaceæ*) is from the East-Indian Archipelago. It contains two bitter alkaloids, **Ditain** and **Ditamine**; has been used as an antiperiodic in treatment of ague; and is said to be of value in dysentery. The dose is 4 to 15.5 Gm. (or *ʒi-iv*), best given in the form of a fluid extract.

**DIURETIN.**—(See **Theobromin**.)

**DRACONTIUM.**—**Skunk-cabbage.** The dried rhizome and roots of *Spathyema fetida* (*Araceæ*), a herbaceous plant of North America. The bruised leaves have a very disagreeable smell, which warrants its common name. Besides this volatile principle the drug contains a resin, tannin, etc.

**Therapy.**—It is regarded as an antispasmodic, and has been used in chorea and hysteria, asthma, and chronic catarrh, using the recently-dried root or a good fluid extract (two-thirds alcoholic). The dose is 0.65 to 4 Gm. (or gr. *x-5j*).

**DROSERA.**—**Sundew.** The *Drosera rotundifolia* (*Droseraceæ*), growing in Europe and North America, has a very limited use in medicine. The entire plant is used, and a recent infusion or fluid extract is the best method in which to administer it. It contains a resin, a red coloring matter, and, according to G. Stein, citric acid.

**Physiological Action.**—*Drosera* is irritating to the skin, and the juice is used as an application for corns or warts. Internally, it is expectorant.

**Therapy.**—It is used in chronic bronchial catarrh, and has some reputation in the treatment of phthisis. In spasmodic affections of the chest, whooping-cough, and paroxysmal asthma it is said to be serviceable. The fluid extract, in doses of 0.30 to 1 c.cm. (or *mv-xv*), is the best preparation. A tincture is also used in the dose of 1 to 4 c.cm. (or *mxv-f5j*). *Drosera* has been employed with advantage in hay asthma, gastric catarrh, gastric ulcer, and atonic dyspepsia.

**DUBOISIA.**—**Duboisia.**

**Pharmacology.**—The leaves of the *Duboisia myoporoides* (*Solanaceæ*), of Australia, have a bitter, acrid taste, but very slight odor, and contain an alkaloid, **Duboisine** (now regarded as being identical with *hyoscyamine*), with a little **Hyoscyne**. It also contains a very small proportion of **Pseudo-**

**hyoscyamine.** The following preparations have been employed: *Tinctura duboisiae* (tincture of duboisia); dose, 0.30 to 0.60 c.cm. (or *mv-x*). *Extractum duboisiae fluidum* (fluid extract of duboisia); dose, 0.60 to 1.20 c.cm. (or *mx-xx*). *Extractum duboisiae* (extract of duboisia); dose, 0.01 to 0.03 Gm. (or gr.  $\frac{1}{80}$ - $\frac{1}{2}$ ). *Duboisinae sulphas vel hydrobromas* (duboisine sulphate or hydrobromate); dose, 0.0004 to 0.002 Gm. (or gr.  $\frac{1}{150}$ - $\frac{1}{30}$ ).

**Physiological Action.**—The effects of duboisia are the same as those of belladonna, although, on account of its greater solubility, its effects are manifested more quickly and pass away sooner than those of belladonna. Duboisine may cause loss of appetite, headache, giddiness, and the symptoms of belladonna poisoning. According to Evensen, duboisine will sometimes give rise to hallucinations of sight. Loiacono and Masuro, in a number of cases of epilepsy, observed improvement in two-thirds of the cases from the use of duboisine sulphate. Birnabee has found this remedy injected daily serviceable in the morphine habit. The craving for morphine seemed to be destroyed. Experience has shown that the frequent administration of duboisine exerts a deleterious influence upon nutrition, irrespective of whatever digestive derangement it may occasion. The presence of gastro-intestinal disorder aggravates its depressant effect upon the nutritive processes. The drug must, therefore, be administered with caution to persons of feeble constitution.

**Therapy.**—It is used in medicine for the same purposes as belladonna, and is antagonistic to morphine. In ophthalmology a watery solution of 1 per cent. may be instilled for making examinations, etc. Its effects upon the pupil pass off more quickly than a similar solution of atropine. Various nervous disturbances occasionally follow the use of a collyrium containing duboisine: faintness and strange sensations in the head, as in Dr. Seely's case, and a feeling of impending death, giddiness, pain over the heart, and hallucinations, as in a case reported by Aubone.<sup>1</sup> Crouzet met with a case in which the application of duboisine to the eye gave rise to frequent pulse, extreme weakness, rise of temperature, and disturbances of speech similar to those of aphasia.

Duboisine has been found useful as a sedative in cases of alienation accompanied by restlessness and great mental excitement. Dr. H. Gollhorn has lately published a communication upon the use of duboisine sulphate in various forms of cerebral disease. He administers the drug both by the mouth and hypodermically, the dose for injections being from 0.0008 to 0.0013 Gm. (or gr.  $\frac{1}{80}$ - $\frac{1}{100}$ ) for women and 0.0013 to 0.002 Gm. (or gr.  $\frac{1}{80}$ - $\frac{1}{50}$ ) for men. In a few instances slight pain was caused by the injections, but abscesses or extensive infiltration were not observed. The cases in which a favorable action was witnessed were progressive paralysis, senile dementia, secondary imbecility, hallucinations, idiocy, acute melancholia, periodic mania, hallucinations from injury, and alcohol-nicotinism. Dr. Gollhorn esteems this preparation as a prompt sedative in cases of alienation attended with excitement. It possesses the advantage over hyoscyne of being less dangerous. A rapid subsidence of the tremor of paralysis agitans, according to Dr. Mendel, of Berlin, follows the hypodermic injection of duboisine. The effect continued for several hours. Professors Albertoni, Bemando, and Samuely have witnessed a notable effect upon the convulsions

<sup>1</sup> *Medical Bulletin*, Jan., 1890, p. 14.

of hystero-epilepsy, produced by the injection of 0.00046 Gm. (or gr.  $\frac{1}{130}$ ) of duboisine sulphate.

The effect of the remedy may not be at once apparent, but may be postponed to the second or third day. To correspond with this slowness of action, its influence is generally continued for a considerable period. Duboisine is, in general, more efficient in chronic than in acute insanity. It is not adapted for use as a general hypnotic, as the sleep which it produces is not of a refreshing character. It has, however, a beneficial effect as an hypnotic in cases of insomnia caused by intense motor excitement.

**DULCAMARA.**—*Dulcamara* (Bitter-sweet).

**Dose,** 2 to 4 Gm. (or gr. xxx-5j).

*Preparation.*

*Fluidextractum Dulcamaræ.*—Fluid Extract of *Dulcamara*. Dose, 2 to 4 c.cm. (or mxxx-f3j).

**Pharmacology.**—The dried young leaves of *Solanum Dulcamara* (Solanaceæ) are official in most pharmacopœias, but not in the United States Pharmacopœia. A decoction may be made (1 to 16). A substance exists in this plant which yields a bitter alkaloid, **Solanine**, crystallizing in white needles, readily soluble in alcohol, less soluble in water; its salts are soluble in either alcohol or water. It also contains a bitter glucoside, **Dulcamarin**.

**Physiological Action.**—Eruptions upon the skin attended by duskiness and itching are among the effects of poisoning, which is likely to occur in children, from eating the berries. It also causes vomiting, dizziness, convulsive attacks, abdominal pains, thirst, heat and dryness of the throat, rapid respiration and pulse, and prostration of vital powers. In the ordinary doses it does not produce these effects, but acts as a sedative and mild narcotic.

The treatment in cases of overdose would be large amounts of warm water and mustard to wash out the stomach, and hypodermic injections of morphine and atropine, with diffusible stimulants by the mouth.

**Therapy.**—*Dulcamara* is seldom used at present, although it is believed to be serviceable in chronic skin affections of a scaly character. The recent decoction may be used as a diaphoretic in rheumatism, or acute bronchitis and colds. A distinct anaphrodisiac effect has been noted in patients during the administration of *dulcamara*. The extract may be given in mania, and especially nymphomania or satyriasis.

Desnos has reported favorably concerning the use of solanine in painful affections of the stomach. He usually administered it in pill form and in doses of 0.045 Gm. (or gr.  $\frac{3}{4}$ ) half an hour before meals. If the pain is very severe, the remedy may be beneficially given in gummy solution. Solanine was found of service in gastralgia, painful dyspepsia, alcoholic gastritis with or without dilatation of the stomach, ulcer of the stomach, and cancer of the pylorus. Good results have also been reported from the use of solanine in various forms of neuralgia, in locomotor ataxia, asthma, muscular rheumatism, chronic bronchitis, and the vomiting of pregnancy.

It is claimed that *dulcamara* is beneficial in the diarrhœa of children, when this condition is caused by exposure to cold or damp.

**ECHINACEA.**—*Echinacea angustifolia*, a plant growing in our Western States, is said to possess active therapeutic properties, especially as an anti-

**septic.** A tincture made by macerating 1 pound of the fresh root in 1 pint of alcohol has been used, diluted with water, as a local application to chronic ulcers, abscess-cavities, and wounds. Internally, in doses of 0.60 c.cm. (or 10 drops), it is recommended in cholera infantum and cholera morbus. It is also reported to be useful in typhoid fever, malarial fevers, measles, small-pox, erysipelas, diphtheria, boils, and carbuncles. The tincture has been used with asserted success in the case of several individuals who had been bitten by rabid dogs. In some cases it seems to be prophylactic, while in others it favorably modified the symptoms. It is said to be an antidote to bites or stings of venomous insects or reptiles.

**EIGON.**—Eigon is the generic name given by Dieterich<sup>1</sup> to a group of compounds of albumin with iodine in stable combination. The preparations are intended to replace the iodine preparations hitherto used, both internally and externally. The following are to serve as a basis for various medicinal preparations: **Alpha-eigon**, occurring as a light-brown, odorless, tasteless, and insoluble powder, containing 20 per cent. of combined iodine, which is liberated by both acids and by alkalis, more readily, however, by acids; **alpha-eigon sodium** (sodium iodoalbuminate), an almost colorless, odorless, and nearly tasteless powder, containing about 15 per cent. of iodine, soluble in cold, but more readily so in hot water, and principally intended to replace potassium and sodium iodides; **beta-eigon** (iodized peptone), with properties similar to those of the above-mentioned preparations, but specially intended for use where large quantities of iodine are required to be ingested, and a more ready and rapid absorption required because of weakened digestive functions or of gastric affections. Five parts of alpha-eigon sodium are equal, in iodine-content, to 1 part of potassium iodide; and 5 1/2 parts are equal to 1 part of sodium iodide.

Tischer and Beddies studied the effect of topical application of alpha-eigon in wounds of various descriptions, and report that it manifested a prompter and more satisfactory action than iodoform. It was found very satisfactory in boils, felons, and tuberculous and venereal processes of the skin. The authors also used alpha-eigon sodium and beta-eigon internally, in malignant syphilis, syphilitic laryngitis, scrofula, and tuberculous lung trouble. The doses were 3 Gm. (or gr. xlv) a day, gradually increased to 10 Gm. (or gr. cl) daily, taken in malt extract or wine.

**ELASTICA (U. S. P.).—India Rubber (Caoutchouc, Liq.).**

**CAOUTCHOUC (B. P.).—India Rubber.**

#### *Preparations.*

**Empastrum Adhæsivum (U. S. P.).—Adhesive plaster.** (India rubber, 20 parts; Petrolatum, 20 parts; Lead-plaster, 960 parts.)

**Liquor Caoutchouc (B. P.).—Solution of India Rubber** (India rubber, 50 Gm.; benzol and carbon bisulphide, each, 500 c.cm.).

**Pharmacology.**—"The prepared milk-juice of several species of *Hevea* (*Euphorbiaceæ*; *Hevea brasiliensis*, B. P.) known in commerce as Para rubber." India rubber occurs in cakes or balls, or hollow bottle-shaped masses; externally brown or brownish-black, internally of lighter tint. It is dense,

<sup>1</sup> *Pharmaceutische Centralhalle*, xxxiii, p. 183.

very elastic, and, when pure, or nearly pure, floats on water. It is quite insoluble in water, diluted acids, or dilute solutions of alkalies, but is soluble in chloroform, carbon disulphide, oil of turpentine, benzin, and benzol. If heated to 125° C. (257° F.), it will melt, remaining soft and adhesive after cooling. Odor faint, peculiar; nearly tasteless.

Is used in pharmacy for making rubber adhesive plasters. The rubber bandage is used in surgery.

**ELATERINUM** (U. S. P., B. P.).—**Elaterin.**

**ELATERIUM** (B. P.).—**Elaterium.**

#### *Preparations.*

**Trituratio Elaterini** (U. S. P.).—**Trituration of Elaterin** (1 to 9 milk-sugar). Dose, 0.006 to 0.04 Gm. (or gr.  $\frac{1}{16}$ - $\frac{1}{4}$ ).

**Pulvis Elaterini Compositus** (B. P.).—**Compound Powder of Elaterin** (1 to 39 milk-sugar). Dose, 0.065 to 0.25 Gm. (or gr. i-iv).

**Pharmacology.**—Elaterin is "a neutral principle obtained from *Elaterium*: a substance deposited by the juice of *Cucurbitum Elaterium* (*Cucurbitaceæ*)" (U. S. P.). The active principle of *Elaterium* (B. P.). The freshly-expressed juice of the fruit of the squirting cucumber, upon standing, deposits a peculiar, resinous substance, which, when collected upon muslin and dried, forms flat pieces of variable thickness and irregular shape, of a pale-green or grayish color, mostly amorphous, but containing some crystals. This constitutes commercial, and formerly official, elaterium. **Elaterinum** exists in the proportion of from 15 to 40 per cent. in elaterium. On account of this variability in strength the latter has been dropped from the U. S. P., and the more reliable elaterin substituted. The elaterin is extracted from elaterium by chloroform and precipitated from the chloroform solution by the addition of ether, in which it is nearly insoluble. In prescribing, elaterin must not be dispensed for elaterium, as it is from two to six times stronger. Elaterin in crystalline, odorless, intensely bitter and acrid, soluble in chloroform, fusel-oil, or carbon disulphide, and in 125 parts of alcohol. It is a neutral substance, and is not precipitated by tannic acid or by salts of mercury.

**Physiological Action.**—Elaterin is violently purgative, causing profuse, watery stools with griping, and in large doses producing great prostration. Death has resulted from excessive doses. Dangerous symptoms require demulcents, opiates, and stimulants. It must be used with caution in elderly persons. It purges when injected hypodermically, but to obtain its full effects it must be mixed with the bile. It also occasions an excessive flow of saliva.

**Therapy.**—In ascites, uræmia, cerebral congestion, pulmonary œdema, and poisoning by narcotic substances, elaterin affords a ready means of evacuating the bowels, and of reducing the volume of circulation by draining water from the vessels, or "bleeding through the tissues." It should not be given for ordinary constipation, as it is too depressing. On account of its great activity a small fraction of a grain may produce collapse from hypercatharsis. It is not safe to begin with a dose larger than 0.003 Gm. (or gr.  $\frac{1}{20}$ ). The trituration, therefore, in which the drug is reduced by triturating it with 9 parts of sugar of milk, is an eligible and useful preparation. According to Dr. Hyde Salter, a small dose of elaterin, given on alternate mornings, is of value in dropsy dependent on aortic disease.

**ELECTROZONE.**—An antiseptic solution obtained from sea-water by partial decomposition by electricity, the chlorides and bromides being converted into hypochlorites and hypobromides.

**ELEMI.**—The concrete, resinous exudation from *Canarium commune* (Burseraceæ). This is a tree of the Philippine Islands and other tropical localities which affords an oleoresin, obtained from incisions into the living bark. Elemi somewhat resembles granular honey when fresh, becomes more solid and friable when kept for some time. The taste is rather pungent and bitter. It contains 60 per cent. of amorphous resin, **Brein**; 25 per cent. of crystallizable resin, **Amyrin** (*a*, **Amyrin**, and *b*, **Amaryn**); about 10 per cent. of a volatile oil, besides a crystallizable, bitter, acrid substance, **Bryoidin**; also, **brüidin** and **elemic acid**.

**Physiological Action.**—It has stimulating and irritating properties, and is only used as an ingredient in plasters and ointments, or for use externally. It is similar to other terebinthinate agents in its effects. The British Pharmacopœia recognizes an ointment of elemi, composed of 8 Gm. (or 3ij) of elemi and 31 Gm. (or 3j) of simple ointment.

**Therapy.**—Used as an application to enlarged joints, and as a resolvent to swollen glands. It may also be applied to indolent ulcers, and is a good dressing for burns, blisters, and chilblains.

**EMBELIA RIBES.**—**Babarang.** The *Embelia ribes* (Myrsinæ) is a climbing plant of southern China, eastern India, and Malaya. The dried and powdered fruit is used, or the fluid extract of the fruit (dose, 4 to 15 c.cm., or fʒi-iv). It is an efficient anthelmintic and tœniacide; is believed to be a tonic in rheumatism; and is an alterative in chronic skin diseases. In cases of flatulent dyspepsia it is claimed to be serviceable. The active principle was found to be an acid, which has been named **Embelic Acid** (Warder), and is insoluble in water. It forms salts with soda, potash, and ammonia, the latter being most readily obtained crystalline.

**Ammonium embelate** occurs in the form of red needles or powder devoid of taste. This ammonium salt was found effective as an anthelmintic against tœnia, in doses of 0.38 Gm. (or gr. vj) for adults, or 0.20 Gm. (or gr. iij) for children. It is administered in syrup, to be followed by castor-oil. It has the advantages over male fern of smallness of dose and tastelessness. It kills the worm. The powdered seeds may be given with milk early in the morning, fasting, followed by a purgative some hours later. The dose of the powder for a child is 4 Gm. (or 3j), twice a day, as a tœniacide, or about the same quantity of a fluid extract.

**EPHEDRA.**—**Mormon Tea.** The stems or the whole herb of *Ephedra sinensis* (*Gentianaceæ*) is used in Arizona as a recent infusion, or in the form of fluid extract (dose, 4 to 7.5 c.cm., or fʒi-ij) as an alterative, and especially in the treatment of gonorrhœa and syphilis. It contains a peculiar kind of tannin, to which its effects are probably attributable, according to Prof. Oscar Loew's analysis; although in a Japanese variety, *E. vulgaris*, Professor Nagai discovered an alkaloid, which he named **Ephedrine**.

The physiological action of ephedrine has been studied by Professor Bogoslawski, who concludes that it influences especially the motor apparatus of the heart and probably also the cardiac muscle. It at first reduces blood-

pressure temporarily and accelerates the pulse, but arterial pressure is finally elevated and the pulse retarded. The respiration is quickened in the beginning by small doses, but, under the influence of larger amounts, sooner or later becomes slow and irregular. The pupils are dilated and salivation occurs. Professor Bogoslawski places the active dose of the alkaloid at 0.10 to 0.50 Gm. (or gr. iss-vss) for adults. The best preparations for use are the fluid extract and the ephedrine hydrochlorate.<sup>1</sup> The alkaloid occurs in the form of colorless crystals. Ephedrine hydrochlorate is also colorless and is soluble in water.

**Ephedrine**, in 10-per-cent. solution, is a mydriatic, dilating the pupil without irritation in forty to sixty minutes. Under the name of **Mydrin** a combination of ephedrine and homatropine has been employed, and is esteemed particularly serviceable for diagnostic purposes on account of the transitory character of its action. Mydrin is a white powder, soluble in water. It is used in the strength of 10 per cent.

**Therapy.**—Dr. H. H. Rusby<sup>2</sup> is satisfied that the reputation of this drug as a remedy in gonorrhœa and in syphilis has some solid foundation. As an antiblennorrhagic its action is probably very similar to that of astringents now in use. As a remedy in syphilis, he says, its value is, probably, solely that of a depurative. In the removal from the system of the accumulated products of the disease, ephedra will take rank with any agent now in use, with the single exception of potassium iodide, and it may well serve to alternate or combine with that drug. It is also considered by persons living in the region of its growth to be a "sure and speedy cure for skin diseases."

*Ephedra vulgaris* has long had a popular reputation in Russia as an antirheumatic remedy. Clinical experiments by Dr. Bechtine in the service of Professor Popow showed it to be of value especially in acute articular and muscular rheumatism. It was also found to have some laxative effect and to act as a decided diuretic.

**EPIGÆA.**—**Trailing Arbutus.** The *Epigæa repens* (Ericaceæ) is a small, herbaceous plant, with sweet-smelling flowers. The part used is the leaves, which are odorless, bitter, and astringent. They contain **Arbutin**, **Ursone**, and tannic acid.

**Therapy.**—The constituents of the plant are very much the same as those of *uva ursi* and *chimaphila*, and its uses are similar. It is given as an astringent in vesical catarrh, blennorrhœa, etc.

#### **EPINEPHRIN.** (See **Animal Extracts**.)

**ERGOTA** (U. S. P., B. P.).—**Ergot** (Ergot of Rye).

Dose, 0.65 to 4 Gm. (or gr. x-3j).

#### *Preparations.*

**Fluidextractum Ergotæ** (U. S. P.).—Fluid Extract of Ergot. Dose, 0.60 to 7.50 c.cm. (or mx-f3ij).

**Vinum Ergotæ** (U. S. P.).—Wine of Ergot (20 per cent.). Dose, 4 to 15 c.cm. (or f3i-iv).

**Extractum Ergotæ** (U. S. P., B. P.).—Extract of Ergot. Dose, 0.13 to 0.65 Gm. (or gr. ii-x).

<sup>1</sup> *Medical Bulletin*, Aug., 1894.

<sup>2</sup> *Druggists Bulletin*, 1888, p. 220.

**Extractum Ergotæ Liquidum (B. P.).**—Liquid Extract of Ergot. Dose, 0.60 to 2 ccm. (or ℥ss-xxx).

**Tinctura Ergotæ Ammoniata (B. P.).**—Ammoniated Tincture of Ergot. Dose, 2 to 8 ccm. (or f5ss-ij).

**Injectio Ergotæ Hypodermica (B. P.).**—Hypodermic Injection of Ergot (about 13 per cent.). Dose, 0.18 to 0.60 c.cm. (or miii-x).

**Infusum Ergotæ (B. P.).**—Infusion of Ergot (5 per cent.). Dose, 30 to 60 c.cm. (or ℥ij).

**Pharmacology.**—Ergot is the compact spawn or "sclerotium of the *Claviceps purpurea* (class, Fungi) replacing the grain of rye, *Secale cereale*, Gramineæ" (U. S. P.). The sclerotium of *Claviceps purpurea* originating in the ovary of *secale cereale* (B. P.). The ergot of rye is the only one official, although it also affects other grasses. The *Ustilago maidis* of corn is very similar in chemical composition and effects. Ergot is in compact masses, from 1 to 2 inches long and about  $\frac{1}{8}$  inch thick. The grains are nearly triangular, somewhat curved, and marked lengthwise by three grooves, thickest in the middle and tapering toward each end; of a dark-purple color externally, they are nearly white in the centre. They have a heavy, unpleasant odor, and a fatty, mawkish, disagreeable taste. The addition of a strong alkali develops an odor like that of herring-brine (due to trimethylamine). Ergot contains about 35 per cent. of fixed oil, a peculiar sugar, and two coloring matters. Chemists have isolated or derived a number of more or less active principles, the most important being those which act specifically upon the uterus. **Cornutine** is an alkaloid, insoluble in water and petroleum ether, but soluble in ether, chloroform, and alcohol. It is precipitated from acid solutions by alkalis, but is redissolved in excess. According to Keller the specific action of the drug is due to this alkaloid, which is much more stable than has been supposed by other investigators. Recent physiological tests have demonstrated that the full vaso-constrictor and oxytocic power of the ergot resides in cornutine. It has been observed that a fluid extract of ergot which possessed decided vaso-constrictor activity, lost it entirely when the cornutine was extracted.<sup>1</sup> **Ergotinic Acid** of Kober has little effect when taken into the stomach, where it is probably decomposed. But when injected hypodermically, it exerts a depressing and paralyzing action upon the spinal cord, and to a less degree on the brain. It has a narcotic action, and death occurs from respiratory paralysis. It is claimed to have no effect upon the gravid uterus. Kober claims that ergotinic acid is the basis of the **sclerotic acid** of Dragendorf, and is the principal ingredient in **Ergotin** (Bonjean). Vahlen reports<sup>2</sup> the isolation of a substance, which does not produce gangrene or convulsions; but has an energetic ecbotic action on the pregnant uterus. This principle he calls **Clavin**; it is soluble in water, microcrystalline, formula  $C_{11}H_{22}N_2O_4$ . It does not form salts. It has been used by Bunn and by Vahlen, in 2-per-cent. solution by subcutaneous injection, 0.01 to 0.02 Gm. (or gr.  $\frac{1}{6}$ - $\frac{1}{3}$ ), for uterine inertia in labor. The solution should be freshly prepared. **Sphacelinic acid** (probably identical with **Sphacelotoxin**), according to Kober, represents the portion of the drug causing gangrenous ergotism through its action upon the blood-vessels and vasomotor centres, and acting on the uterus with cornutine in causing contraction of its muscular fibres. A substance similar in composition to

<sup>1</sup> *National Standard Dispensatory*, Philadelphia, 1906, p. 571.

<sup>2</sup> *Deutsch Med. Woch.*, August 10, 1905.

cholesterin, and therefore termed ergosterin, has been extracted from ergot by C. Tanret. As both sphacelic acid and cornutine lose their properties by keeping, it is important to use fresh ergot. After being kept for one year, ergot is unfit for use.

**Physiological Action.**—No local effects are observed from application of ergot to the skin; upon mucous membranes it acts as an astringent. Upon the nervous system little effect is produced directly, although in ergotism we have convulsions and other nervous symptoms, caused indirectly. It induces anæmia of nerve-centres by exerting a selective action upon their blood-vessels, which it causes to contract. When introduced into the circulation, there is, first, a fall of blood-pressure, soon followed by a rise; the primary fall is most marked where a large amount comes in contact with the heart-muscle, which is depressed by it, and paralysis of the heart may cause death, after intravenous injection of ergot. The secondary rise of blood-pressure represents the effect of the physiological stimulating action of the drug upon the vasomotor centres and upon the unstriated muscular fibres in the arterioles.

The action of ergot upon the uterus is due to a primary influence upon the lumbar cord, according to the experimental study of Hemmeter. It produces intestinal peristalsis and contraction of arterioles and capillaries by a centric action. The effects of ergot upon the parturient uterus are those of a stimulant to the contractions, increasing their force and frequency until the full action is brought about of tetanic contraction of the organ. Upon the non-parturient uterus the effects are more evident in checking the blood-supply. The lower animals abort after eating ergotized grain, and in some States there are laws against the administering of ergot to pregnant women in order to produce miscarriage; but such result does not follow the use of ergot in ordinary medicinal doses, although in chronic ergotism this accident may occur.

**Toxic Effects.**—When an overdose is administered, effects result which are known collectively as **acute ergotism**. The symptoms are peculiar restlessness, with anxiety, headache, vertigo, dilated pupils, tinnitus aurium, with hyperacusis, the action of the heart is slowed, the pulse is weak, respirations reduced in frequency, and, as the effects increase in intensity, suddenly nausea and vomiting occur, even when the drug is introduced hypodermically. This cerebral vomiting is distinct from the local effects of the drug when taken by the mouth, when vomiting may occur early if the stomach is very sensitive. Coldness of the surface is a prominent symptom and seems to depend upon a general depression of temperature.

**Chronic ergotism** occurs in regions of the country, notably in Europe, where rye-bread is the staple food, in seasons when ergot is most present in the grain. It appears in two forms, the convulsive and the gangrenous, the former being characterized by vertigo, dimness of vision, and numbness of the extremities, followed by tonic contractions, particularly of the flexor groups of muscles. Attacks of dyspnoea also occur, resembling asthma, caused by tetanoid contractions of the respiratory muscles. Cramps of abdominal muscles, colic, and diarrhœa take place; the pulse is slow and weak; the surface of the body is cold; the symptoms increase in intensity; the special senses are affected; hearing and smell are lost; the pupils are permanently dilated, and vision is impaired. The case may be terminated by clonic convulsions or death result from exhaustion. The gangrenous form is

marked by the intensity of the local phenomena, the numbness of the fingers and toes terminating in vesications, and moist or dry gangrene, more or less extensive, destroys these parts, or may affect the nose or other portions of the body. It is evident that in chronic ergotism there is a profound dyscrasia, perhaps attributable as much to the unhygienic mode of life and poor food as it is to the toxic effects of ergot. Such grave effects are not observed from the medicinal administration of ergot, even when continued for a long time. The prolonged administration of ergot has, however, been known to cause a vesicular, pustular, and furuncular eruption, with petechiæ.

**Treatment of Poisoning.**—The phenomena of acute ergotism are easily controlled by placing the patient in a hot bath and administering cardiac and arterial stimulants, such as coffee. Amyl nitrite, aconite, veratrum viride, and tobacco antagonize the effects of ergot upon the circulation. The treatment of chronic ergotism is mainly hygienic and symptomatic.

**Therapy.**—Ergotin made into a paste with water has been employed locally in conjunctivitis, gonorrhœa, endocervicitis, acne rosacea, and incipient boils. Ergot is valuable in hæmorrhoids, prolapsed rectum, and relaxation of the sphincter ani, when applied upon a tent or introduced as suppositories. Incontinence of urine, due to relaxed sphincter, is cured by ergot given in this manner, or administered by the mouth.

By Dr. T. Clemens, ergotin is said to be a valuable remedy in the ammoniacal cystitis of paraplegic patients. The bladder is injected with a solution containing about 4 grains to the ounce, and the drug is, at the same time, administered by the mouth.

Chronic follicular pharyngitis is sometimes improved by the topical application of the fluid extract, or of ergotin in the proportion of 0.65 to 1.30 to 30 c.cm. (or gr. x-xx to ℥j). The oil of ergot is a valuable local medicament in seborrhœa, removing the sebaceous material, and, at the same time, by its astringent and stimulant action, benefiting the diseased follicles and glands. Locally, in congestive conditions, ergot may be prescribed according to the appended formulæ:—

R Ext ergotæ.....	2	Gm. or 3ss.
Cocaine hydrochloridi.....	32	Gm. or gr. v.
Plumbi carbonatis.....	2	Gm. or 3ss.
Ungt. aque rose.....	15½	Gm. or 3ss.

M. For external use in acne rosacea and in boils.

R Ext ergotæ.....	4	Gm. or 3j.
Sulphuris sublimati.....	2	Gm. or 3ss.
Mentholi.....	32	Gm. or gr. v.
Ext. belladonnæ folior.....	65	Gm. or gr. x.
Ungt. zinci oxidi.....	15½	Gm. or 3ss.

M. Valuable in fissures of the nose, mouth, rectum, and in hæmorrhoids.

R Ext ergotæ.....	32	Gm. or gr. v.
Camphoræ.....	65	Gm. or gr. x.
Ext. opii.....	17	Gm. or gr. iiss.
Plumbi acetatis.....	130	Gm. or gr. xx.
Ol. theobromatis.....	q. s.	

M et ft. suppositoriæ no. x.

Sig. Insert one in the bowel when necessary, for prolapsed rectum, diarrhœa, or for fissure of rectum.

R Fluidextracti ergotæ.....	ss	45	c.cm. or ℥iiss.
Fluidextracti hamamelidis.....		30	c.cm. or ℥j.
Glycerini.....			

M. Sig.: Apply several times a day for chronic pharyngitis and nasal catarrh.

R. Olei ergotæ .....	90	c.cm. or fʒiij.
Adipis lane .....	31	Gm. or ʒj.
Ol. verbenæ .....	30	c.cm. or mv.
Ol. rosæ .....	18	c.cm. or miiij.

M. Sig.: Rub into the scalp well once or twice a day for dandruff. Useful, also, in loss of hair and sycosis.

Ergot is a reliable remedy in the several forms of capillary hæmorrhage, and in overcoming the congestion attendant upon and causing the oozing. In hæmoptysis, epistaxis, hæmaturia, bloody discharges from the bowels (melæna), and in uterine hæmorrhage, ergot in 2 c.cm. (or fʒss) doses of the fluid extract, repeated every hour or two, will generally promptly cause cessation of the bleeding. Ergot may be prescribed for various hæmorrhages with advantage, combined with geranium and witch-hazel:—

R. Fluidextracti ergotæ .....	45	c.cm. or fʒiss.
Fluidextracti geranii .....	30	c.cm. or fʒj.
Fluidextracti hamamelidis .....	45	c.cm. or fʒiss.

M. Sig.: A teaspoonful or two every half-hour or hour until bleeding ceases.

Blaschko, of Berlin, employs the following formula in hæmoptysis:—

R. Ergotin,		
Acid. gallici .....	aa 1	Gm. or gr. xv.
Syr. althææ,		
Aq. destill. ....	aa 22	c.cm. or fʒvj.

M. Sig.: Teaspoonful every two hours.

Binz considers, however, that the action of ergot in stopping hæmorrhages, other than uterine, is doubtful.

In severe cases of post-partum hæmorrhage a better practice is to administer the fluid extract or ergotin by subcutaneous injection. The same method is preferable when ergot is used in the treatment of fibromyomata of the womb. Where uterine hæmorrhages are due to submucous polypi or fibromyomata, ergot not only checks the hæmorrhages, but may cause the separation and expulsion of the growth; in such cases the progress of the treatment should be accelerated by dilatation of the cervix uteri, incision into the capsule, if one exists, and removal of the growth by surgical operation. In multipara, where there is a history of flooding after previous labors, full doses of ergot should be given just before the delivery of the child. The usual rule for the administration of ergot is to wait until the child's head is upon the perineum before giving it; otherwise there may be an hour-glass contraction, or tetanic contraction with unyielding os, and the child's life be endangered. The administration of 2 to 4 c.cm. (or fʒss-j) of fluid extract of ergot, after labor has terminated, prevents relaxation of the organ and the formation of large clots, which cause after-pains. An antiseptic preparation of ergot, especially designed for subcutaneous injection, is supplied under the name of **Ergone** (P. D. & Co.). It is standardized, and is kept from spoiling by a little chloroform, which it contains.

In subinvolution of the uterus, Professor Barton Cooke Hirst recommends:—

R. Strychnin. sulphat. ....	ʒ003	Gm. or gr. ʒ/xx.
Quinin. sulphat.,		
Ext. ergotæ .....	aa	ʒ065 Gm. or gr. j.

M. et ft. pil. no. j. Mitte tales no. xxx.

Sig.: One pill three times a day.

In night-sweats, ergot may be given alone in full doses, or combined with picrotoxin or atropine. This remedy has likewise been found of advantage in the treatment of galactorrhœa. Ergot is often of avail in hyperidrosis. It is efficacious in all varieties of purpura, and in severe cases of the hæmorrhagic form may very properly be hypodermically injected. This drug is of value in the treatment of chronic diarrhœa and dysentery.

In dysentery of children, accompanied by severe pain and excessive tenesmus, the following preparation is beneficial:—

R̄ Cocain. hydrochloridi.....	065	Gm. or gr. j.
Ext. ergotæ .....	65	Gm. or gr. x.
Ext. opii .....	13	Gm. or gr. ij.
Thymolis iodidi.....	32	Gm. or gr. v.
Ol. theobromatis .....	q. s.	

M. et ft. suppos. no. x.

Sig.: One every two or three hours.

R̄ Fluidextracti ergotæ,		
Fluidextracti hamamelidis.....	aa 45	c.cm. or fʒiss.
Elix. guaranæ .....	60	c.cm. or fʒij.

M. Sig.: Two teaspoonfuls in water every two or three hours, for an adult.

In passive or hypostatic congestion of the lungs, it may be combined with digitalis with advantage:—

R̄ Ext. ergotæ .....	25	Gm. or gr. iv.
Extracti digitalis .....	20	Gm. or gr. iij.
Pulv. ipecacuanhæ et opii .....	155	Gm. or gr. xxiv.

M. et ft. pil. no. xij.

Sig.: A pill every three or four hours.

R̄ Ext. ergotæ .....	1	Gm. or gr. xv.
Glycerini,		
Aquæ destillatæ .....	aa 4	c.cm. or fʒj.
Aquæ phenolis.....	2	c.cm. or mxxx.

M. Sig.: Inject hypodermically 1.20 to 2 c.cm. (or mxx-xxx) from two to four times a day in hæmoptysis.

In diabetes insipidus the fluid extract of ergot produces marked effect on the disease, having a decided influence in controlling the urinary excretion. Favorable results have been claimed in diabetes mellitus from the hypodermic injection of ergotin or ergotinin. It is serviceable in congestive dysmenorrhœa, paralysis of the bladder, congestive form of migraine, and in hyperæmia of the spinal cord. It is claimed that ergot is capable of relieving whooping-cough. Varicose veins are restored to their normal calibre by hypodermic injections of ergotin, and Bartholow strongly recommends this mode of treatment as efficacious in varicocele. The needle should be thrust among the enlarged veins in such a manner as not to wound their walls. Injected into the neighborhood of an aneurism, or administered by the mouth, ergot proves valuable by favoring the coagulation of blood within the sac. Enlarged spleen may be reduced by the same methods. In view of the fact that ordinary pharmaceutical preparations are not aseptic, and that ergot fluid extract cannot be readily sterilized by heat without injury, manufacturers now supply a special form of ergot for hypodermic use, the usual dose being put up, singly, in small hermetically-sealed glass flasks. Each bulb contains 1.20 c.cm. (or mxx) of aqueous solution, representing the equivalent weight of ergot.

Ergot combined with iron has very often a beneficial action in enlarged spleen :—

R Fluidextracti ergotæ,  
Tincturæ ferri chloridi,  
Glycerini ..... aa 30] c.cm. or fʒj.

M. Sig.: From one to two teaspoonfuls in water three or four times a day.

From its effects upon the vascular supply of the spinal cord, Brown-Séquard has proposed its use in some forms of paraplegia attended by signs of local irritation and hyperæmia of the cord. It is useful in congestive headache and in chronic mania, and has been used with asserted good result in spermatorrhœa and incontinence of urine. The hypodermic injection of a sterilized fluid extract is said to afford relief in facial neuralgia and in insomnia. In delirium tremens, and the wet brain of drunkards, ergot hypodermically is of great value, according to F. N. Wigger and F. A. Livingston.<sup>1</sup>

From Budapest, cornutine is recommended as having an efficient action upon unstriped muscular tissue, while it is, at the same time, less dangerous than the other constituents of ergot. Pure cornutine is almost insoluble in water. The hydrochlorate, or citrate, is more readily soluble. Dr. Meisels has administered the drug in daily doses of 1 cg. (or gr.  $\frac{1}{16}$ ), divided into four portions. In hæmorrhages from the genito-urinary organs cornutine rapidly caused a cessation of the bleeding. He observed it to act promptly in gonorrhœa accompanied by hæmorrhage from the bladder or urethra, in hæmorrhage from cystitis, and during the lying-in period from atony of the womb. Professor Bokai also has given cornutine citrate, with excellent results, in spermatorrhœa of the paralytic type.

When impaired vision depends upon congestion of the retina incident to dilated or hypertrophied heart, and in cases of epilepsy when hemierania occurs in the intervals of rest, when the pupils are contracted and vision disordered, ergot has been used with advantage. In the treatment of psychoses, associated with intracranial congestion and perhaps inflammation, ergot is a valuable adjunct to other modes of treatment.

### ERIODICTYON (U. S. P.).—Eriodictyon (Yerba Santa).

#### Preparation.

Fluidextractum Eriodictyi (U. S. P.).—Fluid Extract of Eriodictyon. Dose, 1 to 4 c.cm. (or mxv-fʒj).

**Pharmacology.**—"The dried leaves of *Eriodictyon Californicum* (Hydrophyllaceæ)." of California, have a fragrant odor and an aromatic, sweetish taste, and contain about 9 per cent. of a greenish-yellow, acrid, and bitter resin, which forms soluble salts with basis, and unites with quinine to form a crystalline quinine resin. They also contain a small quantity of amorphous brown **Ericolin**, and also **Eriodictyonic Acid** (crystallizing in yellow plates of sweet-acid taste), and a volatile oil. The effects are most evident in the bronchial mucous membrane, to which it is a stimulant and expectorant. The extract of eriodictyon is not official (made by evaporating the fluid extract to a pilular consistency). Dose, 0.20 to 1 Gm. (or gr. iii-xv).

<sup>1</sup> *Merck's Archives*, April, 1903.

**Therapy.**—Yerba Santa has a reputation in the treatment of bronchitis, laryngitis, and consumption. It has likewise been found beneficial in asthma, and may be very well administered in conjunction with *grindelia robusta*. It is used as a vehicle for the administration of quinine, the bitterness being overcome by the aromatic principles of the plant. The National Formulary provides an aromatic syrup of eriodictyon, of which a teaspoonful completely masks the bitterness of 0.13 Gm. (or gr. ij) of quinine sulphate, as in the following formula:—

R Quinine sulphatis ..... 3'10 Gm. or gr. xlvij.  
 Fluidext. belladonnæ radicis ..... |12 c.cm. or mij.  
 Syrupi eriodictyi aromatici (N. F.) ..... q. s. ad 90 c.cm. or fʒij.  
 M. Sig.: A teaspoonful four times daily in laryngitis or chronic bronchitis.

### ERYTHROPHLEUM.—*Erythrophloeum*. (See *Casca Cortex*.)

**ESCHSCHOLTZIA.**—The *Eschscholtzia Californica* (Papaveraceæ), or the California poppy, enjoys a reputation upon the Pacific coast of this country as a soporific and analgesic. It is represented by a number of varieties, and it is necessary to obtain the genuine species, as some appear to be inert. It is claimed that it possesses a small amount of **Morphine**, although other principles contribute toward producing its effects, among which is **Sanguinarine**. Professor Schmidt, from his examination of the plant, is unable to confirm the statement that it contains morphine.

**Physiological Action.**—The effects upon animals are gradual slowing of respiration after a brief preliminary increase of rapidity; death is due to failure of respiration. The effect upon the nervous system is that of a narcotic. The motor nerves are affected before the sensory. The cumulative effects in human subjects resemble those produced by codeine. Though its narcotic effects are not very decided, yet they continue for a considerable period after its discontinuance.

**Therapy.**—It is claimed that the *eschscholtzia* is an efficient, though harmless, soporific agent, especially for children. It relieves pain and induces sleep, relieves tremor, and agrees well with the digestive organs. *Eschscholtzia*, in the form of the fluid extract or the syrup (2 to 18.5 c.cm., of fʒss-v, at a dose), is a good addition to a cough-mixture where the use of opium is not considered advisable.

**EUCAINE, A AND B** (Alpha-eucaine = Eucaine Hydrochloride "A," and Beta-eucaine = Eucaine Hydrochloride "B").—The manufacturers announce that when eucaine is ordered they will hereafter invariably supply beta-eucaine, unless otherwise specified. Both agents are in the form of a colorless crystalline powder, soluble in water. They have been introduced as a safe substitute for cocaine in minor surgery and as a local anæsthetic. Eucaine-B is claimed to be five times less toxic than cocaine and one-third as toxic as Eucaine-A. The solutions should be made with distilled water, and they can be sterilized by boiling. It is said that they will keep an indefinite time without spoiling. A 5-per-cent. solution may be injected into the gums previous to extraction of teeth, and is much safer for this purpose than 2-per-cent. solutions of cocaine. Beta-eucaine is used in Schleich's method of local anæsthesia, also in ophthalmological and laryngological practice for the same purpose that cocaine was used.

Recently eucaine has been used to produce spinal anæsthesia (see *Coca*) by lumbar puncture, allowing the surgeon to perform painless major operations below the diaphragm. It has the advantage over cocaine in that the solution may be sterilized without impairment of its efficacy. Though spinal anæsthesia is of advantage in selected cases, yet the danger attending its use must necessarily restrict its general employment in major surgery.

**EUCALYPTI GUMMI (B. P.).—Eucalyptus-gum.**

**Dose,** 0.13 to 0.32 Gm. (or gr. ii-v).

A ruby-colored exudation, or so-called red gum, from the bark of the *Eucalyptus rostrata*, and some other species of *eucalyptus*. Imported from Australia.

**EUCALYPTUS (U. S. P.).—Eucalyptus Leaves.**

*Preparations.*

**Fluidextractum Eucalypti (U. S. P.).—Fluid Extract of Eucalyptus.** Dose, 0.30 to 4 c.cm. (or *mv-f3j*).

**Eucalyptol (U. S. P.).—Eucalyptol ( $C_{10}H_{18}O$ ).** Dose, 0.30 to 2 c.cm. (or *mv-xxx*).

**Oleum Eucalypti (U. S. P., B. P.).—Oil of Eucalyptus.** Dose, 0.18 to 1.20 c.cm. (or *miil-xx*). B. P., 0.03 to 0.18 c.cm. (or *miss-ijj*).

**Unguentum Eucalypti (B. P.).—Eucalyptus Ointment (10 per cent.).**

**Trochiscus Eucalypti Gummi (B. P.).—Eucalyptus-gum Lozenge (0.085 Gm., or gr. j, of red gum with simple basis).**

**Pharmacology.**—The blue gum of Australia is a tall tree that has been of considerable interest to sanitarians, since it is easily cultivated in marshy grounds, and is said to render malarious districts, such as the Campagna, healthy. This is partly on account of the volatile oil and resins of the tree, and partly because it drains the soil of water, the exhalation of water from the leaves being equal in amount each day, on an average, to the weight of the tree. The official portion of the plant (U. S. P.) are "the dried leaves of *Eucalyptus globulus* (Myrtaceæ) collected from the older parts of the tree." They have a camphor-like odor and a pungent, bitter taste; contain a volatile oil, a crystallizable resin, and some tannin. The official volatile oil is distilled from the fresh leaves of *Eucalyptus globulus* and some other species of *eucalyptus*. The oil is soluble in absolute alcohol, and in 3 volumes of 90 per cent. alcohol. It is also soluble in ether, chloroform, and the fatty oils, but does not dissolve in water. It does not become resinous on exposure to the air. The volatile oil, by fractional distillation, is separated into three oils of different density, the lightest and most important being **Eucalyptol** (or **Cineol**, about 50 per cent.), the others being **Pinene** and **Eudesmol**. Pure eucalyptol is officially defined as "a neutral body obtained from the volatile oil of *Eucalyptus globulus* (fam. Myrtaceæ), and from other sources." It is a colorless fluid and has an odor and taste resembling that of camphor. The fluid extract, being made by percolation with alcohol, is a strong tincture. A medicated water, made like the official waters, is useful as a vehicle for alkaloids for hypodermic use, as it prevents fermentation and deterioration; it is also a vehicle for medicated sprays. Alkalies, mineral acids, and metallic salts (iron, mercury, lead, zinc) are chemically incompatible with preparations of this drug; while tonics, simple and aromatic bitters, essential oils, turpentine, camphor, cubeb, etc., are synergistic, and increase its physiological and therapeutical effects.

**Physiological Action.**—Eucalyptus is obnoxious to lower forms of life and is a good disinfectant. Applied to the skin, the oil is an irritant, increasing the local blood-supply and partly diffusing into the blood, where it produces systemic disease. The vapor of eucalyptus, inhaled in quantity, also produces systemic effects besides its local action upon the bronchial mucous membrane. In the mouth it is pungent, aromatic, camphor-like, or resembling cubeb in its impressions upon the nerves of taste. Eucalyptus excites the flow of saliva and leaves a disagreeable, hot, astringent flavor. In the stomach a sensation of warmth is felt, and it acts as a carminative and antiseptic; the appetite and digestion improve, and the secretion of the gastric juice and of the intestinal fluids is increased. It favors the evacuation of the bowels, and the alvine evacuations are somewhat more copious. This drug is a diaphoretic and diuretic, the eucalyptol being eliminated largely by the kidneys, but also through the skin and bronchial mucous membrane. Eucalyptus sometimes communicates to the urine an odor which has been likened to that of violets. The excretion of urea is augmented; the action of the heart is increased; the arterial tension is at first increased, then lowered. The respiratory movements are accelerated. Eucalyptus inhibits the amoeboid movements of the white blood-cells. Very large doses cause gastric distress, indigestion, diarrhoea, with congestion of the kidneys, the characteristic odor of eucalyptus being recognized in the urine, breath, and discharges from the bowels. The action of the heart and lungs is decreased and the temperature falls. Wakefulness is one of the physiological results, but it may indirectly favor sleep in debilitated conditions of the system. Paralysis of the respiration causes death in the lower animals to which a lethal dose has been given. Its action may be summed up as antiseptic, carminative, digestive, tonic, laxative, diaphoretic, expectorant, and diuretic.

Several cases of poisoning from the oil of eucalyptus have been reported. Dr Alfred Neale, of New Norfolk, Tasmania, observed a fatal case, death being preceded by great embarrassment of respiration. A large quantity of blood was found in the pleural cavities, the lungs were collapsed and bloodless, and the right heart contained frothy blood. A fatal case has recently been reported from England.<sup>1</sup> A man, 34 years of age, swallowed six drachms with an equal quantity of hot water. He soon became unconscious, and died two days later with acute congestion of the lungs.

**Therapy.**—Eucalyptus is used as an antiseptic in the treatment of wounds and ulcers, acting as a substitute for carbolic acid. An ointment of eucalyptus is official in the British Pharmacopœia, which is a good dressing to chronic, indolent, or unhealthy ulcers. The tincture, or the water, of eucalyptus may be used externally for the same purpose. A combination of eucalyptus and iodoform is a serviceable application to chancres and chancrelets. The oil is a very useful *addendum* to preparations for the relief of chronic eczema, in which the following combination is often found beneficial:—

R Hydrarg. ammoniat. ....	1	Gm. or gr. xv.
Olei eucalypti .....	50	c.cm. or ℥viiij.
Betanaphthol. ....	85	Gm. or gr. x.
Pulv. marantæ .....	8	Gm. or 3j.
Unguent. zinci oxidl. ....	31	Gm. or 3j.—M.

<sup>1</sup> *Journal of the American Medical Association*, February 17, 1906, p. 524.

The vapor may be used by dropping the oil upon hot water, or upon cotton-wool placed in an inhaler; or the steam-atomizer may be employed with eucalyptol-water for inhalation in phthisis, dilated bronchial tubes, bronchial catarrh with fetid expectoration, etc. Applied directly to the diseased membrane, or inhaled in a vaporized state, the oil is a good antiseptic in diphtheria. As a local application in diphtheria, Dr. Marion Thrasher, of San Francisco, uses a 10-per-cent. solution of eucalyptol in pure alcohol. One part of the oil to 50 of plain or medicated water, may be advantageously used as an injection in gonorrhœa. It may likewise be employed as a mild counter-irritant in bronchial and arthritic inflammations. In alopecia, when the scalp is covered and the glands occluded by a thickened and vitiated sebum, the oil of eucalyptus is of very material service. Its local stimulant effects sometimes prove valuable in anidrosis. A soap (sapo eucalyptoli) containing 5 per cent. of the oil is of utility in the treatment of foul wounds, or ulcers, and bromidrosis. In asthma, cigarettes may be smoked, containing leaves of eucalyptus, with belladonna or coca, and stramonium-leaves, associated with tobacco, if desired, and much advantage derived from it, especially if the fumes are inhaled. The fluid extract is an efficient stomachic in indigestion due to deficient secretion or to gastric or intestinal catarrh; by its use the intestinal tract becomes more healthy in character, and no longer affords a place of development for intestinal parasites. Eucalyptus is an efficient remedy in the vomiting caused by sarcinæ. In the ordinary oxyurides, or seat-worms, injections of a decoction of eucalyptus-leaves are useful, and this preparation may also be employed as a gargle for sore throat and stomatitis, scurvy, etc. The stimulating effect upon the circulation of the volatile oil, is well shown in cases of palpitation, irregularity, sudden flashes, and flatulence. As the drug is antiseptic, and escapes by the bronchial mucous membrane to a considerable degree, it is serviceable in chronic bronchitis, in the declining stage of pneumonia, in incipient phthisis, gangrene of the lungs, and diphtheria.

M. J. Roussel employs a mixture of eucalyptol and carbolic acid in some bland vegetable oil in the treatment of tuberculosis. He makes use of three different preparations, which respectively contain 10, 15, and 20 per cent. each of eucalyptol and carbolic acid. To the mixture he has given the name phenoeucalyptol and uses it by injection. He claims good results, in phthisis, anthrax, epithelioma, and lupus. The injections are said to be practically painless.

In acute bronchitis or laryngo-tracheitis of children, Dr. S. Solis-Cohen prescribes:—

R. Ammon. carbonat. ....	50 to	1	Gm. or gr. viii-xv.
Ammon. chlorid. ....	1/40 to	3/10	Gm. or gr. xxii-xlviij.
Fluidext. eucalypt. ....		6	c.cm. or f3ias.
Syr. acaciæ,			
Syr. Tolutan. ....	aa	15	c.cm. or f3ss.
Aquæ .....		60	c.cm. or f3ij.

M. Sig.: A teaspoonful in milk or water every two or four hours for a child two years of age.

In subacute cases he adds a little paregoric to the above or a similar mixture.

When there is an anæmic state of the nerve-centres manifested by chorea, neurasthenia, hysteria, and asthma, benefit is derived from eucalyptol

given in capsules, emulsion, or simply dropped upon sugar (0.12 to 0.30 ccm., or *mi-i-v*, at a dose). In rheumatic or malarial headache it sometimes proves efficacious. The oil of eucalyptus affords decided relief to the headache which accompanies epidemic influenza, and is likewise efficacious in the neuralgia which may follow as a sequel, and in migraine. The elixir of eucalyptus (N. F.) is a good restorative. It represents gr.  $7\frac{1}{2}$  of eucalyptus in each drachm.

Eucalyptus is believed to be especially serviceable in catarrhal affections of the genito-urinary organs, desquamative nephritis, pyelonephritis, chronic catarrh of the bladder, with putrid urine, and in gleet. It likewise effects improvement in vaginitis. In fevers, especially malarial fevers, it is useful; but it is inferior to quinine in controlling the paroxysms, being mostly employed in chronic malarial poisoning and in convalescence from acute attacks, when it may be used in alternation with cinchona. This remedy causes reduction of the enlarged spleen, or "ague-cake," due to malarial toxæmia.

Dr. Benjamin Bell recommends tincture of eucalyptus to be given in 4-ccm. (or *fʒj*) doses every third or fourth hour in typhoid fever, and believes that it exerts a favorable influence upon the diarrhœa. In scarlatina it is a good practice to add 5 drops of the oil of eucalyptus to 31 Gm. (or *ʒj*) of prepared lard, for use as an unguent to the general surface.

The red gum, or eucalyptus rostrata, is a pleasant astringent and is used in the form of the fluid extract as an application for tonsillitis and pharyngitis. Mr. Joseph W. England originated the following formula for a gargle, which is in use at the Philadelphia Hospital:—

Potassium chlorate .....	8	Gm. or gr. cxx.
Boiling water .....	120	c.cm. or <i>fʒiv</i> .
Powdered alum .....	4	Gm. or <i>ʒj</i> .
Stronger rose-water .....	79.50	c.cm. or <i>fʒiʒv</i> .
Glycerin,		
Syrup .....	aa 15	c.cm. or <i>fʒiv</i> .
Fluid extract of eucalyptus rostrata (red gum) ...	11	c.cm. or <i>fʒiij</i> .

Dissolve the potassium chlorate in the boiling water, cool, and reserve. Dissolve the alum in the stronger rose-water, add the glycerin, syrup, and fluid extract of red gum in the order named, and then add this to the reserved portion.

The product is a transparent ruby-red liquid, of a very agreeable odor and taste. To use, take a tablespoonful, add an equal volume of water, and gargle every three or four hours, or more often, if required.

It is a singular fact that fluid extract of red gum has not been received with more favor by the medical profession than it has. It possesses many advantages over other vegetable astringents; unlike sumach and catechu, its liquid preparations remain clear on dilution with water, and, what is more important, the astringency it exerts on mucous surfaces is peculiarly persistent. Stronger rose-water is double the strength of the usual rose-water, and gives, of course, a correspondingly stronger flavor of rose to the gargle. Possibly it might be of advantage, in some cases, to flavor the gargle with a few drops of oil of gaultheria in place of the rose-water.

**Eucalyptol**, or eucalyptene bichlorhydride, is a crystallized product derived from the essence of eucalyptus, by treating it with hydrochloric acid. Eucalyptol occurs in the form of white, micaceous scales, having a camphoraceous odor and a peculiar, faintly-bitter, persistent taste. This sub-

stance is soluble in ether, chloroform, fixed and volatile oils, petroleum ether, and acetic ether. It is almost insoluble in water and glycerin. In alkaline solutions and cold alcohol it is partially decomposed, a substance having the odor of terpinol being formed. According to the report of Dr. Lafage, eucalyptol is well borne by the stomach, is innocuous, and is decomposed in the intestine into hydrochloric acid and eucalyptol.

Eucalyptol is an efficient antiseptic, minute quantities preventing putrefaction, though it does not check the action of the digestive ferments. When taken by the mouth it is eliminated by the lungs, kidneys, and bowels. Eucalyptol is likewise eliminated in the saliva. When subcutaneously injected it is removed almost exclusively by the lungs.

**Therapy.**—Eucalyptol exerts a decided antiseptic action upon the bowel. It is appropriate to the treatment not only of diseases of the respiratory passages, but also to those involving the intestine, such as enteritis, diarrhoea, typhoid fever, fetid diarrhoea, the green diarrhoea of infants, etc.

In phthisis it allays the cough and other symptoms. It is preferably given in powders or capsules. The usual dose is 0.03 to 0.20 Gm. (or gr. ss-ij) or a total, daily, of 1.55 Gm. (or gr. xxiv) to adults.

**EUGALLOL.**—Pyrogallol Monacetate. (See Pyrogallol.)

**EUGENOL** (U. S. P.).—Eugenol. An unsaturated aromatic phenol obtained from the oil of cloves and other sources. It may be employed as a substitute for oil of cloves. (See *Oleum Caryophyllum*.)

**EUONYMUS** (U. S. P.).—Euonymus (Wahoo).

**EUONYMI CORTEX** (B. P.).—Euonymus-bark.

*Preparations.*

**Fluidextractum Euonymi** (U. S. P.).—Fluid Extract of Euonymus. Dose, 4 to 8 ccm. (or fʒi-ij).

**Extractum Euonymi** (U. S. P.).—Extract of Euonymus. Dose, 0.13 to 0.25 Gm. (or gr. ii-iv).

**Extractum Euonymi Siccum** (B. P.).—Dry Extract of Euonymus. Dose, 0.065 to 0.13 Gm. (or gr. i-ij).

**Pharmacology.**—"The dried bark of the root of *Euonymus atropurpurea* (Celastraceæ)" contains a bitter, amorphous substance; also, resins, euonic acid, and asparagin. The impure resin, with the bitter principle, is known commercially as **Euonymin** (dose, 0.03 to 0.13 Gm., or gr. ss-ij). The principal constituents are **Euonymin** and **Euonic Acid**. It also contains a fixed and a volatile oil, resins, bitter extractive, etc. True euonymin is an amorphous, odorless, bitter principle, soluble in alcohol, and slightly in ether. It is probably a crystalline glucoside.

**Physiological Action.**—Euonymus in small doses a tonic, increasing appetite and gastric secretions; in larger doses it is an irritant and cathartic. Euonymus is also an expectorant and diuretic, and exerts considerable influence upon the liver, as a cholagogue, resembling rhubarb in its action. The excretion of uric acid is at first increased, but subsequently diminished.

**Therapy.**—It has been employed as a cholagogic purgative, especially in conjunction with antiperiodic treatment, in malarial poisoning. In torpid liver and chronic constipation it aids the action of other remedies. Intestinal indigestion and jaundice are benefited by the administration of this

agent. As a diuretic, it has also been employed in cases of dropsy. Euonymin is a convenient form in which to prescribe it, although the solid extract is practically the same. It is claimed that it will cause the disappearance of albumin from the urine in acute Bright's disease. It also relieves a form of lumbago, which is more of a soreness and tenderness than actual pain. A preference is expressed for the preparations obtained from the green, fresh drug by the eclectic physicians, who esteem it highly.<sup>1</sup>

**EUPATORIUM** (U. S. P.).—*Eupatorium* (Thoroughwort, Boneset).

Dose, 1 to 4 Gm. (or gr. xv-3j).

#### Preparation.

*Fluidextractum Eupatorii* (U. S. P.).—Fluid Extract of *Eupatorium*. Dose, 2 to 4 c.cm. (or mxxx-f3j).

**Pharmacology.**—The dried leaves and flowering tops of *Eupatorium perfoliatum* (Compositæ), an indigenous plant, enjoy considerable reputation in recent infusion (boneset-tea) for acute colds, rheumatism, and dysmenorrhœa. They contain **Eupatorin**, a very bitter glucoside, with volatile oil, gum, and tannic acid. The root yields 5 per cent. of inulin.

**Therapy.**—The hot infusion (1 to 8) is a diaphoretic and (in large doses) emetic, acting like chamomile-flowers. The powdered dried herb is a domestic remedy for dyspepsia, but is best given in fluid extract.

The *Eupatorium purpureum*, gravel-root or trumpet-weed, an allied species, contains in its root an acrid resin and an oil, and is a stimulating diuretic. It is best given as a fluid extract of the root in dose of 2 to 7.5 c.cm. (or mxxx-f3j). Crystals of **Euparin** sometimes deposit from the fluid extract; it is a yellow, neutral crystalline principle, distinct from, but resembling, quercitrin.

**EUPHORBIA PILULIFERA.**—*Snake-weed*. *Euphorbia pilulifera* (Euphorbiacæ), pill-bearing spurge, is a native of most tropical countries. The variety which has been introduced into medical practice comes from Queensland, Australia. It is an annual herbaceous plant, growing to the height of one or two feet. The fresh root is red; the dry is reddish brown. The stalk is more or less procumbent and covered with yellowish hairs. The leaves are of a deep-green color. The fruit incloses three seeds, which bear some resemblance to a coffee-grain. The plant yields its virtues to water. The aqueous solution seems to contain tannin, but no alkaloid. The following are useful preparations of this agent: *Decoction euphorbiæ piluliferæ* (decoction of *euphorbia pilulifera*); dose, 60 c.cm. (or f3ij). *Extractum euphorbiæ piluliferæ* (extract of *euphorbia pilulifera*); dose, 0.065 to 0.13 Gm. (or gr. i-ij). *Tinctura euphorbiæ piluliferæ* (tincture of *euphorbia pilulifera*); dose, 0.60 to 2 c.cm. (or mx-xxx). *Extractum euphorbiæ piluliferæ fluidum* (fluid extract of *euphorbia pilulifera*); dose, 2 to 4 c.cm. (or mxxx-f3j).

**Physiological Action.**—A strong solution of this drug has no irritant effect upon the skin. The taste is slightly astringent. It causes no redness or smarting of the tongue or buccal cavity, but is irritant to the gastric

<sup>1</sup> *Journal of Medicine and Science*, May, 1898.

mucous membrane, and may occasion nausea or epigastric pain. No effect has been observed upon the spinal cord or muscular system. It produces no change in the calibre of the capillary vessels. The secretions are unaffected. Small doses are fatal to frogs and guinea-pigs, first accelerating and then retarding the respiration and circulation, probably acting directly upon their respective centres. It is thought to be eliminated by the liver, and is devoid of cumulative effects. The case has been recorded of a gardener who, after handling several species of euphorbia, was suddenly attacked by burning of the conjunctiva,—extending to the cheek, mouth, nose, and fauces,—increased lacrymation, sneezing, and constant desire to urinate. The manifestations were attributed to idiosyncrasy.

**Therapy.**—*Euphorbia pilulifera* is chiefly of value as a remedy in spasmodic asthma, though it is not without merit in other thoracic diseases. Dr. Marsset, to whom we owe our knowledge of its physiological action, employed it in a number of cases in private practice, and reports others from the service of Dujardin-Beaumetz. It was found of signal benefit in paroxysmal asthma, whether uncomplicated or connected with chronic bronchitis and emphysema. The effect was favorable and prompt, irrespective of the origin of the disorder. This remedy has also been used with good effect in the treatment of hay asthma. Dr. Tison has found the remedy beneficial in the dyspnoea of cardiac disease. In Australia the plant is highly esteemed for its power of allaying the asthmatic paroxysm. It has likewise been found of service in chronic bronchitis, especially when occurring in old people. Dr. Marshall has prescribed it with advantage in phthisis, in which it checked the cough, promoted expectoration, and exerted some anodyne influence. The decoction is slightly tonic. The leaves have also been smoked in a pipe with satisfactory results in cases of asthma. This remedy may be beneficially combined with potassium iodide in asthma associated with chronic bronchitis. A formula which has been recommended for asthma is as follows:—

R Ext. euphorb. pilulif. ....	2℥	Gm. or gr. xxx.
Nitroglycerin .....		006 Gm. or gr. $\frac{1}{10}$ .
Sodii iodid.,		
Potass. bromid. .... aa	1/30	Gm. or gr. xx.
Tr. lobeliæ .....	1/20	c.cm. or mxx.

M. et ft. pil. vel capsul. no. x.

Sig.: One, two, or three pills or capsules three times a day.

**EUPHORBIIUM.**—The *Euphorbia resinifera* (Euphorbiaceæ) is a native of Morocco, the official portion being a gum-resin, which flows from incisions in the stem and hardens in the air. The substance is yellowish, opaque, or slightly translucent, and brittle; without odor, but the powder causes much irritation and sneezing; taste acrid and burning. It is insoluble in water, only partly soluble in alcohol. It consists of an acrid resin (38 per cent.), euphorbon (22 per cent.), gum (18 per cent.), malates (12 per cent.), etc.

**Physiological Action.**—It is irritating to the skin, and vesicant, owing to the acrid resin. **Euphorbon** is a drastic purgative and emetic.

**Therapy.**—It is employed only for external purposes as a rubefacient and counter-irritant. When combined with cantharides, it forms a good vesicating plaster (Janin's plaster).

The *Euphorbia corollata*, or large flowering spurge, is emetic, dia-

phoretic, and expectorant. The root is used (1 to 1.30 Gm., or gr. xv-xx), of which a decoction may be made.

**EUPHORIN.**—Phenylurethane. This compound, introduced by Professor Giacosa, of Turin, is an aniline product, occurring in the form of a white crystalline powder, sparingly soluble in cold water. It possesses a faint, aromatic odor, and a taste which, at first feeble, becomes warm and causing dilatation of peripheral blood-vessels.

**Physiological Action.**—Euphorin is antiseptic, antipyretic, and analgesic. It diminishes suppuration, and reduces abnormal temperature by causing dilatation of peripheral blood-vessels.

According to Dr. C. Curtis, its effect in depressing temperature manifests itself in from half an hour to two hours after administration, and may continue for as long a period as ten hours. It is said to occasion no serious secondary symptoms. In some instances cyanosis has been observed, but it does not seem to cause collapse. It likewise promotes diaphoresis. Euphorin is thought to increase the excretion of urea. When given by the mouth, it is not followed by the appearance of phenol, aniline, albumin, or sugar in the urine.

**Therapy.**—Euphorin in powder has been used with advantage upon ulcerated surfaces, and has been found capable of stimulating repair in chronic lesions. Peroni and Bovera report favorably of its efficacy as a local agent in various cutaneous manifestations of syphilis, having employed it in ninety-one cases in doses of 0.20 to 0.38 Gm. (or gr. iii-vj). Bergerio found it serviceable in ulcerative cervicitis. He employed it in the form of powder by insufflation and as a 1 to 3 alcoholic solution. Euphorin has been advantageously used in surgery as a substitute for iodoform. It is an efficient application in wounds, burns, scalds, bed-sores, herpes, and other cutaneous diseases, especially those of vegetable parasitic origin. In aphthous stomatitis it is equally of avail. Professor Stiller, of Pesth, administered euphorin in different forms of neuralgia, including hemicrania and sciatica, and, in most cases, observed relief of pain. He also found it beneficial in cases of chronic articular and muscular rheumatism, and rheumatic fever. By other observers it has been successfully employed in supra-orbital and intercostal neuralgia, syphilitic pains of the limbs, and orchitis. In acute rheumatism euphorin has sometimes been found more efficacious than the sodium salicylate.

**EUPHRASIA.**—Eyebright. The *Euphrasia officinalis* (Scrophulariaceae), a small herb of the White Mountains and Lake-Superior region and also of Europe, with opposite leaves and spikes of blue flowers. In spite of its name it is not official in the United States Pharmacopœia. It is astringent, containing tannin, euphrastic acid, etc. A tincture (10 per cent.) is useful in incipient catarrhal affections, hay fever (dose, 0.60 c.cm., or *mx* every two hours), and measles.

**EUPHTHALMIN HYDROCHLORIDE** is a colorless crystalline substance derived from eucaine B. In aqueous solutions its action is that of a eudratine and bears the same relation to eucaine that homatropine does to tropacaine.

Dr. A. Darier, of Paris, reports that after his repeated use, covering

quite a period of time, he has yet to observe any of the unpleasant symptoms often met with after the use of the other well-known agents; to obtain full dilatation of the pupil he uses 1 or 2 drops of a 5-per-cent. solution. He also noticed that a rapid dilatation followed, while the power of accommodation was unaffected. Dr. Grandclément uses a solution containing 0.25 Gm. to 10 c.cm. (or gr. iv-mclx) of distilled water, while Dr. Edward Jackson prefers the combination of euphthalmin with cocaine to produce mydriasis.

**EUROPHEN.**—*Isobutyl-ortho-cresol Iodide.* Europhen is the product of the action of iodine upon isobutylortho-cresol in a solution of potassium iodide. It occurs in the form of a fine, soft, amorphous powder, of a light-yellow color, without taste, and having a faint, not unpleasant odor. The odor almost entirely disappears when the substance is made into a mixture or solution. Europhen is insoluble in water or glycerin, but dissolves in alcohol, ether, chloroform, and fixed oils. The specific gravity of europhen is half that of iodol and one-fifth that of iodoform. Europhen is easily decomposed by light and heat, and should be kept in a dark, dry, and cool place, and its solutions be made at a low temperature. The average proportion of iodine contained in europhen is 27.6 per cent. Its solutions, upon standing, throw down a precipitate, consisting of an organic iodine compound, soluble in water. Europhen contains a very small percentage of free iodine. It is incompatible with starch, metallic oxides, and the salts of mercury.

**Physiological Action.**—Europhen adheres firmly to the skin, mucous membrane, and open surfaces. When taken into the system it undergoes little change. A very small proportion of iodine is found in the urine, and the greater portion passes through the intestinal canal unchanged. Europhen is non-toxic, but by a chemical action prevents the development of pathogenic micro-organisms in culture-media.

**Therapy.**—Europhen, in the form of a powder or 10-per-cent. ointment, is an excellent dressing to ulcers of various kinds. Leg-ulcers often heal rapidly under its influence. It forms a valuable application to wounds, chancroids, open buboes, ulcerated chancres, condylomata, and ulcerated lesions of secondary and tertiary syphilis. Dr. P. J. Eichhoff used it with advantage in scrofuloderma, lupus vulgaris, and deep burns, but found it of no avail in favus or gonorrhœa. He notes, however, that excellent results were obtained from europhen in the treatment of the erosions and ulcerations of the uterine neck of such frequent occurrence in association with gonorrhœa. The powder may be applied twice daily, or a tampon charged with europhen may be introduced.

The author has used<sup>1</sup> this substance with success in the treatment of incised, contused, and lacerated wounds. In chronic ulcers of the leg and scrofulodermata, also, it exerted a beneficial influence and led to rapid cicatrization of the lesions. A lupous ulcer was decidedly improved by the application of europhen, and eventually healed. In one case of superficial epithelioma an ointment containing 4 to 8 Gm. (or ̄i-ij) of europhen to 31 Gm. (or ̄j) effected a cure. In a second case, after europhen first, and subsequently aristol, had been used without much result, a mixture of equal

<sup>1</sup>"Europhen: with Clinical Reference to Europhen and Europhen-aristol." By John V. Shoemaker, A.M., M.D. See *Medical Bulletin*, Sept., 1892.

parts of euophen and aristol, made into an ointment, was applied with entire success. A 10-per-cent. ointment of euophen was efficient in sycosis, and the powder, dusted upon the surface of a carbuncle after the necrotic tissue had been removed, promoted the healing of the wound. Papular acne was cured by the application of an ointment containing from 4-8 Gm. to 31 Gm. (or 3i-ii to 5j) of base. In the second stage of rosacea a marked improvement followed the use of an alcoholic solution of euophen. The papules and pustules, together with the roughness of the skin, disappeared, and the capillary injection was diminished. An ointment was advantageous in erysipelas and in the dermatitis caused by poisoning by rhus toxicodendron. Applied as a dusting-powder, euophen proved beneficial in herpes progenitalis, herpes zoster, seborrhoea oleosa, hyperidrosis, and bromidrosis. An ointment was of assistance in the treatment of alopecia circumscripta. The powder was of value in several cases of acute vesicular eczema, while the ointment rendered good service in some severe cases of chronic eczema. The writer obtained a good result in one case of psoriasis from the use of an ointment containing the equal mixture of euophen and aristol. In syphilitic ulcers the experience of the writer is confirmatory to that of Eichhoff. From the clinic of Professor Jurasz, of Heidelberg, Dr. von Szoldrski reports a favorable influence in three cases of laryngeal tuberculosis with abundant secretion. He esteems euophen of value after operations upon the nose or larynx. Dr. Löwenstein has obtained good results with euophen in perforating ulcer of the nasal septum, and in epistaxis dependent upon erosion of the septum. Dr. Nolda employed euophen successfully in three cases of suppurative inflammation of the middle ear. Dr. Fernandez recommends euophen in cases of accidental or operative traumatism of the eye, in conjunctivitis and keratitis. He generally employs a 1-per-cent. ointment. Euophen powder forms a convenient dressing, on account of its adhesive qualities and the fact that it does not harden into a compact cake upon the surface to which it is applied. Dr. K. J. Schumann, of Athens, Tenn., states that, in dental practice, euophen as a root-canal dressing cannot be surpassed. He makes a paste by combining euophen with a drop or two of carbolic acid. In pyorrhoea he cleanses the parts, applies protargol solution (20 per cent.), and fills pockets with euophen. Eichhoff has experimented with it hypodermically in the treatment of syphilis.

**EXALGINE.**—Methylacetanilide is a neutral derivative of the aromatic series, with the formula  $C_6H_5N(CH_3)CH_2CO$ , and is one of the three methyl derivatives of acetanilide. It is in fine, acicular, or long tablet-like crystals, the first being obtained by evaporation from solution, the latter from fusion. It is sparingly soluble in cold water, more so in hot water, and extremely soluble in diluted alcohol. Dose, 0.065 to 0.38 Gm. (or gr. i-xj), or from 0.38 to 0.75 Gm. (or gr. vi-xij) in the course of the day. Exalgine is devoid of odor or taste, and is of neutral reaction.

**Physiological Action.**—Exalgine has been brought forward by Brignonet, of the Cochin Hospital, and has been extensively employed as an analgesic, its effect being principally manifested upon the sensory nerves. Exalgine, which is also an antiseptic, is eliminated by the urine, the amount of which it diminishes. It reduces abnormal temperature like other members of the group, and is claimed to be equally efficient in about half the dose of antipyrin. Broadbent has reported a case in which 0.25 Gm. (or gr. iv) doses

of exalgine had been ordered on account of neuralgia. The first dose relieved pain, but caused some dizziness. After the lapse of some hours, feeling a slight return of the pain, the patient took 0.75 Gm. (or gr. xij) at one dose. He immediately fell prostrate, was unconscious, and frothed at the mouth. The pulse was feeble and slow, the eyes closed, and pupils normal. Upon recovering consciousness he complained of noises in the head, was nauseated, and experienced pain in the hypogastrium. Evacuation of the stomach and stimulation were followed by recovery. In the case of a 2-year-old child, to whom 0.32 Gm. (or gr. v) of exalgine had been given in mistake, Dr. Reynery, of Havana, observed that the face and hands were of a dark-blue color, there was copious vomiting of mucus, with free perspiration, rapid and feeble pulse, prominence of veins of the neck, and pulsation of the carotids. The urine was dark gray and albuminous. There was diminution of sensibility in the lower limbs. The child was revived by the use of stimulants, and the symptoms gradually disappeared. As it is soluble in diluted alcohol, it may be given in water flavored with elixir of orange or rum. The smallness of the dose gives it a decided advantage over some other preparations of this group.

**Therapy.**—In all forms of neuralgia, especially the visceral forms, exalgine has been shown to have marked control over pain. It is said to decrease the quantity of sugar excreted in diabetes mellitus. In diabetes, from 0.38 to 0.75 Gm. (or gr. vi-xij) daily may be given. In facial neuralgia and myalgia, especially in anæmic, neurotic patients, good results are obtained from doses of 0.065 Gm. (or gr. j) every four hours. Löwenthal administered exalgine in thirty-five cases of chorea. It exerted no specific influence, but the severity of the manifestations was reduced. He concluded that the effect of the drug was much more favorable when its administration was begun early in the disease. Moncorvo recommends exalgine in the treatment of painful affections of children, to whom it is acceptable in taste and by whom it is well borne. He gives it in doses gradually ascending from 0.045 to 0.25 Gm. (or gr.  $\frac{1}{4}$ -iv), and considers it as equally efficacious as antipyrin in small doses. Visceral neuralgia, dysmenorrhœa, nephritic colic, and angina pectoris are relieved by the use of exalgine. The solubility of exalgine in water is promoted by the addition of an equal quantity of sodium salicylate: a combination which will often be of therapeutic efficiency.

**EXODIN.**—The trade name of diacetyl-rufi-gallic-acid-tetramethyl-ether. Is said to be tasteless, and does not excite nausea. It acts as a cathartic without griping or diarrhœa. Defecation occurs in 8 or 10 hours. It is supplied in tablets (0.50 Gm., or gr. viiss), two being the dose for an adult, one for a child.

**FABIANA IMBRICATA.**—*Fabiana imbricata* (Solanaceæ), or *Pichi*, a South-American plant, is a shrub, or small tree, which grows upon high, dry hill-tops. Its branchlets are arranged in the form of plume-like sprays, which have a peculiar, light-bluish-green color, due to the large amount of bluish or greenish-gray resin, with which all its tender parts are covered. Its principal constituents are a bitter ether-soluble alkaloid, **Fabianine**; a volatile oil containing **Fabianol**, a crystallizable resin. Besides these, the drug contains tannin, starch, and an abundant proportion of a glucoside analogous to esculin. The medicinal preparations are made from the dried leafy twigs.

**Physiological Action.**—A tincture of pichi has a disagreeable, persistent bitter taste, and, unless combined with an alkali, its resin is precipitated upon the addition of water. Pichi exerts a stimulant effect upon the kidneys, but its physiological action has not been closely studied. Administration of the resin-acid to frogs caused narcosis, followed by paralysis and death. The fluid extract, when given to human subjects in medicinal doses, has no disturbing effect upon the stomach, but, on the contrary, improves the appetite. The essential oil of pichi acts as a stimulant to secreting organs generally, and modifies or cures chronic purulent discharges from mucous membranes.

**Therapy.**—Its therapeutic influence is chiefly manifested in affections of the genito-urinary apparatus. In enuresis nocturna pichi has often a most beneficial action. The following combination will be found useful:—

R Fluidextractum fabianæ .....	4	c.cm. or f3j.
Tinet. belladonnæ foliorum .....	75	c.cm. or ℥xij.
Aquæ cinnamomi .....	90	c.cm. or f3iij.

M. Sig.: A teaspoonful morning and night for a child.

It has also been efficaciously employed in gonorrhœa, especially during the inflammatory stage. Pichi is beneficial in epididymitis and prostatitis, and has been given with success in jaundice and dyspepsia dependent upon an insufficient secretion of bile. The oil is of service in the treatment of bronchial and intestinal catarrh. It is of value in lithiasis, or calculus of the kidney or bladder. In chronic renal congestion and calculous pyelitis this drug is of service, except when degeneration of renal tissues exists. Dr. Hal. C. Wyman reports very favorably upon this remedy in cystitis dependent on stricture or manipulative procedures within the urethra, and likewise in cases of lumbago and sciatica associated with the deposition of uric acid. As a diuretic in cases of gravel and calculi the following combination will often prove of service:—

R Fluidextractum fabianæ .....	60	c.cm. or f3ij.
Liq. potass. ....	18½	c.cm. or f3v.
Tr. nucis vom. ....	7½	c.cm. or f3ij.
Elix. calisayæ .....	q. s. ad 120	c.cm. or f3iv.

M. Sig.: Teaspoonful in hot water every four or five hours.

Pichi is likewise of service in prostatic inflammation or hypertrophy, and is valuable in gonorrhœa attended by complications in which it is necessary to suspend the use of local methods.

**PARINA TRITICI (R. P.).—Wheaten Flour.** The grain of wheat, *Triticum sativum* (Gramineæ), ground and sifted.

**FEL BOVIS (U. S. P.).—Ox-gall.**

#### Preparations.

*Fel Bovis Purificatum* (U. S. P.).—Purified Ox-gall (pilular consistence). *Fel Vesicæ Purificatum* (R. P.).—Purified Ox-bile. Dose, 0.32 to 1 Gm. (or gr. v-xv).

**Pharmacology.**—Fresh bile of *Bos taurus* (class, Mammalia; order, Ruminantia) is a greenish-brown, viscid liquid, with a peculiar, nauseating

odor and bitter, offensive taste. Its solution froths when shaken and saponifies fat. Its reaction is alkaline; specific gravity, 1018 to 1028.

**Physiological Action and Therapy.**—Ox-gall is antiseptic and laxative, assisting in the absorption and digestion of fats in the intestinal tract and stimulating peristalsis. The local application of bile causes absorption of hypertrophies, and enlarged tonsils. It may be used internally to assist the digestion and assimilation of fatty foods or of codliver-oil, and may be given in habitual constipation with deficient assimilation. Ox-gall has likewise been used for the purpose of expelling lumbricoid worms.

In jaundice, Harley recommends the use of ox-gall, given in capsules, in order that it may reach the duodenum without being acted on by the stomach. It is also of benefit in hepatic and intestinal affections.

R. *Fellis bovis purificati*,  
*Magnesi carbonatis* ..... aa 6/50 Gm. or gr. c.  
*Ol. menth. pip.* ..... 06 c.cm. or mj.  
 M. et ft. capsulæ no. xx.

Sig.: A capsule three or four times a day, after meals, in dyspepsia and constipation.

R. *Fellis bovis purificati*..... 4j Gm. or 3j.  
*Extracti nucis vomicæ*,  
*Aloini* ..... aa 065 Gm. or gr. j.  
*Ol. cinnamomi* ..... 06 c.cm. or mj.  
 M. et ft. pil. no. xx.

Sig.: Two pills between meals. Serviceable in torpor of the liver and in dyspepsia.

#### FERMENTUM.—Yeast.

Yeast is the ferment obtained in brewing beer, and is produced by *Saccharomyces cerevisiæ*. According to Schlossberger, its composition is carbon, 49.9 per cent.; hydrogen, 6.6 per cent.; nitrogen, 12.1 per cent.; and oxygen, 31.4 per cent. It contains, as proximate constituents, cellulose, albuminoids, fats, and resinous substances.

**Pharmacology.**—Yeast is a pale-brown, viscid, frothy liquid, with a bitter taste. Used externally in a poultice for boils and suppurating wounds or foul ulcers, and internally as an alterative tonic in furuncles and typhoid fever. Dr. M. B. Thompson has reported thirty-seven cases in which yeast was used in the treatment of typhoid, in all of which recovery took place without relapse. It is said to cause disappearance of sugar from the urine in diabetes. Dose, 15 to 30 c.cm. (or fʒss-j) before meals. Roos<sup>1</sup> has used yeast (dried at 86° F.) in powder in doses of 0.50 Gm. (or gr. viij) two or three times a day in the treatment of constipation. He reports twenty cases; sixteen were so benefited that their evacuations were easy and copious, and in most of them the appetite was increased. *Cerevisine*, a proprietary article, is a pure desiccated yeast, and has been used with success in the treatment of psoriasis, herpes, and some varieties of eczema in doses of 1 teaspoonful three times a day.

**FERRUM.**—Iron. Metallic iron in the form of fine, bright, and non-elastic wire (U. S. P.). Wrought iron in the form of wire or nails free from oxide (B. P.).

<sup>1</sup> N. Y. Med. Jour.; Med. Bull., May, 1901.

*U. S. P. Preparations.*

**Elixir Ferri, Quininae, et Strychninae Phosphatum (U. S. P.).**—Elixir of Phosphates of Iron, Quinine, and Strychnine. Dose, 4 c.cm. (or 3j) (containing strychnine phosphate, gr.  $\frac{1}{100}$ ).

**Glyceritum Ferri, Quininae, et Strychninae Phosphatum.**—Average dose, 1 c.cm. (or xxx) (containing gr.  $\frac{1}{100}$  of strychnine).

**Ferri Carbonas Saccharatus.**—Saccharated Ferrous Carbonate. Dose, 0.13 to 0.65 Gm. (or gr. ii-x).

**Ferri Chloridum.**—Ferric Chloride. Used as hæmostatic and pharmaceutically.

**Ferri Citras.**—Ferric Citrate. Dose, 0.32 to 1.30 Gm. (or gr. v-xx).

**Ferri Hypophosphis.**—Ferric Hypophosphite. Dose, 0.32 to 0.65 Gm. (or gr. v-x).

**Ferri Phosphas Solubilis.**—Soluble Ferric Phosphate. Dose, 0.32 to 0.65 Gm. (or gr. v-x).

**Ferri Pyrophosphas Solubilis.**—Soluble Ferric Pyrophosphate. Dose, 0.13 to 0.32 Gm. (or gr. ii-v).

**Ferri Sulphas.**—Ferrous Sulphate. Dose, 0.065 to 0.32 Gm. (or gr. i-v).

**Ferri Sulphas Exsiccatus.**—Dried Ferrous Sulphate. Dose, 0.065 to 0.32 Gm. (or gr. i-v).

**Ferri Sulphas Granulatus.**—Granulated Ferrous Sulphate. Dose, 0.065 to 0.32 Gm. (or gr. i-v).

**Ferri et Ammonii Citras.**—Iron and Ammonium Citrate. Dose, 0.20 to 0.32 Gm. (or gr. iii-v). (Should always be given in solution.)

**Ferri et Ammonii Sulphas.**—Ferric Ammonium Sulphate (Ammonio-ferric Alum). Dose, 0.20 to 0.32 Gm. (or gr. iii-v).

**Ferri et Ammonii Tartras.**—Iron and Ammonium Tartrate (Ammonio-ferric Tartrate; about 25 per cent. ferric oxide). Dose, 0.32 to 1.30 Gm. (or gr. v-xx).

**Ferri et Potassii Tartras.**—Iron and Potassium Tartrate (Potassio-ferric Tartrate). Dose, 0.32 to 1 Gm. (or gr. v-xv).

**Ferri et Quininae Citras.**—Iron and Quinine Citrate (ferric citrate, 85; quinine, 12 citric acid, 3 parts). Dose, 0.20 to 0.32 Gm. (or gr. iii-v). (Suitable for pills.)

**Ferri et Quininae Citras Solubilis.**—Soluble Iron and Quinine Citrate. Dose, 0.20 to 0.65 Gm. (or gr. iii-x). (Best prescribed in solution.)

**Ferri et Strychninae Citras.**—Iron and Strychnine Citrate (98 Gm. iron and ammonium citrate; 1 Gm. each of strychnine and citric acid). Dose, 0.065 to 0.20 Gm. (or gr. i-ii).

**Ferri Hydroxidum.**—Ferric Hydroxide. (Hydrated Oxide of Iron freshly precipitated by the addition of an excess of ammonia to the solution of the ferric sulphate and washed and strained. For use as an antidote to arsenious-acid poisoning, 20 grains to be taken for each grain of arsenic swallowed, a tablespoonful the ordinary dose as an antidote.)

**Ferri Hydroxidum Hydratum eum Magnesii Oxido.**—Ferric Hydroxide with Magnesium Oxide. (Solution of ferric sulphate, 50 c.cm., or f3xiii ss; magnesia, 10 Gm., or ℥ss.) The solution of ferric sulphate is to be diluted with 100 c.cm., or f3xxvij, of water and kept in a large, well-stoppered bottle until needed for use. The magnesia should be kept in a bottle filled about three-fourths with water. When required for use the magnesia is to be shaken into a homogenous thin magma and the iron solution gradually added, and shaken together until a uniform smooth mixture results. Antidote to arsenic.

**Ferrum Reductum.**—Reduced Iron. Dose, 0.065 to 0.32 Gm. (or gr. i-v).

**Liquor Ferri Chloridi.**—Solution of Ferric Chloride (29 of ferric chloride). Principally used in making the tincture. Dose, 0.12 to 0.60 c.cm. (or mii-x).

**Liquor Ferri et Ammonii Acetatis.**—Solution of Iron and Ammonium Acetate (Beck's Mixture) (contains tincture of ferric chloride, 40 c.cm.; diluted acetic acid, 60 c.cm.; solution of ammonium acetate, 500 c.cm.; aromatic elixir, 120 c.cm.; water, 120 c.cm.; water, a sufficient quantity to make 1000 c.cm.) Should be freshly made when wanted. (This preparation is about twice as strong as that of 1890 Pharmacopœia.) Dose, 2 to 8 c.cm. (or f3ss ij).

**Liquor Ferri Subsulphatis.**—Solution of Ferric Subsulphate (Monsel's Solution). Dose, 0.12 to 0.60 c.cm. (or mii-x).

**Liquor Ferri Tersulphatis.**—Solution of Ferric Sulphate (for making hydrated oxide of iron).

**Massa Ferri Carbonatis.**—Mass Ferrous Carbonate, Vallet's Mass (ferrous sul-

phate, 100; sodium carbonate, 38; honey, 38; sugar, 25; syrup and water, q. s. ad 100 parts), has 42 per cent. ferrous carbonate. Dose, 0.20 to 0.32 Gm. (or gr. iii-v).

*Mistura Ferri Composita*.—Compound Iron Mixture. Griffith's Mixture (ferrous sulphate, 6; myrrh, 18; sugar, 18; potassium carbonate, 8; spirit of lavender, 60; rose-water, q. s. ad 1000 parts). Dose, 30 to 60 c.cm. (or fʒi-ij).

*Pilulæ Aloes et Ferri*.—Pills of Aloes and Iron (aloes, iron sulphate, aromatic powder). Dose, 1 to 3 pills.

*Pilulæ Ferri Carbonatis*.—Pills of Ferrous Carbonate (Blaud's Pills).—Iron Pill. Dose, 2 to 5 pills.

*Pilulæ Ferri Iodidi*.—Pills of Ferrous Iodide. Dose, 2 to 4 pills.

*Syrupus Ferri Iodidi*.—Syrup of Ferrous Iodide (5 per cent ferrous iodide). Dose, 0.30 to 2 c.cm. (or mv-xxx).

*Syrupus Ferri, Quininae, et Strychninae Phosphatum*.—Syrup of the Phosphates of Iron, Quinine, and Strychnine contains about 0.07 Gm. (gr. 1 $\frac{1}{4}$ ) of iron; 0.10 Gm. (or gr. iss of quinine, and 0.00082 Gm. (or gr.  $\frac{1}{100}$ ) of strychnine to 4 c.cm. (or fʒj). Dose, 2 to 4 c.cm. (or fʒss-j).

*Syrupus Hypophosphitum*.—Syrup of Hypophosphites (ferrous lactate, 1 per cent.). Dose, 4 to 15 c.cm. (or fʒi-iv).

*Syrupus Hypophosphitum Compositus*.—Compound Syrup of Hypophosphites.

*Tinctura Ferri Chloridi*.—Tincture of Ferric Chloride (13.28 per cent. of ferric chloride; solution of ferric chloride, 35; alcohol, q. s. ad 100 parts). Dose, 0.30 to 1.30 c.cm. (or mv-xx).

*Vinum Ferri Amarum*.—Bitter Wine of Iron. Dose, 4 to 15 c.cm. (or fʒi-iv).

*Vinum Ferri*.—Wine of Ferric Citrate (contains iron and ammonium citrate, 4 parts; tincture of sweet orange-peel; syrup, and white wine). Dose, 4 to 15 c.cm. (or fʒi-iv).

### B. P. Preparations.

*Ferri Arsenas*.—Iron Arsenate. Dose, 0.004 to 0.015 Gm. (or gr.  $\frac{1}{100}$ ,  $\frac{1}{100}$ ).

*Ferri Carbonas Saccharatus*.—Saccharated Iron Carbonate. Dose, 0.65 (or gr.x).

*Ferri et Ammonii Citras*.—Iron and Ammonium Citrate. (Should always be given in solution.) Dose, 0.13 to 0.32 Gm. (or gr ii-v).

*Ferri Phosphas*.—Iron Phosphate. Dose, 0.32 to 0.65 Gm. (or gr. v-x).

*Ferri Sulphas*.—Ferrous Sulphate. Dose, 0.065 to 0.32 Gm. (or gr. i-v).

*Ferri Sulphas Exsiccatus*.—Exsiccated Ferrous Sulphate. Dose, 0.03 to 0.20 Gm. (or gr. ss-ijj).

*Ferri et Quininae Citras*.—Iron and Quinine Citrate. Dose, 0.32 to 0.65 Gm. (or gr. v-x).

*Ferrum Redactum*.—Reduced Iron. Dose, 0.065 to 0.32 Gm. (or gr. i-v).

*Ferrum Tartaratum*.—Tartarated Iron. Dose, 0.32 to 0.65 Gm. (or gr. v-x).

*Liquor Ferri Acetatis*.—Solution of Ferric Acetate. Dose, 0.30 to 1 c.cm. (or mv-xv).

*Liquor Ferri Perchloridi*.—Solution of Ferric Chloride. Dose, 0.30 to 1 c.cm. (or mv-xv). Compound of one part strong solution and three parts of distilled water.

*Liquor Ferri Perchloridi Fortis*.—Strong Solution of Ferric Chloride (100 c.cm., or fʒxxvij, contain 22.5 Gm., or 3v  $\frac{1}{4}$ , of iron).

*Liquor Ferri Pernitrat*.—Solution of Ferric Nitrate. Dose, 0.30 to 1 c.cm. (or mv-xv).

*Liquor Ferri Persulphatis*.—Solution of Ferric Sulphate.

*Mistura Ferri Composita*.—Compound Mixture of Iron (ferrous sulphate, 2.5 Gm.; potassium carbonate, 3 Gm.; myrrh, 6 Gm.; sugar, 6 Gm.; spirit of nutmeg, 4.5 c.cm.; rose-water, 437.5 c.cm.). Dose, 30 to 60 c.cm. (or fʒi-ij).

*Pilula Ferri*.—Iron Pill. Dose, 0.32 to 1 Gm. (or gr. v-xv).

*Pilula Aloes et Ferri*.—Pill of Aloes and Iron. Dose, 0.25 to 0.50 Gm. (or gr. iv-vij).

*Syrupus Ferri Iodidi*.—Syrup of Ferrous Iodide. Dose, 0.30 to 2 c.cm. (or mv-xxx).

*Syrupus Ferri Phosphatis*.—Syrup of Ferrous Phosphate. Dose, 2 to 4 c.cm. (or fʒss-j).

*Syrupus Ferri Phosphatis cum Quinina et Strychnina*.—Syrup of Phosphate of Iron, Quinine, and Strychnine. Dose, 2 to 4 c.cm. (or fʒss-j).

*Tinctura Ferri Perchloridi*.—Tincture of Ferric Chloride (strong solution of ferric chloride, 25 c.cm.; alcohol, 90 per cent., 25 c.cm.; distilled water, q. s. 100 c.cm.). Dose, 0.30 to 1 c.cm. (or mv-xv).

**Trochiscus Ferri Redacti.**—Reduced-Iron Lozenge (contains reduced iron, 0.005 Gm., or gr.  $\frac{1}{2}$ , with a simple basis).

**Vinum Ferri.**—Iron-wine (iron, 50 Gm., or 3iij; sherry-wine, 1000 c.cm., or ℥ssiv). Dose, 4 to 15 c.cm. (or fʒi-iv).

**Vinum Ferri Citratis.**—Wine of Iron Citrate (iron and ammonium citrate, 160 Gm.; orange-wine, 20 fluid ounces). Dose, 4 to 15 c.cm. (or fʒi-iv).

**Pharmacology.**—Iron is a metallic element, the most abundant, the most widely distributed and most useful to mankind of all the metals. In its pure state it is malleable and ductile, and the pharmacopœia directs its use, therefore, in the pure form of “fine, bright, non-elastic wire,” out of which preparations should be made. Ferric salts in solution or in crystals are generally red, and the ferrous salts green; they are likely to be decolorized by drying and become white. The iron compounds are also known as chalybeates, or martial preparations; a large number are used in medicine, besides those found as constituents in natural water. The chemical tests—vegetable astringents containing tannic or gallic acid, alkalies and their carbonates, acidulous salts and mucilage of acacia—are incompatible with iron preparations.

**Physiological Action.**—As one of the proximate principles of the human organism, and playing an important part in the red blood-corpuscle (as hæmoglobin) in the nutrition of the body, iron is a necessary element in the food. When applied to the tissues, most of the salts of iron exercise an astringent effect, producing coagulation of albumin. Some of the preparations, notably the solution of the subsulphate and the chloride, are very useful in coagulating blood and checking hæmorrhage, when locally applied. A similar astringent effect is observed in the mouth and along the alimentary canal. One of the objections to the use of most of the iron salts in medicine is the fact that they cause constipation and headache. The phosphate and pyrophosphate are exceptions to this, being non-constipating. Only a small proportion of the iron administered is assimilated, the larger proportion being discharged with the fæces, to which a black color, due to the formation of the sulphide, is imparted. The portion absorbed is largely thrown out again in the bile.

Iron augments the amounts of urea and increases the frequency of micturition, the tincture of the chloride especially being credited with diuretic properties. It has a tonic influence upon the nerve-centres, but improves nutrition principally by its effect upon the circulation. While iron has little power of increasing the number of blood-corpuscles in health, this power is shown very decidedly in conditions of anæmia or hydræmia, the number of globules being rapidly increased and the hæmoglobin of the blood gradually brought up to the healthy standard. The absorption of iron preparations by the alimentary canal is accepted, by Binz, but he looks on them rather as stimulating the blood-forming organs than as contributing directly to the production of hæmoglobin. Ilyashoff\* found that salts of the heavy metals, copper, mercury, and manganese, administered in small amounts by the mouth, have no appreciable influence on the amount of hæmoglobin or on the number of the reds. Salts of iron, however, under the same conditions always have a marked effect in increasing the number of reds and the amount of hæmoglobin. It is evident that iron not only stimulates the func-

\* *Vratch*, St. Petersburg, November 2, 1901.

tions of the blood-producing organs, but directly aids in the production of hæmoglobin. The influence of the iron is first manifested in the increased number of red corpuscles; the increase in the hæmoglobin is a later phenomenon. The eosinophile cells also increase to a remarkable proportion under the influence of iron. This is not observed in animals nor in other conditions in man. The eosin granules contain iron and apparently in a stable organic combination, as they give the iron reaction with ammonium sulphate only after twelve to twenty-four hours. It is supposed that the iron present in the blood-corpuscles has the property of converting oxygen into ozone, and that it thus promotes oxidation. The heart is also toned up by the effects of the iron preparations, probably owing largely to the stimulus of a better blood-supply to its walls. The stomach is stimulated by the astringent action of the iron, and the appetite and digestive capacity are improved under small doses not too long continued.

As confirmatory of this view, A. Hoffmann, of Halle,<sup>2</sup> has found that absorption and excretion of iron takes place in the small intestine in man, and, also in animals, in the colon. In recent observations he determined the fact that all forms of iron were absorbed in the duodenum and entered the circulation in transport-cells combined with albuminous matter in a combination which had no toxic action. There was no apparent increase in the coloring matter of the blood from the use of iron. In fact, iron has a stimulating action on the physiological activity of the bone-marrow, and accelerates the ripening and entrance into the circulation of the young cells: the anuclear erythrocytes. The action of the iron depends directly upon the quantity absorbed. Iron slightly raises the temperature of the body partly by increasing tissue-waste, partly by its ozonizing effects. Some of the stronger preparations—sulphates, nitrate, iodide, and chloride—are irritant, and, in large doses, poisonous. An acneic eruption sometimes results from the internal administration of iron.

**Therapy.**—The styptic qualities of iron are best shown by Monsel's solution and the chloride, in powder or solution, when applied directly to the oozing surface, as in surgical operations, post-partum hæmorrhage, hæmorrhage from the uterus after miscarriage, or cancer of that organ.

The resulting clot is very tough and dark colored, and makes a dirty, disagreeable mass, so that, in ordinary surgical practice, iron is rarely used as an hæmostatic, when a substitute can be found. In some forms of uterine hæmorrhage Monsel's solution may be used, diluted (1 to 24) or applied in full strength, upon a small swab to the inner surface of the uterus, if the os has been previously dilated; or the vagina may be temporarily packed with tampons of absorbent cotton wet with a 5-per-cent. solution.

In epistaxis, or hæmoptysis, a spray of 1- or 2-per-cent. strength of Monsel's solution may be inhaled. Excessive hæmorrhage from leech-bites or after the extraction of teeth may be controlled by the direct application of the same agent. A solution of the subsulphate may be successfully used to restrain bleeding from hæmorrhoids. The same preparation is effective in destroying syphilitic vegetations. Fissured nipples may be cured by painting them with a mixture of 1 part of Monsel's solution to 3 or 4 of glycerin. A spray of the subsulphate is beneficial in chronic ozæna. In erysipelas the tincture is an excellent local application. The astringent preparations of

<sup>2</sup> *Münchener medizinische Wochenschrift*, 1899, No. 29.

iron may be used with good effect as injections in gonorrhœa and gleet. Two c.cm. (or f5ss) of the tincture to  $\frac{1}{2}$  pint of water, with 4 c.cm. (or f5j) of laudanum or 0.75 Gm. (or gr. xij) of the sulphate to the same quantity of water and laudanum, are forms in which iron may be used for this purpose. These solutions of iron, however, are open to the objection that they stain the patient's clothing. A liquid containing an astringent salt of iron is also a serviceable wash in leucorrhœa. In tonsillitis, pharyngitis, and diphtheria the same agent may be applied directly to the throat, either pure or diluted with an equal quantity of glycerin; this application is sometimes painful, but is very efficient. The tincture of ferric chloride, though less astringent than Monsel's solution, may be used locally in the same way. In diphtheria it can be administered internally in this form, and if, as is usually done, the preparation is suitably diluted with water, and then taken through a glass tube (so as to prevent the iron from staining and corroding the teeth), the solution will come directly in contact with the pharynx as it is swallowed, and thus combine the local and systemic effects. In such cases it is sometimes prescribed in combination, as follows:—

R Tincturæ ferri chloridi .....	30	c.cm. or f5j.
Potassii chloratis .....	4	Gm. or 5j.
Syr aurantii .....	60	c.cm. or f5j.

M Sig.: Half a teaspoonful to a teaspoonful every two hours, in water, in diphtheria or erysipelas.

These styptic preparations have also been injected into nævi and vascular tumors, to produce coagulation of their contents, but death has resulted from the escape of some of the fluid into the general circulation.

The tincture of iron is a beneficial local application in certain affections of the skin. It will in some instances relieve paræsthesia and the itching which accompanies eczema. The conjoined internal and external use of this preparation is frequently of advantage in chronic disorders attended by suppuration, as pustular eczema, impetigo, ecchyma, and rupia. A combination of tincture of iron and glycerin has been serviceably applied in herpes.

The principal employment of the iron preparations is for their effect upon hæmatisis. They are pre-eminently useful in cases of anæmia, hydræmia, or chlorosis, and in many cases of debility. The well-known Basham's mixture, or solution of iron and ammonium acetate (U. S. P.), is very commonly given to overcome the anæmia of chronic Bright's disease of the kidney. Dr. James Tyson has called attention to the fact, however, that, as regards the degenerative and inflammatory conditions in the kidneys, it is not always beneficial and, in fact, is often very injurious<sup>1</sup>. Dr. Tyson says that it should not be given in any case of acute Bright's disease, nor where there is not anæmia. If it causes headache, constipation, and reduces excretion by the kidneys, it is doing harm.

Dr. Andrew Smart, of Edinburgh, has found, by means of the apparatus employed for estimating the number of corpuscles contained in a specimen of blood, that the sulphate is the most valuable preparation of iron in the treatment of anæmia and chlorosis. The carbonate comes next in order of efficiency, and the syrup of the protochloride occupies the third place upon the list. A combination with arsenic increases the efficacy of the sulphate.

<sup>1</sup> *Journal of the American Medical Association*, July 23, 1898, p. 172.

The preparations of iron should not be used in plethora. As they all, to a greater or less degree, interfere with the digestive function, checking the secretions along the alimentary tract, and frequently constipate, the state of the stomach should always be considered when prescribing iron. Where the tongue is red and dry, as Fothergill has shown, iron always disagrees, and should not be ordered. On the other hand, a pale, broad, and flabby tongue, marked by the impression of the teeth, is especially indicative of the demand of the system for iron. There are great differences in this respect, however, between the several preparations of iron, and new chalybeates are being constantly brought forward with the recommendation that they do not derange the digestion nor produce constipation.

One of the most efficacious of the ferruginous preparations is the tincture of the chloride, but, in addition to its disturbing effect upon the digestion, it is open to the objection that it stains and corrodes the enamel of the teeth. This action is due to the presence of free hydrochloric acid. It is customary to direct patients to largely dilute the liquid, to imbibe it through a tube, and to clean the teeth, immediately after taking the medicine, with a weak alkaline solution. The virtues, without the disadvantages, of the tincture of iron seem to be possessed by a preparation devised by Dr. George W. Weld, of New York. This syrup of the chloride consists of the official tincture with the excess of acid neutralized and a certain amount of the syrup of gaultheria added for the sake of palatability. Each fluidounce contains 24 minims of the tincture. It is said not to injure the enamel and not to derange the digestion.

In amenorrhœa, Bland's pills of carbonate of iron are of great service, or the compound mixture may be used with excellent effect. Iron is of most value in simple anæmia, such as that following hæmorrhage; it is of less service where the anæmia is symptomatic and accompanies organic diseases or blood poisoning. In such cases it acts more quickly when given hypodermically, the ammoniocitrate dissolved in distilled water being preferred.

This salt has been successfully employed in the same manner for the relief of subacute or chronic eczema, associated with or dependent upon anæmia.

Da Costa extolled the citrate of iron and manganese, administered hypodermically, in anæmia. Professor Rummo injects every day, into the interseapular region, half a syringe of a 1 to 10 solution of iron and ammonium citrate in distilled water. No inflammatory action is excited.

Dori has applied this method with success to chlorosis. As a result of a comparative study he states that the most satisfactory and rapid results were obtained from the injection of iron and ammonium citrate. The usual daily dose administered was about 0.065 Gm. (or gr. j).

In advocating the subcutaneous injection of iron in anæmia, Dr. Enrico Magagni contends that when introduced by the mouth it is borne by the portal system to the liver, which alone it directly influences, while upon the hæmatopoietic organs it can only exert an indirect and altogether feebler effect. When thrown under the skin it is able to act directly upon the whole blood-forming apparatus. A larger actual dose is, by this method, absorbed than when it is given by way of the mouth. In consequence of the more rapid absorption a more rapid effect is obtained. As the most convenient place for injection Magagni recommends the nates, where the pain is almost imperceptible.

The anæmia which results from chronic malaria is very amenable to the influence of iron. The enlarged spleen of malaria diminishes in size and malarial neuralgia is relieved. Iron is of constant service in the treatment of neuralgia, which so often depends upon a condition of anæmia:—

R. Mass. ferri carbonatis .....	1	65	Gm. or gr. xxiv.
Extracti hyoseyami .....		32	Gm. or gr. v.
Podophyllotoxin. ....		065	Gm. or gr. j.
Quininæ sulphatis .....		75	Gm. or gr. xij.

M. et ft. pil. no. xij.

Sig.: From four to six pills a day, for neuralgia.

R. Ferri et quininæ citratis solubilis.....	7	5	Gm. or 3ij.
Liquor potassii arsenitis.....		7	5 c.cm. or f3ij.
Elix. guaranæ .....	q. s.	ad 90	c.cm. or f3ij.

M. Sig.: A teaspoonful three or four times a day. Use in malaria and neuralgia.

Improvement takes place in pseudoleukæmia, or Hodgkin's disease, when iron is administered, especially in conjunction with arsenic, though the chalybeate preparations are of no utility in true leukæmia:—

R. Ferri pyrophosphatis .....	2	60	Gm. or gr. xl.
Arseni trioxidi .....		065	Gm. or gr. j.
Extracti nucis vomicæ .....		20	Gm. or gr. iij.
Extracti belladonnæ folior.....		13	Gm. or gr. ij.

M. et ft. pil. no. xx.

Sig.: A pill three times a day.

The tincture of iron is, at times, beneficial in acute rheumatism. It is in the case of weak and pale individuals that iron is likely to be of service. In such subjects the same remedy is capable of acting, to a certain extent, as a prophylactic. It is frequently judicious in syphilis, when accompanied by evidence of profound deterioration of general nutrition, to suspend specific remedies temporarily, and place the patient upon a tonic course containing iron, which may be favorably combined with quinine, strychnine, or ignatia.

An efficient mixture made use of in the Skin Clinic of the Post-graduate School of New York is thus composed:—

R. Ferri et ammon. citrat.....	4		Gm. or 3j.
Hydrarg. chlor. corr. ....		065	Gm. or gr. j.
Potass. iodidi .....	8		Gm. or 3ij.
Vini ferri dulcis (Malaga).....	q. s.	ad 90	c.cm. or f3ij.

M. Sig.: Teaspoonful in water after meals.

In the so-called gonorrhœal rheumatism iron will generally be found advantageous. Hequet for nearly twenty years has used ferrous bromide in nervous affections, and Da Costa found it useful in chorea. This salt has also been recommended as of service in leucorrhœa, diabetes, and tuberculosis.

Anæmic epileptics are benefited by iron, which may be very appropriately given in the form of the bromide and combined with potassium bromide, as:—

R Potassii bromidi .....	23 3	Gm. or 3vj.
Syrupi ferri bromidi .....	22 1	c.cm. or f3vj.
Tincturæ chiritæ, Elixir aromatici .....	aa 30 1	c.cm. or f3j.
Aquæ cinnamomi .....	q. s. ad 180 1	c.cm. or f3vj.

M. Dose: A tablespoonful three times a day.

Dr. Rosenthal advises subcutaneous injections of iron in nervous disorders. He prefers either the ferrum peptonatum, a syringe-ful of a 1 to 10 aqueous solution being given every second day, or ferrum oleatum, diluted to 1 to 20 by olive-oil and used in the same manner. Ferrum peptonatum has the advantage of greater solubility and stability. It is obtained by the decomposition of ferric-chloride solution with solution of pepsin and occurs as a brownish-yellow powder.

The following combinations containing iron may be employed with good effect in gonorrhœa and syphilis:—

R Pilulæ ferri iodidi .....	4 1	Gm. or 3j.
Extracti ignatiæ, Extracti belladonnæ folior .....	aa 13	Gm. or gr. ij.

M. et ft. pil. no. xxx.

Sig.: From four to six pills a day in gonorrhœal rheumatism and in gleet.

R Ferri phosphatis, Salolis .....	aa 10 1	Gm. or gr. cl.
Terebenæ .....	7 5	c.crn. or f3ij.

M. et ft. capsulæ no. xxx.

Sig.: Three to six capsules a day in gonorrhœa, gonorrhœal rheumatism, and cystitis.

R Ferri et potassii tartratis .....	8 1	Gm. or 3ij.
Arsenii trioxide .....	1005	Gm. or gr. i.
Extracti cocæ .....	4 1	Gm. or 3j.

M. et ft. pil. no. xl.

Sig.: Two pills three times a day in syphilis.

R Liquor ferri malatis, Aquæ cinnamomi, Glycerini .....	aa 30	c.cm. or f3j.
---	-------	---------------

M. Sig.: One to two teaspoonfuls in water three times a day for syphilis with irritable stomach.

R Ferri lactatis .....	2 60	Gm. or gr. xl.
Extracti cannabis Indiæ .....	10	Gm. or gr. iss.
Extracti rhamni purshianæ .....	20	Gm. or gr. iij.

M. et ft. pil. no. xij.

Sig.: A pill three or four times a day in syphilis.

R Syrup. ferri iodidi .....	15 1	c.cm. or f3ss.
Fluidextracti nucis vomicæ .....	3 10	c.cm. or ml.
Aquæ cinnamomi .....	75 1	c.cm. or f3iiss.

M. Sig.: A teaspoonful three times a day for infantile syphilis.

Hysteria, especially when associated with anæmia and amenorrhœa, is improved by the systematic administration of iron.

In order to overcome the tendency which exists in neurasthenia to palpitation of the heart Zerner makes use of:—

<b>R</b> Ferri pyrophosphat.,		
Zinci bromid. ....	aa	3 50 Gm. or gr. liv.
Tr. digitalis .....	15	c.cm. or fʒss.
Extracti ergotæ .....	12	Gm. or ʒiij.
Syr. aurant. ....	22	c.cm. or fʒvj.
Aq. destill. ....	105	c.cm. or fʒiiss.
<b>M</b> Sig.: From one to three teaspoonfuls a day.		

Certain cerebral disorders depend more or less immediately upon *anæmia*, as some forms of puerperal mania and the insanity of lactation; chronic mania and melancholia, also, are not infrequently due to impoverishment of the blood. In all these cases the tincture of ferric chloride is a valuable remedy. The continued use of iron is very beneficial in rachitis. In this disease a combination of the ferric phosphate and calcium phosphate is especially advantageous:—

<b>R</b> Ferri phosphatis solubilis,		
Calcii phosphatis præcipitat. ....	aa	8  Gm. or ʒij.
Extracti nucis vomicæ .....	32	Gm. or gr. v.
Ol. eucalypti .....	30	c.cm. or mv.

**M.** et **ft.** pil. no. xl.

**Sig.:** Two pills three times a day.

The styptic preparations of iron, given internally, are useful in hæmorrhage. A drop or two of the nitrate or subsulphate solution, given in ice-water and frequently repeated, will usually check bleeding from the stomach; 0.30 to 0.60 c.cm. (or *mv-x*) of the tincture given upon shaved ice every half-hour is recommended in the hæmorrhagic vomiting of yellow fever. The tincture of the chloride is an excellent remedy in hæmorrhage from the bowels or kidneys, and in purpura hæmorrhagica. Iron is useful, likewise, in the treatment of menorrhagia. Profuse discharges from mucous membranes, due to chronic inflammation, are restrained by the exhibition of iron, which acts as an astringent and at the same time favorably modifies the nutrition of the cells. Chronic diarrhœa and dysentery, chronic bronchitis, prostatorrhœa, gleet, and leucorrhœa are ameliorated by a chalybeate course. Dilatation of the stomach, dependent upon or connected with *anæmia*, is sometimes improved by the administration of iron, and, owing to its beneficial effect upon the mucous membrane, the syrup of iron is useful in the treatment of thread-worms. (Four c.cm., or fʒj, of the tincture to 240 c.cm., or Oss, of water is a good rectal injection when these parasites are present.) By maintaining the quality of the blood and promoting nutrition, iron is of service in phthisis and emphysema. Affections of the heart are notably improved by this remedy. In fatty degeneration, dilatation, and valvular disease, iron is demanded, in order to maintain the quality of the blood and the nutrition of the heart and to promote compensatory growth. The *anæmia* and indigestion of Bright's disease also receive benefit from this remedy, especially in the form of the tincture of the chloride or acetate.

Hamberger prefers to use a pill containing 0.02 Gm. (or gr.  $\frac{1}{50}$ ) of ferric chloride, three to six pills being given in the course of the day, or a pill of ferrous sulphate as recommended by Wiethe:—

<b>R</b> Ferri sulphatis,		
Sodii bicarb. ....	aa	5  Gm. or gr. lxxv.
Ext. taraxaci .....		q. s.

**M.** et **ft.** pil. no. lx

**Sig.:** Three pills to be given in the morning and three in the evening.

In addition he regulates the diet and administers decoction of cinchona-bark.

The nocturnal incontinence of urine in children often yields to iron. This is especially true of strumous children, for whom the syrup of the iodide is the best preparation. Iron is remedial in spermatorrhœa when that affection is the result of anæmia and relaxation. Both amenorrhœa and dysmenorrhœa are often due to impoverished blood, and, when this is the case, are best treated by iron. The menstrual irregularity, anæmia, and neurasthenia so often seen in overworked and underfed women in our great cities are conspicuously benefited by the administration of the "four chlorides," as introduced by Professor Goodell. The combination may be made as follows:—

R Tinct. ferri chloridi .....	9 25 c.cm. or f3iiss.
Hydrarg. chloridi corr. ....	13 Gm. or gr. ij.
Liquor arseni chloridi .....	9 25 c.cm. or f3iiss.
Acid. hydrochlorici dil. ....	185 c.cm. or f3v.
Syrup. simplicis .....	q. s. ad 120} c.cm. or f3iv.

M. et ft. sol.

Sig.: Teaspoonful in water three times a day.

The vasomotor disturbances incident to the menopause are often relieved by full doses of the tincture of iron, given several times a day. Phagedæna usually occurs in dissipated and debilitated individuals, and iron internally materially assists the action of the appropriate topical applications.

Reduced iron, or Quevenne's iron, is in such a minute state of subdivision that it is readily acted upon by the acid of the gastric juice, and generally agrees with the stomach. As it is tasteless, it may be given to children in the form of chocolates, each containing 0.065 Gm. (or gr. j), and thus forms an excellent tonic for anæmic and poorly-developed children. When used for its systemic effect, small doses are as efficient as large ones; it is best given when digestion is active,—about half an hour after meals.

R Ferri reducti .....	2 60 Gm. or gr. xl.
Sodii arsenatis .....	1065 Gm. or gr. j.
Extracti ignatiæ .....	132 Gm. or gr. v.
Extracti gentianæ .....	1 30 Gm. or gr. xx.

M. et ft. pil. no. xx.

Sig.: Take one three times a day, after meals, as a general tonic for an adult.

It is well to bear in mind that the prolonged administration of iron is liable to cause intestinal concretions.

The diuretic action of the tincture of the chloride is aided by saline combination. Thus, in chronic Bright's disease of the kidneys with œdema, we may give:—

R Tinct. ferri chloridi.	
Acid. phosphoric. dilut. ....	aa 7 5 c.cm. or f3ij.
Glycerini .....	30} c.cm. or f3j.
Liq. ammonii acetatis .....	q. s. ad 180} c.cm. or f3vj.

M. Sig.: A tablespoonful three or four times daily in dropay attending Bright's disease or pregnancy.

Instead of this, we may order the official solution of the acetate of iron and ammonium (Basham's mixture), or the following:—

R. Tr. cantharidis .....	4	c.cm. or f3j.
Tr. ferri chloridi .....	60	c.cm. or f3ij.

M. Sig.: Give twenty to thirty drops, well diluted, four times daily, to be taken through a glass tube, in gleet.

The syrup of ferrous iodide is valuable in strumous skin diseases, in conjunction with codliver-oil. The same remedy, alone or in conjunction with codliver-oil, is of undoubted efficacy in the treatment of enlarged strumous glands prior to the occurrence of caseous degeneration.

In erysipelas comparatively large doses of the tincture of the chloride are well borne (2.50 to 4 c.cm., or *mxl-f3j*, every two hours) and exert almost a specific effect, rapidly checking the force and progress of the disease.

**Special Preparations.**—Among the best-known preparations are the solutions of **ferrous malate** and of **dialyzed iron**, both of which cause very little disturbance and rarely constipate. That the latter does exert astringent effects, however, may be inferred from the fact that Dr. W. Judkins has found it a useful remedy in the diarrhœa of childhood. **Lævulose ferride** is another very eligible preparation of iron, differing, in many respects, from the others. It is of alkaline reaction, agreeable to the palate and the stomach, and, it is said, can be mixed with the ordinary fluid extracts and tinctures without causing chemical union between the iron and the tannin and the formation of insoluble tannates. **Iron albuminate** is an aromatic, reddish-brown, alkaline solution, which is said to be more readily assimilable than other iron salts, less frequently the cause of gastric disorder, and is promptly assimilated, causing rapid increase in the globular richness of the blood. It may be given in milk (Dumont). Dr. J. A. Quicherlon<sup>1</sup> finds it especially serviceable when anæmia and debility are associated with weak and irritable digestive organs.

The following are some modern organic preparations of iron:—

**Liquor Mangano-Ferri Peptonatus.**—Dr. Gude has prepared a solution of iron and manganese which is well adapted to the treatment of chlorosis, anæmia, and the various secondary ailments which depend upon a deficiency of red corpuscles and hæmoglobin. This solution is a clear, dark wine-colored fluid, of an agreeable, astringent, but non-metallic taste. It is given in the dose of a dessertspoonful to a tablespoonful three times a day, and is acceptably administered in milk. This preparation increases the appetite and has no prejudicial effect upon digestion. It can be steadily taken for a long period.

**Hæmogallol.**—This substance is obtained from hæmaglobin by treatment with pyrogallol. It is a reddish-brown powder, and is given in the dose of 0.13 to 0.50 Gm. (or gr. ii-viiij). Hæmogallol is without taste and has no disturbing effect upon digestion.

**Hæmol.**—Hæmol is the zinc compound of hæmaglobin prepared by treatment with zinc dust. It is of a blackish-brown color and its dose is the same as that of hæmogallol. Hæmol has but a slight taste. Both hæmogallol and hæmol can be readily administered as powders in water or mixed with sugar and placed dry upon the tongue. They are readily absorbed and slowly eliminated. They have been beneficially employed in chlorosis, anæmia, and dependent conditions, and Dr. W. H. Porter, of New York, has given them in diabetes mellitus with reported good results. These preparations are

<sup>1</sup> Communication to Louisville Clinical Society, Oct. 22, 1889.

regarded as of particular service in the anæmia which accompanies Bright's disease.

A number of metallic compounds of hæmol have been prepared and proposed as substitutes for older salts. **Bromhæmol**, containing 2.7 per cent. of bromide, has been experimentally used in epilepsy. **Cuprohæmol**, in which 2 per cent. of copper is embodied, and the dose of which is 0.10 to 0.13 Gm. (or gr. iss-ij), is thought to be serviceable in anæmia, scrofula, and tuberculosis. **Ferrohæmol** is a compound of iron and hæmol; its dose is 0.50 Gm. (or gr. viij). **Iodehæmol** contains 1.66 per cent. of iodine. **Mercuriodohæmol** is composed of 12.35 per cent. of metallic mercury and 26.68 per cent. of iodine, in addition to the hæmol. Metallic zinc in the proportion of 1.01 per cent. enters into the composition of **zincohæmol**, which is said to be very useful in diarrhœa and chlorosis.

**Oviferrin**.—A permanent, organic compound of iron and albumin of egg, discovered by Barnes and Hille, of Philadelphia. Its chemical formula is  $C_{47}N_{17}SH_3Fe_3O_{27}$ . It is a clear ruby-red solution, the usual dose of which is 15 c.cm. (or 3ss) (corresponding to 0.065 Gm. (or gr. j) of reduced iron). It does not cause disturbance of the digestive function, nor cause constipation. The author has found it very valuable in anæmia, and in rheumatic and neuralgic conditions. It is almost tasteless, and is readily taken by children.

**Ferratin**.—This name has been given to a fine powder, reddish brown in color, obtained by Professor Schmiedeberg, of Strassburg, from hogs' liver. Ferratin, as a rule, contains 7 per cent. of iron. Ferratin is believed to be identical in form with the iron as contained in food. It occurs in two varieties, one of which is insoluble in water, while the other, combined with sodium, is readily dissolved in water by agitation. Water containing lime forms with it an insoluble calcium ferratin. The daily dose of ferratin is from 0.10 to 0.45 Gm. (or gr. iss-vij) for children and from 1 to 1.30 Gm. (or gr. xv-xx) for adults. Ferratin has been found valuable in the treatment of anæmia, and especially of chlorosis.

**Hæmoferrum**.—This is another new preparation of iron described as a natural proteid compound of iron obtained from bullock's blood. The advantages claimed for it are palatability, solubility, and freedom from disturbing effect upon stomach or bowels. It is given in 0.20 Gm. (or gr. iij) doses for the relief of debility and anæmia.

**Iron-quinine chloride**, a yellowish-red powder, soluble in water, alcohol, and glycerin, has been used, both externally and internally, as a hæmostatic. In hæmorrhage from accessible mucous membranes a concentrated solution, or the powder itself, may be applied to the bleeding surface. Gastro-intestinal and pulmonary hæmorrhages may be treated by the internal administration of this substance. The dose is from 0.10 to 0.20 Gm. (or gr. iss-ij).

#### **FICUS (U. S. P., B. P.).—Fig.**

##### *Preparation.*

**Confectio Sennæ (U. S. P., B. P.).** (See *Senna*.)

**Pharmacology**.—The fig-tree is a native of the south of Europe and is cultivated in the southern part of the United States. The official part is "the partially dried fruit of *Ficus carica* (Moraceæ)," which has a pleasant taste. Figs are used as food, and contain 62 per cent. of sugar, with

gum, fat, salts, etc. Musci has obtained from the leaves and stems a new ferment-like principle, which he terms *cradine*. It is said to be more energetic than pepsin, and acts either in an acid or alkaline medium. It has no influence upon carbohydrates, but its action upon fats has not yet been studied.

**Therapy.**—Figs are slightly laxative, and may be used to correct a tendency to constipation, especially in children. The seeds act mechanically in stimulating peristalsis. Split open and heated, they may be used, particularly in the mouth, to fulfill the indications of a poultice. The proprietary syrup of figs is said to owe its laxative quality to senna leaves.

**FILIX MAS** (B. P.).—**Male Fern.** See *Aspidium* (U. S. P.), page 237.

**FLUORESCEIN.**—This is the name given to a body which results from heating together resorcin and phthalic anhydride. It is of acid reaction, and, when freshly precipitated, readily soluble in ether and alcohol, slightly soluble in hot water, more freely soluble in alcoholic solution. Fluorescein is of a dark-brown color, becoming green when added to water, and the solution exhibiting a beautiful fluorescence. **Fluorescein** is made by heating fluorescein with a solution of caustic soda and zinc dust.

**Therapy.**—Fluorescein and fluorescein are of service from their property of staining abraded corneal surfaces, by which means such lesions may be readily located. They have no effect in ulcers of the cornea or interstitial keratitis. These substances may be used also for the purpose of determining the permeability of stricture of the nasal duct. Forced into the canaliculus, if there is the least opening through the occlusion, some of the green solution will find its way into the nose. Sixty-five centigrammes (or gr. x) of either substance may be dissolved in 30 c.cm. (or f℥j) of water by the addition of 0.50 Gm. (or gr. viiss) of sodium bicarbonate.

**FÆNICULUM** (U. S. P.).—**Fennel.**

**FÆNICULI FRUCTUS** (B. P.).—**Fennel-fruit.**

**Dose,** 1.30 to 2 Gm. (or gr. xx-℥ss).

#### *Preparations.*

**Oleum Fœniculi** (U. S. P.).—**Oil of Fennel.** **Dose,** 0.30 to 1 c.cm. (or mv-xv).

**Aqua Fœniculi** (U. S. P., B. P.).—**Fennel-water.** **Dose,** 7.5 to 30 c.cm. (or f℥iii-f℥j).

**Pharmacology and Therapy.**—"The dried, nearly ripe fruit of *Fœniculum vulgare* (Umbelliferae)" contains an agreeable volatile oil (3 per cent.), which is used as a flavoring and carminative. It is an ingredient in the compound infusion of senna and compound spirit of juniper (U. S. P.), and compound licorice-powder (U. S. P., B. P.). Fennel-tea (infusion: 8 to 12 Gm. to 473 c.cm., or ℥ij-℥ij to 0j) is used to relieve colic in infants and in dysmenorrhœa. The oil may be added to purgative medicines for the purpose of preventing griping. Fennel has been thought to have an influence in promoting the secretion of milk.

**FORMALDEHYDUM.**—(See *Liquor Formaldehydi*.)

**FRANGULA** (U. S. P.).—**Frangula (Buckthorn).***Preparation.*

**Fluidextractum Frangulæ** (U. S. P.).—**Fluid Extract of Frangula.** Dose, 2 to 4 c.cm. (or f3ss-j).

**Pharmacology.**—"The dried bark of *Rhamnus Frangula* (Rhamnaceæ), collected at least one year before being used." It is a European species of a plant of which this country has a valuable variety in the California buckthorn, or *Cascara sagrada*. (See *Rhamnus purshiana*.) It contains a lemon-yellow, odorless, and tasteless glucoside, **Frangulin** (or rhamnnoxanthin), insoluble in water, but soluble in alcohol or ether. The recent bark contains a gastro-intestinal irritant, which is lost or modified by age, and therefore it is directed that only bark that has been dried for a year shall be used. Old bark contains **Emodin**, probably the most valuable constituent. The fluid extract is made with diluted alcohol, and better represents the bark than the preparations made simply with water, as the decoction (1 to 16) or the extract.

Frangula communicates a deep-yellow hue to the urine and fæces.

**Therapy.**—Frangula is a good laxative or purgative, resembling senna in its action. It can be used during pregnancy and is improved by the addition of a small amount of some aromatic to prevent griping.

**FRANKENIA.**—**Frankenia, Yerba Reuma.** A California plant, the *Frankenia grandiflora* (Frankeniaceæ), is recommended as a mild astringent. It is best given as a fluid extract, made with diluted alcohol, in diseases of the mucous membranes, as catarrh, leucorrhœa, gonorrhœa, etc. Dose, 0.60 to 1 c.cm. (or mx-xv) of the fluid extract.

It has also been used with reported success as a local application in chronic rhinitis and ozæna, preferably in the form of a spray.

**FRASERA.**—**Frasera, American Calumba.** The root of *Frasera Walteri* (Gentianæ) contains a bitter principle, **Gentiopieirin**, and a yellow, crystallizable substance, **Gentisic Acid**. It is used like gentian and other vegetable bitters. The fluid extract (alcoholic) is the best preparation. Dose, 2 to 4 c.cm. (or mxxx-f5j), several times daily, as a bitter tonic and gastric stimulant.

**FRAXINUS.**—**Ash.** The dried bark is bitter and astringent, containing bitter glucosides, **Fraxin** and **Fraxetin**, tannic acid, and volatile oil. It has been used in infusion in the treatment of intermittent fever. An infusion of the leaves has also been used: they are diaphoretic, diuretic, and purgative.

**FUCHSIN.**—**Fuchsin, Rosaniline Hydrochloride**, is a derivative of aniline, of special interest from the beautiful magenta-red solution which its greenish crystals make with water. Like other preparations of this group, it may happen to be contaminated with arsenic.

Dr. Elliot reports a case of Puget's disease in which remarkably good results were obtained by the application of an ointment containing 0.16 Gm. (or gr. iss) of fuchsin to 31 Gm. (or 5j) of lanolin and 26 c.cm. (or f5vij) of rose-water. A 1-per-cent. alcoholic solution has been successfully used in some cases of traumatic erysipelas. The intralaryngeal injection of a 2-per-

cent watery solution of boric acid, saturated with fuchsin, is said to be beneficial in tuberculous laryngitis. When administered internally, it colors the urine and the saliva; and also the fluids of the body, since the vision is affected (chromatopsia). It is claimed to have some influence over chronic kidney disease and that some cases of albuminuria have been arrested by it given in doses of 0.03 to 0.25 Gm., or gr. ss-iv, daily, with some vegetable extract). This remedy has likewise been administered with asserted advantage in typhus fever.

**FUCUS VESICULOSUS.**—*Fucus*, **Bladder-wrack**, **Gulf-weed**. *Fucus vesiculosus* is an alga, or unicellular plant, growing to immense size, forming masses of sea-weed in the Atlantic Ocean, found principally in the gulf-stream. It occurs in dried pieces of dark-brown or greenish color, with a disagreeable, fishy odor, and a rather bitter, sea-water taste. It contains mucilage, a bitter extractive, small amounts of iodine and bromine, with chlorides, phosphates, etc. It is supposed to be alterative and to have the power of reducing obesity, probably from the observation that pigs feeding upon it in Ireland do not fatten. It has been used with some success in enlarged scrofulous glands, bronchocele, and psoriasis. The decoction (1 to 16) may be used before meals to take away the appetite for food, or if used warm it acts as an emetic. The fluid extract and solid extract are irrational preparations; the only form in which to obtain the effects of the plant is the recent decoction. A charcoal from the leaves has been used for goitre.

**GALANGA.**—*Galangal*, the dried rhizome of *Alpinia officinarum* (Zingiberaceæ), is a native of China, where it is highly prized as a medicine. It is aromatic, resembling ginger and anise, and contains a volatile oil and an acrid resin. Dose, 1 to 2 Gm. (or gr. xv-xxx).

*Galanga* is stimulating and carminative, resembling ginger or cube. It is an ingredient in the powder for colds or catarrh, "catarrh snuff," and is also used in lozenges for pharyngitis and coughs.

**GALBANUM (B. P.).**—*Galbanum*.

Dose, 0.25 to 0.50 Gm. (or gr. iv-viiij).

#### *Preparation.*

*Pilula Galbani Composita* (B. P.).—Compound Pill of Galbanum (equal parts of asafetida, myrrh, and galbanum). Dose, 0.25 to 0.50 Gm. (or gr. iv-viiij).

**Pharmacology.**—A gum-resin obtained from *Ferula galbaniflua* (Umbelliferae), and probably from other allied plants. Like crude turpentine, it comes in tears or masses, often rough and dirty upon the surface. The taste and odor are characteristic and warm, bitter, and unpleasant. Galbanum contains a volatile oil, resin (60 to 67 per cent.), and gum. The purified resin contains 20 per cent. of **Umbelliferone**, combined and free, and about 50 per cent. of **Galbaresino-tannol** (Conrady). By dry distillation a beautiful blue oil is obtained agreeing in its characters with oil of *Matricaria chamomilla*. By infusing galbanum with potash, Hlasiwerth and Benth obtained resorcin (see **Resorcinum**).

**Therapy.**—As a local application, it is stimulant, and the plaster is used as a counter-irritant and resolvent over old swellings. Asafetida may be

combined with it, as in the formerly-official asafetida plaster. Internally it is an expectorant and antispasmodic. The compound pills of galbanum may be used in chronic bronchitis; also in chronic rheumatism and rheumatic affections. Some emmenagogic power has also been attributed to the compound pills of galbanum.

**GALEGA.**—Goat's-rue. *Galega officinalis* and *Galega apolinea* (Leguminosæ), indigenous plants, stimulate the secretion of milk. A watery extract possesses the properties and peculiar odor of the plant. In the daily dose of 4 to 6 Gm. (or 5i-iss), galega excites within a few days a notable augmentation of the milk. According to M. de la Carrière, the increase relates not only to the water, but to the globules also, as is shown by direct analysis.

**GALIUM.**—Cleavers, Bed-straw. The whole plant of *Galium aparine* (Rubiaceæ), a common indigenous herb, is used in domestic practice. *Galium* yields its virtues to water and alcohol, is bland to the taste, and devoid of bitterness or astringency. According to Dr. Eckfeldt, it is aperient, diuretic, and alterative. It may be used in the treatment of dropsy, incontinence of urine, jaundice, icterus neonatorum, and strumous manifestations associated with inactivity of liver and kidneys. *Galium* may be given in the form of an infusion or a fluid extract, the dose of which is 4 to 7.5 c.cm. (or f5i-ij).

**GALLA** (U. S. P., B. P.).—Nut-gall, Galls.

*Preparations.*

*Tinctura Gallæ* (U. S. P.).—Tincture of Nut-gall (20 per cent.). Dose, 2 to 11 c.cm. (or f3ss-ijj).

*Unguentum Gallæ* (U. S. P., B. P.).—Nut-gall Ointment (20 per cent.).

*Unguentum Gallæ cum Opio* (B. P.).—Gall and Opium Ointment (gall ointment, 92.5 Gm., or 3xxiv; opium, 7.5 Gm., or 3i 1/4).

**Pharmacology.**—Galls are "excrecences on *Quercus lusitanica* (Cupuliferæ), U. S. P.; *Quercus infectoria* (B. P.) caused by the punctures and deposited ova of the gall-fly, *Cynips Gallæ tinctoriæ* (class, Insecta: order, Hymenoptera)." Galls are small (2.5 cm., or 1 in., in diameter), hard, irregularly-spherical bodies. Externally, they are dark green or gray; internally, yellowish gray and dark in the centre, with a central cavity. The important constituents are tannic acid (40 to 75 per cent.) and gallic acid 2 to 3 per cent.). The Aleppo galls are considered to be the best; light-colored, spongy bulks and so-called white galls are inferior. Their preparations are incompatible with metallic salts and generally form insoluble precipitates with alkaloids.

The powdered galls are very astringent locally to the skin and to the gastro-intestinal mucous membrane. Stockman doubts if they exert any astringent effect in the blood or by systemic action; any such action he considers as merely reflex, from the effect upon the stomach.

**Therapy.**—In the form of ointment, galls are used as an application to hæmorrhoids; a drachm of powdered opium to each ounce of nut-gall ointment is a good addition for this purpose. Nut-gall ointment is also a useful dressing to indolent ulcers, to eczema of the scalp after the scales have been removed, to herpes, fissured nipples, chilblains, and alopecia circumscripta.

It is also serviceable in prolapse of the rectum. Grose claims that an ointment containing 1 part of powdered galls to 8 of vaselin is efficacious in extensive burns, and that it restrains the tendency to subsequent cicatricial contraction.

The tincture of galls may be used, diluted with water, as a wash or gargle; but, for internal use, gallic or tannic acid is preferable. An infusion or decoction is sometimes made use of as an enema in diarrhœa and dysentery. The aromatic syrup of galls (containing galls, cinnamon, ginger, brandy, and sugar) is a pleasant astringent for children (dose, 2 to 4 c.cm., or *mx-15j*). (See also **Acidum Gallicum**.)

**GAMBIR** (U. S. P.).—Gambir. (See **Catechu**.)

**GARRYA FREMONTII**.—California Fever-bush, Skunk-bush. *Garrya Fremontii* is an evergreen shrub found in the higher localities of the mountains of California. The leaves, the part used medicinally, have little odor, but are very bitter to the taste. Mr. D. J. Ross claims<sup>1</sup> to have found in the leaves a new alkaloid, which he terms **Garryine**. *Garrya* possesses tonic and antiperiodic virtues and is said to be a reliable cholagogue. Excessive doses cause buzzing in the ears. A solid and a fluid extract have been prepared. The dose of the former is 0.03 to 0.065 Gm. (or gr. ss-j) and of the latter 0.60 to 2 c.cm. (or *mx-xxx*). Dr. Q. C. Smith, of Austin, Texas, writes that, from an experience of fifteen years, he regards this remedy as of more service than quinine in treating chronic or relapsing cases of malarial disease. He states that it is of value, also, in acute pulmonary inflammations.

**GAULTHERIA**.—Partridge-berry, Wintergreen, Tea-berry.

#### Preparations.

**Oleum Gaultheriæ** (U. S. P.).—Oil of Gaultheria. Dose, 0.12 to 1.20 c.cm. (or *mi-xx*).

**Spiritus Gaultheriæ** (U. S. P.).—Spirit of Gaultheria (oil of gaultheria, 5 per cent. in alcohol). Dose, 0.60 to 1.30 c.cm. (or *mx-xx*).

**Oleum Betulæ** (U. S. P.).—Oil of Betula. Oil of sweet-birch (a volatile oil obtained by distillation from the bark of sweet-birch, identical with menthyl-salicylate and nearly identical with oil of gaultheria). Dose, 0.06 to 0.30 c.cm. (or *mi-v*).

**Methyl Salicylas** (U. S. P.).—Methyl Salicylate. Artificial (or synthetic) oil of wintergreen. Dose, 0.06 to 0.30 c.cm. (or *mi-v*).

**Pharmacology**.—The *Gaultheria procumbens* (Ericaceæ) is a small plant growing in the woods in North America; the leaves were formerly official: they contain a volatile oil, **Arbutin**, **Ursin**, **Ericolin**, **tannic acid**, etc. The taste is aromatic, slightly bitter, and astringent; the flavor is agreeable. The volatile oil consists principally of **Gaultherilene** and **methyl-salicylate** (99 per cent.), which yields a pure salicylic acid. The oil of sweet-birch is frequently sold for oil of gaultheria, with which it is nearly identical. **Methyl salicylas** (U. S. P.) is the artificial, or synthetic, oil of wintergreen, and may be substituted for it. It is made by distilling salicylic acid with methylic alcohol and sulphuric acid.

**Therapy**.—The oil of gaultheria is antiseptic and antipyretic. It may be used in doses of 0.60 to 1.20 c.cm. (or *mx-xx*) in articular rheumatism

<sup>1</sup> *American Journal of Pharmacy*, 1877.

as a substitute for salicylic acid. It is efficacious, but is not as well tolerated as sodium salicylate on account of its local irritant properties. The oil, being a salicyl compound, is also used internally in both acute and subacute articular rheumatism with excellent results. In Bozzolo's clinic, where it was first used for rheumatism, it is now looked upon as the most available of the antirheumatics in the treatment of chorea in children. The oil of gaultheria, combined with its own weight of vaselin, is employed locally over painful points, and not only ameliorates the pain, but also acts beneficially upon the chorea. Schoull<sup>1</sup> says that it is more particularly in the articular manifestations of rheumatism that it is successful, especially as a means of relieving pain, which disappears very rapidly under its administration, much more so than with salicylate of soda. The swelling of the joints is somewhat longer in disappearing, as is also the temperature, and salicylate of soda seems, in this instance, more efficacious. It is therefore proposed to administer the two salicylates together, under which circumstances the similar dose of the soda salt can be employed. Schoull has also employed a combination of salicylate of methyl and antipyrin, and has thus obtained some surprising results in the reduction both of the pain and temperature. The author points out that the amount of urine should be watched during the administration of this drug. Salicylate of methyl is also of extreme advantage in subacute and chronic rheumatism, in which cases it presents a marked superiority over the soda salt. The same may be said of gouty arthritis. In certain other infective conditions as gonorrhœa, syphilis, and erythema nodosum, the effects, though good, are not so striking. The writer quotes Roger as having obtained very good results in the arthritic complications of eruptive fevers, especially scarlet fever, in which the action of antipyrin, salicylate of soda, or salophen, is slight. The drug is also efficacious in neuralgia, sciatica, some forms of neuritis, and herpes zoster, and lightning pains of tabes. Schoull has also tried salicylate of methyl in cases of orchitis from mumps and with remarkable results, all the symptoms disappearing in two days. Even in cases of epididymitis the effects are very favorable. The treatment of mumps itself by salicylate of methyl has been tried by Picard, of Troyes, with considerable success. Dr. John A. Wyeth, of New York, regards the oil of gaultheria as a serviceable remedy in the treatment of acute gonorrhœa. He administers it in 6-drop doses three times a day.

The decoction of the leaves or a fluid extract may be used in bowel disorders as an astringent. The infusion is in some parts of the country used as a substitute for tea at the table. It is also used as a galactagogue and emmenagogue. It is a good addition to liniments for rheumatic pains and swollen joints. A combination of equal parts of oil of wintergreen and olive-oil is a good application in such conditions.

Excessive doses of oil of gaultheria give rise to violent gastro-enteritis, followed by convulsions, coma, and death. Half an ounce has caused death; in another case recovery occurred after ingestion of the same quantity. A child, two years of age, died in convulsions, after swallowing 4 c.cm. (or 5j).<sup>2</sup>

**Salicylamide.**—This substance is made by treating oil of gaultheria saturated ammonia-water. It has also been prepared from artificial oil of

<sup>1</sup> *Journal de Médecine*, March 10, 1899.

<sup>2</sup> *American Journal of Medical Sciences*, February, 1904.

wintergreen. Pure salicylamide occurs in the form of colorless and transparent crystals. It is without taste and is moderately soluble in water. It is claimed to possess the virtues of salicylic acid with greater analgesic power. Salicylamide has been given in doses of 3 to 5 grains repeated several times during the day.

**GELATINUM** (U. S. P., B. P.).—Gelatin.

**GELATINUM GLYCERINATUM** (U. S. P.).—Glycerinated Gelatin, Glycerin Jelly (gelatin, 100 Gm.; glycerin, 100 Gm.; water to make 200 Gm.).

By adding water and glycerin (of each 25 parts) to glycerinated gelatin (50 parts), gelatin suppositories may be made extemporaneously.

**Pharmacology.**—The air-dried product of the hydrolysis of certain animal tissues as skin, ligaments, and bones after treatment with boiling water. It occurs in translucent and almost colorless sheets or shreds. It dissolves in boiling water and (5 per cent.) makes a jelly on cooling. It is a basis of many agreeable and nutritive preparations for the sick, such as wine-jelly.

**Therapy.**—In eczema, where a dressing of more or less fixed character is required, gelatin in the following combination is often used:—

Gelatin .....	15 to 25 parts.
Zinc oxide .....	10 to 15 parts.
Glycerin .....	15 to 25 parts.
Water .....	50 parts.

To this may be added ichthyol, 2 parts; this is heated over a water-bath each time it is employed, a good coating painted on with a brush, and when partly dry the parts wrapped with gauze bandage.

In 1895 Dastre demonstrated that the injection of a solution of gelatin into the veins of a dog rendered the blood more coagulable. This discovery has been utilized in the treatment of aneurism of the first portion of the aorta. Prof. K. Barth<sup>1</sup> describes a case in which he used gelatin injections in the strength of 1 Gm. (or gr. xvss) in solution (1 per cent.) every second day until twelve injections were given; later a second course was carried out, and the examination after the latter showed a diminution of the dullness from a diameter of 4 1/4 inches to 2.34 by 1.95 inches; the subjective symptoms (pain, discomfort, inability to make any exertion) had entirely disappeared.

**GELSEMIUM** (U. S. P.).—Gelsemium (Yellow Jasmine).

**GELSEMI RADIX** (B. P.).—Gelsemium-root.

Dose, 0.13 to 1.30 Gm. (or gr. ii-xx).

*Preparations.*

**Fluidextractum Gelsemii** (U. S. P.).—Fluid Extract of Gelsemium. Dose, 0.12 to 0.60 c.cm. (or mii-x).

**Tinctura Gelsemii** (U. S. P., B. P.).—Tincture of Gelsemium (10 per cent.; the British tincture is also 10 per cent.). Dose, 0.18 to 1 c.cm. (or miii-xv).

**Pharmacology.**—"The rhizome and roots of *Gelsemium sempervirens*" (*Loganiaceae*), U. S. P.; *Gelsemium nitidum* (B. P.): a climbing plant of the southern part of the United States.

<sup>1</sup> *Münchener medizinische Wochenschrift*, April 2, 1901.

Two bases have been extracted from gelsemium. **Gelsemine** is a crystallizable alkaloid; **Gelseminine** is amorphous, of a pale, grayish-brown color, bitter to the taste; readily soluble in alcohol, ether, or chloroform, and but slightly soluble in water. They exist in combination with Gelseminic Acid and a peculiar resin.

**Physiological Action.**—It has no special local action beyond slight sedative influence or astringency. Internally, it is a powerful motor depressant and sedative, motion being affected before sensibility, in warm-blooded animals. It acts especially upon the centres in the spinal cord and medulla. Small doses occasion injection of the conjunctivæ, pain in the eyelids, contraction of pupils (if locally applied or in very large doses it may cause dilatation), with drooping of the upper lid, or, more decidedly, vertigo and confusion of vision. Larger doses exert a paralyzing influence upon the spinal cord; the power of voluntary movement is progressively lost, numbness and staggering gait being observed as preliminary symptoms. Reflex irritability is lowered, the pupils dilate, and the sensory columns of the cord become paralyzed. No brain symptoms are produced directly, but the cerebral functions may be disturbed by the accumulation of carbonic acid in the blood, the result of paralysis of muscles of respiration. Death results from asphyxia. In animals convulsions may appear. Little effect is observed upon the heart directly; the pulse-rate is lessened by lowering the excitability of the excitomotor ganglia of the heart (Ott) and the arterial pressure by diminution of vasomotor tonus. It produces a decided lowering of the bodily temperature and is diaphoretic. Languor, muscular depression, and prostration occur.

**Poisoning.**—In cases suffering with toxic symptoms from an overdose, diffusible stimulants, hot drinks, friction to the surface of the body, and artificial respiration are useful, after evacuation of the contents of the stomach. Hypodermic injections of morphine and atropine are antagonistic to gelsemium. Tannic acid and caustic alkalies and their carbonates are chemically incompatible. In case of poisoning with gelsemium, the stomach should be promptly emptied by an emetic or the stomach-pump. External heat should then be employed, together with cardiac and respiratory stimulants, as digitalis, ammonia, atropine, and strychnine.

The smallest quantity of gelsemium which is known to have caused death is a teaspoonful of the fluid extract. In one fatal case Professor Wormley estimated that the quantity of fluid extract taken was equivalent to 0.01 Gm. (or gr.  $\frac{1}{60}$ ) of gelsemine.

**Therapy.**—Gelsemium may be given to allay excessive nervous irritability, as in neuralgia, ovaralgia, tic douloureux, and in some cases of myalgia. Gelsemium is frequently beneficial in lumbago. It will often allay the pain of dental neuralgia. In facial neuralgia comparatively large doses of the tincture (0.60 to 1.20 c.cm., *mx-xx*), every two hours, are well borne. It has also been proposed as a remedy for tetanus, and might be useful in hydrophobia to control the spasms. In painful spasmodic affections the fluid extract or the tincture may be hypodermically administered either to supplement small doses of morphine, or as a substitute for this drug.

Dr. John B. Read treated a case of tetanus successfully by the administration of 2.50 c.cm. (or *mxl*) of the fluid extract every second hour until the symptoms began to ameliorate, when the dose was reduced by one-half and continued for several days.

Ringer has found the tincture, in 0.60-c.cm. (or *mx*) doses thrice daily,

beneficial in some cases of Ménière's disease. The same preparation, in 0.30 c.cm. (or *℥v*) doses every quarter of an hour, will sometimes arrest an attack of bilious colic. In the spasmodic stage of whooping-cough, in asthma, laryngismus stridulus, and torticollis gelsemium has given relief. It is of service in migraine and in headache from eyestrain, in maniacal paroxysms, mania a potu, and insomnia. Certain fevers, notably cerebro-spinal and remittent, are benefited by the administration of gelsemium. When acute eczema is accompanied by considerable constitutional reaction, gelsemium may be given with marked advantage. This agent, likewise, especially when administered at bed-time, relieves the itching of eczema. It allays the pain of spasmodic dysmenorrhœa, favors dilatation of a rigid os in labor, and quells after-pains. It is of considerable service in the treatment of hæmoptysis. It is used in small doses as an antispasmodic in coughs, and in pneumonia and pleurisy. A full dose of gelsemium may prove successful in aborting an acute coryza. It is safer, on account of possible idiosyncrasy, to begin with very small doses of the tincture or extract, and gradually increase until slight drooping of the eyelid shows the beginning of full physiological effect. Gelsemium may be employed locally in the treatment of prurigo in the form of fluid extract, diluted. Dr. H. P. Nottage finds gelsemium exceedingly useful in influenza, all forms of catarrhal fevers, and, especially, in neuralgia where there is a tendency to recurrence or exacerbation on any particular day or time of day. He prefers small doses of a fluid extract made from the green root. It acts best when the pulse is large, full, quick, but easily obliterated by pressure. He has also found it useful in the headaches which occur at the menopause, together with flushings, the head and body hot, in 2- or 3-drop doses every three hours. It is useful in meningitis and convulsions, especially in childhood. In fractional doses (tincture diluted to  $\frac{1}{10}$ , and 2 drops given every two hours) it has been serviceable in vertigo, or dizziness. In chorea, when the usual remedies fail, gelsemium is worth trying.

In the dermatitis caused by *Rhus radicans* Dr. Edson has successfully used a lotion containing 7.5 c.cm. (or *f3ij*) of the fluid extract of gelsemium to 120 c.cm. (or *f3iv*) of water, a small quantity of carbolic acid and glycerin being also contained in the mixture. It has been also used as a mydriatic in eye practice.

**GENTIANA** (U. S. P.).—Gentian.

**GENTIANÆ RADIX** (B. P.).—Gentian-root.

Dose, 0.50 to 2 Gm. (or *gr. viii-xxx*).

#### *Preparations.*

**Fluidextractum Gentianæ** (U. S. P.).—Fluid Extract of Gentian. Dose, 2 to 4 c.cm. (or *mxxx-f3j*).

**Extractum Gentianæ** (U. S. P., B. P.).—Extract of Gentian. Dose, 0.13 to 0.50 Gm. (or *gr. ii-vij*).

**Tinctura Gentianæ Composita** (U. S. P., B. P.).—Compound Tincture of Gentian (U. S. P. contains gentian, 10 Gm.; bitter orange-peel, 4 Gm.; cardamom, 1 Gm.; alcohol and water, each, q. s. ad 100 c.cm.). Dose, 4 to 7.5 c.cm. (or *f3i-ij*).

**Infusum Gentianæ Compositum** (B. P.).—Compound Infusion of Gentian (contains gentian, 12.50 Gm.; bitter orange-peel, 12.50 Gm.; fresh lemon-peel, 25 Gm.; and distilled water, boiling, 1000 c.cm.). Dose, 15 to 30 c.cm. (or *f3ss-j*).

**Pharmacology.**—Gentian is "the dried rhizome and roots of *Gentiana*

*lutea* (Gentianaceæ): a native of Europe. Many species are indigenous, as the *Gentiana puberula*, *G. saponaria*, *G. Andrewsii*, and the beautiful *G. crinita*, which differ in therapeutical effects only in degree from the official gentian, and may be employed for like purposes. Both water and alcohol dissolve the active principle, which is very bitter, and appears to be a glucoside, **Gentiopierin**, combined with **gentisic acid**, a coloring ingredient. There is no tannin present; although the preparations are darkened by most of the iron salts (the citrochloride is excepted), due to a change in this coloring matter, probably. Of the American varieties a decoction or infusion may be used, although a fluid extract would better represent the drug.

**Physiological Action.**—Gentian is a simple bitter, with little, if any, astringency, and has the same physiological action as others of this class. When combined with an alkali its local effects upon the stomach are much increased. From experiments upon dogs Dr. P. Terray concludes that gentian is the most powerful stimulant to the automatic movements of the stomach.

Gentian has been thought to exert a slight stimulant effect upon the liver. The chalybeates are synergistic, with reference to general tonic effects. It enjoys a reputation as a *sulcedaneum* for cinchona, as an antipyretic and antiperiodic, though to a less-marked degree; its actions have not been as much studied as those of the latter. No toxic effects have been noted.

**Therapy.**—As a stomachic tonic, the preparations of gentian are deservedly esteemed in cases of weak stomach during convalescence, catarrhal gastric disorder in infants, or ordinary atonic dyspepsia:—

R Sodii bicarb. ....	15½	Gm. or ℥iv.
Infusi gentianæ comp. ....	180	c.cm. or ℥vj.
M. Sig.: A tablespoonful or two half an hour before meals.		

It may be given with advantage in cases of atony of the stomach with a moderate amount of dilatation. The compound infusion of gentian is a good vehicle for administration of potassium iodide in cases where its tonic effects would be useful. Combinations of gentian and iron are numerous, but none are used so much as the Elixir Gentianæ cum Tinctura Ferri Chloridi (N. F.):—

R Elixir gentianæ .....	120	c.cm. or ℥iv.
Tincturæ ferri citrochlorid. (N. F.) .....	10	c.cm. or m℥x.
M. Sig.: Two teaspoonfuls after each meal.		

The gentian mixture official in the British Pharmacopœia is, according to Whittle, excelled by few remedies in the treatment of the vomiting of pregnancy, especially when combined with a mineral acid.

The infusion, or decoction, is useful as a stomachic in gastric disorders associated with gout or malarial fever, or the compound tincture may be used where the alcohol is not objectionable:—

R Tincturæ cinchonæ,		
Tr. cardamom. comp. ....	aa 30	c.cm. or ℥j.
Tr. gentianæ comp. ....	60	c.cm. or ℥ij.

M. Sig.: A dessertspoonful to a tablespoonful in malarial dyspepsia and debility with loss of appetite.

**Gentiana Quinquifolia.**—The five-flowered gentian is common in the

United States. The whole plant is bitter, and may be given in infusion, but a fluid extract of the root would be better (dose, 0.30 to 2 c.cm., or *mv-xxx*). It may be used for the same purpose as the preceding.

**GERANIUM<sup>1</sup> (U. S. P.).—Geranium (Cranes-bill).**

**Dose,** 1 to 4 Gm. (or gr. xv-5j).

**Preparation.**

**Fluidextractum Geranii (U. S. P.).—Fluid Extract of Geranium.** Dose, 2 to 4 c.cm. (or *mxix-f3j*).

**Pharmacology.**—An indigenous plant, found in the woods from Canada to Florida, of which the rhizome only is official. The spotted geranium, as it is called, or *Geranium maculatum* (Geraniaceæ), contains tannic (13 to 15 per cent.) and gallic acids, which are its most important constituents, besides some resin, gum, starch, pectin, coloring matter, etc. According to the analyses of Trimble and Peacock, gallic acid does not exist in the plant, but is easily found in the rhizome after drying, and results from the easily-decomposable tannin. A crystalline vegetable principle has also been found in geranium by Dr. Edward Staples.

As geranium imparts its virtues to both water and alcohol, it may be used in decoction and tincture, as well as in the official fluid extract, which is made with dilute alcohol.

**Physiological Action and Therapy.**—Geranium improves the appetite and digestion and promotes nutrition. As it is decidedly astringent, the drug may be used, in fine powder, as a styptic in hæmorrhages after extraction of a tooth, epistaxis, etc. Its astringency renders it an excellent hæmæstatic. The writer has obtained good results from the local application of the fluid extract, diluted with 3 or 4 parts of water, in buccal ulcer, fissure of the anus, and metrorrhagia. The same treatment promptly arrested a hæmorrhage from the urethra and at the same time cured a rebellious gleet which had been in existence for two years.

Geranium makes a useful throat- and mouth- wash:—

R Potassii chloratis .....	8	Gm. or 3ij.
Fluidext. geranii .....	22	c.cm. or f3vj.
Glycerini .....	30	c.cm. or f3j.
Aque rose .....	q. s. ad 180	c.cm. or f3vj.

M Sig.: Add a tablespoonful to two tablespoonfuls or more of water, and use as a gargle.

In catarrhal inflammations, as an injection in gonorrhœa, gleet, and leucorrhœa, the decoction is more serviceable, according to Prof. L. Johnson, than a simple solution of tannin, doubtless from the fact that there is present mucilaginous material, which acts as a demulcent. The fluid extract is useful internally in diarrhœa. In infantile diarrhœa the decoction may be very acceptably administered in milk, which covers its taste. It is a valuable remedy in the early stages of phthisis, diminishing cough and expectoration, reducing the fever and pulse-rate, checking night-sweats and hæmoptysis. Under its use the appetite improves and the patient gains in weight. In a rapid case of phthisis, accompanied by profuse night-sweats, complete loss of appetite, and a severe, harassing cough, marked temporary relief was obtained by the following prescription:—

<sup>1</sup> See paper by author in the *Atlanta Medical and Surgical Journal*, Oct., 1899.

R. Ol. menth. -ip. ....	1	20 c.cm. or mxx.
Fluidext. geranii. ....	45	c.cm. or f3iss.
Vini Portensis ....	30	c.cm. or f3j.

M. Sig.: Teaspoonful every third hour.

Geranium is mild and unirritating, and especially suited to the later stages of diarrhoea and dysentery in children. It has also been employed in internal hæmorrhage, with good results.

**GEUM.**—**Avens.** Two species of Geum (Rosaceæ) are used in medicine: the Geum urbanum, or European avens, and the Geum rivale, or water avens, a native of North America. In each the root is the part possessing medicinal properties. Geum contains a bitter principle called **Gein** by Buchner, a little volatile oil, and a large proportion of tannic acid (10 to 40 per cent.). A recent infusion or decoction would best represent the physiological action of geum, though a fluid extract made with dilute alcohol is also used.

**Therapy.**—Avens is tonic and astringent. It is chiefly useful in relaxation of mucous membranes. An infusion made with boiling water is given for diarrhœa.

**GILLENIA.**—**Gillenia, American Ipecacuanha.** The Gillenia trifoliata, or Indian physic, and Gillenia stipulacæa, which is a species closely resembling it, were formerly official, but have been dropped from the pharmacopœia, as they are very inefficient substitutes for ipecacuanha. They belong to the botanical family Rosaceæ, and are indigenous to this country, growing from Canada to Georgia. The part used is the root, which contains **Gillenin**, a peculiar bitter principle, to which its therapeutic properties are due. It also contains tannic acid, gum, resin, starch, etc. Dose of the root, 0.32 to 2 Gm. (or gr. v-xxx).

**Physiological Action and Therapy.**—Gillenia is an active emetic, and in small doses is thought to resemble ipecacuanha as a tonic and cholagogue; it is also diaphoretic and expectorant.

It has been used as a substitute for ipecacuanha, as an emetic, stomachic tonic, and diaphoretic, and in domestic practice in dyspepsia, etc.

**GLANDULÆ SUPRARENALÆ SICCÆ (U. S. P.).**—Desiccated Suprarenal glands.

**GLANDULÆ THYROIDEÆ SICCÆ (U. S. P.).**—Desiccated Thyroid Glands. (See Animal Secretions, page 203.)

**GLONCINUM.**—Glonoin (Nitroglycerin, Trinitrin), Glyceryl Trinitris.

#### Preparations.

**Spiritus Glycerilis Nitratis (U. S. P.).**—Spirit of Glyceryl Trinitris (1 per cent. by weight). Dose, 0.03 to 0.18 c.cm. (or mss-ij).

**Liquor Trinitrini (B. P.).**—Solution of Trinitrin, Solution of Nitroglycerin (1-per-cent. alcoholic solution). Dose, 0.03 to 0.12 c.cm. (or mss-ij).

**Tabellæ Trinitrini (B. P.).**—Trinitrin Tablets (chocolate tablets each containing 0.00005 Gm., or gr.  $\frac{1}{200}$ ). Dose, 1 or 2.

**Physiological Action.**—*Nitroglycerin*, or *glonoin*, has the same physiological effects as amyl nitrite, but is usually administered in solution. The official Spiritus Glycerilis Nitratis, therefore, is preferable to the tablets. The action is slower, but more permanent, than that of amyl nitrite.

**Antagonists.**—The physiological antagonists to the action of amyl nitrite and nitroglycerin are strychnine, belladonna, sclerotinic acid, and, in general, those remedies which raise arterial tension and diminish blood-supply to the great centres by producing contraction of blood-vessels. In case of unpleasant or serious symptoms after its use, the exhibition of ammonia by inhalation and by the mouth, the hypodermic injection of atropine or ether, with cold water or ice-bag to the head, mustard poultice to the epigastric region or to the extremities, keeping the patient warm and in the recumbent posture, will very soon be followed by relief, as the symptoms are usually quite evanescent.

**Therapeutic Applications.**—Murrell praises this remedy highly, not only for typical angina, but for breathlessness and attacks of pseudo-angina. Da Costa has given it in Bright's disease attended by high arterial tension (cirrhotic kidney), in the following combination:—

R Glycerylis trinitritis.....	0.0065 Gm. or gr. $\frac{1}{100}$
Tr. digitalis,	
Tr. atrophanthi .....	aa.  12 c.cm. or <i>mij.</i>
Tr. belladonnæ .....	03 c.cm. or <i>miss.</i>

M. et ft. tabella.

Sig: Take one every six hours until effect upon the pulse is obtained.

In the treatment of angina pectoris and severe asthma Hoffmann<sup>1</sup> recommends subcutaneous injections of nitroglycerin in alcoholic solution in dose of 0.0005 to 0.001 Gm. (or gr.  $\frac{1}{120}$ – $\frac{1}{60}$ ). He claims remarkable results from these injections, without any objectionable after-effects.

Dr. Elliot Bates has, in a number of instances, seen very marked relief from the hypodermic injection of nitroglycerin in those cases of epilepsy where the patient falls with rigid limbs. He administered it in the dose of 0.00065 Gm. (or gr.  $\frac{1}{100}$ ). Good results have been observed in hystero-epilepsy from the hypodermic injection of the same quantity, the spasm being controlled within a few minutes.

A few drops of the solution of nitroglycerin placed upon the tongue have been used with success in order to relieve the craving of the opium habituate. Dr. Speer records a case in which nitroglycerin was successfully employed in morphine poisoning, 0.38 Gm. (or gr. *vj*) having been taken by a lad aged 17 years. An injection of 0.0013 Gm. (or gr.  $\frac{1}{50}$ ) was soon followed by an improvement in the respiration and, in half an hour, by vomiting, after which 0.00065 Gm. (or gr.  $\frac{1}{100}$ ) was administered in the same manner. Two hours subsequently the patient was out of danger. Case reports great relief in Raynaud's disease from the injection, thrice daily, of the same quantity of nitroglycerin gradually increased to 0.0013 Gm. (or gr.  $\frac{1}{50}$ ). In threatened collapse caused by pneumonia, drop doses of the 1-per-cent. solution, as advocated by Dr. Andrew H. Smith, of New York, act as a diffusible stimulant and often avert the danger.

Dr. Trussewitsch recommends the use of nitroglycerin in the algid stage of cholera. One or 2 drops of the 1-per-cent. solution placed upon the tongue causes dilatation of the peripheral blood-vessels, decreases the blood-pressure, and relieves the heart. Dr. Humphries employs nitroglycerin in various forms of vomiting with very good results. He has also found it valuable in acute or chronic gastric catarrh of the infant or adult, and has used it suc-

<sup>1</sup> *Pharmaceutical Journal and Transactions*, June 28, 1890.

cessfully in the vomiting of pregnancy. Given subcutaneously it acted as a prompt restorative in a case of poisoning from illuminating gas. Dr. D. D. Stewart points out that a tolerance to this remedy is sometimes readily acquired by patients, whose anxiety prompts them to increase the doses. This tendency must be guarded against by temporarily discontinuing the drug from time to time and resuming with a smaller dose than that last used.

A remarkable example of acquired tolerance to nitroglycerin has been placed upon record by Dr. G. E. Reading, of Woodbury, N. J. The patient, a woman, suffering from chronic interstitial nephritis, was placed at first upon the doses of 0.00065 Gm. (or gr.  $\frac{1}{100}$ ), which was gradually increased until, in less than a year, she was taking an amount equivalent to 0.38 Gm. (or gr.  $\frac{v}{j}$ ). The symptoms of the disease were by this time apparently cured.

On account of the explosive properties of nitroglycerin, it is advisable not to accumulate too large a number of the tablets, nor to shake them violently. This objection, says Murrell, will not apply to the forms in which nitroglycerin is ordinarily dispensed, however. The 1-per-cent. solution, he adds, is perfectly safe, and may be used without fear; in fact, most chemists keep a 5-per-cent. solution. The same authority also gives a series of experiments made by himself in hammering and bringing a red-hot wire in contact with pills of nitroglycerin, thus demonstrating their safety. All pills and tablets of nitroglycerin may not be so safe as those he referred to.

**GLUCOSUM.**—Glucose, Grape Sugar ( $C_6H_{12}O_6$ ).

**GLUSIDUM** (B. P.).—Gluside. **BENZOSULPHINIDUM** (U. S. P.).—Saccharinum. (See **Benzosulphinidum**.)

Gluside, or benzoyl-sulphonicimide, is a sweet imide derived from toluene. Its constitution is represented by the formula

• Gluside, or saccharin, is a light, white, minutely-crystalline powder having an intensely-sweet taste in dilute solutions. It is soluble in 400 parts of cold water, 24 of boiling water, in 25 parts of alcohol (90 per cent.), and but slightly in ether or chloroform.

On account of its sweet taste, gluside is in use commercially as an addition to glucose, especially in the form of cheap confectionery. As its effects on the animal organism are scarcely toxic, 5 Gm. (or  $\frac{5i}{j}$ ) being administered without any obvious effects, in a man, it has been employed in the diet of diabetes, as a substitute for sugar, in sweetening coffee or other articles of food. It is made into tablets with bicarbonate of soda to increase its solubility. The usual dose is 0.13 to 0.20 Gm. (or gr.  $\frac{ij}{ij}$ ).

**GLYCERINUM** (U. S. P., B. P.).—Glycerin (Glycerol).

Dose, 4 to 15 c.cm. (or  $\frac{f3i}{iv}$ ). B. P., 4 to 7.5 c.cm. (or  $\frac{f3i}{ij}$ ).

*U. S. P. Preparations.*

**Glyceritum Acidi Tannici.**—Glycerite of Tannic Acid (20 per cent.). For external use.

**Glyceritum Amyli.**—Glycerite of Starch (glycerin, 80; starch, 10 parts). For external use.

**Glyceritum Boroglycerini.**—Glycerite of Boroglycerin. Solution of Boroglyceride.

*Glyceritum Hydrastis*.—Glycerite of Hydrastis. (Each c.cm. = 1 Gm. of Hydrastis.)

*Glyceritum Phenolis*.—Glycerite of Phenol (20 per cent.).

*Glyceritum Ferri, Quinine, et Strychnine Phosphatum*.—Glycerite of the Phosphates of Iron, Quinine, and Strychnine.

*Suppositoria Glycerini*.—Glycerin Suppositories.

### B. P. Preparations.

*Glycerinum Acidi Borici*.—Glycerin of Boric Acid. For external application.

*Glycerinum Acidi Carbolici*.—Glycerin of Phenol (16 $\frac{1}{2}$  per cent.).

*Glycerinum Acidi Tannici*.—Glycerin of Tannic Acid (16 $\frac{1}{2}$  per cent.).

*Glycerinum Aluminis*.—Glycerin of Alum (14 $\frac{1}{2}$  per cent.).

*Glycerinum Amyli*.—Glycerin of Starch (11 per cent.).

*Glycerinum Boracis*.—Glycerin of Borax (14 $\frac{1}{2}$  per cent.).

*Glycerinum Pepsini*.—Glycerin of Pepsin (4 c.cm., or f3j, contains 0.32 Gm., or gr. v, of pepsin). Dose, 4 to 7.5 c.cm. (or f3i-ij).

*Glycerinum Plumbi Subacetatis*.—Glycerin of Lead Subacetate.

*Glycerinum Tragacanthæ*.—Glycerin of Tragacanth.

*Suppositoria Glycerini (B. P.)*.—Glycerin Suppositories (each suppository contains 70 per cent. of glycerin).

*Unguentum Glycerini Plumbi Subacetatis*.—Lead-Subacetate Ointment (glycerin of lead subacetate, 1; white paraffin ointment, 5 parts).

Glycerin is also a constituent in several U. S. P. extracts, fluid extracts, pill masses, mucilage of tragacanth, solution of pepsin, and other preparations.

**Pharmacology.**—Official glycerin is "a liquid obtained by the decomposition of vegetable or animal fats or fixed oils, and containing not less than 95 per cent. of absolute glycerin." In the process for making lead plaster, the olive-oil, being decomposed by the lead oxide, yields lead oleate and free glycerin. It is also produced in the ordinary process of soap-making, being a constituent of the waste, from which it is now recovered in large quantities for commercial purposes. A purer glycerin is obtained by decomposing fats by steam, or superheated water, and distillation. A superior article is made from vegetable fats by Messrs. Proctor & Gamble, of Cincinnati, which is best adapted for medical use. The British Pharmacopœia defines glycerin as "a trihydric alcohol associated with a small percentage of water. It is obtained by the interaction of alkalies or of superheated steam, with fats and fixed oils." It is colorless, resembling syrup, oily to the touch, without odor, very sweet, slightly warm to the taste, neutral in reaction, hygroscopical, soluble in all proportions in water or alcohol, and insoluble in ether, chloroform, benzol, or fixed oils. Under certain conditions it becomes a mass of dense, brilliant crystals, but may be cooled to  $-40^{\circ}$  C. without congealing, only becoming more viscid. Treated with strong nitric acid, it forms glonoin, or nitroglycerin: a substance of powerful explosive properties.

**Physiological Action.**—As it has an affinity for water, glycerin absorbs the latter from mucous surfaces and excites secretion. It is irritating in its concentrated state to both skin and mucous membrane, being entirely different in its effects from oils or fats, although, when diluted, it keeps the skin moist and prevents cracking or chapping. Glycerin is absorbed by the skin and passes into the blood. It has very little effect upon the stomach. A certain amount is absorbed, with the effect of increasing nutrition and improving the appetite; it is slightly laxative, and is said to lessen the excretion of urea, though, according to the experiments of Lewin, it exerts no influence upon the quantity of urea eliminated. Large doses have produced

hæmoglobinuria, owing to some action, as yet unexplained, upon the blood. In these cases the urine, according to Fuchsinger, contains the coloring matter of the blood, but no free corpuscles.

In the case of a man who was accustomed to taking 90 c.cm. (or fʒiij) of glycerin daily, but who used no alcoholic liquor, extreme cerebral excitement was produced, according to the statement of Constantin Paul.

Glycerin is considered antiseptic, yet Koch found that it did not destroy spores nor the activity of formed ferments, although a solution in water (1 to 3) arrests the action of some enzymes (pepsin, ptyalin, emulsin), and a stronger solution (1 to 2) prevents the action of others (myrosin, diastase, invertin), but preserves their activity unimpaired, and is used to preserve them (Wernitz). Glycerin is destructive to parasites, intestinal and external. It increases the action of codliver-oil, and is a solvent for some of the alkaloïds, though not for others. Owing to its sweetness, it has been used as a substitute for sugar in the diet of diabetics, though saccharin has now largely taken its place. According to the clinical observations of Pavy, glycerin increases polyuria, and he therefore opposes its use as a substitute for sugar. It seems to augment considerably the quantity of glycogen contained in the liver, though it probably prevents the transformation of glycogen into sugar.

**Therapy.**—Diluted with 3 parts of rose-water, glycerin is a good application to the hands and lips to prevent chapping during cold weather. Glyconin is also used for this purpose. The same mixture is one of those employed in ichthyosis, after a warm-water, hot-air, or vapor-bath, in order to protect the diseased area and aid in maintaining its nutrition. In more concentrated form it has been used with success in pityriasis, pruritus, acne, eczema, fissured nipples, or acute coryza, applied with a brush or spray. In combination with collodion ( $\frac{1}{2}$  per cent.) it forms collodium elasticum, which is less painful than pure collodion, and is a good protective for fissures and abrasions. The daily application of glycerin is capable of causing a steady reduction in the size of hypertrophied tonsils. The glycerite of tannic or of gallic acid is a useful astringent as an application for sore throat, relaxation of mucous membrane, and upon tampons to the cervix uteri for leucorrhœa. A pledget of absorbent cotton, saturated in glycerin, is an excellent application, also, in congestion of the womb, as, on account of its affinity with water, it provokes an abundant serous transudation. The glyceritum vitelli is used as a vehicle for chloroform or heavy powders. Glycerin alone, or with some astringent or sedative, is useful in preventing bed-sores. Injected into the bowels, it is a mild enema, and in small quantities is efficient in evacuating the lower bowel, and may be introduced in the form of suppositories.

In obstruction by fæcal impaction, the injection of several ounces into the colon, through a long tube, was successful in the hands of Dr. Edward Mayer, of Wilkes-Barre, Pa., in saving life after failure of all ordinary means of relief. Glycerin administered by the mouth has a peculiarly soothing effect upon inflamed and painful hæmorrhoids. Equal parts of glycerin and distilled water may be used as an application to keep the tongue moist in typhoid and other fevers; and a dilute solution may be sipped to moisten the throat during an attack of tonsillitis or pharyngitis, although the direct application by spray or brush should not be omitted. The red, dry, and glazed mouth of advanced phthisis is moistened by the use of a wash of glycerin and water. Reflex cough is often allayed by the application of

glycerin to the fauces, and, administered internally in 4-c.cm. (or f3j) doses, the same agent may prove of advantage in the cough of phthisis. It may be given to infants as a laxative in combination with oil. Administered alone, it has been used for the same purposes as codliver-oil, but is less efficient, although possessing some nutritive properties. It is the best remedy in cases of trichiniasis, administered in tablespoonful doses, as successfully used by Dr. James M. Barton; and is used as a laxative in cases of piles. Some forms of indigestion are improved by its administration after meals; and it is the best solvent and preservative for pepsin, either from the pig or the calf, the latter having been introduced by Dr. Frank Woodbury as the special digestive ferment for infants or adults upon a milk diet. In acidity of the stomach and flatulence, glycerin in 4-c.cm. (or f3j) doses two or three times a day is beneficial. It is often extremely useful in improving the appetite. Dr. J. A. Pollard esteems glycerin as of value in preventing stomach trouble during convalescence from debilitating diseases. He claims also that it has considerable power to control the vomiting of pregnancy. Ferrand regards glycerin as a valuable remedy in biliary lithiasis and as a powerful cholagogue, capable of affording relief in hepatic colic. In 18.5- to 22-c.cm. (or f3v-vj) doses it terminates the attack. In 4- to 7.5-c.cm. (or f3i-ij) doses, taken every day in a little alkaline water, it prevents fresh attacks. According to the experiments of A. Hermann, its action is mechanical and depends upon its power to abstract water from tissues.

Glycerin given in the form of suppository is often serviceable in relieving and overcoming constipation, especially when the lower bowel is inactive. (Professor Remington recommends as the best formula for glycerin suppositories: 40 grains of sodium carbonate, 80 grains of stearic acid, and 1080 grains of glycerin. The sodium carbonate is dissolved in the glycerin, the stearic acid added, and the mixture is carefully heated upon a water-bath until effervescence ceases. The solution is then poured into a suppository-mold to make 12 suppositories.) Gelato-glycerin bougies are useful in earache. Richards states that further experience has convinced him more than ever of the value of gelato-glycerin bougies in an early stage of acute otitis media and in acute otitis externa. They can be inserted in the ear without difficulty by simply washing off the lycopodium powder with which they are covered; they are then very slippery, and, with the affected ear uppermost, easily slip down into the canal. Here the bougie soon dissolves, the anodyne is brought directly into contact with the inflamed surfaces, and the pain is relieved. Besides being a medium for the exhibition of other remedies, the glycerin is of itself distinctly curative, in that it tends to draw out more serum from within and lessen the tension. After insertion the ear should be stoppered with absorbent cotton or gauze, and a lightly-filled hot-water bottle placed at the side of, or over the ear. Many a case of acute earache in children will, if promptly treated in this manner, at once subside without going on to severe inflammation. The following formula is recommended:—

R Phenolis liquefact.....	43 c.cm. or mvj.
Tinet opil deodorat.....	37 c.cm. or mvj.
Cocaine,	
Atropine sulphatis .....	aa
Aque .....	120 Gm. or gr. iij.
Gelatin .....	320 c.cm. or mlj.
Glycerini .....	120 Gm. or gr. xvij.
	960 c.cm. or f3iimxxxviiij.
M. et ft. bougies xliij.	

After making, they should be covered with lycopodium, and dispensed in a bottle, as they are hygroscopical. They should be no larger than will readily slip in the external canal. The size made in urethral-bougie mold has proved satisfactory.<sup>1</sup>

Griffith has employed it with marked effect in the treatment of constipation. An enema of glycerin and infusion of flaxseed (1 to 4) allays tenesmus in cases of acute dysentery (Bartholow).

The injection, under strict antiseptic precautions, of about 150 c.cm. (or fʒv) of glycerin into the womb has been successfully practiced in order to excite premature delivery. The tube of the syringe is introduced as far back as possible, between the wall of the uterus and the membranes. According to Pelzer, from 30 to 45 c.cm. (or fʒi-iss) are sufficient to accomplish the purpose. In the experience of Dr. Embden, this practice is not without danger, and is liable to cause thrombosis or decomposition of the blood. He thinks also that it may lead to the introduction of air into the circulation.

Semmola asserted that glycerin has antipyretic action in acute infectious diseases, in which he administers it as follows:—

R. Glycerin. ....	60	c.cm. or fʒij.
Acidi tartarici vel citrici. ....	5	Gm. or ʒi¼.
Aquæ .....570		c.cm. or fʒix.

M. Sig.: Three tablespoonfuls, or an ounce and a half, to be taken every hour, or half that quantity every half-hour.

Herman<sup>2</sup> states that, out of 115 cases of nephrolithiasis, in 15 cases concretions were passed and improvement was noticed in the patients' complaints; in 29 cases concretions passed without bringing about any such improvement; in 25 cases there was improvement only of the patients' condition without any concretions being passed; in 46 cases glycerin had no effect whatever. Thus, glycerin proved to be efficacious in 60 per cent. of the cases so treated, either by removing concretions or else by removing the pain which accompanies this disease. He administers the drug according to the weight and age of the patient, and states that 31 to 124 Gm. (or ʒi-iv), by weight, is his usual dose. He gives it in equal parts of water, at one dose, between two meals, and repeats it two or three times during several days. He has never had any disagreeable symptoms from it.

Externally glycerin can be combined with admirable effect as follows:—

R. Glycerini, Liquor calcis, Aquæ rosæ .....	aa 60	c.cm. or fʒij.
--	-------	----------------

M. For excoriations, erythema, superficial burns, and scalds.

R. Glycerini, Aquæ hamamelidis Aquæ rosæ .....	aa 60	c.cm. or fʒij.
--	-------	----------------

M. Use on chapped face and hands, sore nipples, and hæmorrhoids.

R. Glycerini, Aquæ hamamelidis. ....	aa 90	c.cm. or fʒiiij.
Bismuth. subnit. vel sodii bicarbonatis. ....	8	Gm. or ʒij.
Phenolis liquefact. ....	60	c.cm. or mx.

M. For erythematous or vesicular eczema, burns, and seborrhœa, especially around the axilla and genital organs.

<sup>1</sup> *Journal of the American Medical Association*, 1900.

<sup>2</sup> *Medical Chronicle*, 1899.

B Glycerini,  
Acidi lactici,  
Aque rosæ ..... aa 15℥ c.cm. or fʒss.

M. For freckles and other pigmentations of the skin.

B Glycerini ..... 150℥ c.cm. or fʒv.  
Creosoti ..... 4℥ c.cm. or fʒj.  
Ol. menth. pip. .... 60 c.cm. or mxx.

M. Valuable for catarrh, pharyngitis, and laryngitis, in the form of a spray. It can be mopped on the skin or sprayed over the surface for pruritus, eczema, and urticaria.

The glycerite of starch is a bland material, which can be impregnated with various medicaments, astringents, etc., for application to the eye or to the skin. Glycerin is a good vehicle for alkaloids, and it is thus used in various diseases of the ear, in abnormal dryness of the external auditory canal, and impaction of cerumen.

Glycerite of Bismuth Borate was recommended by Keyser as a good remedy in phlyctenular and scrofulous conjunctivitis.

Unna has devised a preparation termed casein ointment which may be noticed in this place. It consists of 14 parts of casein, about  $\frac{1}{2}$  part of potassium and sodium hydroxide, 7 parts of glycerin, 21 parts of vaselin, 1 part of salicylic or boric acid, and about 56 parts of water. It is a thick, white emulsion, which soon dries upon the skin and has been used in affections of the skin accompanied by itching. Various drugs may be incorporated with the ointment.

The urine of persons using glycerin reduces copper in Fehling's test, and, being mistaken for glycosuria, is liable to lead to error. This is not due directly to the presence of glycerin, but to a decomposition-product.

**GLYCOGEN.**—Glycogen is a proximate principle of the human body, where it is found in the liver and also in the nucleus of the leucocytes. It is also found in some fungi (mushrooms). It is a stimulant to the circulation, sustaining the heart, neutralizing toxins, and probably facilitates phagocytosis. It has been used in tuberculosis, diabetes, albuminuria, neurasthenia, anaemia, and infectious conditions. In migraine, it is claimed to be especially effective, giving prompt relief. It may be administered subcutaneously, or in capsules (0.06 Gm. or gr. j each). Dose, 1 to 5.

**GLYCERYLIS TRINITRIS, AND SPIRITUS GLYCERYLIS NITRATIS** (U. S. P.).—(See Glonoinum.)

**GLYCYRRHIZA** (U. S. P.).—Glycyrrhiza (Liquorice-root).

**GLYCYRRHIZÆ RADIX** (B. P.).—Liquorice-root.

#### Preparations.

**Extractum Glycyrrhizæ Purum** (U. S. P.).—Pure Extract of Glycyrrhiza. Dose, 0.32 to 4 Gm. (or gr. v-3i).

**Fluidextractum Glycyrrhizæ** (U. S. P.).—Fluid Extract of Glycyrrhiza (made with aqua ammonia and alcohol). Dose, 1.20 to 4 c.cm. (or mxx fʒj).

**Elixir Adjuvans** (U. S. P.).—Adjuvant Elixir (contains fluid extract licorice, 120 parts; aromatic elixir, 880 parts.) As a vehicle.

**Mistura Glycyrrhizæ Composita** (U. S. P.).—Compound Mixture of Glycyrrhiza, Brown Mixture (pure extract, 3; paregoric, 12; antimonial wine, 6; spirit of nitrous ether, 3; mucilage of acacia, 10; syrup, 5; and water, q. s. to make 100 c.cm.). Dose, 4 to 15 c.cm. (or f3i-iv).

**Trochisci Glycyrrhizæ et Opii** (U. S. P.).—Troches of Glycyrrhiza and Opium (extract of licorice and pulv. opium, with ol. anise, sugar, and acacia). Dose, 1 or 2.

**Glycyrrhizinum Ammoniatum** (U. S. P.).—Ammoniated Glycyrrhizin (for flavoring).

**Extractum Glycyrrhizæ** (U. S. P., B. P.).—Extract of Glycyrrhiza (extract of liquorice, B. P.).

**Pulvis Glycyrrhizæ Compositus** (U. S. P., B. P.).—Compound Powder of Glycyrrhiza (U. S. P. contains senna, licorice-root, powdered; oil of fennel, washed sulphur, sugar). Dose, 4 to 8 Gm. (or f3i-ij).

**Extractum Glycyrrhizæ Liquidum** (B. P.).—Liquid Extract of Liquorice. Dose, 2 to 4 c.cm. (or f3ss-j).

**Pharmacology.**—The dried rhizome and root of *Glycyrrhiza glabra*, which yields the Spanish, French, or Sicilian licorice; or of *G. glandulifera*, yielding the Russian licorice (*Leguminosæ*), United States Pharmacopœia, "the peeled root and peeled subterranean stem of *Glycyrrhiza glabra* and other species" (B. P.). This plant is a native of southern Europe. The root contains an amorphous, bitter-sweet glucoside, **Glycyrrhizin**, which is probably in combination with ammonia; it also contains **Asparagin**, sugar, resin, starch, gum, pectin, coloring-matter, etc. Glycyrrhizin, when acted upon by dilute acids, splits up into sugar and a brownish-yellow, bitter substance, **Glycyrrhetin**. The resin is also bitter.

The aromatic glycyrrhizin masks the taste of sulphate of quinine when prescribed with it in about double the quantity, but the after-taste is still bitter. The elixir of aromatic glycyrrhizin is a good vehicle in which to administer sulphate of quinine, but no acid should be added, since the quinine is largely suspended and not dissolved. Licorice enters into the other adjuvant elixirs for the administration of bad-tasting medicines. A syrup of licorice may be used as a flavoring agent or as a vehicle.

**Physiological Action.**—Licorice-root is demulcent and slightly stimulating to the bronchial mucous membranes, and is laxative. It has an agreeable taste, the bitterness being masked by the sweet principle, but leaves an acrid taste in the fauces. The extract covers the taste of other remedies. The root is used as a dusting-powder and coating for pills.

**Therapy.**—The compound infusion of flaxseed (U. S. P., 1870) is a good demulcent in acute bronchitis and diarrhœa. The extract is useful in relieving dryness of the throat and hoarseness, especially if combined with ammonium chloride. The troches contain 0.005 Gm. (or gr.  $\frac{1}{14}$ ) of opium, and may be used where an opiate is not objectionable, but are dangerous, since their pleasant taste leads children to take an overdose; one every hour is sufficient for an adult with irritable cough.

The compound mixture is a good expectorant for bronchitis, and is often combined with syrup of senega and ammonium chloride.

In constipation, especially during pregnancy, the compound licorice-powder is very valuable; given at night on retiring, it causes one or two natural stools in the morning, generally without griping. Where a more decided effect is desired, it may be combined with an equal portion of compound jalap-powder.

**GOSSYPIUM PURIFICATUM** (U. S. P.), **GOSSYPIUM** (B. P.).—  
Purified Cotton.

**GOSSYPII CORTEX** (U. S. P.).—Cotton-root Bark.

### *Preparations.*

**Gossypium Purificatum** (U. S. P.).—Purified Cotton (absorbent cotton).

**Fluidextractum Gossypii Radicis**.—Fluid Extract of Cotton-root Bark. Dose, 2 to 4 ccm. (or f5ss-j).

**Oleum Gossypii Seminis** (U. S. P.).—Cotton-seed Oil.

**Pyroxylinum** (U. S. P.).—Pyroxylin, Collodion Cotton. Soluble gun cotton.

**Pharmacology and Therapy.**—Cotton is a native of the southern portion of the United States, and is "the hairs of the seed of *Gossypium herbaceum* (Malvaceæ) and of other species of *Gossypium* freed from adhering impurities and deprived of fatty matter." The British Pharmacopœia directs "the hairs of the seed of *Gossypium barbadense*, and of other species of *Gossypium*, freed from fatty matter." It is composed almost entirely of cellulose, and is in a mass of white, interlacing fibres, forming sheets of so-called carded cotton-wool. By a preliminary treatment with alkalis to extract the fatty matters, it becomes absorbent cotton, which is of great value in modern surgical practice, and has succeeded the sponge as a dressing for wounds. Absorbent cotton may be treated with various agents, so as to be of special value (carbolyzed, borated, salicylated, or treated with mercuric chloride, etc.). These are used to exclude air from wounds, burns, etc., and afford some support, and may also be applied to a blister after puncture. In inflammations, as in acute articular rheumatism, the part may be enveloped in cotton, either dry or moistened with anodynes, with great comfort to the patient. It is also a good material for tampons, or for making an artificial ear-drum after perforation. Cotton is much in use as a padding for splints. Dr. Whittle speaks very favorably of its use in phlegmasia dolens, enveloping the entire limb in a thick layer surrounded by oiled silk and carefully bandaged. Hæmostatic cotton may be made by dipping absorbent cotton in a solution of ferric chloride, and afterward drying and picking it, or dilute Monsell's solution may be used (1 in 24) and the cotton kept immersed in it until used as a tampon, in uterine cancer, etc.

Pyroxylinum, or gun-cotton, is official only as a component of collodion.

The oil of the seeds is bright, pale, odorless, and free from acrid after-taste. It is a good substitute for olive-oil, and is frequently sold for it. It enters into the U. S. P. official liniments of ammonia and of camphor. In pharmacy it answers a similar purpose to olive-oil.

The bark of the root of gossypium contains resin, tannic acid, and a red coloring matter. A solid and a fluid extract can be obtained (both alcoholic), the dose of the former being 0.065 to 0.32 Gm. (or gr. i-v); of the latter, 2 to 4 ccm. (or f5ss-j). A recent decoction is also used in the South. It has a special action upon the uterus, like ergot, and is employed in the same class of cases—in scanty menstruation, dysmenorrhœa, and during labor. Phillips has found it useful in hæmoptysis, and in the West Indies it is administered in dysentery.

Dr. Poteyenko has extended the use of cotton-root bark to other hæmorrhages. He speaks particularly of a case of persistent epistaxis which had resisted various internal and topical remedies, but which was promptly and permanently checked by the administration of 1.54 ccm. (or mxxv) of the

fluid extract thrice daily for three days. Dr. Garrigues has found this drug of special service in chronic uterine hemorrhages, even when these depend upon fibroids or carcinoma.

**GRANATUM** (U. S. P.).—Pomegranate.

**GRANATI CORTEX** (B. P.).—Pomegranate-bark.

Dose, 4 to 8 Gm. (or ʒi-ij).

*Preparation.*

**Fluidextractum Granati** (U. S. P.).—Fluid extract of Pomegranate. Dose, 1.3 to 2 Gm. (or mxx-xxx).

**Decoctum Granati Corticis** (B. P.).—Decoction of Pomegranate-bark (20 per cent.). Dose, 15 to 60 c.cm. (or fʒss-ij).

**Pelletierinæ Tannas** (U. S. P.).—Tannate of Pelletierine.

**Pharmacology.**—Pomegranate is "the dried bark of the stem and root of *Punica granatum* (Punicaceæ)," cultivated in subtropical countries. The rind of the fruit, though it is not official, contains very similar constituents, and is also useful. The liquid alkaloid, **Pelletierine** ( $1\frac{1}{2}$  per cent.), is found in this plant in combination with punico-tannic acid, and to these the peculiar virtues of the bark are due. The tannic acid is largely in excess (20 to 28 per cent.). It has been shown that Pelletierine is a mixture of four alkaloids, three of which are liquid and one solid. Pelletierine is a colorless aromatic, oily fluid, soluble in water, alcohol, ether, and chloroform.

According to Professor Flückiger, the commercial pelletierine tannate is a mixture of the tannates of the total alkaloids of pomegranate-bark.

**Physiological Action and Therapy.**—Pomegranate has powerful astringent properties, and a decoction flavored with orange or aromatics is useful in sore throat or pharyngitis, and as an astringent injection for gonorrhœa. Coronedi has determined that pelletierine acts as a muscle-poison and probably produces a condition of rigidity. In excessive amount pelletierine is stated to have an action similar to that of curare, paralyzing motor nerves without influencing muscular contractility or sensation.

The special use of this agent is for the destruction of tape-worms, a wineglassful of the decoction being taken every hour for three hours, to be followed by a purgative dose of castor-oil. The drug itself, in large doses, acts both as an emetic and purgative. The pelletierine tannate, 1 Gm. (or gr. xv) at a dose, in capsules, is an effective, but expensive, remedy. The decoction is so astringent that it may not be possible for the patient to take it, in which case the same result may be obtained by evaporating it, in a water-bath, to a pilular consistency, and administering the extract thus made in gelatin capsules, preceded and followed by a cathartic. Pomegranate has been used with success in the diarrhœa and dysentery of hot climates. Dujardin-Beaumetz has witnessed good results from the employment of pomegranate in Ménière's disease. In paralysis of the third and sixth nerves M. Galezowski asserts that pelletierine is of service.

**GRINDELIA** (U. S. P.).—Grindelia.

*Preparation.*

**Fluidextractum Grindeliæ** (U. S. P.).—Fluid Extract of Grindelia. Dose, 0.60 to 4 c.cm. (or mx-fʒj).

**Pharmacology.**—"The leaves and flowering tops of *Grindelia robusta* and of *Grindelia squarrosa* (Compositæ)," a perennial California plant, contain a volatile oil, a resin, and, possibly, an alkaloid. The plant possesses a balsamic odor, a warm, aromatic, and bitter taste. The resin is precipitated by water. The active principles are not completely extracted by alcohol, but an aqueous, alkaline solution has been found by Dr. W. P. Gibbons to be the most satisfactory menstruum.

**Physiological Action.**—*Grindelia* creates a sensation of warmth in the stomach, and, in small quantities, if not too long continued, improves the appetite and digestion. It slows the action of the heart and lungs, and augments the blood-pressure. It possesses antispasmodic and expectorant qualities. Large quantities dilate the pupil, produce an hypnotic effect, and paralyze first the sensory and then the motor nervous system. Death occurs from paralysis of the muscles of respiration. The plant, however, is but feebly poisonous. It exerts some diuretic effect.

**Therapy.**—*Grindelia* is an efficient local application in dermatitis caused by contact with the rhus toxicodendron, or poison-ivy. Cloths dipped in a mixture of 2 to 4 c.cm. (or f3ss-j) of the fluid extract to 120 to 180 c.cm. (or f3iv-vj) of water, and laid upon the affected surface, will, in many instances, afford rapid relief. This mixture has also been advantageously employed upon burns and blisters. A combination with creolin is likewise efficient in these conditions:—

Fluidext. grindeliæ .....	15	c.cm. or f3ss.
Creolini .....	7½	c.cm. or f3ij.
Aque .....	q. s. ad 150	c.cm. or f3v.—M.

An injection of the above strength is useful in vaginitis, or, applied upon absorbent cotton, in pruritus vaginæ. It may likewise be resorted to in leucorrhœa and endometritis. A weaker solution thrown into the urethra is of service in gonorrhœa and gleet. Diluted with water or glycerin, the fluid extract of *grindelia* is a beneficial application to chronic or irritable ulcers, and in these cases it is a good practice to conjoin the internal administration of the remedy. One part of fluid extract to 4 parts of water as a local dressing, together with the internal exhibition of the same preparation, has been found efficient in iritis.

Its fumes may be inhaled for the relief of the paroxysm of asthma, either by smoking in a pipe or saturated in a solution of potassium nitrate, dried and burned upon a plate.

As an internal remedy, the chief value of *grindelia* is in the treatment of asthma. The paroxysm may usually be notably abridged by the administration of 1.20 to 2 c.cm. (or mxx-xxx) of the fluid extract, repeated every twenty or thirty minutes. Two or three such doses will, in many instances, allay the spasm. After the attack has subsided, the medicine should be continued in order to avert recurrence. In the interval *grindelia* may very profitably be combined with other agents having similar power, as, for example:—

R Potassii iodidi .....	23½	Gm. or 3vj.
Liq. potassii arsenitis .....	6	c.cm. or f3iss.
Fluidext. grindeliæ .....	60	c.cm. or f3ij.
Tinct. euphorbiæ pilulif. ....	18½	c.cm. or f3v.
Fluidext. eriodictyi .....	q. s. ad 120	c.cm. or f3iv.

M. et ft. sol.

Sig.: Teaspoonful three times a day. For asthma and chronic bronchitis.

Another efficient combination in asthma is:—

R Fluidext. grindeliæ.....	60	c.cm. or f3ij.
Potassii iodidi .....	8	Gm. or 3ij.
Syrup. Tolutan. ....q. s. ad	120	c.cm. or f3iv.

M. et ft. sol.

Sig.: Teaspoonful every three hours.

A formula which has been recommended is:—

R Ammonii iodid. ....	8	Gm. or 3ij.
Fluidext. grindel. ....		
Fluidext. glycyrrhiz. ....	aa 15	c.cm. or f3ss.
Tinct. lobeliæ, .....		
Tinct. belladonn. fol. ....	na 7½	c.cm. or f3ij.
Syrup. Tolutan. ....q. s. ad	120	c.cm. or f3iv.

M. et ft. sol.

Sig.: Teaspoonful three times a day and additionally during a paroxysm.

Grindelia is eliminated in part by the bronchial mucous membrane, which it stimulates. It is an excellent expectorant in chronic bronchitis, and hence when this condition, as is so often the case, complicates emphysema and asthma, grindelia is no less efficacious than in pure nervous asthma. It relieves cough and promotes expectoration in chronic pneumonia. It is sometimes of advantage in ameliorating the cough of phthisis. In shortness of breath due to anæmia, and in some cases of dyspnoea dependent upon valvular disease of the heart, grindelia has proved beneficial. In certain cases of hay fever this remedy has been used successfully. The paroxysms of whooping-cough are diminished in frequency and mitigated in severity by the administration of grindelia. As it escapes from the system principally by the kidneys, it exerts a favorable influence upon pyelitis and chronic cystitis. The dried leaves may be moistened with nitre solution, and, mixed with a little tobacco, rolled into cigarettes for use in asthma.

**GUAIACOL** (U. S. P.).—(See under **Creosotum**.)

**GUIACOLIS CARBAMAS** (U. S. P.).—Carbamate of Guaicol. (See under **Creosotum**.)

**GUAIACUM** (U. S. P.).—Guaiac.

**GUAIACI LIGNUM** (B. P.).—Guaiacum-wood.

#### *Preparations.*

**Guaiaci Resina** (U. S. P., B. P.).—Guaiac. The resin of the wood of *Guaiacum officinale*. Dose, 0.32 to 1 Gm. (or gr. v-xv).

**Tinctura Guaiaci Ammoniata** (U. S. P., B. P.).—Ammoniated Tincture of Guaiac. Dose, 0.60 to 4 c.cm. (or mx-f3j).

**Tinctura Guaiaci** (U. S. P.).—Tincture of Guaiac. Dose, 0.60 to 4 c.cm. (or mx-f3j).

**Pilulæ Antimonii Compositæ** (U. S. P.).—Compound Antimonial Pills (contain guaiac, sulphurated antimony, and calomel).

**Mistura Guaiaci** (B. P.).—Guaiacum Mixture (guaiac resin, 2½, per cent., with sugar, tragacanth, and cinnamon-water). Dose, 15 to 30 c.cm. (or f3ss-j).

**Trochiscus Guaiaci Resinæ** (B. P.).—Lozenge of Guaiac Resin (each containing 0.20 Gm., or gr. iij).

**Pharmacology.**—The heart-wood of *guaiacum officinale* (*Zygophyllacæ*), or of *G. sanctum*, enters into one United States Pharmacopœia official preparation of doubtful value, the compound decoction of sarsaparilla,

seldom used at present except as a vehicle for potassium iodide, to cover its unpleasant taste. The resin is the most important constituent of the wood (20 to 25 per cent.), from which it is obtained by heating or by boiling with water. The resin contains **Guaiacetic acid** (10 per cent.), **Guaiaconic acid** (10 per cent.), **Guaiacic acid** (a small quantity), and **Betaguaiac resin** (10 per cent.), with some **Guaiac yellow**. The active principles are insoluble in water, but soluble in alcohol and alkaline fluids.

**Physiological Action.**—It is esteemed to be alterative and expectorant, but the taste is so unpleasant as to greatly limit its use in medicine. It is a gastro-intestinal irritant, stimulating the liver, and is stated by some to act also on the excretory organs of the skin; and, when it fails to act upon the skin, is diuretic. Dr. Murrell finds it an efficient laxative.

**Therapy.**—Guaiac was formerly used as an alterative and antisyphilitic, but it is not much valued for this at present,—only as an ingredient in the compound preparation of sarsaparilla, which is used as a vehicle for the iodides. In tonsillitis frequent small doses of the tincture will sometimes cut an attack short.

As a gargle in acute tonsillitis Dr. S. Solis-Cohen makes use of the following preparation:—

R Tr. guaiaci ammoniat. ....	15	c.cm. or f℥ss.
Tr. cinchon. co. ....	75	c.cm. or f℥ij.
Mell. despumat. ....	22	c.cm. or f℥vj.
Infus. coar. ....	60	c.cm. or f℥ij.
Sodii salicylat. ....	6	Gm. or 3iss.
Aquæ ....	q. s. ad 180	c.cm. or f℥vj.

M. et ft. sol.

Sig.: A tablespoonful to be used in divided portions and, if advisable, a small quantity may be swallowed.

In various neuralgic and rheumatic affections, in rheumatoid arthritis, in amenorrhœa, and in dysmenorrhœa it is also very useful. In rheumatic sore throat the ammoniated tincture may be administered internally, and added to hot water makes a good gargle.

The following is a formula used by Dr. R. B. Falkner, of Pittsburgh, for a compound guaiac pastille:—

R Resinæ guaiacum ....	13	Gm. or gr. ij.
Morphine bimeconat. ....	00005	Gm. or gr. $\frac{1}{100}$ .
Tincture aconiti ....	12	c.cm. or m℥j.
Ol. cinnamomi ....	005	c.cm. or m $\frac{1}{10}$ .
Pulv. cinnamomi ....	005	Gm. or gr. j.
Paste ribes nigri (or black-currant paste) ....	q. s.	

"The cinnamon disguises absolutely the taste of the guaiac, and, at the same time, adds to the therapeutic efficiency of the pastille. Guaiac, in this combination, is very pleasant, very potent, and very prompt in reducing the inflammatory engorgement in tonsillitis, acute pharyngitis, and in the removal of arthritic throat affections. The peculiar acid of black currants seems to enhance the efficiency of all these forms of pastilles, and the currant-jelly or paste renders the above formula permanently plastic, soluble, and pleasant."

The ammoniated tincture has been given for the purpose of relieving chronic hoarseness dependent upon thickening of the vocal cords.

The compound known in Philadelphia as Zollickofer's mixture is often advantageous in chronic rheumatism. Its composition is:—

- R Pulv. resin. guaiaci,  
 Potass. iodid. .... aa 65 Gm. or gr. x.  
 Tinct. colchici sem. .... 2 c.cm. or f3ss.  
 Aq. cinnamomi .... 15 c.cm. or f3ss.  
 Syrupi ..... q. s. ad 30 c.cm. or f3j.  
 M. Sig.: From a dessertspoonful to a tablespoonful three times a day.

Good results are sometimes obtained from guaiac in chronic gout, gouty bronchitis, and lumbago.

Dr. Augustus A. Eshner has found the following formula of service in myalgia:—

- R Tinct. guaiac. ammoniat.,  
 Fluidext. cimicifugæ  
 Fluidext. cocæ..... aa 30 c.cm. or f3j.  
 M. Sig.: Teaspoonful before each meal.

In valvular lesions of the heart dependent upon a rheumatic element Dr. A. E. Tussey has prescribed with advantage:—

- R Resinæ guaiaci,  
 Digitalis fol.  
 Quinin. sulph. .... aa 2 Gm. or gr. xxx.  
 Strychnin. sulph. .... 1065 Gm. or gr. j.  
 M. et ft. pil. no. xxx.  
 Sig.: One pill thrice daily.

The ammoniated tincture is regarded as the best preparation; it may be given in milk, in glyceritum vitelli, or in aromatic elixir of licorice. In chronic constipation Murrell<sup>1</sup> has obtained very satisfactory results from the administration of the resin in 0.65 to 1.30 Gm. (or gr. x-xx) doses, in a tablespoonful of thick extract of malt, two or three times daily, according to the case. It occasionally produces a rash. Murrell advises the trial of a triturate with cream of tartar, sugar of milk, or some other inert substance.

Levy asserts that tincture of guaiacum is a valuable remedy in hæmaturia. He gives it in doses of 2 to 4 c.cm. (or f3ss-j) in milk every four hours.

### GUARANA (U. S. P.).—Guarana (Pasta Guaranæ).

#### Preparation.

Fluidextractum Guaranæ (U. S. P.).—Fluid Extract of Guarana. Dose, 0.60 to 4 c.cm. (or mx-f3j).

**Pharmacology.**—"A dried paste prepared from the crushed or pounded seeds of *Paullinia cupana* (Sapindacæ)": a climbing plant of Brazil. It is in round masses or cylindrical sticks, resembling chocolate in color and odor. It contains **Guaranine** (5 per cent.), an alkaloid practically identical with **Caffeine**; **tannic acid** (25 per cent.), traces of volatile oil, saponin, etc.

**Physiological Action.**—The physiological effects are the same as those of coffee or chocolate, but it is of very uncertain strength.

**Therapy.**—The principal use of guarana is in nervous headache, 2-c.cm. (or f3ss) doses of the fluid extract being administered every hour during the beginning of the attack. It has also been used in diarrhœa. In the headache of chlorosis Dr. Albert Robin, of Paris, often prescribes:—

<sup>1</sup> *Medical Bulletin*, Jan., 1891, "Guaiacum as a Laxative," by William Murrell, M.D., of London, England.

R. Pulv. guaranæ .....	20 Gm. or gr. iij.
Ext. cannabis Ind. ....	101 Gm. or gr. 1/2.

M. et ft. pil. no. j.

Sig: One such pill to be taken thrice daily.

**GURJUN.**—Gurjun Balsam or Oil, or Wood-oil, is an oleoresin obtained from the *Dipterocarpus turbinatus* and other species of *Dipterocarpaceæ* of East India. The balsam flows from the wounded tree. It contains from 40 to 70 per cent. of volatile oil, some resin, and **Gurjunic Acid**. It resembles copaiba in physical and physiological properties, but is more acceptable to the digestive organs and has less effect upon the kidneys. Dose, 0.60 to 7.5 c.cm. (or *mx-f5ij*), in emulsion or capsules, or with extract of malt.

**Therapy.**—Gurjun-oil is antiseptic and alterative. It likewise exerts a laxative and diuretic influence. In combination with lime-water (1 to 4) it is a useful application in psoriasis and chronic eczema. It has been employed in leprosy, both internally and locally, with asserted curative effect. The oil has been administered successfully in the treatment of gonorrhœa and gleet, also in chronic bronchitis.

**GUTTA-PERCHA.**—Gutta-percha is the concrete milk juice of *Palasium gutta* (*Sapotacæ*): a tree of the East Indies. It is insoluble in water or in alcohol, but soluble in chloroform, oil of turpentine, and carbon disulphide. It softens easily, and can be cut with a hot knife.

**Therapy.**—Used externally in sheets for making molded splints, as, after softening with hot water, it adapts itself to the surface and soon hardens again. It is also used in making mechanical appliances, such as pessaries, specula, etc. The solution is used as a protective, like collodion.

A solution of 1 part of gutta-percha in 10 parts of chloroform is known by the name of *traumaticin*, or *liquor guttæ perchæ*, and in the treatment of certain cutaneous disorders answers a good purpose as a solvent for various medicaments. The solution constitutes a cleanly application and one which is not too easily removed.

**GYNOCARDIA.**—*Chaulmoogra*. The ripe seed of *Hydnocarpus Kurzii* (*Flacourtiacæ*), and perhaps also of *Gynocardia Odorata*. (See page 324.)

**HÆMATOXYLON** (U. S. P.), **HÆMATOXYLI LIGNUM** (B. P.).—*Hæmatoxylen* (Logwood).

#### Preparations.

*Extractum Hæmatoxyli* (U. S. P.).—Extract of *Hæmatoxylen*. Dose, 0.32 to 0.65 Gm. (or gr. v-x).

*Decoction Hæmatoxyli* (B. P.).—Decoction of Logwood (5 per cent.). Dose, 15 to 60 c.cm. (or *f5ss-ij*).

**Pharmacology.**—Logwood is "the heart-wood of *Hæmatoxylen campechianum* (*Leguminosæ*)": a large tree of Central America and the West Indies. It occurs as chips or raspings of a reddish-brown color. Tannin is the principal medical constituent. It also contains **Hæmatoxylin** (12 per cent.), a red coloring constituent resembling licorice in its taste, which is soluble in water and in alcohol.

**Physiological Action.**—*Hæmatoxylen* is astringent, tonic, and unirritating. It colors the urine and stools red, and has the disadvantage of staining the linen. It does not produce constipation.

**Therapy.**—Formerly used as an astringent for children's diarrhœas, but, as the medicine was occasionally spilt or vomited upon the clothing, it was productive of much dissatisfaction, and was abandoned, especially since the new dietetic and antiseptic method has come into vogue. Nevertheless, it is of decided value in tuberculous diarrhœa, and should not be entirely overlooked. The decoction has been used as an astringent in leucorrhœa and bleeding hæmorrhoids.

**HAMAMELIDIS CORTEX** (B. P.).—Hamamelis-bark (Witch-hazel Bark).

**HAMAMELIDIS FOLIA** (U. S. P., B. P.).—Hamamelis-leaves.

*Preparations.*

**Fluidextractum Hamamelidis** (U. S. P.).—Fluid Extract of Hamamelis. Dose, 0.60 to 4 c.cm. (or *mx-f3j*).

**Extractum Hamamelidis Liquidum** (B. P.).—Liquid Extract of Hamamelis. Dose, 0.30 to 1 c.cm. (or *mv-xv*).

**Aqua Hamamelidis** (U. S. P.).—Hamamelis-water (distilled).

**Liquor Hamamelidis** (B. P.).—Solution of Hamamelis (distilled from fresh leaves).

**Tinctura Hamamelidis** (B. P.).—Tincture of Hamamelis (bark, 10 per cent.). Dose, 2 to 4 c.cm. (or *f3ss-j*).

**Unguentum Hamamelidis** (B. P.).—Hamamelis Ointment (10 per cent., with lanolin).

**Pharmacology.**—"The dried leaves of *Hamamelis virginiana*<sup>1</sup> (*Hamamelaceæ*) collected in autumn" are official, and, although not stipulated by the pharmacopœia, they should be fresh, as they owe their efficacy largely to some volatile principle not yet isolated; they also contain tannin and a bitter extractive, coloring matter, etc. The British Pharmacopœia directs "the dried bark of *Hamamelis virginiana*," and "the leaves, fresh and dried, of *Hamamelis virginiana*." The old leaves and many preparations are devoid of physiological activity, but a well-made fluid extract, and especially the distilled extract, have been found to have decided therapeutical power. The bark of the younger branches is more astringent than the leaves; it contains about 8 per cent. of tannin, and can be used for the same purposes as the leaves. F. Grüttner, after a careful examination of the bark, found fat, gallic acid, tannins consisting of crystalline and amorphous forms of a body having a formula  $C_{12}H_{14}O_6$  with a varying amount of water. These bodies, which he calls **Hamamelitanin**, are dextrogyre, possess five hydroxyl groups and one carboxyl, form definite benzoyl derivatives, and hydrolyze to gallic acid. There is also a tannin hydrolyzing to glucose and gallic acid. It also contains glucose. It is probable that the popular distilled extract is made from the leaves and smaller twigs, freshly gathered and treated with dilute alcohol before distillation. Some of the undoubted good results of this agent as a local application, as a wash, a gargle, etc., may be due to the alcohol present.

<sup>1</sup> See papers by the author on "*Hamamelis Virginica*," read before the British Medical Association, Section of Therapeutics, at Brighton, Aug., 1886—*The Medical Register*, June 4, 1887; "*Hamamelis in the Treatment of Diseases of the Skin*," read before the Section of Dermatology at the Meeting of German Naturalists and Physicians, held in Berlin, Sept., 1886—*The Medical Bulletin*, Dec., 1886. See also paper on "*Hamamelis and Alcohol*," by Dr. E. H. Griffin—*Medical Record*, Dec., 1890.

**Physiological Action.**—Negative physiological results from an investigation of the root have been reported by Wood and Marshall. Dujardin-Beaumetz, on the other hand, believed that witch-hazel owes its utility to an action on the muscular fibres of the veins. Hector Guy<sup>1</sup> reports, after experiments with witch-hazel, that it shows no special physiological action on the vascular system, but that headache sometimes follows full doses.

**Therapy.**—For sprains, bruises, and superficial inflammations, the distilled extract is a pleasant and valuable application. It is also useful diluted with 2 to 3 parts of water or alcohol in inflammation of the gums, pharyngitis, nasal catarrh after the removal of nasal polypi, in the form of a spray or wash. Either form may be injected into the bladder, properly diluted, in cases of catarrhal inflammation or hæmorrhage. The topical application of hamamelis is much more decidedly hæmostatic than is explained by our present knowledge of its composition. It is a reliable agent in the treatment of capillary hæmorrhage from wounds, epistaxis, bleeding sockets after the extraction of teeth, and in bleeding piles is one of the most efficient agents at our command. This medicament, according to Flagg, is very efficacious in chronic and incurable hæmorrhagic, anæmic, and inflammatory conditions. Leg-ulcers, especially those occasioned by varicose veins, are remarkably benefited by the application of a lotion or ointment containing witch-hazel. This drug possesses a marked sedative as well as astringent action upon congested or inflamed tissues. Hamamelis ointment often, therefore, proves of avail in burns, erysipelas, eczema, and herpes. Excessive secretion is likewise restrained, and for this reason it is sometimes of service in seborrhœa, acne, and rosacea:—

R	Fluidext. hamamelidis . . . . .	4  to 6	c.cm. or f3i-iss.
	Zinci oxidi . . . . .	4	Gm. or 3j.
	Amyli . . . . .	2 60	Gm. or gr. xl.
	Glycerini . . . . .	2	c.cm. or mxxx.
	Ung. aquæ roseæ . . . . .	31	Gm. or 3j.
M.	An ointment for sunburn, eczema, intertrigo, etc.		

A lotion made from the fluid extract relieves the pain and stiffness of chronic rheumatism. A diluted fluid extract is an efficient lotion in carbuncle, chancre, freckles, hyperidrosis, and lupus erythematosus. In burns and frost-bites the following combination is useful:—

R	Liq. plumbi subacetatis . . . . .		
	Tinct. opii . . . . .	aa 30	c.cm. or f3j.
	Aq. hamamelidis . . . . .	60	c.cm. or f3ij.
	Aquæ . . . . .	473	c.cm. or Oj.—M.

As an external application to relieve itching in pemphigus vulgaris:—

R	Creosoti . . . . .	1	c.cm. or mxxv.
	Liquoris calcis . . . . .		
	Aquæ hamamelidis . . . . .	aa 90	c.cm. or f3iij.

M. Sig.: For external use.

Fissures of the anus and ulcers of the anus or rectum are improved by the application of a wash or ointment containing witch-hazel.

A 1-per-cent. solution of creosote in decoction of hamamelis with the

<sup>1</sup>Thèse de Paris, 1884.

addition of boric acid has been recommended as an excellent injection in gonorrhœa.

Given by the mouth, hamamelis is scarcely less astringent and sedative than when applied externally. It renders good service in cases of acute or chronic diarrhœa, enteritis, and dysentery. It restrains suppuration in pyelitis and reduces the inflammatory congestion of cystitis. In hæmorrhage from internal organs it is an admirable remedy, and may be given with considerable confidence in bleeding from the stomach, bowels, kidneys, womb, or lungs, and in purpura hæmorrhagica. Hamamelis is useful in chronic bronchitis attended by copious discharge. It may be of service in the night-sweats of phthisis. Its internal, conjoined with its external, use is productive of excellent results in epistaxis and varicose ulcers. Varicose veins, varicocele, and internal hæmorrhoids may, not infrequently, be entirely cured by the persistent administration of hamamelis. It has been found serviceable in phlegmasia dolens and often mitigates the pain of dysmenorrhœa. The combined internal and external use of witch-hazel is useful in gonorrhœa after subsidence of the acute stage, and in leucorrhœa. Witch-hazel, also, has the reputation of preventing abortion.

#### **HEDEOMA (U. S. P.).—Hedeoma (Pennyroyal).**

##### *Preparation.*

Oleum Hedeomæ (U. S. P.).—Oil of Hedeoma. Dose, 0.12 to 0.60 c.cm. (or *mii-x*).

**Pharmacology.**—"The dried leaves and tops of *Hedeoma pulegioides* (Labiatæ)" contain an aromatic, volatile oil, which is official, and is its only important constituent.

**Physiological Action and Therapy.**—Pennyroyal-tea, or a recent infusion of the leaves and tops, is used in flatulent colic and recent suppression of the menses. The oil may be similarly employed, but is very seldom used internally except as a constituent of emmenagogue pills. Dr. Wingate has reported the case of a woman who took a teaspoonful of the oil of pennyroyal with half a teaspoonful of the fluid extract of ergot. In an hour she was unconscious, with small pulse, cold extremities, and slightly-dilated pupils. Several convulsions occurred, and opisthotonos was well marked. Morphine and atropine hypodermically with heat externally proved restorative. Hedeoma is carminative and can be used for flatulence. The oil has stimulant, carminative, and emmenagogic properties.

The fresh herb is said to be obnoxious to mosquitoes, and may be hung about the sleeping room, or the hands and face bathed with a recent infusion or a solution of the oil in alcohol (1 to 10), in order to keep off these midnight marauders. The spirit may be used with an atomizer or as an embrocation for the same purpose.

**HELIANTHEMUM.**—Frost-wort. The whole herb of the *Helianthemum Canadense* (Cistacæ) is a domestic remedy as an alterative and astringent. It contains tannin and some bitter substance. A recent decoction may be used, but a fluid extract made with diluted alcohol (dose, 4 to 7.5 c.cm., or *f̄i-ij*, several times a day) is a better preparation for diarrhœa and dysentery. It is also esteemed useful as a tonic in scrofula and syphilis.

**HELIANTHUS ANNUUS.**—The Sunflower, or *Helianthus annuus* (Compositæ), is a well-known plant, a native of Peru, but cultivated in many parts

of America and Europe and in China. It is valued chiefly on account of the fixed oil obtained from its seed. The oil possesses nutritive properties and is an excellent illuminating material. Other constituents of the plant are helianthitannic acid, inulin, levulin, a dextrorotatory sugar, and a peculiar oleoresin. In different parts of the world the sunflower is popularly esteemed as a remedy in malaria. M. Moncorvo, of Rio de Janeiro, has reported to the Therapeutical Society of Paris his clinical experiments with sunflower in 100 cases of malaria occurring among children. He found that the plant exerted a decided influence. In sixty-one patients, from one month to twelve years of age, the action of the medicine could be watched for a sufficiently long time, and all the patients recovered as rapidly as if they had taken quinine. M. Moncorvo used the tincture and an alcoholic extract and seems to prefer the former preparation. The drug was nearly always well tolerated in the dose of 2 c.cm. to 9.25 c.cm. (or f3ss-iiss) of the tincture, administered in a potion every two hours and taken in four or five doses. The alcoholic extract was given in the dose of 1 to 6 Gm. (or gr. iv-5iss).

**HELLEBORUS.**—The Christmas rose, black hellebore, *Helleborus niger* (Ranunculaceæ), is a native of Central and Southern Europe, and is cultivated in England and the United States for its showy flowers. The rhizome with rootlets is the part used. The most important constituents are two glucosides,—**Helleborin** and **Helleborein**,—both crystalline, which are cardiac and nervous poisons. There is no tannin.

**Physiological Action.**—The taste is bitter and acrid; the freshly bruised drug, but not the dried preparation, has a somewhat rancid odor. The dust is irritating and causes violent sneezing. Internally the effects are emetic, drastic, cathartic, and emmenagogic. In its action upon the heart it resembles *digitalis*. Venturini and Gasparini have ascertained that solutions of helleborein, dropped into the conjunctival sac of rabbits and dogs, produce, within fifteen minutes, such complete anæsthesia that the cornea can be penetrated without causing pain. At the same time, the sensibility of other parts of the eye and its appendages is left intact. The anæsthesia is of longer duration than that due to cocaine. No alteration of the pupil or the intra-ocular pressure is produced.

**Therapy.**—Rarely used at present, except as an ingredient in some proprietary emmenagogic pills. (For American hellebore, see **Veratrum**, U. S. P.). Helleborein, which is soluble in water, has been experimentally employed in doses from 0.006 to 0.015 Gm. (or gr.  $\frac{1}{10}$ – $\frac{1}{4}$ ) as a substitute for *digitalis*.

**HELONIAS.**—*Helonias*, False Unicorn. The *Chamæirium luteum* (Gray) or *Helonias dioica* (Pursh), belonging to the natural order, *Melanthaceæ*, is a native of North America, east of the Mississippi. The root is the portion used, and, from its resemblance to a horn, is called unicorn-root. It contains a bitter principle, **Chamælirin**. A fluid extract is made with the aid of alcohol, of which the dose is 1.20 to 2 c.cm. (or *mx*–*xxx*). It is reported to be tonic and anthelmintic.

#### **HEMIDESMI RADIX (B. P.).—Hemidesmus-root.**

##### *Preparation.*

**Syrupus Hemidesmi (B. P.).**—Syrup of *Hemidesmus* (10 per cent.). Dose, 2 to 4 c.cm. (or f3ss–j).

**Pharmacology and Therapy.**—The dried root of *Hemidesmus indicus* (Asclepiadaceæ), commonly known as Indian Sarsaparilla, or Nunnari, contains a volatilizable active principle: **hemidesmic acid**. It has tonic, diuretic, diaphoretic, and alterative properties; and is also used for the same purposes as sarsaparilla, usually as a decoction (62 Gm. to 437 c.cm., or  $\bar{3}$ ii-Oj). The official syrup is a more pleasant preparation.

**HEPATICA.**—*Hepatica, Liverwort.*

**Pharmacology and Therapy.**—The *Hepatica triloba* (Ranunculaceæ) is a native of North America. Its leaves contain mucilage and tannin; a recent infusion of them, taken hot, is useful in the early stage of bronchitis. The fluid extract may be employed as a demulcent astringent in diarrhœa. Dose, 2 to 6 c.cm. (or f3ss-iss), in fluid extract.

**HEROINÆ HYDROCHLORIDUM.**—**Heroinæ Hydrochloride** [ $C_{17}H_{17}(C_2H_3O_2)_2NOHCl$ ]. Heroinæ is an artificial alkaloid, diacetyl-morphine, which is almost insoluble in water, but its combination with hydrochloric acid, as heroinæ hydrochloride, is very soluble, and is preferable for medical use. Experiments upon animals show heroinæ to be less toxic than morphine or codeine, which it resembles in physiological effect, especially as a sedative for cough. Doses of 0.0025 to 0.005 Gm. (or gr.  $\frac{1}{24}$ - $\frac{1}{12}$ ) will usually quickly relieve the cough of acute bronchitis. Dr. John North found it especially valuable in pneumonia, relieving dyspnœa and cough, reducing temperature and pulse, and favoring sleep, in doses of 0.005 Gm. (or gr.  $\frac{1}{12}$ ) at night.

As regards the safety of this agent, it appears that the statements as to its entire freedom from depressing action upon the heart cannot be relied upon. Dr. A. L. Russell, of Midway, Pa., in a recent communication to the *Pennsylvania Medical Journal*,<sup>1</sup> reported two cases of sudden and alarming attacks of heart-weakness during the administration of small doses (0.005 Gm., or gr.  $\frac{1}{12}$ ). One case, male, 24 years of age, after taking this dose three times a day for several days, "fell over on his face while at table in a spasm of dyspnœa, with marked cyanosis."

Dreser recommended a dose of from 0.005 to 0.01 Gm. (or gr.  $\frac{1}{12}$ - $\frac{1}{6}$ ), but Leo<sup>2</sup> has seen unpleasant results, such as giddiness, nausea, and once even fainting, after 0.01 Gm. (or gr.  $\frac{1}{6}$ ). The narcotic action of heroinæ is much less than that of either morphine or codeine. Thus, in sciatica, trigeminal neuralgia, cardialgia, including the pain due to gastric ulcer and muscular rheumatism, it either did not relieve the pain or did so only momentarily. Leo found its action exceptionally satisfactory in the various forms of dyspnœa. It increased the duration of inspiration and the amount of air taken in. In hay fever, the internal administration of heroinæ hydrochloride in small doses, 0.002 Gm. (or gr.  $\frac{1}{30}$ ) every two or four hours, conjoined with treatment locally with applications of suprarenal-gland extract, has been found useful by Abrams, of Hartford, and others. Leo employed it in 2 cases of uræmic dyspnœa, 8 cases of marked emphysema, 15 cases of chronic bronchitis without obvious emphysema, and 5 cases of bronchial asthma. Only in 1 case of emphysema and 2 of chronic bronchitis was no good effect noted. Its action was almost magical in some cases. After one or two doses

<sup>1</sup> September, 1900, p. 200.

<sup>2</sup> *Deutsche medicinische Wochenschrift*, March 23, 1899.

the patients were able to sleep in the recumbent posture. When the drug was discontinued, in emphysema and chronic bronchitis, the symptoms mostly returned, but in many cases there was an interval of from eight to fourteen days. Sometimes the expectoration became more difficult after the use of heroine and for this the author combined it with potassium iodide.

Eulenberg<sup>1</sup> used a 2-per-cent. solution of heroine hydrochloride for subcutaneous injection, the single dose being from 0.24 to 0.50 c.cm. (or *miv-mj*) of this solution, or 0.005 to 0.01 Gm. (or gr.  $\frac{1}{12}$ - $\frac{1}{6}$ ) of the salt. Thus, the doses of heroine are less than those of morphine. Only on two occasions did he use more than the above-named doses. Once he injected 0.02 Gm. (or gr.  $\frac{1}{24}$ ) in a patient accustomed to morphine, and once 0.012 Gm. (or gr.  $\frac{1}{32}$ ) in a woman with sciatica. In both cases unpleasant symptoms arose; thus, in only exceptional cases should 0.01 Gm. (or gr.  $\frac{1}{6}$ ) be given in a single dose, and it should only be very gradually increased. The action of heroine in allaying cough and in diminishing attacks of asthma and dyspnoea is more rapid when given by subcutaneous injection than by the mouth. Eulenberg thinks that it possesses a more marked narcotic and antineuralgic action than is accredited it by Leo. He has found it of special value in those long accustomed to the use of morphine. It may be of service, as a temporary substitute, in cases of the morphine habit. The hydrochloride of heroine can also be given by the mouth, and here the single dose should not exceed 0.005 to 0.01 Gm. (or gr.  $\frac{1}{12}$ - $\frac{1}{6}$ ). The usual dose to begin with should not be more than 0.0025 Gm. (or gr.  $\frac{1}{24}$ ), which may be added to cough mixtures, or given in glycerin. In tuberculous laryngitis, it may be applied locally, as well as administered internally. Arthur Strauss, of Barmen, Prussia, claims that heroine has an anaphrodisiac effect, when given in doses of 0.01 Gm. (or gr.  $\frac{1}{6}$ ) each evening. George E. Petty, of Memphis, Tenn., warns against forming a heroine addiction, which he finds is as hard to overcome as the morphine habit itself. The antidotes to toxic doses are coffee, and arterial stimulants, as in opium poisoning.

**HEUCHERA.**—*Heuchera*, Alum-root. The *Heuchera Americana* belongs to the Saxifragaceæ, and is a native of the United States. The root contains considerable tannin (18 to 20 per cent.), and an infusion or fluid extract is useful as a mouth-wash, gargle, etc., or may be given for diarrhoea.

**HEXAMETHYLENAMINA** (U. S. P.).—Hexamethylenamine (Urotropin, Formin, etc.).

**HEXAMETHYLEN TETRAMIN.**—This agent is formed chemically by the union of ammonia with formaldehyde. It is an unstable compound, and may be decomposed by a feeble acid, or even by the sodium acid phosphate, present in the urine, liberating formaldehyde, which again combines with the sodium salts present in the urine, as the characteristic odor is not manifest. In medicinal doses it causes no digestive disturbance and only a moderate increase of urine. It is necessary, while treating a patient with urotropin, that the urine should be kept acid, otherwise the decomposition will not occur and the disinfectant action of the formaldehyde not obtained.

In genito-urinary therapeutics urotropin is of value, especially in the medical treatment of the diseases of the urinary passages. Thus, in

<sup>1</sup> *Deutsche medicinische Wochenschrift*, March 23, 1899.

pyelitis, in cystitis with ammoniacal urine, and in chronic inflammation of the deep urethra. The average daily dose is 1 to 2 Gm. (or gr. xv-xxx), or 0.32 Gm. (or gr. v) four times daily. This treatment has also been found efficient in phosphaturia, the urine clearing up almost immediately after the remedy was taken. Nicolaier claims that it will even dissolve uric-acid concretions.

The drug, though of undoubted value, is not quite so free from injurious effects as has been thought. Dr. W. Langdon Brown<sup>1</sup> reports two cases of hæmaturia following the use of 0.65 Gm. (or gr. x) of urotropin three times a day, both patients recovering after discontinuance of the drug. Dr. T. J. L. Forbes also reported an interesting case of hæmaturia due to urotropin in a male, aged 62 years, suffering from cystitis of about ten days' duration. The urine contained pus, but no blood, and was ammoniacal; there was enlargement of the prostate; the patient was given 0.65 Gm. (or gr. x) of urotropin thrice daily in half a pint of warm water. Two days later the patient expressed himself as feeling better, and the urine was much improved; on the evening of the third day there was increased difficulty in micturition, a burning feeling in the urethra, abdominal pains, with diarrhœa, and marked hæmaturia; the urine was not scanty. The urotropin was withdrawn, and in five days, all traces of blood having disappeared, he was again given 0.32 Gm. (or gr. v) of the drug, and, after taking 1 Gm. (or gr. xv), felt a return of the burning sensation in the urethra and again passed a little blood in the last quantity of his urine.

Albuminuria may follow the ingestion of urotropin, as in a case cited by Dr. A. Griffith, in which the albumin disappeared on the third day after withdrawal of the drug.

#### **HIRUDO (B. P.).—Leeches.**

The speckled leech, *Sanguisuga medicinalis*, and the green leech, *Sanguisuga officinalis*, are recognized by the British Pharmacopœia. The animal of either variety is two or more inches in length, worm-like, having a soft, smooth body. The American leech, *Hirudo decora*, is an inferior animal, and does not withdraw as much blood as the other varieties. (For further considerations see **Leeches**, Part II.)

**HOLOCAIN** is a synthetic product closely allied to phenacetin, and in its action resembles cocaine. It is formed by the combination of molecular equivalents of phenacetin and para-phenetidin with the separation of water, the product being fine, crystals of para-di-eth-oxy-ethenyl-amidin. It is basic in action and insoluble in water. The hydrochlorate, which is the salt generally used, dissolves in boiling water, but on cooling deposits all but  $2\frac{1}{2}$  per cent. It is perfectly neutral and will keep for months without change. It should be boiled in porcelain, as the hot solution attacks glass. In 1-per-cent. solutions it rapidly produces anæsthesia of the cornea without altering the pupil, or intra-ocular pressure, or the corneal epithelium. Dr. Hermann Knapp claims that it is superior to cocaine, as it has a very beneficial action on septic ulcers of the cornea. Dr. Hasket Derby considers it of especial value in corneal ulceration on account of its bactericidal action.<sup>2</sup>

<sup>1</sup> *British Medical Journal*, June 15, 1901.

<sup>2</sup> *Archives of Ophthalmology*, vol. xxviii, No. 1, 1899.

**HOMATROPINÆ HYDROBROMIDUM** (U. S. P., B. P.).—Homatropine Hydrobromide.

Dose, 0.0008 to 0.003 Gm. (or gr.  $\frac{1}{18}$ – $\frac{1}{20}$ ).

*Preparation.*

*Lamellæ Homatropinæ* (B. P.).—Disks of Homatropine (each contains 0.00065 Gm. or gr.  $\frac{1}{100}$  of homatropine hydrobromide).

**Pharmacology and Therapy.**—"The hydrobromide ( $C_{15}H_{21}NO_3HBr$ ), of an alkaloid prepared from tropine," is a reliable mydriatic for examination and determination of refraction in ophthalmological practice, having the advantage over other mydriatics in being prompt in its action, but more transitory in its effects, which pass away in from thirty-six to forty-eight hours, while those of hyoscyamine last eight or nine days and those of atropine continue for ten or twelve days. The ordinary solution for paralyzing the accommodation is of the strength of 1 per cent., in distilled water, a few drops of which are instilled into the eye every five or ten minutes until the full effect is obtained. Some hyperæmia of the conjunctiva generally follows its use, but not true inflammation, unless under very exceptional circumstances.

It is less irritant than atropine and much less apt to occasion systemic intoxication. The only evidence of constitutional action usually observed is a moderate retardation of the pulse.

Dr. Pooley has recorded the case of a girl 7 years of age, in whom intellectual, sensorial, and motor disturbances followed the instillation of a 2-per-cent. solution of homatropine every fifteen minutes for an hour. Several days elapsed before the patient recovered her usual health.

In the treatment of choroiditis, and other disorders for which a mydriatic is used, atropine is more suitable because its action is more prolonged, and it causes less hyperæmia.

In making homatropine solutions, the water should be boiled just before using, and small quantities only made at a time, as distilled water, unless recently boiled, usually contains bacteria and other germs derived from the air, which might induce irritation.

*Homatropine hydrochloride* and *salicylate* are salts which have a similar action to the hydrobromide, the dose of each being from 0.0005 to 0.003 Gm (or gr.  $\frac{1}{120}$ – $\frac{1}{20}$ ). Besides the mydriatic properties already referred to, these salts have likewise been used in checking night-sweats, especially of phthisis.

**HUMULUS** (U. S. P.), **LUPULUS** (B. P.).—Hops.

*Preparations.*

*Tinctura Humuli*.—Tincture of Hops (20 per cent.). Dose, 2 to 4 c.cm. (or flss j).

*Fluidextractum Lupulini*.—Fluid Extract of Lupulin. Dose, 0.30 to 1 c.cm. (or m̄v–xx).

*Oleoresina Lupulini* (U. S. P.).—Oleoresin of Lupulin. Dose, 0.12 to 0.30 c.cm. (or m̄ii–v).

*Lupulinum* (U. S. P., B. P.).—Lupulin. (The glandular powder separated from the strobiles.) Dose, 0.13 to 0.32 Gm. (or gr. ii–v).

*Infusum Lupuli* (B. P.).—Infusion of Hops, Hop-tea (5 per cent.). Dose, 30 to 60 c.cm. (or f̄ss–ij).

**Tinctura Lupuli (B. P.).**—Tincture of Hops (20 per cent.). Dose, 2 to 4 c.cm. (or f3ss-j).

**Pharmacology.**—Hops are “the carefully dried strobiles of *Humulus lupulus* (Urticaceæ), bearing their natural glandular indumentum.” The official definition of lupulin is “the glandular trichomes separated from the fruit of *Humulus lupulus*.” The constituents are bitter **Lupamaric**, or hop-bitter acid, and lupulotannic acid, besides nearly 1 per cent. of volatile oil, 9 to 18 per cent. resin, and 3 to 4 per cent. tannin, etc. Hops likewise contain a fermentable sugar, diastase, and a small quantity of asparagin. The fluid extract of lupulin is made with alcohol; the oleoresin is extracted with ether; both are eligible preparations.

**Physiological Action.**—The preparations of hops are stomachic, tonic, hypnotic, slightly diaphoretic, and anaphrodisiac. Although usually devoid of any local irritant effect, Dr. John W. Eckfeldt has met with several cases of severe and prolonged dermatitis caused by the vapor produced in making a hop poultice. He ascribes the effects to the volatilization of the oil of hops with its subsequent condensation upon the skin.<sup>1</sup>

**Therapy.**—Malt liquors, containing hops, are largely used as aids to the appetite and digestion; unfortunately, many of them contain a very small proportion of hops, the deficiency being made up with aloes or other bitter substances, with *cocculus Indicus*, grains of paradise, glycerin, soap, salicylic acid, etc., which detract from their value both from a medicinal and a commercial stand-point. A well-made beer of good quality, however, is a useful preparation of hops, and has considerable medicinal value as a tonic during convalescence, or in feeble digestion, or as a stimulant to the appetite and nutrition. The sedative effect of the hops is assisted by the alcohol and carbonic acid, making beer useful in gastric catarrh with gastralgia and as an hypnotic in neurasthenia with insomnia. In this condition a hop-pillow is appropriately used. Though not of much efficacy in itself, yet it assists in producing a narcotic effect. Beer may be given when all other forms of nourishment are refused, as in diphtheria; and eggs or beef-powder may be added to it to increase its value. The tincture of hops, or the fluid extract of lupulin, are also alcoholic, but in them the proportion of alcohol is so considerable as to make it the chief constituent. Malt liquors increase the flow of milk during lactation.

The sedative effects of hops are obtained from a hop-poultice in local painful affections, or the hops may be placed in flannel and moistened with hot whisky and applied to painful areas, as in toothache or earache, where the warmth and steam are very soothing.

The inhalations of the vapor of hops are often attended with good results, especially in diseases of the throat and chest. Lefferts used with benefit this combination:—

R Sodii carbonatis exsiccati .....	1/30	Gm. or gr. xx.
Aque ferv. (140°) .....	473	c.cm. or Oj.
Solve et adde:—		
Extracti humuli .....	4	Gm. or 3j.
M. The vapor to be inhaled.		

<sup>1</sup>“On the Poisonous Action of Hops.” By John W. Eckfeldt, M.D., *Medical Bulletin*, Jan., 1892.

In delirium tremens hop-tea, with a quantity of Cayenne pepper, quiets drink-craving and settles the stomach. In hysteria and nervousness preparations of hops are useful medicaments. Hops—especially when employed in the form of the infusion or tincture—are often most efficacious for their hypnotic action in insomnia and restlessness. The following formulæ are useful combinations:—

R Tinct. humuli .....	90	c.cm. or ℥iij.
Tinct. capsici .....	75	c.cm. or ℥ij.
Glycerini .....	60	c.cm. or ℥ij.

M. Sig.: A tablespoonful every hour or two for nervousness.

R Tinct. humuli,		
Tinct. ammon. valerianatis,		
Spiritus ætheris nitrosi .....	aa 60	c.cm. or ℥ij.

M. Sig.: Two teaspoonfuls in water every hour or two. Use in insomnia, hysteria, and nervousness.

In irritation of the genito-urinary passages full doses of the oleoresin of lupulin afford much relief, and it has also been used as an anaphrodisiac in priapism, chordee, spermatorrhœa, and similar affections. A very suitable prescription in genito-urinary irritation, of service in the diseases just referred to, is:—

R Lupulini,		
Camphoræ monobromatæ .....	aa 4	Gm. or 3j.
Ol. theobromatis .....	q. s.	

M. et ft. suppositorie no. xij.

Sig.: Insert one into the bowel every three or four hours.

**HYDRANGEA.**—*Hydrangea*. The dried root of *Hydrangea arborescens* (Saxifragaceæ) has long been used by the aborigines, in the South, in the form of a decoction, in the treatment of calculous affections. A fluid extract, made with diluted alcohol, is a convenient form in which to administer the remedy in doses of 2 to 4 c.cm. (or f5ss-j). It is of especial utility in gravel and renal colic.

### **HYDRARGYRUM (U. S. P., B. P.).—Mercury, Quicksilver.**

"It should be 99.9 per cent. pure, and be kept in strong bottles."

#### *U. S. P. Preparations.*

**Hydrargyrum cum Cretâ.**—Mercury with Chalk, Gray Powder (mercury, 38 Gm.; clarified honey, 10 Gm.; prepared chalk, 57 Gm.; water, to make 100). Dose, 0.03 to 0.65 Gm. (or gr. ss-x).

**Hydrargyri Chloridum Corrosivum.**—Corrosive Mercuric Chloride, Corrosive Chloride of Mercury, Corrosive Sublimite. Dose, 0.002 to 0.006 Gm. (or gr.  $\frac{1}{100}$ – $\frac{1}{10}$ ).

**Hydrargyri Chloridum Mite.**—Mild Mercurous Chloride, Calomel, Mild Chloride of Mercury. Dose, 0.003 to 0.65 Gm. (or gr.  $\frac{1}{100}$ –x).

**Hydrargyri Iodidum Flavum.**—Yellow Mercurous Iodide, Protiodide, Yellow (or green) Iodide of Mercury. Dose, 0.02 Gm. (or gr.  $\frac{1}{2}$ ).

**Hydrargyri Iodidum Rubrum.**—Red Mercuric Iodide, Biniodide. Dose, 0.00125 to 0.006 Gm. (or gr.  $\frac{1}{100}$ – $\frac{1}{10}$ ).

**Hydrargyri Oxidum Flavum.**—Yellow Mercuric Oxide. For external use.

**Hydrargyri Oxidum Rubrum.**—Red Mercuric Oxide, Red Precipitate. Dose, 0.0012 to 0.006 Gm. (or gr.  $\frac{1}{100}$ – $\frac{1}{10}$ ).

**Hydrargyrum Ammoniatum.**—Ammoniated Mercury, White Precipitate. For external use.

**Massa Hydrargyri.**—Mass of Mercury, Blue Mass, Blue Pill (mercury, 33 per cent., with althaea, licorice, glycerin, and honey of rose; a 3-grain blue pill contains 1 grain of mercury). Dose, 0.03 to 0.75 Gm. (or gr. ss-xij).

**Emplastrum Hydrargyri.**—Mercurial Plaster (mercury, 30 Gm.; oleate of mercury, 1.2 Gm.; lead plaster, q. s. to make 100 Gm.).

**Emplastrum Ammoniaci cum Hydrargyro.**—Ammoniac Plaster with Mercury (contains mercury, 18 Gm.; and ammoniac, 72 Gm., with oleate of mercury, diluted acetic acid, and lead plaster).

**Liquor Arseni et Hydrargyri Iodidi.**—Solution of Arsenic and Mercuric Iodide, Donovan's Solution (1 per cent. each arsenic iodide and red mercuric iodide). Dose, 0.06 to 0.60 c.cm. (or *mi-x*).

**Liquor Hydrargyri Nitratis.**—Solution of Mercuric Nitrate (contains red mercuric oxide, 40 Gm.; nitric acid, 45 Gm.; distilled water, 15 Gm.).

**Oleatum Hydrargyri.**—Oleate of Mercury (yellow mercuric oxide, 25 Gm.; oleic acid, 75 Gm.).

**Unguentum Hydrargyri.**—Mercurial, or Blue, Ointment (mercury, 50 per cent., triturated with lard, suet, and oleate of mercury).

**Unguentum Hydrargyri Dilutum.**—Diluted with 33 per cent. of petrolatum.

**Unguentum Hydrargyri Ammoniaci.**—Ointment of Ammoniated Mercury (ammoniated mercury, 10 Gm.; benzoated lard, 90 Gm.).

**Unguentum Hydrargyri Nitratis.**—Ointment of Mercuric Nitrate, Citrine Ointment (mercury, 7 Gm.; nitric acid, 17.5 Gm.; lard, 76 Gm.).

**Unguentum Hydrargyri Oxidi Flavi.**—Ointment of Yellow Mercuric Oxide (10 per cent.).

**Unguentum Hydrargyri Oxidi Rubri.**—Ointment of Red Mercuric Oxide (10 per cent.).

### B. P. Preparations.

**Hydrargyrum cum Creta.**—Mercury with Chalk, Gray Powder (mercury, 20 Gm.; prepared chalk, 40 Gm.). Dose, 0.065 to 0.32 Gm. (or gr. i-v).

**Hydrargyri Perchloridum.**—Mercuric Chloride, Bichloride of Mercury, Corrosive Sublimate. Dose, 0.002 to 0.004 Gm. (or gr.  $\frac{1}{32}$ – $\frac{1}{16}$ ).

**Hydrargyri Subchloridum.**—Mercurous Chloride, Calomel, Hydrargyri Chloridum. Dose, 0.03 to 0.32 Gm. (or gr. ss-v).

**Hydrargyri Iodidum Rubrum.**—Mercuric Iodide, Biniodide of Mercury. Dose, 0.002 to 0.004 Gm. (or gr.  $\frac{1}{32}$ – $\frac{1}{16}$ ).

**Hydrargyri Oxidum Flavum.**—Yellow Mercuric Oxide. For external use.

**Hydrargyri Oxidum Rubrum.**—Red Mercuric Oxide. Dose, 0.0012 to 0.006 Gm. (or gr.  $\frac{1}{80}$ – $\frac{1}{10}$ ).

**Hydrargyrum Ammoniatum.**—Ammoniated Mercury, Ammonio-chloride of Mercury, White Precipitate. For external use.

**Hydrargyri Oleas.**—Mercuric Oleate (mercuric chloride, 32 Gm.; hard soap, powdered, 64 Gm.; oleic acid, 4 c.cm.; distilled water, boiling, q. s.).

**Pilula Hydrargyri.**—Mercury Pill, Blue Pill (mercury, 40 Gm.; with confection of roses and licorice-root). Dose, 0.25 to 0.5 Gm. (or gr. iv-vij).

**Emplastrum Hydrargyri.**—Mercurial Plaster (mercury, 82 Gm.; olive-oil, 3.5 Gm.; sublimed sulphur, 0.5 Gm.; lead plaster, 164 Gm.).

**Emplastrum Ammoniaci cum Hydrargyro.**—Ammoniacum and Mercury Plaster (ammoniacum, 328 Gm.; mercury, 82 Gm.; olive-oil, 3.5 Gm.; sublimed sulphur, 0.5 Gm.).

**Liquor Arsenii et Hydrargyri Iodidi.**—Solution of Arsenious and Mercuric Iodides (1 per cent. each of arsenic iodide and mercuric iodide). Dose, 0.30 to 1.20 c.cm. (or *mv-xx*).

**Liquor Hydrargyri Nitratis Acidus.** Acid Solution of Mercuric Nitrate.

**Liquor Hydrargyri Perchloridi.**—Solution of Mercuric Chloride (1 Gm., or gr. xv, to make 87.5 c.cm., or f3xxx). Dose, 2 to 4 c.cm. (or f3ss-j).

**Lotio Hydrargyri Flava.**—Yellow Wash (corrosive sublimate, 0.46 Gm., or gr. viij; in solution of lime, 100 c.cm., or f3xxvij). For external use.

**Lotio Hydrargyri Nigra.**—Black Mercurial Lotion, Black Wash (calomel, 0.685 Gm., or gr. xj, with glycerin and mucilage of tragacanth and solution of lime, q. s. 100 c.cm., or f3xxvij).

**Linimentum Hydrargyri.**—Liniment of Mercury (ointment of mercury, 30 Gm.; strong solution of ammonia, 10 c.cm.; liniment of camphor, q. s. ad 90 c.cm.).

**Pilula Hydrargyri Subchloridi Composita.**—Compound Pill of Mercurous Chloride, Compound Calomel Pill, Plummer's Pill (contains calomel, 25; sulphurated antimony, 25; guaiacum resin, 50; castor-oil, 10.3; alcohol, 3 c.cm. or q. s.). Dose, 0.25 to 0.50 Gm. (or gr. iv-vij).

**Unguentum Hydrargyri.**—Mercury Ointment (mercury and lard, each, 160 Gm.; prepared Auet, 10 Gm.).

**Unguentum Hydrargyri Ammoniaci.**—Ammoniated-Mercury Ointment, White-Precipitate Ointment (ammoniated mercury, 30 Gm.; paraffin ointment, 270 Gm.).

**Unguentum Hydrargyri Nitratis.**—Mercuric-Nitrate Ointment (mercury, 100 Gm.; nitric acid, 300 c.cm.; lard, 400 Gm.; olive-oil, 700 Gm.).

**Unguentum Hydrargyri Nitratis Dilutum.**—Diluted Mercuric-Nitrate Ointment (30 per cent. mercuric-nitrate ointment, with paraffin).

**Unguentum Hydrargyri Compositum.**—Compound Mercury Ointment (mercury ointment, 150; bees-wax, 90; olive-oil, 90; camphor, 45).

**Unguentum Hydrargyri Iodidi Rubri.**—Mercuric-Iodide Ointment (4 per cent.).

**Unguentum Hydrargyri Oleatis.**—Mercuric-Oleate Ointment (1 to 3).

**Unguentum Hydrargyri Oxidi Flavi.**—Yellow Mercuric-Oxide Ointment (yellow mercuric oxide, 0.5 Gm.; soft paraffin, 24.5 Gm.).

**Unguentum Hydrargyri Oxidi Rubri.**—Red Mercuric-Oxide Ointment, Red-Precipitate Ointment (red mercuric oxide, 10 Gm.; paraffin ointment, 90 Gm.).

**Unguentum Hydrargyri Subchloridi.**—Mercurous-Chloride Ointment, Calomel Ointment (10 per cent. of mercurous chloride).

Triturations can be made with any mercurial and sugar of milk, usually in decimal proportions.

**Pharmacology.**—Commercial mercury is always impure, being combined with tin, antimony, zinc, and other metals. It can be purified by treating it with dilute nitric acid, and afterward washing it free from the acid with water. In the pure state, it is a shining, silver-white metal, liquid at common temperatures, and having the specific gravity of 13.5. The chlorides are the salts of the greatest medical importance. They are made by double decomposition; thus, mercuric sulphate and sodium chloride are triturated together and heat applied, when the mercuric (or corrosive) chloride sublimes in the form of white crystalline masses or powder; in order to form the mercurous chloride (calomel), an additional proportion of mercuric sulphate is added before subliming. Owing to the tendency to combine with other metals, the presence of mercury may be ascertained by half-immersing a gold piece in a suspected solution, when the mercury will be deposited as a gray or silver coating, if present. Reinsch's test and the reduction test may be employed as in testing for arsenic, when the small globules of mercury may be detected upon the glass, which are as easily recognized with the microscope as the crystals of arsenic.

In accordance with the chemical theory of Mialhe, it is usually taught that calomel is converted within the body into corrosive sublimate by the agency of sodium chloride. As a result of careful experiments, Dr. Paul Adam finds that, although this change may take place in the air, the access of air is practically excluded from the alimentary tract and that but a trace of calomel passes into solution. This is the case even in the presence of organic matter, and he arrives at the conclusion that sodium chloride is not incompatible with calomel. For the same reason it had generally been held that muriatic or nitromuriatic acid should not be given in conjunction with the mild chloride.

**Toxic Action and Antidotes.**—The salts of mercury are very poisonous to all lower forms of life, and mercurial solutions form our most convenient and useful antiseptics. Applied to the skin in concentrated form, most of

them are irritating, and some are destructive, to the tissues. They easily diffuse through the integument, and may in this way cause systemic effects, even from the solutions employed for antiseptic purposes, but especially from contact with mercurial ointment or fumigations. Various forms of paralysis are produced by the influence of this metal, especially among workmen who are habitually exposed to its vapors. Mercury has a marked influence upon the nervous system, causing debility with tremors. The nervous disorder is often accompanied by a brownish discoloration and a dryness of the skin. Symptoms simulating those of chronic lead poisoning, including wrist-drop, have resulted from prolonged mercurial inunction. Nerves of special sensation may be affected. Neuralgia, epilepsy, and insanity may also occur.

Upon the salivary glands, mercurials have very stimulating effects. The salivary secretions may be increased to several pints daily, the fluid at first being albuminous and thick, but subsequently becoming thin and watery. The irritation may cause inflammation, and ulceration or sloughing of the mouth or cheek may result, especially where the patient is in poor physical condition or suffers with some cachexia, or is exceptionally susceptible to the action of mercury. The condition of the general system accompanying the action of the mercurial upon the salivary glands and mouth is known as "ptyalism," or salivation. A febrile movement of low type usually accompanies these manifestations. It has been found by Dr. Petersen that disease of the kidney establishes a predisposition to the occurrence of ptyalism. For this reason, when the gums of a syphilitic patient become affected, the urine should at once be examined.

Mercury also affects the digestive organs, causing diarrhœa and a fetid breath; if continued a sufficient length of time, emaciation also occurs. These symptoms, taken collectively, constitute **Hydrargism**, or **Mercurial Cachexia**, or **Erethism**, which might be mistaken for malignant disease, especially if accompanied by some enlargement of the liver.

A bright- or dark- red rash sometimes occurs upon the skin while mercury is being taken. The discoloration may be attended by itching and may be followed by desquamation. An eruption resembling that of small-pox has been observed as a consequence of the use of a  $\frac{1}{2}$ -per-cent. sublimate solution as a vaginal wash conjoined with the application of a mercurial ointment to the abdomen. Cases have been observed in which mercury caused generalized dermatitis, with swelling, desquamation, subcutaneous infiltration, fever, and prostration. This form of intoxication may even have a fatal termination.

Pure metallic mercury is not poisonous, and passes through the alimentary tract unchanged, acting as a mechanical laxative. Acute poisoning by corrosive sublimate occurs when a toxic dose has been swallowed. The symptoms are immediate and violent: these are vomiting; purging, at first serous, afterward bloody; burning pain in the stomach and œsophagus, suppression of urine, face swollen and bloated, with much prostration of the bodily powers, etc. Severe and even fatal intoxication may take place from absorption through an abraded surface. Dr. Sackur has reported a case in which death occurred in consequence of absorption of mercurial ointment through some trivial fissures of the skin.

Albumin is the antidote to corrosive sublimate; eggs and milk should be freely swallowed, the stomach washed out with a stomach-pump, arterial stimulants administered, hypodermic injections of morphine and whisky

given, and external heat applied. After the first symptoms are over, the patient is liable to perish from ulceration or stricture of the œsophagus, destruction of the peptic glands in the stomach, salivation, and exhaustion.

Ptyalism is best treated by mouth-washes containing potassium chlorate and tincture of myrrh, and by tonics and small doses of belladonna, or atropine with morphine. The gums may become inflamed, soft, and bleeding, and the teeth loose, but under this treatment the inflammation subsides and the teeth again become firm. Salivation was of such common occurrence when mercury was given freely that it was looked upon as salutary, and it was thought necessary to "touch the gum" in order to obtain therapeutic results from the remedy; but this idea no longer prevails, and patients are no longer fully salivated intentionally, this part of the so-called antiphlogistic treatment having fallen into disuse.

**Physiological Effects.**—The action of mercury upon the liver has occasioned much controversy. The corrosive chloride in small doses is an hepatic stimulant and cholagogue; but this action has been denied to calomel, which acts principally upon the excretory glands in the lower part of the small intestine and colon. It is not yet known, however, in what form calomel enters the blood, but it is possible that a soluble combination is formed with albumin and hydrochloric acid; it is even possible that part of it may be changed into corrosive chloride, in which case some action upon the liver would naturally follow. Whatever ingenious explanation the laboratory may have to offer with regard to the cholagogic action of the mercurials, and calomel especially, clinical medicine has already settled the fact that where the tongue is heavily coated and the conjunctivæ slightly jaundiced, the skin sallow, and the liver inactive, with clay-colored stools, it can all be set right with a few small doses of calomel, and bilious stools be produced.

Salivation is a reflex phenomenon and depends upon a primary mercurial stomatitis. Both these effects are much more decided when the drug is administered by inunction. Ricord found perfectly healthy salivary glands in a ptyalized patient who died of an intercurrent disease. In administering mercury it is important that the mouth be kept in good condition. The presence of carious teeth, for instance, is often the starting-point of a stomatitis. P. Diday has reported a case in which this accident was transferred by kissing from man to wife, and believes that we may admit that certain of the numerous microbes which inhabit the mouth become virulent under the influence of the mercurial impression.

The diuretic action of mercury has of late years attracted considerable attention. It has been found that mercury, and more especially calomel and blue pill, have the power of decidedly promoting the action of diuretics. Keem<sup>1</sup> claims that the absorption of mercury salicylate, which is incomplete, is, however, greater than that of calomel. It is stated, as the result of some investigations by F. Klemperer,<sup>2</sup> that, in rabbits, corrosive sublimate injected into the blood was eliminated by the intestinal glands and kidneys. In acute cases there was congestion of the kidneys, with extravasations, and, if prolonged, the parenchyma showed signs of inflammation, with a deposit of chalk in the straight tubules; while, in the dog, there occurred fatty degeneration instead of chalky deposit. According to the studies of Calanconi, if death is not caused within ten hours, necrosis of the renal epithelium

<sup>1</sup> *British Medical Journal*.

<sup>2</sup> *Therapeutic Gazette*, Oct. 15, 1890, p. 693.

occurs. Intestinal lesions are chiefly present in the colon, and consist of hyperæmia, hæmorrhage, and necrosis. No apparent relation exists between the severity of the renal and intestinal lesions. In a monograph on the action of mercury on the kidneys Dr. Karvonen<sup>1</sup> gives an account of his experiments on rabbits and dogs, various mercurial preparations having been administered subcutaneously, and the kidneys afterward examined microscopically. In all cases changes were detected in these organs, varying from simple hyperæmia to marked nephritis with albuminuria and tube-casts. The well-known deposits of lime-salts in the kidney were often obtained as a result of the action of mercury. From his own experience the author describes similar symptoms occurring in man. He also mentions the occasional occurrence of glycosuria.

It is evident that mercury in small doses is capable of acting as a stimulant to the kidneys, and this agrees with the observations of Jendrassik upon the use of calomel as a diuretic. Small quantities of mercurials, therefore, are useful additions to squill, digitalis, and other diuretic remedies.

The fact has been established that small doses of corrosive sublimate (0.0006 Gm., or gr.  $\frac{1}{100}$ , three times daily) favor physiological functions and stimulate the blood-making glands. These constitute the so-called "tonic doses" of mercury.

The metal is slowly eliminated in the urine and glands of the digestive tract. It has been detected in most of the tissues and secretions of the body. The bone-marrow may retain it for a long period, and it may be found in metallic globules in the cancellated tissue of bones long after death. When death results from mercury, diphtheroidal, hæmorrhagic inflammation of the large intestine is found.

The external, as well as internal, use of mercury may occasion local paralysis, as in a case narrated by Dr. A. W. Foot, in which there was loss of power in the muscles of the hand and forearm after rubbing cattle with an ointment containing the red iodide.

**Therapy.**—1. *Local Application, or External Use.*—A most important field of usefulness for mercurials, at present, is in antiseptic surgery. The solutions have the advantage of convenience, being easily made and cheap, odorless and permanent. The field of operation, having been well soaped and shaved and washed with ether, is usually irrigated with a solution of corrosive sublimate (1 to 2000, or 1 to 4000 and much weaker if the skin is broken). For washing out wound-cavities, or the peritoneum, still weaker solutions should be made use of (1 to 6000 or 10,000). In lying-in hospitals, or where the surroundings are decidedly unhygienic, and also where symptoms of septic infection are manifested after delivery, the danger may be averted by the free use of these mercurial antiseptic vaginal douches several times a day. In modern surgery much attention is given to the proper disinfection of the hands. Abbott<sup>2</sup> states that of the numerous methods two are thoroughly trustworthy, viz.: that of Fürbringer and that of Welch, developed at the Johns Hopkins Hospital. Fürbringer's method: 1. Remove all dirt under and around nails. 2. Brush nails and skin of hands thoroughly with soap and hot water. 3. Immerse in alcohol, 95 per cent., for not less than a minute, and before this evaporates (4) plunge the hands in

<sup>1</sup> *British Medical Journal*, June 11, 1899.

<sup>2</sup> "Hygiene of Transmissible Diseases," 1899.

1 to 500 corrosive-sublimate or 3-per-cent. carbolic-acid solution, and thoroughly wash them for at least a minute, after which the hands may be rinsed in warm water and dried. Welch's method: 1. The hands and nails are to be thoroughly cleansed with hot water and soap. The water is to be as hot as can be borne, and the brush used is to have been sterilized with steam, this preliminary brushing to occupy from three to five minutes. 2. The hands are then rinsed in clean, warm water. 3. They are then immersed for one or two minutes in a warm, saturated solution of potassium permanganate. While in this solution they are rubbed thoroughly with a sterilized swab of absorbent cotton. 4. They are then placed in a warm, saturated solution of oxalic acid, and kept there until completely decolorized. 5. They are then thoroughly washed in clean, sterilized water or salt solution. 6. Finally, they are immersed for two minutes in 1 to 500 corrosive-sublimate solution, rinsed in water, and dried.

The use of corrosive-sublimate injections during and after parturition has caused a remarkable reduction of the death-rate in lying-in hospitals.

A mercurial solution has also been used to irrigate the uterus in puerperal septicæmia, but the practice is not without the danger of giving rise to poisoning by absorption.

In 1880, Koch demonstrated that bichloride of mercury (sublimate) was the most powerful of antiseptics. It was found that in a solution of 1 to 1000 it would soon destroy the spores of anthrax: the most virulent of all germs. This was true with regard to non-albuminous media, but when the medium to be disinfected contained albumin, the mercury coagulated the albumin, formed an albuminate of mercury, which deposited, leaving the supernatant liquid practically free from mercury, and, hence, without antiseptic power. Dr. Ernest Laplace,<sup>1</sup> in Koch's laboratory, seeking a method to prevent this coagulation, and, therefore, to retain for the mercury its same disinfecting power in albuminous as in non-albuminous fluids, found that an addition of a small quantity of any acid to the ordinary solution would fulfill this purpose. Accordingly, the acid sublimate solution consists of:—

Mercuric sublimate .....	1 part.
Hydrochloric acid (pure) .....	5 parts.
Water .....	q. s. ad 1000 parts.

Hydrochloric acid is used preferably to all others. When, however, the acid sublimate must be carried in a solid form, tartaric acid is substituted for the hydrochloric acid.

Mercuric sublimate .....	1 part.
Tartaric acid .....	5 parts.
To be made into a tablet, which must be dissolved in 1000 parts of water.	

This form was adopted by the Academy of Medicine of Paris, to be used by midwives throughout France. The acid sublimate is the only disinfectant used in Koch's laboratory. It is also used in the Pasteur Institute of Paris. Besides being the surest and most powerful antiseptic, it is the only solution of mercury that will always retain its integrity, and never form a deposit of earthy salts. It is used for all manner of disinfection, except that

<sup>1</sup> *Deutsche medicinische Wochenschrift*, No. 40, 1887.

of instruments. In a solution as weak as 1 to 50,000 it retains sufficient power to destroy the germs of suppuration.

Dr. A. C. Abbott enjoins caution in the use of corrosive sublimate upon open wounds, for the reason that the albumin of the parts tends to counteract its influence and that it materially injures the integrity of the tissues, impairing the normal resistance of the solids and fluids of the body to the attacks of micro-organisms. As a result of many experiments, he finds that, under favorable conditions, only a certain number of the pathogenetic microbes are destroyed by the mercurial, and that, though the remainder may be temporarily attenuated, the effect disappears by successive cultivation in normal media.

The biniodide (1 to 4000 or 1 in 20,000) is recommended by Miquel, and Panas prefers it in eye surgery, it being less irritating than corrosive sublimate. It might also be added that there is much less danger of a mercurial impression being made upon the system by absorption where this salt is used, as the solutions usually only contain half as much mercurial.

The biniodide of mercury is not very soluble in water, but its solution may be promoted by the addition of alcohol or of an equal quantity of potassium iodide.

In ear affections, an ointment of yellow mercuric oxide, 0.32 to 0.65 Gm. to 31 Gm. (or gr. v-x to 5j) of lard or cold cream, is much used to relieve inflammation and keep the canal clean.

In a case where a mass of molten lead had run into the ear, filling the tympanum, Mr. A. Marmaduke Sheild<sup>1</sup> succeeded in removing the impaction by filling the external meatus with liquid mercury, which seemed to have a solvent action upon the lead. After remaining undisturbed in the ear for sixteen hours the mercury escaped, mingled with lead, and on the following day the latter metal was so softened that it could be easily removed.

An ointment of yellow oxide has been used in eye practice in the treatment of chronic blepharitis, tinea tarsi, and eczema, or by rubbing in at night a largely-diluted citrine ointment. The irritant properties of the red oxide render its ointment a useful application to indolent ulcers, whether of syphilitic or common origin; to enlarged scrofulous glands, or goitre, rosacea, scleroderma, and lepra. The oleate is a milder and a safer application, though less efficient. The yellow wash is a good application in scrofulous conjunctivitis. Finely-powdered calomel may be dusted over the surface of the lids in phlyctenular ophthalmia and corneal ulcerations. The subconjunctival injection of a 1 to 1000 solution of corrosive sublimate was originally practiced by Darier, 0.12 c.cm. (or *mij*) being introduced, and very favorable results have been reported by Dr. Adolf Alt, of St. Louis,<sup>2</sup> from the use of this method in iritis, iridochoroiditis, exudative choroiditis, central chorioretinitis, and detachment of the retina. The cases of iritis were of all varieties, including those of syphilitic, rheumatic, and traumatic origins. In the treatment of corneal troubles, however, especially parenchymatous keratitis, this writer observed no beneficial action. A certain number of cases of sympathetic ophthalmia have also been reported as cured by this method of treatment. It is regarded, however, as unadapted to cases in which the stasis of the local circulation prevents, either wholly or in part,

<sup>1</sup> *Lancet*, April 30, 1892.

<sup>2</sup> *American Journal of Ophthalmology*, Feb., 1894.

absorption of the injected fluid. Mercuric cyanide has been employed instead of the corrosive sublimate.

In granular conjunctivitis, the following ointment is beneficial:—

R Hydrarg. oxid. flav. ....	20 Gm. or gr. iij.
Zinci oxid,	
Thymol,	
Cocain, hydrochlorid. .... aa	10 Gm. or gr. iss.
Camphor. ....	03 Gm. or gr. ss.
Petrolati albæ. ....	23 3 Gm. or 3vj.

M. Sig.: Apply locally.

R Hydrargyri oxid. flav. ....	38 Gm. or gr. vj.
Camphoræ ....	20 Gm. or gr. iij.
Ungt. aquæ rosæ,	
Adipis læne hyd. .... aa	8 1 Gm. or 3ij.

M. For irritable and inflamed eyelids.

Before applying calomel to the eye, the physician should always ask whether or not the patient has been upon an iodine course, since a caustic compound may form between the mercury and iodine and give rise to intense pain, with inflammatory swelling of the conjunctiva and lids. Cases have occurred in which this unfortunate accident has led to almost complete loss of vision.

The ointment of the red oxide, properly diluted, is a valuable resolvent in enlarged glands, goitre, and ague-cake, the application being made in the direct rays of the sun, or before a fire. This ointment may also be serviceably applied to indolent ulcers, seborrhœa, and lupus erythematosus. Ulcers, especially venereal, are stimulated by the application of diluted acid nitrate of mercury (1 to 10 or 20), but this preparation often gives rise to pain and hæmorrhage, and should be used very cautiously upon soft parts for fear of causing sloughing. It should never be used for venereal ulcers in full strength. A better method is to wash the sores, or condylomata, with solution of chlorinated soda, and, after drying with absorbent cotton, dust calomel, or equal parts of calomel and starch, over the surface, as practiced by Ricord. The black wash also makes a good dressing in such cases and in rhus poisoning. In acne or eczema of the scalp, lotions containing 1 or 2 parts per thousand, or, in infants, 1 in 10,000 of corrosive sublimate, are much used.

Corrosive sublimate in the form of an ointment or lotion,  $\frac{1}{2}$  to 1 per cent. (or gr. ii-v to 5j), is employed successfully for the removal of freckles.

Calomel alone, or combined thus, is of service in herpes and irritation around the genital organs:—

R Hydrargyri chloridi mitis ....	12 1 Gm. or 3iij.
Bismuth. subnit.,	
Pulv. lycopodii .... aa	15 5 Gm. or 3ss.

M. Sig.: Dust over the surface.

Calomel is also of much value, dusted over the surface, to diminish exuberant granulations, as follows:—

R Hydrargyri chloridi mitis,	
Iodoformi .... aa	15 5 Gm. or 3ss.

M. Sig.: Sprinkle over the ulcer or ulcerated surface.

Dr. J. B. James, of London, claims good results from the application of calomel to hæmorrhoids, especially when the tumor is inflamed.

Calomel likewise forms an ingredient of many cancer powders for destroying malignant growths upon and in the skin. Eschmarch's painless powder contains calomel, and is composed as follows:—

R Hydrargyri chloridi mitis .....	5	20 Gm. or gr. lxxx.
Arsenii trioxidi .....		
Morphinæ hydrochloridi .....	aa	65 Gm. or gr. x.
Pulveris acaciæ .....	31	Gm. or ʒj.—M.

For acne we may use the following:—

R Hydrarg. chloridi corrosivi .....	38	Gm. or gr. vj.
Mist. amygdalæ .....	180	c.cm. or ʒvj.
M. Sig.: Apply night and morning.		

Stronger solutions are useful in scabies, tinea versicolor, ringworm, and alopecia:—

R Hydrargyri chloridi corrosivi .....	75	Gm. or gr. xij.
Spiritus thymoli .....	75	c.cm. or ʒij.
Aquæ hamamelidis .....	150	c.cm. or ʒiv.—M.
R Hydrargyri chloridi corrosivi .....	85	Gm. or gr. x.
Spiritus rosmarini .....	30	c.cm. or ʒj.
Ammonii chloridi .....	2	Gm. or ʒss.
Spiritus vini rectificat. ....	120	c.cm. or ʒiv.—M.

Mercurials are frequently used for their local effects upon mucous membranes: for instance, in syphilitic ulceration of the tongue, lozenges of licorice containing 0.002 Gm. (or gr.  $\frac{1}{30}$ ) of corrosive sublimate may be allowed to dissolve slowly in the mouth, and the solution, being swallowed, also produces its constitutional effects. In disease of the uterus and pelvic organs, Dr. A. L. Smith, of Montreal, uses cotton and wool tampons containing mercuric chloride, 0.006 Gm. (or gr.  $\frac{1}{10}$ ), in conjunction with boroglyceride solution (10 per cent.), introduced into the vagina twice a week. Several cases have been placed on record of corrosive sublimate poisoning from a vaginal douche (1 to 2000). This method of treatment is too dangerous to be carried out by the patient herself; the ordinary corrosive sublimate tablets are for surgical and obstetric use, and should only be employed by the physician, since the danger of poisoning is too great to allow them to lie around the house, within the reach of children. Lamentable accidents have occurred through neglect of this precaution.

In acute follicular tonsillitis, good results have been reported by A. Sbrocchi,<sup>1</sup> by local treatment with corrosive sublimate. A solution (1 to 1000) is applied carefully by means of a cotton-wool sponge, to the whole surface of the inflamed gland; but without wounding the mucous membrane. The soft palate and uvula should also be brushed with the solution. The sittings should be repeated at intervals of 3 or 4 hours. This treatment does not avail for diphtheria. When four paintings fail to effect improvement, he resorts to antitoxin.

Red precipitate ointment has been used for the anointing of chapped lips, the treatment of sores and cracks at mouth-corners, and for the cure of fissured lips. By distending the fissures and filling them repeatedly with the ointment—*distending the fissure* with each insertion of ointment—a

<sup>1</sup> Medical Bulletin, January, 1906.

quality of cicatricial tissue is produced which, by its toughening, almost always prevents any subsequent fissuring.

Dr. Marshall employed a 5-per-cent. solution of the oxide of mercury in oleic acid, adding one-eighth part of ether, for syccosis and parasitic and itching affections. The oleates are useful where induration exists. The official oleate (25 per cent. of mercuric oxide) is preferable to blue ointment in the inunction treatment of syphilis, being more elegant and cleanly, and equally efficient. This preparation is of decided value in old patches of psoriasis and chronic eczema of the palms or soles. The mercuric oleate exerts a powerful resolvent influence upon enlarged glands and upon a thickened, indurated condition of the integument. It is, likewise, curative in animal and vegetable parasitic affections.

In the treatment of eczema capitis, or impetiginoides, in infants, much benefit is derived from removal of crusts with sweet oil, followed by compresses wet with bichloride (1 to 10,000); and with due attention to general health and the diet.

In the treatment of favus, Kinsh holds that there is nothing better than persistent and repeated epilation, with brisk rubbing of a watery solution of corrosive sublimate (0.005 to 0.008 Gm., or gr.  $\frac{1}{12}$ - $\frac{1}{8}$ ) into the diseased surface. This, however, should not be intrusted to the patient, who will either underdo or overdo it, but he may apply some other antiparasitic ointment, or antipruritic. Of the former may be mentioned mercurial and sulphur ointments, of the latter those containing tar, carbolic acid, creosote, etc.

In the varieties of trichophytosis and in phtheiriiasis a diluted ointment of the nitrate is often valuable. It is beneficial, also, in chronic eczema, psoriasis, rosacea, syccosis, and in numerous chronic disorders of the skin.

The following formulæ, containing one of the mercurial ointments, may be employed in the diseases referred to above:—

R	Ungt. hydrargyri ammoniat. ....	15/5	Gm. or ʒss.
	Olei lavandule-florum. ....	1/20	c.cm. or mxx.
	Ungt. zinci oleatis .....	15/5	Gm. or ʒss.
M.	Use in acne, rosacea, and chronic eczema.		
R	Ungt. hydrargyri nitratis .....	15/5	Gm. or ʒss.
	Olei juniperi .....	2/ to 7/5	c.cm. or fʒss vel fʒij.
	Adipis lane. ....	15/5	Gm. or ʒss.
M.	For chronic psoriasis and eczema, especially of the hands and feet.		
R	Ungt. hydrargyri oleatis (20 per cent.) .....	31/	Gm. or ʒj.
	Thymolis iodidi. ....	4/	Gm. or ʒj.
M.	Serviceable in animal and vegetable parasitic diseases.		
R	Ungt. hydrargyri ammoniat. ....	31/	Gm. or ʒj.
	Mentholi,		
	Cocaine hydrochloridi. ....	aa	65 Gm. or gr. x.
	Ol. caryophylli .....		60 c.cm. or mx.

M. Beneficial in herpes, herpes zoster, seborrhœa, and eczema, especially of the genital organs.

An ointment of calomel (1.30 to 31 Gm., or gr. xx-ʒj. of lard) is also serviceable in similar cases, and Metchnikoff has found it to prevent the infection of syphilis, if rubbed on the spot inoculated within one hour after infection. A weak calomel ointment is of service in impetigo contagiosa and ecthyma. The latter stage of dermatitis is also benefited by the use of this unguent.

In gonorrhœa or urethritis, either acute or chronic, irrigation of the urethra with weak solutions of corrosive sublimate (1 to 10,000), used every four hours, is sometimes followed by rapid cure. A little tartaric acid should be added to the solution to keep the mercury from becoming changed into an albuminate. In gonorrhœa and gleet, the injection of a solution of mercury salicylate ( $\frac{1}{4}$  to 1 per cent.) may rapidly remove the discharge. Mercurial inunction or the subcutaneous injection of corrosive sublimate is recommended as of advantage in gonorrhœal rheumatism.

The application of mercurial ointment is a popular treatment for pubic pediculosis. A case is reported by Wightnick, in which a patient salivated himself by the free use of the remedy (nearly two ounces in three days).<sup>1</sup>

Professor Guyon, of Paris, introduced the practice of injecting a solution of corrosive sublimate into the bladder for the relief of tuberculous cystitis, and excellent results have been reported as obtained by the adoption of this method.

In affections of the joints, orchitis, enlarged glands, an ointment containing 0.065 to 0.13 Gm. (or gr. i-ij) of morphine and 4 Gm. (or 5j) of calomel in 31 Gm. (or 5j) is very useful in reducing the swelling and averting threatened abscess. By the use of the Vigo plaster, compression may be made around a joint or a swollen testicle with great benefit. An ointment of sublimate (0.13 to 0.20 to 31 Gm., or gr. ii-iii to 5j) is also useful in the ulcerated stage of lupus vulgaris. The official blue ointment is useful in erysipelas as a local application, allays inflammation in paronychia, and is a good dressing in chilblains and dermatitis. The solution of mercuric nitrate, much diluted (1 to 20, or more) is serviceably applied to warts, chancreoids, syphilitic condylomata, mucous patches, and ulcers of the mouth. It should not be used carelessly or salivation may ensue, or local sloughing.

Miller<sup>2</sup> claims to have cured 15 out of 17 cases of hydrocele by drawing off the fluid aseptically and immediately returning through the cannula, 1 c.cm. (or *mxv*) of water, containing 0.002 Gm. (or gr.  $\frac{1}{32}$ ) of corrosive sublimate, and leaving it in the hydrocele-sac. There is very little pain, but, if complaint be made, he advises application of belladonna ointment.

2. *Internal Administration.*—Since fermentation is now known to play an important part in disorders of digestion, it is to be expected that the antiseptic powers of mercury would make it conspicuously useful in treating digestive disorders. When there is a foul stomach, coated tongue, some vertigo or headache, constipation, and depression of spirits,—what is commonly called a bilious attack,—0.65 to 0.75 Gm. (or gr. x-xij) of blue mass or calomel, followed in from six to eight hours by a saline purgative, will entirely change the state of affairs. It is probably true that these doses are larger than necessary, but, as the excess is carried away by the saline, no harm is done. In some cases much smaller quantities given in broken doses—say, 0.006 Gm. (or gr.  $\frac{1}{10}$ ) of calomel with a little soda, given each hour until five doses are taken—is sufficient to produce the same effect if followed by a cathartic. If there is much engorgement of the liver, larger doses are preferable, and we may use with advantage the old “ten and ten” (10 grains, or 0.65 Gm., each of calomel and jalap). During the first week of typhoid fever, two or three full doses of calomel are useful in cleaning the alimentary

<sup>1</sup> *Lancet*, Sept. 9, 1905.

<sup>2</sup> *Lancet*, Sept. 4, 1897.

canal and making it to some degree aseptic. This is a part of the so-called specific treatment of typhoid.

The corrosive chloride has likewise been used in the treatment of enteric fever, and Loranchet reports that in twenty-one cases, where this salt was the principal remedy, it caused decided amelioration of severe symptoms and apparent abatement of the toxic manifestations.

Digestive disorders in infancy are very frequent, and often are promptly controlled by mercurials. Mercury with chalk is a common ingredient in teething-powders, but should not be used freely unless the infant suffers with congenital syphilis; for, although children are not easily salivated, yet they may be affected by the mercurial, as is shown by the peculiarity in the shape of the permanent teeth due to malformation, the result of the incautious use of teething-powders containing mercury. Calomel is used for the same purpose, as well as the corrosive chloride, both of which are particularly useful in mucous diarrhoea, or enterocolitis, in small or minute doses, given every hour, suspended or dissolved in recently-boiled water. In strumous children, with poor digestion, small appetite, and irregular bowels, the following is a valuable tonic:—

R Hydrarg. chlor. corrosivi .....	1032	Gm. or gr. ss.
Tr. gentiane composita .....	150	c.cm. or f℥v.
Syr. aurantii .....	30	c.cm. or f℥j.

M. Sig.: A teaspoonful four times daily, at meal-times.

In vomiting of adults and infants, 0.0006 Gm. (or gr.  $\frac{1}{1000}$ ) of corrosive sublimate, or minute doses of calomel with soda, or saccharated pepsin, will often check the irritability of the stomach, if the diet be properly restricted. In vomiting infants, it may be necessary to stop the use of milk for a few days, and rely altogether upon rice-water or albumin-water until the digestion is normal again. The vomiting of cholera infantum is often relieved by small doses of calomel, and the nausea of adults frequently yields to the same treatment. A minute dose of calomel, or corrosive sublimate, administered at hourly intervals, is advantageous in acute or chronic dysentery, soon causing the disappearance of blood and mucus from the discharges. The corrosive chloride, in doses of 0.001 to 0.002 Gm. (or gr.  $\frac{1}{400}$ – $\frac{1}{200}$ ) before each meal, promotes cicatrization of a gastric ulcer. The occasional use of a mercurial purge aids in expelling intestinal worms, and, in fact, calomel is an efficient remedy against tape-worm. Given in full cathartic dose, mercury also is an excellent anthelmintic in case of lumbricoid worms. It is a common and good practice to use a mercurial in combination with santonin.

Mercury is no longer regarded as essential in the treatment of all forms of inflammation of internal organs, but small doses are valuable in promoting the absorption of inflammatory exudations, especially in glandular affections, in orchitis, in croupous pneumonia or broncho-pneumonia, tonsillitis, and meningitis.

Calomel is of special value in limiting or promoting the absorption of inflammatory exudations of serous membranes. It is also efficacious in iritis.

Wallace Beatty points out its value<sup>1</sup> especially in case of venous engorgement, due to chronic pulmonary or mitral valve disease, or dependent on mitral incompetence, or from failure of the right heart caused by emphysema

<sup>1</sup> *Dublin Journal of Medical Science*, Oct., 1899.

and bronchial and cardiac dilatation due to chronic interstitial nephritis. Also in cases of dilatation with general dropsy, without obvious valvular disease. He finds the method most successful in his hands, of administering mercury, to be with small doses frequently repeated, for its diuretic effects. The plan he adopts is to give a pill containing 0.03 Gm. (or gr. ss) of calomel, usually with digitalis or squills, every four hours, night and day, for ten to fourteen days. In case they produce purgation, he changes the pills to one with opium, 0.008 to 0.03 Gm. (or gr.  $\frac{1}{4}$ -ss), instead of the digitalis. He usually gives two sets of pills to be employed according to the circumstances. The mercury acts by stimulating the renal secretions and increasing the activity of absorption at the same time. He does not pretend to say that it is useful in all cases, but, when digitalis and other cardiac tonics fail, the use of mercury is often attended with the happiest results.

In ascites caused by disease of the liver, Palma obtained excellent results from the administration of calomel. The urine was greatly increased in quantity and the transudation correspondingly diminished.

In a case of hypertrophic cirrhosis of the liver, Sior observed disappearance of the jaundice and marked reduction in the size of the liver and spleen in consequence of the use of calomel. In cases of hydatid cyst of the liver Baccelli advises that after about 30 c.cm. (or f $\bar{3}$ j) of the fluid has been withdrawn a corrosive-sublimate solution should be injected into the sac. Twenty c.cm. (or f5vss) of a 1 to 1000 solution are used in this manner, and, at the end of five days, the parasite is dead and the symptoms steadily improve.

In the treatment of diphtheria, Dr. Daly,<sup>1</sup> of Pittsburgh, strongly advocated Reiter's method of using calomel, 0.13 to 0.32 Gm. (or gr. ii-v) being given every hour, or every two or three hours, to young children, until the discharges from the bowels appear as colorless serum, with a little greenish mucus or bile upon the surface resembling chopped spinach. Then the interval is lengthened, but the same dose continued. Shorts<sup>2</sup> gives from 0.32 to 1 Gm. (or gr. v-xv) every two or three hours to an adult until the greenish stools are obtained, avoiding salivation by the simultaneous administration of 0.32 to 0.50 Gm. (or gr. v-viiij) of potassium chlorate. The corrosive chloride has also its advocates in this disease, and here the system tolerates comparatively large doses, not only with impunity, but with benefit. From 0.0015 to 0.006 Gm. (or gr.  $\frac{1}{40}$ - $\frac{1}{10}$ ) may be given every two hours to an infant for twenty-four to forty-eight hours, until the worst part of the illness has passed over, when the interval can be lengthened and the dose reduced. This has the advantage of being less likely to cause salivation than the calomel. In true membranous or diphtheritic croup, this plan of treatment may avert the necessity of intubation or tracheotomy. Rennert, however, has used with very satisfactory results, in diphtheria, an application to the throat of Laplace's tartaric-acid, corrosive-sublimate solution, in the strength of 1 to 500. His statements have been corroborated by Dr. M. Graham Tull, of Philadelphia. In whooping-cough, Raubitschek reports favorably on the local employment of a 1 to 1000 solution of corrosive sublimate, applied upon a cotton tampon and pressed against the base of the tongue and swabbing the tonsils, uvula, and soft palate. The procedure was repeated every day or every second day with the result of materially modifying and abridging the

<sup>1</sup> "Transactions of American Laryngological Association," 1886.

<sup>2</sup> *Physician and Surgeon*, Sept., 1889; "Annual of the Universal Medical Sciences," 1890.

course of the disease. In diphtheria, Dr. E. L. B. Godfrey uses iron in combination with corrosive mercuric chloride:—

R Hydrargyri chloridi corrosivi .....	1065	Gm. or gr. j.
Tinct. ferri chloridi .....	7/5	c.cm. or f3ij.
Syrup. simplicis .....	22	c.cm. or f3vj.
Aque .....	q. s. ad 90	c.cm. or f3iij.

M. Sig.: A teaspoonful in water every three hours.

The yellow, mercuric subsulphate is a valuable adjunct in the treatment, for 0.13 to 0.20 Gm. (or gr. ii-iiij) administered to a child are followed by prompt emesis and the ejection of false membrane from the throat. Fordyce Barker considered it uniformly successful in croup. It should not be allowed to remain in the stomach in case the first dose does not produce vomiting, as it may cause gastritis or mercurial poisoning; it generally is rejected too rapidly for absorption to take place.

In other constitutional diseases attended by inflammation of the throat, we may give 0.02 Gm. (or gr.  $\frac{1}{3}$ ) of gray powder three or four times a day, as recommended by Ringer. This high authority also advises the same preparation in the same dose, given hourly, in acute tonsillitis when the swollen glands interfere with deglutition and respiration. In troublesome ulcerations of the throat, corrosive-sublimate solution is often beneficial as a local application, accompanied by other treatment suitable to the case. In diphtheria, the best results are obtained by antitoxin, and the internal administration of mercurials, conjoined with local disinfection by salt-water douches, potassium permanganate, trypsin, tolual, or boroglyceride, instead of local applications of mercurials, since where they are frequently used it is impossible to estimate how much has been swallowed.

The appended formulæ containing mercury will be of benefit in diphtheria, acute tonsillitis, and often in acute laryngitis:—

R Hydrargyri chloridi mitis .....	13	Gm. or gr. ij.
Antimonii et potassii tart. ....	1065	Gm. or gr. j.
Sacchari albi .....	2	Gm. or 3ss.

M et ft. chartulæ no. x.

Sig.: A powder every hour or two.

R Hydrargyri chloridi corrosivi .....	1065	Gm. or gr. j.
Tinct. guaiaci .....	30	c.cm. or f3j.
Glycerini .....	60	c.cm. or f3ij.

M. Sig.: A half to one teaspoonful every two or three hours.

The sore throat of scarlatina is benefited by the administration of the gray powder, or the corrosive chloride. Petresco, after numerous bacteriological and clinical experiments, relies upon Van Swieten's solution<sup>1</sup> in the treatment of measles, scarlet fever, and small-pox. In scarlet fever the solution of the corrosive chloride was applied directly to the throat, either by peniciling or in the form of a gargle.<sup>2</sup>

Mapother,<sup>3</sup> in the treatment of psoriasis, employs mercury externally

<sup>1</sup> Van Swieten's solution is composed as follows: 0.65 Gm. (or gr. x) each of corrosive sublimate and ammonium chloride, dissolved in a pint of distilled water. Dose, 2 to 4 c.cm. (or f3ss-j).

<sup>2</sup> "Recherches Cliniques et Expérimentales sur l'Antisepsie Médicale," par le Dr. Z. Petresco, Mémoire présenté au Congrès de Thérapeutique à Paris en 1889. Jassy: Imprimerie Nationale, 1889.

<sup>3</sup> "The Parasitic Nature of Psoriasis, its Treatment by Mercury," by E. D. Mapother, M.D., F.R.C.S., in *British Medical Journal*, Jan. 17, 1891.

and internally, the blue pill or the protiodide of mercury being usually prescribed. The writer has employed the mercurials, especially the corrosive chloride hypodermically, in the treatment of several cases of psoriasis, with a complete removal of all the eruption from the body, the dose and injection used being similar to that already described in treating syphilis. Poncel, of the Marseilles Hospital, has also employed injections of the corrosive chloride of mercury into tumors of a cancerous appearance, followed by their complete disappearance. Dr. R. Cowan Lees, of Glasgow, reports that he has met with some success in the treatment of sarcomata and carcinomata by injections of corrosive sublimate dissolved in olive-oil. He employs the same method in pneumonic phthisis.

A case of traumatic tetanus in a child has been described by Celli, in which success followed the hypodermic injection of corrosive sublimate, as first practiced by Baculo. During seven days, nine injections of about 0.005 Gm. (or gr.  $\frac{1}{16}$ ) were given. Improvement was observed from the beginning, and on the eighth day the patient was completely cured. Schwab has used for congenital syphilis, the following, hypodermically:—

R Hydrargyri biniodidi.....	0.05	Gm. or gr. $\frac{1}{20}$ .
Sodii iodidi.....	0.05	Gm. or gr. $\frac{1}{20}$ .
Aque destillatæ.....	10j	c.cm. or 3ij $\frac{1}{2}$ .
M. Sig.: Dose for an infant, 0.10 c.cm. (containing 1 mg., or gr. $\frac{1}{60}$ ).		

The ointment of the nitrate, very much diluted, also mercurial ointment, has long been used upon the face in small-pox in order to prevent the development of the pocks and consequent pitting. The effect probably is dependent both upon the mercury and the exclusion of light and air.

For the local treatment of variolous pustules, Dr. Talamon advises spraying the surface with a solution containing 1 Gm. (or gr. xv) each of corrosive sublimate and citric or tartaric acid, 5 c.cm. (or *mlxxv*) of 90° alcohol, and a sufficient quantity of sulphuric ether to make 90 c.cm. (or *f3ij*). He makes use of the same method in the treatment of erysipelas. Dr. H. A. Ingalls,<sup>1</sup> of Cincinnati, reports a series of 36 cases of small-pox, 1 of which was hæmorrhagic and 13 confluent, treated without mortality, as a result of the use of baths of bichloride of mercury (1 to 10,000) given twice daily. A large bath-tub was brought to the side of the patient's bed and filled with a warm (103° to 105° F.) solution of bichloride, and the patient immersed, except the head and shoulders, for about ten or twelve minutes, the nurse gently rubbing the entire body with a soft cloth during the bath. After the bath the patient was anointed with a mixture of carbolic acid, bismuth subnitrate, and olive-oil. Dr. Ingalls reports the following observation of this treatment: 1. There is practically no mortality. 2. The suppurative fever can be shortened four to six days, if patient is treated from the onset. 3. A minimum of pitting is secured and an almost entire absence of the characteristic disagreeable odor. 4. The period of desquamation is materially lessened owing to the thinness of the scab-formation. 5. Pain is very much reduced, morphine being rarely required. 6. The great distortion of features, which gives us such repulsive-looking patients, is eliminated to a great extent. On local treatment of erysipelas, Prof. Roswell Park, of Buffalo, said: "Of all the numerous applications which I have ever tried, I

<sup>1</sup> *Journal of the American Medical Association*, April 28, 1900, p. 1044.

have found but one thing which has given the universal satisfaction afforded by the following prescription or something equivalent to it: Resorcin (or naphthalin), 5; ichthyol, 5; mercurial ointment, 40; lanolin, 50. The proportions of these ingredients may be varied, and I often increase the amount of ichthyol, especially when the skin to which it is to be applied is not too tender. The affected parts are anointed with this, and then covered with oiled silk or some impermeable material, simply to prevent its absorption by the dressings; the parts are then enveloped in a light dressing and bandaged. Whenever I have to deal with local evidences of septic infection, I use an ointment essentially the same as this, and have learned to count on it with more reliance than anything that I have ever resorted to. This one better thing hinted at above is Credé's silver ointment, which is to be used as described. As the disease becomes mitigated, the ointment may, if desirable, be reduced with simple lard, and may be discontinued when local signs have disappeared. Absorption of any of these preparations may be hastened by a series of scratches over the affected area with the sharp point of a knife, not deep enough to draw blood, but deep enough to better expose the absorbent vessels of the skin."

The special applications of mercury to the treatment of syphilis are so important as to deserve more extended consideration than is given to other diseases, and will therefore be considered here at some length.

*Inunction Method.*—Mercury may be applied to the skin with a view to absorption, and for this purpose the ointment or the oleate may be used, a piece the size of a marble or larger being rubbed upon the inner side of the arms and thighs once or twice daily. The place of inunction must be changed, as the mercury causes some local irritation, and a crop of papules is likely to follow its repeated application to the same spot. A small piece of ointment may be rubbed upon the soles of the feet before putting on the stockings each morning, the friction in the act of walking being sufficient to cause absorption. In the case of infants suffering with congenital or acquired syphilis, the ointment may be rubbed upon the abdomen under the belly-band. This method is resorted to when it is desired to impress the system rapidly, as, for instance, in the treatment of the inflammatory manifestations of syphilis, especially in iritis. The constitutional effect can be most rapidly obtained in this way without disturbing the digestive organs.

Lerch<sup>1</sup> gives the following directions for tertiary syphilis: The mercury may be given by inunction in doses from 3 grams to 7.78 grams (45 to 120 grains) of blue ointment. This quantity should, in severe cases, be used each twenty-four hours.

The patient is directed to divide the amount into two equal parts, and use the one for each leg over the inside, with vigorous massage. It is necessary to continue the rubbing for fifteen minutes over each side to cause absorption, and it is best to control the time by the watch, as the process is tedious and too often the time of rubbing is shortened by the patient. The second day the process is repeated over the inside of the thighs in the same manner, the third day the inside of the arms, fourth day, chest and abdomen; the fifth day the back must be treated, and on the sixth day a full warm bath for cleansing purposes is administered. To prevent colds, especially during the winter, the patients are directed to use the inunction before retiring.

<sup>1</sup>The Medical Standard, December, 1905.

The patient may use the inunction himself during the first four days, after full instructions, or all may be given by a professional masseur. Thirty inunctions generally constitute a full treatment. In other words, the process has to be repeated six times.

The late M. Quinquaud, of Paris, claimed that the application of a mercurial plaster over the spleen is an efficient and convenient method of administering mercury in syphilis. The preparation of which he made use was composed of 60 parts of diachylon plaster, 20 parts of calomel, and 6 parts of castor-oil. If a second plaster was not used the metal continued present in the urine for a month or six weeks. By the alternate use and disuse of the plaster during periods of eight days pyalism is said to have been entirely avoided. The plasters employed were four inches square.

In severe cases of constitutional syphilis, Dr. Dymnecki has found it of advantage to associate the internal administration of quinine with the inunction of mercury. The class of cases in which this combination proved valuable was marked by increased tissue-change. In syphilis, especially when the infiltration is marked upon the skin, the efficacy of one of the mercurial ointments may be increased by combining with some stimulating oil or green soap:—

<b>R</b> Ungt. hydrargyri nitratis,			
Sapo viridis .....	aa	46/5	Gm. or ℥ss.
Ol. eucalypti .....		2	c.cm. or f℥ss.—M.
<b>R</b> Ungt. hydrargyri ammoniat. ....		62	Gm. or ℥ij.
Olei anthemidis .....		2	c.cm. or f℥ss.—M.
<b>R</b> Ungt. hydrargyri oleatis (10 vel 20 per cent.)....		62	Gm. or ℥ij.
Olei cadini .....		7 5	c.cm. or f℥ij.—M.
<b>R</b> Ungt. hydrargyri oleatis (10 per cent.) ....		31	Gm. or ℥j.
Olei caryophylli .....		1/2	c.cm. or mxxx.—M.

On the basis of his clinical experience, Dr. Joseph Dymnecki also advocates a combination of sulphur-baths and mercurial inunction. He believes that the baths promote the action of the mercury, and finds that the chemical incompatibility detracts nothing from the therapeutical effects. Watraszewsky prefers the use of calomel soap to mercurial ointment in the treatment of syphilis. The soap is made by triturating pure olive-oil soap with calomel in the proportion of one to two or three. A piece of the soap equal to 2 Gm. (or gr. xxx) is rubbed into a selected part of the body until nothing remains but the foam. This is furthermore rubbed until it also disappears. The method is cleanly, does not irritate the skin, and requires but ten or fifteen minutes for its execution. Another method of keeping mercury in continued contact with the skin is that adopted by Peroni, who adds to the solution of gutta-percha a quarter of its weight of calomel. After the patient has bathed, his back is painted with the solution, and when the chloroform has evaporated a mercurial varnish remains closely adherent to the skin. This practice has been found of service when the internal use of mercury is badly borne and is suitable to children afflicted with hereditary syphilis or late cutaneous manifestations. Welanders has convinced himself, by comparative experiments, that a greater quantity of mercury is absorbed by the simple application of blue ointment to the skin than when friction is employed. If rubbed upon the skin before the patient goes to bed the bodily

heat vaporizes the metal, which is absorbed by the skin and lungs. He advises, therefore, that an excess of the ointment should be used in order that absorption should be continuous. The therapeutic effect of mercurial inunctions and pillow-slip method of administering mercury, Kutner<sup>1</sup> believes to be largely, if not entirely, due to the inhalation of the mercurial fumes, and not the absorption or taking up of the drug by the skin. He rubs the mercury into an air-tight box from which the fumes are inhaled through a rubber tube and mask for half an hour a day. Mercury is found in the urine as in other methods of administration. No toxic effects have been observed in any of the many patients so treated, and in each case recovery resulted.

The advantages of the inhalation method are that the "inhalation dose" can be accurately determined and regulated, and the many annoyances attending the inunctions are done away with. Although stomatitis does not result, it is best to gargle with potassium-chlorate solution after each inhalation. The author evinces considerable enthusiasm over this method of administering mercury, and, judging from his results, his enthusiasm is justifiable.

Often the most rapid way to mercurialize a patient is by using the drug in the form of suppositories. Fumigation is also a method of introducing mercury into the blood by way of the skin. The usual method is to place the patient in a vapor-bath until he is perspiring freely, and then to expose the body to the fumes arising from 0.65 to 1.30 Gm. (or gr. x-xx) of calomel sublimated by the flame of an alcohol-lamp. The fumes should not be inhaled, and, therefore, the patient sitting on a chair has a blanket or his clothing fastened around his neck and extending down to the floor all around, making a canopy; under the chair is placed a small spirit-lamp, and over it, upon a sheet of tin, is placed the mercurial. The patient, after about fifteen minutes' exposure, is wrapped up in dry, warm blankets, and the skin allowed to dry spontaneously. If perspiration continue, it may require a small dose of atropine. In this way the mercury is deposited upon the skin, and is gradually absorbed, producing the greatest impression with the least disturbance. This method is especially valuable in controlling the skin disorders attending syphilis (syphilides), and in the treatment of other manifestations of the poison when mercury is not well borne by the bowels.

The hypodermic method of administering mercurials has been practiced both in France and in Germany, and, to a less extent, in this country. For this purpose solutions of corrosive chloride (hydrarg. chlor. corr., 0.065 Gm., or gr. j; aquæ destillatæ, 7.5 c.cm., or f5j. Sig.: 0.60 c.cm., or mx. a dose once a day) have been gradually increased, by drops, until 50 or more are administered, or until the physiological action of the mercury is apparent. This plan of treatment is as cleanly, quick in results, and more successful than any other in preventing relapses.

It may, however, cause irritation, and has, in some rare instances, when given improperly, led to abscess and sloughing. If the hypodermic needle be properly inserted, the instrument and needle aseptic, the author has never observed any case of abscess follow the hypodermic injection of the corrosive chloride of mercury. The moment the least mercurial impression is made by the subcutaneous injection, the dose should be reduced to the smallest amount. A few minims of the solution already named should be again in-

<sup>1</sup> *Berliner klinische Wochenschrift; Medical Standard*, March, 1900.

jected into the muscle or skin, and the system kept under the impression of the drug by injections every day or two, until all evidence of syphilis disappears. In place of using small doses of mercury every day hypodermically, the writer sometimes, especially in lean subjects, injects from 0.015 to 0.02 Gm. (or gr.  $\frac{1}{4}$ - $\frac{1}{2}$ ) of corrosive sublimate two or three times a week into the muscular tissue of the gluteal region or back. The hypodermic method thus administered is for old cases of syphilis, especially in broken-down individuals, and offers a most positive way of limiting or curing the disease.

The mercurial, when injected in these large doses, is, as the rule, slowly absorbed and exerts only a therapeutic, and not a toxic, action.

The albuminate and peptonate of mercury have been proposed with a view to obviate any accidents, but constitute little, if any, improvement.

The glutin-peptone sublimate, another compound used in the same manner and for the same purpose, is obtained by the action of hydrochloric acid on gelatin. It contains 25 per cent. of corrosive sublimate, and is a white, hygroscopic powder, which readily assumes the form of a colorless, non-corrosive fluid. This preparation is used in doses of 1 Gm. (or gr. xv), and is said not to occasion much pain nor give rise to abscesses.

In the clinic of the late Professor Auspitz the following solution was employed:—

R Hydrarg. chlor. corrosivi .....	1	Gm. or gr. xv.
Sodii chloridi .....	2	Gm. or gr. xxx.
Aqua destillatæ .....	90	c.cm. or fʒiij.
M. Dose: 0.60 to 2 c.cm. (or mx-xxx) every second day hypodermically.		

Mathes states that no irritation results beyond a little tumefaction. About twenty or thirty injections constituted the course of treatment, which resulted in a cure. Liebreich recommends the formamidate of mercury, which does not coagulate albumin, is neutral in reaction, readily combines with water, and is not precipitated by alkalies.

**Formamidate of Mercury**<sup>1</sup> is prepared as follows: 10 to 13 Gm. (or ʒiiss-ʒii  $\frac{1}{4}$ ) of freshly-precipitated, completely-washed, and still moist mercuric oxide are gently warmed with a little water in a porcelain capsule, with a gradual addition of 9.25 c.cm. (or fʒiiss) of formamide (resulting from the reaction of ammonia upon ethyl-formate). As soon as solution has taken place the resulting colorless liquid is filtered into a litre flask, and the latter filled to the litre-mark with distilled water. Each cubic centimetre (or mxv) contains 0.01 Gm. (or gr.  $\frac{1}{4}$ ) of mercury, which is one hypodermic dose. It should be dispensed in brown-colored bottles. Zeissel, of Vienna, after trial of this agent, was well satisfied with it, and found twenty injections the maximum number required to disperse the syphilitic manifestations, even in severe cases. Kopp's<sup>2</sup> conclusions from over three thousand injections were less favorable; he says that "Liebreich's preparation is decidedly useful in certain of the milder forms of primary syphilis, as also for slight secondaries. The formamide should not be employed in severe cases where there are large papules or thick infiltrations; inunction is still the best method of treating these cases. The tertiary forms are likewise not to be treated by the formamide. Relapses are by no means prevented by Liebreich's method; on

<sup>1</sup> "Notes on Hydrargyrum Formamidatum," by J. C. Wilson, M.D., *Philadelphia Medical Times*, vol. xiv, p. 149.

<sup>2</sup> *Vierteljahrsschrift für Dermatologie und Syphilis*, 1885.

the contrary, they appear to be extraordinarily common after this treatment." In order to obtain more permanent effects than are possible by the use of the soluble preparations, it has been thought that by depositing the more stable compounds under the skin a more lasting effect can be obtained, and calomel is now used in this manner. The calomel may be suspended in liquid vaselin or olive-oil (1 in 10). There should be at least a week's interval between the injections, which are usually thrown deeply into the tissues of the buttocks or retrotrochanteric space (Besnier). The part should be washed with antiseptic solution, and the needle sterilized before each operation; the puncture should be immediately covered with emplastrum de Vigo or by a drop of collodion.<sup>1</sup> It should be pointed out that the subcutaneous injection of calomel, gray oil, or other insoluble preparation of mercury, is not without danger. There is a local deposit of the mineral at the point of injection, with continuous slow absorption. Embolic pulmonary infarction has occurred in direct consequence of the procedure, while in other cases a dysenteric condition was established.

Mercury benzoate and other mercurial preparations have been used in the same manner for the same purpose. Gray oil is much in vogue in Vienna, while the salicylate, yellow iodide, and cyanide have been experimentally employed by Roussel and Chernoguboff. Gray oil consists of mercury, lanolin, and olive-oil. A case has lately been reported in which a 30-per-cent. solution (hydrarg., lanolin, aa 3 parts; olei olivæ, 4 parts) had been used during seven weeks as a subcutaneous injection. At the date of the last injection no sign of mercurialism was present, but a week later the gums became tender, ptialism and violent gastro-enteritis soon ensued, and in a month the patient died. The formula for administering the salicylate of mercury, employed by Keyes and Chetwood in 1894, was liquid petrolatum (U.S. c.c.m., or *mxix*, holding in suspension 0.11 Gm., or gr. iss, of the salicylate). D. A. Sinclair, of New York, reports<sup>2</sup> satisfactory results from weekly injections of the above into the muscular tissues, generally in the gluteal region. In severe cases, he injected 0.4 Gm. (or gr. *vj*) at once without any but the most gratifying results. The ordinary dose, however, is 0.1 Gm. (or gr. *iss*), suspended in oil (allowing 0.016 Gm., or gr.  $\frac{1}{4}$ , for loss). Due care must be exercised to keep the mouth in good condition. The treatment is kept up for three years.

Neumann has, in a number of cases, employed asparagin hydrargyrate prepared by dissolving 10 Gm. (or *3iiss*) of asparagin in warm water and adding mercuric oxide until no more dissolves. The solution, when cold, is filtered and the amount of mercury calculated. It is then diluted to the strength of  $\frac{1}{2}$ , 1, or 2 per cent. This solution is a limpid, colorless fluid, devoid of odor, but possessing a sharp, acrid, and metallic taste. It contains no excess of asparagin. A daily injection, generally in the interscapular region, was made of 1 c.cm. (or *mxv*) of the 1-per-cent. solution, being equal to 0.01 Gm. (or gr.  $\frac{1}{4}$ ). Asparagin hydrargyrate is distinguished by the rapidity with which it is absorbed and eliminated. The injections are well borne and accidents are rare.

The succinimide of mercury is a compound concerning which a report

<sup>1</sup> *Revue Générale de Clinique et de Thérapeutique*, Sept. 12, 1880.

<sup>2</sup> *New York Medical Journal*, October 22, 1904.

has been favorably made by Julien. The salt occurs in the form of long needles, and is very soluble in water and alcohol. He made use of a solution in distilled water, each cubic centimetre (or *mxv*) of the fluid containing 0.0027 Gm. (or gr.  $\frac{1}{26}$ ) of succinimide of mercury. From  $\frac{1}{2}$  to 1 c.cm. (or *mvliiss-xv*) of the solution was injected every day and gave rise neither to pain nor irritation. The treatment was found efficient, most of the cases being in the secondary stage. An average of twenty-two injections was made in each case. No salivation was produced. The drug was, in other cases, administered by the mouth in doses of 0.02 to 0.03 Gm. (or gr.  $\frac{1}{15}$ - $\frac{1}{2}$ ) with advantage, though the treatment was more prolonged.

The double hyposulphite of mercury and potassium occurs as colorless crystals, easily soluble in water, and contains 31.4 per cent. of mercury. For hypodermic injection 0.25 Gm. (or gr. *iv*) is dissolved in 9.25 c.cm. (or *f5iiss*) of distilled water and from 0.50 to 1 c.cm. (or *mvii-xv*) is employed, equal nearly to 0.005 to 0.01 Gm. (or gr.  $\frac{1}{12}$ - $\frac{1}{6}$ ) of the corrosive sublimate.

The salicylate of mercury may be readily prepared, according to the following formula of Vacher:—

<b>R</b> Hydrarg. chlor. corrosivi .....	1	Gm. or gr. <i>xv</i> .
Sodii salicylat. ....	2	Gm. or gr. <i>xxx</i> .
Aq. destillat. ....	90	c.cm. or <i>f3iij</i> .

**M.** Each cubic centimetre (*mxv*) contains 0.01 Gm. (or gr.  $\frac{1}{6}$ ) of salicylate of mercury.

Another mercurial salt which has been employed for hypodermic use in syphilis is the thymolacetate. The injection is said to cause but little pain, and is made every eight or ten days. Dr. Tranjen makes use of the same preparation in tuberculosis. Dose, 0.10 Gm. (or gr. *iss*) in alboline or glycerin.

Moncorvo and Ferreira have extended the use of hypodermic injections to infantile syphilis, using by preference the corrosive sublimate and gray oil. The former was given in doses of 0.0006 to 0.002 Gm. (or gr.  $\frac{1}{100}$ - $\frac{1}{33}$ ) to children varying from three months to fourteen years of age. The amount of gray oil injected is said to have been "from two-fifths to the whole of a Pravaz syringe," the ages of the patients ranging from thirty-eight days to twelve years. The result is stated to have been rapid improvement as regards the cutaneous lesions and decided gain in weight and general condition.

It is claimed that if pure guaiacol be incorporated with the oil used as a medium for intramuscular injections of mercurials, the process is rendered practically painless. The following formula is the one recommended, the guaiacol being employed in the proportion of 3 per cent.:—

<b>R</b> Hydrarg. iod. rubr. ....	5	Gm. or gr. <i>viii</i> .
Guaiacol. pur. ....	3	c.cm. or <i>mxlv</i> .
Ol. olivæ ster. ....	90	c.cm. or <i>f3iij</i> .

**M.** Sig.: For hypodermic use.

The injections are practiced daily or every other day, 2 c.cm. (or *mxxx*) representing approximately 0.01 Gm. (or gr.  $\frac{1}{6}$ ) of the biniodide. The needle should be inserted perpendicularly to the skin, pushed in its full length, and the liquid injected very slowly, the buttocks being chosen as the best location for the operation.

*The Intravenous Injection of Mercury* — Dr. Walter L. Pyle,<sup>1</sup> in a recent article, says that the advantages of this method are: 1. There is absolute certainty of absorption. 2. There is no pain to speak of. 3. There is no disturbance of the digestive tract during treatment. Slight salivation and diarrhoea, temporary only, are the only local disturbances reported. 4. There is more rapid absorption and therapeutic effect than by any other method. 5. Less of the mercurial salt is required. 6. Absolute exactitude of dosage can be obtained. 7. Not a single accident has been recorded. 8. The method is perfectly reliable. All cases reported have shown some improvement, and never any retrogression. 9. Abscesses do not form. 10. There are no cutaneous irritations or eruptions, such as follow friction orunctions. 11. The nervous symptoms sometimes associated with the hypodermic method are never observed with the intravenous injections. 12. It is successful often when all other methods fail. 13. There is no history of recurrence after a cure. 14. Mercuric chloride has a preservative action on the red blood-corpuscles, and hence must be valuable intravenously in such a disease as syphilis, in which there is a strong tendency toward destruction of the red blood-corpuscles and subsequent anæmia. The disadvantages are: 1. The needle may not reach the vein; but this can be remedied by applying the needle first and awaiting the appearance of a few drops of blood. 2. Some of the blood may extravasate into the subcutaneous tissue, adjacent to the point of injection; but this has rarely occurred, and the blood is soon absorbed. 3. There is likely to be a slight stomatitis at first. 4. There is the appearance of albumin in the urine after the injections, which, however, often follows hypodermic administration. 5. There is, as in all intravenous injections, a subsequent polyuria and increase of uric acid, but neither has any special disadvantage. 6. During the injection, through a reflex action on the circulatory centre, fainting may supervene, but is of no vital import. 7. Jemima has seen slight salivation immediately after the injection of small doses. This is liable to happen in any administration of mercury. In the opinion of the author the advantages so far overbalance the objections that, viewing the present *status* of treatment, we can but accept this as the most successful. He would not, however, advocate it in cases easily amenable to ordinary treatment or in the early stages of syphilis, but considers it of especial value in obstinate cases, resisting other treatment, or in advanced cases of organic syphilis, or when immediate relief is urgently called for by reason of pain, encroachment on a vital part, or rapid destruction of tissue. Investigation may prove it to be most valuable immediately after the diagnosis is made, eliminating or destroying the syphilitic virus before it has produced any decided effect on the general system. At present there is no evidence to warrant this statement; but, as the method is virtually devoid of dangerous or untoward results, it should be given some trial in the beginning of the disease.

In two cases of cerebral syphilis which had proved unamenable to treatment, Baccelli resorted to the intravenous injection, usually into the superficial veins in front of the elbow, of corrosive sublimate with excellent results. The solution was of such strength that 1 c.cm. (or *mxxv*) corresponded (about) to 0.0004 Gm. (or gr.  $\frac{1}{112}$ ), and this was the amount injected to begin with, the operation being practiced every day and the dose being increased to 0.0027 Gm. (or gr.  $\frac{1}{24}$ ):—

<sup>1</sup> *Medical News*.

R Hydrarg. chloridi corrosivi .....	1	Gm. or gr. xv.
Sodii chloridi .....	3	Gm. or gr. xlv.
Aquæ .....	1000	c.cm. or Oiiſxiv.—M.

In syphilis, the rôle of mercury has been considerably abbreviated in recent years. There is no denying that it does rapidly control the early manifestations of syphilis and also those of congenital syphilis, so that it may be considered, within limits, as antagonistic to the syphilitic poison. The investigations of Leon Levi show that, in syphilitic subjects, the salts of mercury favor metabolism, improve nutrition, increase the corpuscles and hæmoglobin of the blood, and augment the weight and the muscular strength.

From a study of ninety-seven cases, Weilandt states that, during the administration of mercury in syphilis, the urine contained casts, the number of which increased with the length of the treatment. After discontinuance of the remedy the casts disappeared, as a rule, within a month or six weeks, without causing temporary or permanent injury to the kidneys.

As mercury is most efficient when it encounters the poison in the blood, it should be given as soon as induration is observed around the primary sore, and the treatment by small doses, avoiding pyalism, maintained for several months. In some cases there will be no further symptoms; in others, secondaries will appear, but will be much modified. In the secondary stage the mercurial may be combined with iodides, and the tertiary manifestations are generally best treated by iodine without mercury. The mercury with chalk is preferred by Mr. Hutchinson, of London (0.065 Gm., or gr. j, four times daily); Ricord prefers the yellow iodide (0.02 Gm., or gr.  $\frac{1}{3}$ , three times daily). Calomel is used by some, corrosive chloride by others. The elder Gross was fond of a biniodide made extemporaneously, as follows:—

R Hydrarg. chlor. corrosivi .....	065	Gm. or gr. j.
Potass. iodidi .....	4	Gm. or 3j.
Aquæ destillatæ .....	180	c.cm. or f3vj.

M. Sig.: A tablespoonful three times a day.

It may be given directly, as in the "Syrup Gibert":—

R Hydrarg. iodidi rubr. ....	20	Gm. or gr. iij.
Potassii iodidi .....	660	Gm. or gr. cij.
Aquæ destillatæ .....	11	c.cm. or f3iij.

Cola et adde

Syrupi .....	q. s. ad 300	c.cm. or f3x.
--------------	--------------	---------------

M. Sig.: A half to a tablespoonful three times a day.

Hurd<sup>1</sup> writes that the country physicians, as a rule, prefer the "mixed treatment," believing that the combination of mercury with potassium iodide is admirably adapted to secondary syphilis, and that much less mercury is needed when the mercurial is given along with the iodide.

The carbolate of mercury is highly esteemed by some writers, as being rapidly absorbed and capable of being given for a long time without causing salivation.

In administering mercury for the treatment of syphilis, the author recommends the preparation or the combination with it which he deems best for each case, depending in all instances upon the patient's system.

<sup>1</sup>"The Place of Mercury in Therapeutics," by E. P. Hurd, M.D., *Therapeutic Gazette*, Jan. 15, 1891.

Some do best upon calomel, others upon gray powder or the corrosive chloride, while in very many instances the biniodide or blue pill acts more decidedly. One after the other of the various mercurials first named has often to be tested, or combinations containing them made, before the form of the drug suitable to the case under consideration can be selected and its use continued for a proper time.

In the treatment of secondary and tertiary syphilis by mercury the author suggests the following formulæ:—

- R** Hydrargyri chloridi corrosivi ..... |065 Gm. or gr. j.  
Fluidextracti xanthoxyli ..... 150 | c.cm. or f3v.  
**M.** Sig.: Two teaspoonfuls in water three or four times a day.
- R** Hydrargyri chloridi mitis ..... |32 Gm. or gr. v.  
Sacchari albi ..... 2 | Gm. or 3ss.  
**M.** et ft. in chartulæ no. x.  
**Sig.**: A powder three or four times a day.
- R** Hydrargyri iodidi flavi ..... |32 Gm. or gr. v.  
Quininae sulphatis ..... 2 |60 Gm. or gr. xl.  
**M.** et ft. pil. no. xx.  
**Sig.**: A pill three or four times a day.
- R** Massæ hydrargyri,  
Pulveris zingiberis,  
Pulveris capsici ..... aa |65 or 1/30 Gm. or gr. x vel xx.  
**M.** et ft. pil. no. x.  
**Sig.**: A pill three or four times a day.
- R** Hydrargyri cum cretâ,  
Pulveris glycyrrhizæ ..... aa |65 Gm. or gr. x.  
Creosoti ..... |66 c.cm. or mj.  
**M.** et ft. chartulæ no. xx.  
**Sig.**: From four to six powders a day.
- R** Hydrargyri chloridi corrosivi ..... |065 Gm. or gr. j.  
Fluidextracti stillingia ..... 60 | c.cm. or f3ij.  
Tinet. gent. comp. ..... 90 | c.cm. or f3iij.  
**M.** Sig.: Two teaspoonfuls in water three times a day.

Mention has already been made of various methods of treating syphilis, and it is only needed to add that 4 or 8 Gm. (or 3i-ij) of corrosive mercuric chloride with twice as much common salt can be added to a bath for syphilitic subjects with skin-lesions. When the patient is much broken down, cachectic, and anæmic, mercury should only be given in the tonic doses already mentioned; but, as a rule, it is better that the general health should be built up before putting the patient on a mercurial course.

A novel treatment of acute articular rheumatism is advocated by Singer.<sup>3</sup> He recommends a solution

- R** Hydrarg. chlor. corrosivi,  
Sodii chloridi ..... aa |13 Gm. or gr. ij.  
Aquæ destillatæ ..... 10 | c.cm. or m℥x.—M.

of which one-eighth is to be injected into the vein at the bend of the elbow, first thoroughly sterilizing the surface and applying a bandage around the

<sup>3</sup> *Centralblatt für die Gesamte Therapie*, June, 1898.

arm to make the veins prominent; the bandage is removed after the needle is introduced into the vein. He practiced this upon the two arms alternately. He observed diminution of fever and of articular pains. Contra-indications are general debility, renal disease, and idiosyncrasy.

As a rule, the mercurial preparations should, as much as possible, be given alone, avoiding combinations that either lessen their efficiency or possibly make them more active than is desirable.

**Hydrargyrum pyroborate** is a new salt which has been used to fulfill the indications of mercury. The pyroborate is a brown, amorphous powder, insoluble in water, ether, or alcohol. It has been made into an ointment (1 to 50) with vaselin, or, when designed for absorption, with lanolin.

**Mercurous tannate**, an odorless and tasteless salt, insoluble in the ordinary menstrua, contains about 50 per cent. of metallic mercury and is used by Lustgarten in doses of 0.20 to 0.32 Gm. (or gr. iii-v). It is said that this combination does not salivate or disturb the digestive functions. **Mercuric gallate**, which contains about 37 per cent. of mercury, is said to be more stable than the tannate and to cause no mercurial intoxication.

**Hydrargyrol**, Mercury Paraphenylthionate, is a compound of the formula  $C_6H_4.OH.SO_2.Hg$ . It was introduced by Gautrellet as a *succedaneum* for corrosive sublimate, over which it is said to have the advantage of not precipitating the albumin of the tissues and of being seventy-five times less toxic. It occurs in the form of brownish-red scales, having an odor resembling that of ginger-bread. Its specific gravity is 1.85, and in reaction it is neutral. It is insoluble in absolute alcohol, but quite freely soluble in water and glycerin, yielding beautiful ruby-red solutions.

According to Gautrellet, hydrargyrol in 1 to 250 solution completely sterilizes bouillons; and introduced into a growing culture it precipitates the alkali toxins. Its solutions are stated to be neither caustic nor even irritant.

**Hyrgolum** is metallic quicksilver in allotropic form, Hydrargyrum colloïdale (von Leyden). It is soluble in water, and is used in 10-per-cent. ointment for inunction in syphilis, causing less irritation than blue ointment. It may also be given in pill form, 0.03 Gm. (or gr. ss) thrice daily. Dr. Gottheil, of New York, uses a 1-per-cent. solution, in water, in the treatment of infantile syphilis, giving 0.18 to 1.20 c.cm. (or miii-xx) thrice daily.

**Mercuriol** is a compound with nuclein in powder form, containing 10 per cent. of mercury. It is bactericidal, but is neither caustic, nor irritating. In gonorrhœa and cystitis, solutions of  $\frac{1}{2}$  to 3 per cent. are employed for irrigation, with much success. For treatment of conjunctival affections, especially of infectious character, 3- to 5-per-cent. solutions are employed. An ointment may also be used (5 per cent.), which is applied to ulcers and burns, and as an antiseptic dressing for abscesses. It may be used as a dusting powder in full strength for indolent ulcers; or in 2-per-cent. solution, as a wet dressing. The latter is also used as an injection in gonorrhœa. It is used internally in syphilis in doses of 0.045 Gm. (or gr.  $\frac{1}{4}$ ), twice daily, which may be increased. This is to be distinguished from **Mercuriol**, which, according to Dr. Lengefeld, consists of an amalgam of mercury with slight amounts of magnesium, aluminum, anhydrous lanolin, and almond-oil. It is prepared for use by hypodermic injection by adding an equal quantity of sweet almond-oil. The dose recommended is 0.05 to 0.2 c.cm. ( $m\frac{1}{4}$  to lij).

every fifth day. The injection should be made deeply into the muscle. The amalgam is decomposed by water. The remedy acts like hydragryrum salicylatum.

## HYDRASTIS (U. S. P.), HYDRASTIS RHIZOMA (B. P.).—Hydrastis.

### Preparations.

*Fluidextractum Hydrastis* (U. S. P.).—Fluid Extract of Hydrastis (contains 2 per cent of hydrastine). Dose, 0.30 to 2 c.cm. (or *mv-xxx*).

*Hydrastina*.—Hydrastine. Dose, 0.015 to 0.03 Gm. (or gr.  $\frac{1}{4}$  to  $\frac{1}{2}$ ).

*Hydrastinine Hydrochloridum* (U. S. P.).—Hydrastinine Hydrochloride. Dose, 0.03 to 0.13 Gm. (or gr. *ss-ij*).

*Glyceritum Hydrastis* (U. S. P.).—Glycerite of Hydrastis (1 Gm. to 1 c.cm.). Dose, 2 to 4 c.cm. (or *f3ss-j*).

*Tinctura Hydrastis* (U. S. P., B. P.).—Tincture of Hydrastis (20 per cent.; B. P., 10 per cent.). Dose, 2 to 4 c.cm. (or *f3ss-j*).

*Extractum Hydrastis Liquidum* (B. P.).—Liquid Extract of Hydrastis. Dose, 0.30 to 2 c.cm. (or *mv-xxx*).

**Pharmacology.**—The official portions of golden seal, *Hydrastis canadensis*, are the rhizome and roots. It is a small plant belonging to the *Ranunculaceæ*, and grows in rich, moist woods, from Canada to Carolina, in the Alleghenies and westward. Its most important constituents are **Hydrastine**, a white crystalline alkaloid, not bitter, although leaving an acrid sensation in the mouth and throat, **Berberine**, a yellow and intensely bitter, crystalline alkaloid, and **Canadine**.

Hydrastis also contains a resin, starch, sugar, and a volatile principle. The substance commercially known under the name of hydrastin is an impure muriate or hydrochloride of berberine. By decomposing hydrastine with the aid of gentle heat and diluted nitric acid, a new alkaloid, **Hydrastinine**, is formed, together with opianic acid. The hydrochloride of hydrastinine, now official, is "the hydrochloride of an artificial alkaloid derived from hydrastine." It is soluble in water and alcohol, but dissolves sparingly in ether and chloroform. The official glycerite of hydrastis is an efficient and elegant preparation, of the strength of a fluid extract (1 Gm. to 1 c.cm.).

**Physiological Action.**—Hydrastis owes its activity to the hydrastine which it contains, which has oxytocic properties, and is abortifacient. It has also some antiperiodic qualities, though ranking much below cinchona. In small amounts, it promotes appetite, increases the gastric secretions, acts as a cholagogue, and stimulates peristalsis; in larger doses it deranges digestion and causes constipation. In poisonous doses, death may be caused by its action upon the nervous system, from convulsions or paralysis, and from failure of respiration. Introduced into the circulation, it causes rise in pressure after a preliminary fall; if in large dose, the pressure falls, the irritability of the vagus is destroyed, and the heart's action is arrested in diastole. F. Miodowski reports a case of a man, 69 years of age, suffering with bronchitis and excessive expectoration, with weak heart, in which two doses of 1.20 c.cm. (or *mxx*) of the fluid extract of hydrastis brought on dyspnoea, with lividity of the face, and slow, easily-compressible pulse. The lungs were congested and œdematous, the heart apex-beat could not be felt. The prompt use of stimulants and counter-irritants caused the attack to pass off. It was thought that the drug had induced the attack by increasing the cardiac weakness.

The physiological action of hydrastinine has been studied by Serdtseff in many experiments upon cold- and warm-blooded animals. Small doses retard the heart's movements by stimulating the inhibitory apparatus, both peripheral and central. It increases and strengthens uterine action by an influence derived from the cerebral nervous system, probably by way of the vasomotor nerves. Dr. David Cerna has determined that hydrastinine destroys the irritability of muscular tissue and the excitability of motor nerves. Very large amounts produce loss of functional activity of the sensory nerve-fibres and also cause anæsthesia when locally applied. Small quantities increase reflex activity by stimulating the spinal cord.

As hydrastine is eliminated chiefly by the kidneys, it exerts some diuretic action. Rutherford found that it also has a decided action on the liver. The derived alkaloid, hydrastinine, being sparingly soluble in water, the hydrochloride of hydrastinine has been employed, and the result of the investigation shows it to possess powers like ergot. It is used in 5- to 10-per-cent. solution, hypodermically. The injections do not cause pain and do not discolor the tissues, but they so readily control hæmorrhage, and especially uterine hæmorrhage, as to constitute this agent a rival of the preparations of ergot. Wild reports several cases in which the hypodermic use of hydrastinine gave rise to painful inflammatory patches in the throat.

Bordet asserts, as the result of his experience, that hydrastinine hydrochloride has no influence in arresting hæmorrhage from the womb during labor or the puerperal period. The progress of involution is also unaffected by the salt.

**Therapy.**—Hydrastinine hydrochloride, 0.20 Gm. to 30 c.cm. (or gr. iij to f̄ssj) of glycerin, the late Dr. Keyser reported as excellent in some cases of conjunctivitis granulosa. It is also used in nasal catarrh, and in uterine catarrh, or leucorrhœa, both internally and locally. In gonorrhœa, after the acute stage is passed, we may use hydrastine (commercial) in water (1 per cent.) twice daily, or 2 c.cm. (or f̄ss) of fluid extract may be added to 240 c.cm. (or Oss) of water, and used as an injection in subacute gonorrhœa, vaginitis, and leucorrhœa. As a mouth-wash, in syphilitic affections, the tincture may be added to water and freely used. The fluid extract, either in full strength or diluted with water, is likewise a beneficial local remedy in mercurial or aphthous stomatitis and follicular pharyngitis. The same application may be made with advantage in fissured nipples and otorrhœa. Hydrastis and hydrastinine hydrochloride possess a sphere of usefulness in dermatology.<sup>1</sup> From 0.13 to 0.38 Gm. to 30 c.cm. (or gr. ii-vi to f̄ssj) of water, or distilled witch-hazel, makes an excellent lotion in hyperidrosis. Its stimulant effect upon the sebaceous glandular system renders it also of avail in acne and dry seborrhœa. A useful ointment may be prepared by incorporating 0.32 to 2 Gm. (or gr. v-xxx) of hydrastinine hydrochloride in 31 Gm. (or ̄j) of ointment basis. Hydrastine ointment stimulates ulcers to repair and at the same time destroys the fœtor of unhealthy discharges. For this reason it may be appropriately used as a dressing upon ulcerated carcinoma and in bromidrosis. This ointment is an excellent application to chancreoids and chronic eczema:—

**M.** Sig.: Use as a local application. In fissure or prolapse of the anus, ulcerations of the rectum, hæmorrhoids, and ulcerations or erosions of the os uteri.

Unhealthy ulcers, sloughing sores, and chancroids are benefited by the local application of the fluid extract. In affections of mucous membranes, especially of catarrhal character, hydrastis and its preparations are most efficient. In the chronic gastric catarrh of drunkards, in duodenal catarrh with or without jaundice, or chronic catarrh of the intestine with ulceration, it is an excellent remedy. As a vegetable, bitter tonic, it is employed in anorexia and convalescence from fevers.

According to Fedorow, the fluid extract of hydrastis, in doses of 1.20 c.cm. (or *mxx*) four times daily, is an excellent remedy in the treatment of obstinate vomiting of pregnancy. Jordan<sup>1</sup> reports that in an obstinate case of membranous dysmenorrhœa 1.54 c.cm. (or *mxxv*) of the fluid extract of hydrastis twice daily, beginning eight days before each menstruation, was followed by a cure. In malarial attacks, it is less efficient than quinine in checking the paroxysms, but is useful as a stomachic and general tonic. Hydrastis lessens the discharge of albumin in chronic Bright's disease, and of mucus in catarrh of the bladder. Schatz pronounces it a useful agent in controlling hæmorrhages from the uterus. The effects of hydrastis in cancer are very probably limited to its action as a motor nerve-tonic and its stimulating effect upon the digestive organs. The reports as to the favorable action of hydrastinine in uterine hæmorrhage have been confirmed by Gottschalk, Czerny, Kallmorgen, and other observers. An analysis of sixty-four obstetric cases has been published by Bossi in which he made use of hydrastis. He administered it with success in puerperal hæmorrhage, in placenta prævia during dilatation of the os uteri, and as a prophylactic against post-partum hæmorrhage from any cause. He employed the fluid extract in large doses (6.20 to 12.40 c.cm., or *mc-cc*, daily) for several days at any period during pregnancy without ill effect upon either mother or child.

Bleeding hæmorrhoids are successfully treated by Marini<sup>2</sup> with fluid extract of hydrastis, in sweetened water, 0.18 c.cm. (or *mij*) being taken every hour during the day. In an obstinate case that had suffered with hæmorrhages for fifteen years, and in which hypodermic injections of ergotin

<sup>1</sup> *Centralblatt für Gynäk.*, No. 2, 1890.

<sup>2</sup> *Independence Médicale*, April 17, 1898.

had failed, this treatment caused cessation of flow in a few hours after its administration began. It was continued for ten consecutive days and there was no return of hæmorrhage. The same author pronounces hydrastis the best pulmonary hæmostatic. M. Marini maintains that it is the preferable remedy in the hæmorrhages of fibromyomas, and that it is the best means of combating the hæmorrhages of pregnancy at any stage, provided it is taken at sufficiently prolonged intervals—that is, 1.20 c.cm. (or *mxx*) every three hours or four times a day.

In conclusion, M. Marini lays down the following principal indications of the drug: 1. *Hydrastis Canadensis* administered at any stage during pregnancy, in amounts of from 6.20 to 12.40 c.cm. (or *mc-cc*) a day for several consecutive days, has no dangerous action on the mother or on the fetus; it is the same when it is given during labor. 2. Administered either during pregnancy or during labor and delivery, as well as afterward, it exercises an invariable hæmostatic, curative, and prophylactic action on the uterus, without exercising any ecboic action on the uterine muscle or moderating the contractions. 3. It is a much safer remedy in the hands of midwives than ergot.

M. Marini, as an oxytocic, found that it was not so rapid in its action as quinine, but he always used it without the least danger in the following formula:—

B Fluidextracti hydrastis . . . . .	4	c.cm. or <i>mlx.</i>
Sodii salicylatis . . . . .	230	Gm. or gr. xxxviij.
Sodii boratis . . . . .	3	Gm. or gr. xlv.
Aque menthæ piperitæ . . . . .	105	c.cm. or <i>f3iiss.</i>
Sacchari . . . . .	q. s.	—M.

A dessertspoonful of this mixture is to be taken every half-hour until labor occurs. At the same time, two of the following capsules are to be taken every fifteen minutes:—

B Quinina sulphatis . . . . .	1	Gm. or gr. xv.
Caffeina . . . . .	75	Gm. or gr. xij.

M. To make six capsules.

With the employment of these prescriptions, labor is hastened, post-partum hæmorrhage becomes less abundant, and there is less danger of vascular trouble.

According to Rousse,<sup>1</sup> hydrastinine hydrochloride, in pill form, is very effective in uterine hæmorrhages, phthisical night-sweats, hæmoptysis, epilepsy, and nephritis. Its hæmostatic action is particularly shown in all cases of congestive metrorrhagia, in menorrhagia, in hæmorrhage after parturition and abortion, in hæmorrhage consequent upon displacements of the uterus or diseases of the adnexa, and in hæmorrhage during pregnancy and labor. In myoma and carcinoma it is of no use. It has no unpleasant effects; it does not upset the stomach even when given in large doses. Hydrastinine is particularly distinguished from cotarnine by its greater rapidity of action, so that it may be recommended as a stimulant, in place of ether and camphor, in severe acute anæmia. Cotarnine hydrochloride slows the action of the heart and gives tone to it, so that it is of great value after losses of blood.

<sup>1</sup> *Archives Internationales de Pharmacodynamie*, iv, 3, 4, and v, 1, 2; *Centralblatt für Gynäkologie*, Jan. 21, 1899.

On the other hand, it has no vasomotor action, although it strengthens and accelerates the contractions of the gravid uterus. Cotarnine acts more slowly, but more permanently, and is preferable in chronic uterine affections, especially venous stases. Both drugs increase the pains of labor, and probably may awaken them. Hydrastinine contracts the uterine and intestinal blood-vessels; cotarnine dilates them. The author thinks, therefore, that both remedies are useful in hæmorrhage due to uterine atony, but hydrastinine is to be preferred. Hydrastinine possesses unquestioned hæmostatic virtues, and Dr. Paul Strassmann, from an experience of twenty-seven cases, considers it efficacious in menorrhagia and metrorrhagia. He gave it in pill form in the dose of 0.03 Gm. (or gr. ss) and hypodermically as high as 0.065 to 0.13 Gm. (or gr. i-ij). In some cases, however, this dose proves insufficient and, in order to produce the same effect, must be repeated twice or thrice during the day. Such large doses, however, are unsafe; as the rule, the hypodermic dose should begin with not more than 0.01 or 0.015 Gm. (or gr.  $\frac{1}{64}$  to  $\frac{1}{32}$ ).

Hydrastis is useful both in the hæmoptysis and night-sweats of phthisis and is strongly recommended by Kruse. He administered 2 c.cm. (or f5ss) of the fluid extract in the evening, and the result was maintained for three weeks after a short course of this treatment had been discontinued. The ability of hydrastis to control profuse perspiration, not only in tuberculosis, but also in other diseases, is confirmed by Olszewski and other writers. According to the investigations of Porak, hydrastinine is of special utility in the hæmorrhages of puberty and the menopause and in those due to lesions of the appendages.

Hydrastinine has been proposed as a remedy in epilepsy, and in several cases its experimental use has been followed by a diminution in the frequency and severity of convulsions.

**HYDROCOTYLE.**—**Water-pennywort, Indian Pennywort.** Hydrocotyle Asiatica (Umbelliferae, Orthospermæ), a perennial creeper indigenous to subtropical Asia, Africa, and America, contains a peculiar oleaginuous substance termed **Vellarin**, which has a bitter taste and a strong odor. In small doses hydrocotyle is a strong stimulant to the skin. Large doses cause headache, stupor, and vertigo. This remedy has been employed in various chronic skin diseases attended by scaling and itching, in syphilitic and scrofulous lesions, lupus, psoriasis, eczema, and lepra.

Thirty-one Gm. (or 5j) of the dried leaves, made into an infusion (with water, Oj), may be taken throughout the day. Hydrocotyle appears to exert a stimulating influence upon the genito-urinary apparatus.

**HYDROGENII DIOXIDUM** (see **Aqua Hydrogenii Dioxid**, U. S. P., and **Liquor Hydrogenii Peroxidi**, B. P., under **Barium Dioxide**).

**HYOSCYAMUS** (U. S. P.).—**Hyoscyamus** (Henbane).

**HYOSCYAMI FOLIA** (B. P.).—**Hyoscyamus-leaves.**

**Dose.** 0.32 to 0.65 Gm. (or gr. v-x).

*Preparations*

**Extractum Hyoscyami** (U. S. P.).—**Extract of Hyoscyamus.** **Dose,** 0.01 to 0.065 Gm. (or gr.  $\frac{1}{16}$  to  $\frac{1}{8}$ ).

**Fluidextractum Hyoscyami** (U. S. P.).—**Fluid Extract of Hyoscyamus.** **Dose,** 0.06 to 0.30 c.cm. (or m-xx).

**Hyoscyaminæ Hydrobromidum** (U. S. P.).—Hyoscyamine Hydrobromide. Dose, 0.0003 to 0.0006 Gm. (or gr.  $\frac{1}{3000}$  to  $\frac{1}{1000}$ ).

**Hyoscinæ Hydrobromidum** (U. S. P., B. P.).—Hyoscyne Hydrobromide. Dose, the same, hypodermically.

**Tinctura Hyoscyami** (U. S. P., B. P.).—Tincture of Hyoscyamus (10 per cent., assayed; B. P., 10 per cent.). Dose, 1.20 to 4 c.cm. (or  $\text{mxx-fj}$ ).

**Hyoscyaminæ Sulphas** (U. S. P., B. P.).—Hyoscyamine Sulphate. Dose, 0.0003 to 0.0006 Gm. (or gr.  $\frac{1}{3000}$  to  $\frac{1}{1000}$ ).

**Extractum Hyoscyami Viride** (B. P.).—Green Extract of Hyoscyamus. Dose, 0.12 to 0.5 Gm. (or gr. ii-viii).

**Succus Hyoscyami** (B. P.).—Juice of Hyoscyamus. Dose, 2 to 4 c.cm. (or f3ss-j).

**Pilula Colocynthis et Hyoscyami** (B. P.).—Pill of Colocynth and Hyoscyamus (compound pill of colocynth, 50 Gm.; extract of hyoscyamus, 25 Gm.). Dose, 0.25 to 0.50 Gm. (or gr. iv-viii).

**Pharmacology.**—The dried leaves and flowering tops (B. P., the fresh leaves, flowers, and branch) of *Hyoscyamus niger* (Solanaceæ), collected from plants of the second year's growth, yielding, when assayed by the United States Pharmacopœia process, not less than 0.08 per cent. of mydriatic alkaloids. The chief constituent is an alkaloid, **Hyoscyamine**, which is either amorphous, or in tufted crystals, yellowish or colorless; dissolves readily in alcohol, ether, chloroform, and benzin. Hyoscyamine is also very soluble in water; with acids it forms permanent, crystallizable salts. It is isomeric with atropine, and is probably identical with daturine and duboisine. **Hyoscyne** (also known as scopolamine) is very much more powerful, even 0.0001 Gm. (or gr.  $\frac{1}{1000}$ ) producing decided effects. Hyoscyne occurs in the form of an oily, alkaline liquid, having a narcotic odor, and it is deposited from an ethereal solution in a crystalline mass. This, dissolved in solution of hydrobromic acid, yields, by slow evaporation, crystals of hyoscyne hydrobromide.

The root and the seeds contain more hyoscyamine than the leaves, but their strength is more variable.

The relations of these alkaloids to atropine are thus given by A. R. L. Dohme: From hyoscyamine, Ladenburg obtained, by the action of alkalis, tropine and tropic acid, which he found identical with the substances of the same name obtained from atropine. On attempting to reunite the products from hyoscyamine, however, by means of dilute acids as he had done in case of atropine, he did not obtain hyoscyamine, as expected, but atropine. This shows that hyoscyamine and atropine are isomeric, and that the latter is the stabler form of the  $\text{C}_{17}\text{H}_{23}\text{NO}_3$  molecule under ordinary conditions. If hyoscyne, whose formula was believed to be isomeric with that of atropine and hyoscyamine, is treated with dilute alkalis and split up into base and acid, different products are obtained than tropine and tropic acid. Ladenburg called the base he thus obtained from hyoscyne, **pseudotropine**, which means "false tropine," and gave it the formula  $\text{C}_8\text{H}_{15}\text{NO}$ , which is the same as the formula of tropine. Hesse has shown that this pseudotropine is not isomeric with tropine, but has the formula  $\text{C}_9\text{H}_{13}\text{NO}_2$ , and further that hyoscyne itself is not an isomer of hyoscyamine and atropine, but possesses the formula  $\text{C}_{17}\text{H}_{21}\text{NO}_4$ . It hence contains two hydrogen atoms less and one oxygen atom more than they. Hesse finds that when pure hyoscyne is saponified by means of dilute alkalis, it yields the compound  $\text{C}_8\text{H}_{13}\text{NO}_2$ , which he calls **oscine**, and tropic acid according to the equation:—

The tropic acid gradually changes under the influence of the dilute alkali into atropic acid by losing a molecule of water, thus:—

While the alkaline hydroxides at higher temperatures or by continued action will cause this decomposition of the hyoscyne, the alkaline carbonates and ammonia will not, and at ordinary temperatures and during the ordinary manipulation of an assay, even the alkaline hydroxides will not decompose the hyoscyne or other mydriatic alkaloids. Ladenburg had obtained hyoscyne in 1880 as an uncrystallizable syrup from belladonna and henbane, but Bender in 1889 obtained it in crystals from the root of the plant *Scopola atropoides*, and gave it the name of **Scopolamine**. It also occurs in sensible amount in henbane-seed, and in some kinds of *duboisia*-leaves, as well as in small amount in stramonium-seed, belladonna-root, and perhaps also in other plants. Scopolamine occurs in the form of large, transparent crystals, but slightly soluble in water, readily soluble in alcohol, ether, and chloroform. Scopolamine unites with acids and the halogen bodies to form salts. Some differences between the physiological action of hyoscyne and scopolamine are accounted for by Hesse, who found in commercial scopolamine hydrobromate an admixture of a small proportion of **atrosceine** ( $\text{C}_{17}\text{H}_{21}\text{NO}_4$ ): a base isomeric with hyoscyne. Atrosceine is a strong base which completely neutralizes mineral acids, and ammonia or alkalis liberate it from its solution as salt in form of oil drops. Hesse made the hydrochlorate, hydrobromate, and hydroiodate of atrosceine, all of which are soluble in and crystallize readily from water in beautiful crystals. As hyoscyne and atrosceine yield the same product on hydrolysis, it occurred to Hesse that it might be possible to convert hyoscyne into atrosceine. He had previously noticed that hyoscyne in alcoholic solution loses its optical activity if alkalis are added to it, which in the light of his recent observations led him to believe that a conversion of the one into the other was possible. Schmidt has also obtained, from an optically-active scopolamine by the action of moist silver oxide, a well-crystallized base melting at  $55^\circ$  to  $56^\circ$  C. which he called *i*-scopolamine: *i.e.*, indifferent scopolamine. Numerous experiments, however, soon convinced Hesse that this loss of optical activity was due to a conversion of the hyoscyne into oscine and tropic acid, and that in no case was any other alkaloid formed. The *i*-scopolamine is unquestionably identical with atrosceine. The power of dilatation of the pupil of the eye of atrosceine in 0.1-per-cent. solution is more rapid than that of atropine and fully as strong, and its paralysis of the optical accommodation is also more pronounced, more rapid, and more lasting. We, hence, have here an alkaloid which in all respects is superior to the generally-used mydriatic alkaloids. From the above we learn that the name scopolamine which has for some time now been in use in chemical literature and has even been adopted by, and introduced into, the German Pharmacopœia should be therefrom erased, since it is merely a mixture of hyoscyne hydrobromate and atrosceine hydrobromate, and not a chemical compound.<sup>1</sup> The United States Pharmacopœia, although it introduced the title *scopolamine hydrobromide* in the last revision, explains that it is chemically identical with hyoscyne hydrobromide.

<sup>1</sup> *Druggists' Circular*, Oct., 1896.

**Physiological Action.**—The effects of hyoscyamus are similar to those of belladonna and stramonium, but it is more calmative and less irritant. The delirium occasioned by it is not accompanied by hyperæmia. It is sedative in painful affections of the genito-urinary organs, and exerts a mild diuretic effect. Hyoscyamus occasionally gives rise to a bright scarlatini-form rash similar to that produced by belladonna. It is carminative and laxative to the digestive tract. Hyoscyamine and, to a greater degree, hyoscine are appropriate as hypnotics to disordered conditions of the mind accompanied by cerebral hyperæmia. They lower the pulse-rate and frequency of the respirations. The heart is slightly depressed; the respiration finally is paralyzed.

Professor Kobert, of Dorpat, determined that hyoscine reduced appreciably the electrical excitability of the brain. The symptoms of hyoscyamus poisoning are analogous to those produced by belladonna, and are treated in the same manner. J. N. Roussel has noted in two cases a peculiar effect upon the gustatory sense after the administration of ordinary doses of hyoscyamine ( $\frac{1}{4}$  mg., or gr.  $\frac{1}{250}$ ). The patients (hysterical subjects) complained that the hyoscyamine granules produced such a disagreeable taste, like asafetida, in the mouth that they could not continue them. This effect was, on further investigation, not produced either by atropine, or by tincture of belladonna or hyoscyamus given separately.

**Therapy.**—In painful affections of the bladder, hyoscyamus exerts a soothing influence, when administered either by the mouth or in suppositories. Decided relief is given by hyoscyamus in incontinence of urine due to irritability of the bladder and in vesical tenesmus. Dyspnoea and tumultuous action of the heart, dependent upon valvular disease, are materially relieved by the exhibition of hyoscyamus. In colic of various kinds and in constipation it is beneficial, especially to correct the drastic effects of purgatives. Hyoscyamus has been given with advantage in chronic gastric catarrh.

In the pains of locomotor ataxia, and in tremor, hyoscyamus is very efficient, as it is also in delirium tremens and the delirium of fever. Irritative cough, asthma, or whooping-cough is sometimes markedly improved by it. The antispasmodic action of hyoscyamus renders it of avail in the management of chorea and hysterical convulsions.

In nervous cough the following prescription will often be found of service:—

R. Tinct. hyoscyami .....	15	c.cm. or f℥ss.
Syrup. pruni Virg. ....	105	c.cm. or f℥iiss.
M. Sig.: Dessertspoonful every third or fourth hour.		

Hyoscyamus is capable of ameliorating painful maladies, such as neuralgia (especially visceral neuralgia), herpes zoster, and dysmenorrhœa. In these affections hyoscyamus may be combined with opium in order to counteract the constipating effects of the latter, or may substitute that remedy when peculiar susceptibility to its action exists.

Hyoscyamus excels belladonna and stramonium in hypnotic effect, and is consequently useful when a remedy of this character is required by children, by whom it is remarkably well borne. On the contrary, it is not well supported by aged people. In the insomnia of drunkards, hyoscyamine may be given, either as the fluid extract; or hypodermically, as sulphate of hyos-

amine, or hydrobromide of hyoscyne, in doses of 0.005-0.01 Gm. (or gr.  $\frac{1}{100}$ - $\frac{1}{20}$ ). A soothing external application may be made (leaves, 2; flaxseed meal, 6; boiling water, 20) and employed for the reduction of swellings and the relief of the pains of sores.

Professor Verneuil mentions a case of obstinate neuralgia which was cured by hyoscyamine, after resection of nerves and amputation had failed to afford relief. Mr. Embleton has found a combination of hyoscyamine and strychnine very useful in seasickness. But it is in asylum practice that the best results from its use have been obtained. Chronic mania and delusional insanity derive benefit from it. Ringer records a case where 0.065 Gm. (or gr.  $\frac{1}{2}$ ) of amorphous hyoscyamine was given in acute mania, and it quieted the patient and produced sleep; but he considers it useless in delirium tremens. Hyoscyamine separates from ether in an amorphous form, which is considerably less potent than the crystalline alkaloid obtained from solutions in chloroform. Amorphous hyoscyamine may be given from 0.01 to 0.065 Gm. (or gr.  $\frac{1}{20}$ - $\frac{1}{2}$ ). Ringer expressly states, however, that the maximum dose causes sleep so deep and paralysis so marked as to be alarming, and that smaller doses should be preferred. As a rule, much smaller doses are efficient in acute mania than in the exacerbations of chronic mania.

A case has been reported by Dr. Hugh Hagan, of Atlanta, in which alarming symptoms followed the administration of a single dose of 0.0027 Gm. (or gr.  $\frac{1}{24}$ ) of Merck's hyoscyamine. The patient was a man, 57 years of age, suffering from paralysis agitans. An hour after taking the drug he became dizzy, lost his sight entirely, and subsequently complained of severe headache, with soreness of the throat and tongue. The face was flushed and he was much prostrated. The pulse was regular, respiration slightly accelerated, and there was considerable mental confusion. Subcutaneous injection of 0.015 Gm. (or gr.  $\frac{1}{4}$ ) of morphine and a little whisky relieved the manifestations within a few hours.

The amorphous hyoscyamine of commerce contains an admixture of hyoscyne, and confusion has arisen, therefore, as regards the proper dose. Some authorities have asserted that the amorphous hyoscyamine has a much more powerful action than the crystalline form. On account of this uncertainty of composition, danger is avoided by using only the salts such as hyoscyamine hydrobromide or sulphate, or hyoscyne hydrobromide.

Hyoscyamine has also proved of great value in recurrent mania. Murrell has found it of good service in chronic dementia, with agitation and destructiveness. It diminishes the number and violence of the attacks in epileptic mania. Hyoscyne hydrobromide produces similar results in much smaller doses (0.0013 Gm., or gr.  $\frac{1}{50}$ , by the mouth; 0.0006 Gm., or gr.  $\frac{1}{100}$ , hypodermically). Both of these agents have mydriatic effects, and can be used in ophthalmic practice to dilate the pupil; but duboisine is equally efficient and less expensive for this purpose, and homatropine hydrobromide safer and more reliable. Hyoscyamine in crystals is an excellent mydriatic, although amorphous hyoscyamine has been known to have an irritant effect. In exceptional instances, hyoscyamine sulphate provokes painful spasm of the ciliary muscle. The contraction may be overcome by repeated instillations of the remedy until paresis is obtained. In cases of great nervous excitement and insomnia, Prof. S. B. Howell reported to the author that hypodermic injections of from 0.0004 to 0.0008 Gm. (or gr.  $\frac{1}{100}$ - $\frac{1}{20}$ ) of hyoscyne hydrobromide were usually followed, a few moments after administration,

by calm slumber. Sleep generally continued for several hours, with no ill effects, as a rule, upon awakening. Slight mental disturbance was occasionally observed as the patient awakened, but even this condition rapidly disappeared. Howell further states that injections of hyoscine hydrobromide have never failed him, in cases which had been upon the protracted use of morphine. Hyoscine hydrobromide may be used with advantage in doses of 0.0006 Gm. (or gr.  $\frac{1}{100}$ ) to allay the convulsions of cerebro-spinal meningitis. Hyoscine has been successfully used also for the purpose of checking spermatorrhœa.

A toxic dose of hyoscine hydrobromide causes a rapid development of vertigo, followed by sleepiness, loss of consciousness, and stupor. In a number of cases death has followed the combination of hyoscine with morphine, when given hypodermically.

Malfilatre and Lemoine, after the use of hyoscine in sixty-two patients, most of whom suffered from some form of insanity, conclude that it is an excellent remedy in all conditions of insomnia with agitation. In some individuals it produces a temporary intoxication. In others the dose must be constantly increased in order to maintain the hypnotic effects.

Hyoscine or scopolamine hydrochloride in ophthalmological practice, according to the estimate of Raehlmann, is about five times as powerful as atropine. It is used in  $\frac{1}{10}$ - to  $\frac{1}{5}$ -per-cent. solutions; of the latter 0.37 or 0.43 c.cm. (or mvi-vij) may be administered daily to an adult or used every fifteen minutes during an hour and a half. Weaker solutions are employed in the case of children. (See Scopolamine Hydrochloride.)

**HYPNAL.**—**Monochloral-antipyrin.** Chloral forms two definite crystalline combinations with antipyrin: mono- and bi- chloral-antipyrin. The first is known as hypnal, which is an oily liquid with an ether odor and chloral taste.

**Physiological Action and Therapy.**—Dr. Schmidt, of Nancy, found that 1 c.cm. (or mxv) is equal to about 0.50 Gm. (or gr. viiss) of chloral as an hypnotic; upon respiration it is about equal, while upon arterial pressure and cardiac contractions it has less effect than chloral alone. In the stomach it is more poisonous than the amount of chloral contained in it. In the alimentary tract it is split up into its two constituents.

Dr. Fraenkel prefers it to chloral because it is nearly tasteless, is devoid of qualities irritating to the mouth or stomach, and considers it an unrivaled soporific, especially when insomnia is the result of pain. It is sparingly soluble, and is given suspended in mucilage, in capsules or cachets. Mattison writes<sup>1</sup> that he regards hypnal as particularly adapted to children and to patients with phthisis, lessening fever, pain, insomnia, and unrest. He recommends the following formula of hypnal:—

R. Hypnal .....	1	c.cm. or mxv.
Alcoholis .....	67	c.cm. or mxj.
Elixiris vel syrupi .....	ad 15	c.cm. or fʒss.

M. Sig.: One dose; to be followed by one-third of a tumbler of water.

**HYPNONE.**—**Phenyl-methyl-ketone, Benzoyl-methide.** Hypnone is a colorless fluid, insoluble in water or glycerin, and possesses an aromatic odor.

<sup>1</sup> *Medical Record.*

Hypnone is very soluble in alcohol, ether, chloroform, benzin, and certain oils,—as the oil of sweet almonds. It has been hypodermically employed. It is preferably administered in capsules. It has some hypnotic power, and is eliminated by the lungs and kidneys. In large doses it causes coma and paralysis of heart and respiration. Hypnone is thought to be especially adapted to the insomnia of alcoholism, and is likewise regarded as an excellent sedative in mental affections and nervous insomnia in doses of 0.30 to 0.60 c.cm. (or *mv-x*).

**HYSSOPUS.**—**Hyssop**, the herb *Hyssopus officinalis* (Labiatae), contains about  $\frac{1}{2}$  per cent. of a volatile oil, with tannin and a bitter principle. It is stimulant, carminative, and sudorific, and is given in solid or fluid extract in stomach disorders, recent colds, etc.

**HYSTERONICA.**—**Hysteronica**, or **Haplopappus**. The *Hysteronica Baylahuen* (Compositae) is a native of South America. It is a perennial plant with oval leaves; bears a yellow flower; contains an ethereal oil having the specific odor of the plant, a greenish-black resin (also of the same odor), gum, and glucose. The resin is excreted by the kidneys, the oil by the lungs. Dr. G. Baillé<sup>1</sup> reports that the infusion is an excellent remedy in diarrhœa and it has produced good results in acute and chronic dysentery.

It has also been proved useful in the diarrhœa of phthisis or cancer. *Hysteronica* allays inflammation of the bronchial mucous membrane, lessens expectoration, and quiets cough without causing sickness of the stomach. It promotes the action of the kidneys and diminishes the offensive odor of the urine in vesical catarrh. This remedy increases the acidity of the urine, seems to be without effect upon the perspiratory glands, and assists the healing of wounds. It may be used as a vehicle for remedies like the mercurials in order to prevent the production of diarrhœa. Given in alcoholic tincture, it does not produce constipation.<sup>2</sup> The tincture is made by macerating 100 parts of the drug in 500 parts of 90-per-cent. alcohol for ten days, and its dose is from 1 to 2 c.cm. (or *mx-xxx*). A fluid extract in doses of 1.33 c.cm. (or *mxx*) is given in milk, or almond emulsion, three times or more daily, for chronic dysentery.

#### ICHTHYOCOLLA.—Isinglass (Fish Glue).

##### Preparation.

*Emplastrum Ichthyocollæ*.—Isinglass-plaster, Court-plaster.

**Pharmacology.**—"The swimming bladder of *Acipenser Huso* and of other species of *Acipenser* (class, Pisces; order, Sturiones)"; or, more definitely, the inner membrane of the swimming bladder, which is generally spread out in drying, forming flat sheets, or *leaf-isinglass*. The kind imported from Russia is the most valued. Chemically, it is an exceptionally pure gelatin, known to chemists as glutin; it is free from odor and taste, and is soluble almost without residue in boiling water and in boiling diluted alcohol. Isinglass does not dissolve in cold water, as gelatin does, and, therefore, is a valuable constituent of cements. Both are precipitated by tannin.

**Therapy.**—Isinglass is used for clarifying infusions, and may be boiled

<sup>1</sup> Paris letter, *Therapeutic Gazette*, Sept., 1890, p. 640.

<sup>2</sup> *Therapeutic Gazette*, vol. xiii, p. 287.

with milk for internal use in bowel disorders. A codliver-oil jelly is made by means of isinglass, according to the formula given by Dr. Whitla in his excellent work on *Materia Medica*:—

<b>R</b> Olei morrhuae .....	150	c.cm. or fʒv.
Ichthyocollæ .....	8	Gm. or ʒij.
Pulv. sacch. alb. ....	48	5 Gm. or ʒiiss.
Olei amygd.,		
Olei pimentæ .....	aa	24 c.cm. or miv.
Olei cinnamomi .....		18 c.cm. or miiij.
Aquæ .....	30	c.cm. or fʒj.

**M.** This preparation is taken readily by children, and can be given in teaspoonful doses, alone or in milk, orange-juice, etc.

The well-known court-plaster, spread on silk, affords a convenient method of approximating small wounds and excluding the air; the addition of an antiseptic, like salicylic acid, is an improvement, forming salicylated isinglass-plaster.

**ICHTHYOLUM.**—Ichthyol is the **Ichthyosulphonate of Ammonium or Sodium**. A mineral deposit found in the Tyrol, of a bituminous character, yields, upon distillation, a tarry-looking substance called ichthyol, so named from the fact that the deposit appears to be the fossil remains of fishes. It is purified by distillation and with sulphuric acid. Ichthyol has a decided fishy odor, which to some is very unpleasant. The odor may be disguised by the addition of 10 per cent. of the oil of citronella, or by a mixture with coumarin. It is faintly alkaline, and contains a resin and 10 per cent. of sulphur in the form of a sulphur acid. It is soluble in a mixture of alcohol and ether, readily mixes with ointment and fats. It is generally used in a 10- to 20-per-cent. ointment. A synthetically prepared ichthyol is supplied under the trade name, **Thiol**.

**Physiological Action and Therapy.**—Ichthyol applied externally, as well as when internally administered, acts similarly, in many respects, to sulphur and tar. The resin contained in ichthyol, makes it exceedingly objectionable for external application on account of the sticky or gummy deposit left upon the skin. According to the experience of the author, ichthyol is irritating to the integument of many, and is poorly absorbed in the majority of cases. Ichthyol given internally has, in some instances in the writer's experience, occasioned more or less gastro-intestinal irritation, followed by diarrhœa. Dr. A. Stacquant, of Brussels, has reported several cases of gastro-intestinal difficulties attended by various nervous manifestations in which he found the internal administration of ichthyol very useful. He gave the drug in the daily dose of 0.005 c.cm. (or  $m^{1/12}$ ). It is said to check the elimination of albumin in Bright's disease and to be useful in pyelonephritis.

The free application of a 20-per-cent. ointment caused narcotism and stupor in a child, followed, however, by recovery. In the case of a woman whose endometrium had been curetted on the preceding day, Bergerio saw a rapid pulse and general depression, which continued for about twelve hours, follow the injection into the uterine cavity of a solution containing one-third of ammonium ichthyol to two-thirds of glycerin.

Unna considers ichthyol the best agent for treating certain chronic skin diseases, especially eczema and psoriasis. A 20-per-cent. ointment is sometimes useful in acute erysipelas, and also for the pain and swelling of the

joints accompanying acute rheumatism. Ichthylol has been applied to furuncles, exudative erythema, intertrigo, herpes zoster, gout, and neuralgia. It is said to relieve the pain and promote the healing of cracked nipples.

Dr. Ramón Guitéras, of New York, states that a 50-per-cent. ointment has given him better results than any other counter-irritant in gonorrhœal rheumatism. Ichthylol ointment has been employed in chronic eczema, acne, urticaria, lupus, and keloid. Dr. Agnew indorsed its value in enlargement of lymphatic glands, and it acts well at times as an application in chilblains and burns.

Ichthylol has been extensively used in gynæcological practice. It has been found of service in cervical and corporeal endometritis, perimetritis, and parametritis. It promotes the rapid absorption of recent exudates. Dr. Richard Bloch esteems it particularly valuable in the treatment of painful inflammatory diseases. Ichthylol exerts a good effect upon acute gonorrhœal and non-specific vaginitis, in which it manifests also a decided astringent influence upon the vessels. Jadassohn applied with advantage a 10-per-cent. ointment of ichthylol in gonorrhœal catarrh of the cervix. The injection of a 2- to 5-per-cent. aqueous solution is beneficial in gonorrhœa of the male, diminishing the discharge, relieving the pain, and preventing the chordee. A  $\frac{1}{2}$ - to 1-per-cent. solution may be employed to wash out the bladder in cases of cystitis. Dr. Scharff alleviated the pain and reduced the swelling and inflammation of the prostate by the injection of a 10-per-cent. watery solution into the rectum.

Unna advises the combined external and internal employment of ichthylol in leprosy, and several cases have been reported in which this method was of considerable apparent benefit. Dr. Ohman Dumesnil,<sup>1</sup> of St. Louis, reported a case of the tuberculo-anæsthetic form, in a woman, cured by drachm doses given three times a day. The remedy has been used in small-pox in order to prevent pitting. Dr. Lorenz has found an ointment containing 1 to 10 per cent. of ichthylol serviceable in acute coryza and all kinds of inflammation involving the mucous membrane and skin of the nose.

**Thiolinic Acid.**—This substance is prepared from a sulphurated linseed-oil by treating with sulphuric acid, and occurs as a thick, dark-green, viscid mass, which is insoluble in water and soluble in alcohol. It contains 14.2 per cent. of sulphur, principally in organic combination. Thiolinic acid combines with alkaline bases, and its salts are soluble in water. The acid has a faint odor, which resembles that of oil of mustard. The salts are without odor. It is thought that thiolinic acid will prove to be an efficient substitute for ichthylol.

**Ichthalbin**, a combination of ichthylol with albumin, is tasteless and odorless and free from most of the objections against ichthylol, and is used as a substitute for the latter as a dusting-powder. Dr. Samuel Wolfe employs compressed tablets (of each, 0.32 Gm., or gr. v) in diphtheria and various chronic and subacute affections of the mucous membranes of the alimentary, respiratory, and genito-urinary tracts; from 10 to 12 of these tablets were administered daily, with good effect. In florid and inflammatory dermatoses, it is one of the best internal remedies, according to Wolfe. It is a valuable intestinal antiseptic, and is preferable to ichthylol for internal use.

<sup>1</sup> *Jour. Amer. Med. Assoc.*, June 13, 1903, p. 1635.

**Ichthargan** is sulphichthyolate of silver, and it is alleged that it possesses antiseptic power equal to silver nitrate. It is decomposed when taken into the stomach, forming ichthyol. Injected into the blood, it acts like silver nitrate; but is less poisonous. It causes central motor paralysis of the heart. In 1-per-cent. solution in glycerin and water, is useful for gonorrhœa and vaginitis applied as a compress.

**IGNATIA.**—*Ignatia*, Bean of St. Ignatius. The seed of *Strychnos Ignatii* (Loganiaceæ) contains two alkaloids, both highly poisonous, **Strychnine** and **Brucine** (from 0.5 to 1.5 per cent. of each). Strychnine and its salts are official. (See **Nux Vomica**.)

**ILEX.**—**Holly**. The leaves of several American species of *Ilex* contain **Caffeine**, and may be used as substitutes for the *Camellia thea*. In the Southern United States the *Ilex cassine* (Aquifoliaceæ) is used in this way to some extent, but the Brazilian holly, *Ilex Paraguayensis*, is much richer in caffeine, and is extensively used in South America, in recent infusion, where it is known as maté, or Paraguay tea. The maté is the gourd, in which the infusion is made by pouring upon the leaves successive quantities of boiling water. The following analysis will show the analogy and the slight differences between the *ilex* and tea and coffee; it was made by Dr. T. Cranstoun Charles:—

	Caffeine Percentage.	Tannic Acid. Percentage.	Ash. Percentage.
Tea .....	3.10	22.70	5.80
Roasted coffee .....	1.20	5.80	4.60
Maté .....	0.79	21.00	4.10

Besides these constituents there are small amounts of volatile aromatic oils, empyreumatic products, etc., which modify the effects of each upon the system, and upon different individuals. In the main, however, the effects of maté are those of caffeine.

**Physiological Action and Therapy.**—Dr. Charles found holly stimulant to the brain and also to the sympathetic system; the contractions of the muscular tissue of the heart and of the bladder and intestines were increased, and the whole muscular system stimulated to increased labor and wakefulness. *Ilex* augments the flow of urine and amount of urea and phosphoric acid. At present its therapeutic applications seem limited to the treatment of headaches accompanied by constipation, especially when tea and coffee do not agree.

**ILLICIUM.**—*Illicium* (Star-anise).

**ANISI STELLATÆ FRUCTUS** (B. P.).

**Pharmacology and Physiological Action.**—The *Illicium verum* (Magnoliaceæ) is a native of China and Siam; its fruit, which is official, contains a pleasant aromatic volatile oil resembling that of anise, and also some fixed oil. Two species, *I. Floridanum* and *I. parviflorum*, are natives of this country, being found in Florida and adjacent States. The Japanese variety, *Illicium religiosum*, contains a much smaller quantity of the oil, besides a crystalline substance called *sikimin* or *shikimi*, which is poisonous; so that dangerous results have followed the substitution of the latter for the former, such as violent epileptiform convulsions with cyanosis, ending in death. *Illicium*-oil is often substituted for the oil of anise; and, in fact, it is said

to be the chief source. Dr. E. Barral has isolated a poisonous glucoside from the kernel of *Illicium parviflorum*, which is not in the pericarp. The decoction of the seed, if the dose be sufficiently large, produces attacks of gastric irritation and vomiting, followed by paralysis, anæsthesia, convulsions, and death.

**Therapy.**—The medicinal virtues are similar to those of anise and other carminatives. The crushed seeds are sometimes popularly applied externally to allay the pain of earache, colic, rheumatism, etc. It also has some reputation in Germany in the treatment of bronchitis, prepared as a tea, although this form of administration is not recommended.

**INDIGO.**—Indigo is a vegetable coloring agent, obtained from several species of *Indigofera* (*Leguminosæ*) of India. It is prepared from the juices of these plants by macerating the green twigs and leaves and developing a kind of fermentation process. It is sold in masses of a blue or purplish color, and should contain from 70 to 90 per cent. of **Indigo-blue**, or **Indigotin**. Indigo is insoluble in water and alcohol. The sulphate of indigo is a pasty mass and mixes with water, forming liquid blue. Used chiefly as a coloring agent and in solution for chemical tests.

Dr. J. L. Jones has used indigo with advantage in thirteen cases of amenorrhœa. He prescribes 64 Gm. (or  $\text{ʒij}$ ) of indigo mixed with 15.5 Gm. (or  $\text{ʒss}$ ) of bismuth subnitrate, and gave  $\frac{1}{2}$  teaspoonful in water three times a day. Under its administration the urine becomes brownish green in color and acquires an offensive odor. The stools are liquid and have an obnoxious smell.

**INGLUVIN.**—Ingluvin. A digestive preparation.

**Dose.** 0.32 to 1.30 Gm. (or gr. v-xx).

**Pharmacology.**—Ingluvin is prepared from the gizzard of the domestic fowl. It is a soft powder, yellowish gray in color, and possesses a faint odor. It is almost devoid of taste. Ingluvin is insoluble in water and the usual menstrua; it can be administered stirred into water or milk. Ingluvin can be conveniently given to children spread upon bread and butter. The powder has the advantage of being compatible with alkalies. Its virtues depend upon the presence of a peculiar bitter principle.

**Therapy.**—Ingluvin is of special benefit in the relief of sick stomach. As it is free from irritant properties, it may be given with advantage when vomiting depends upon organic affections of the stomach, as acute and chronic gastric catarrh and gastric ulcer. Nausea due to disease of other abdominal or pelvic viscera,—as the liver, kidneys, uterus, and ovaries,—is likewise relieved by the administration of this remedy. Ingluvin allays the gastric irritability which accompanies *tabes mesenterica* and *marasmus*.

It has been found of service in relieving vomiting produced by the abuse of alcoholic liquors. It is of advantage in seasickness and in the relief of the gastric irritability of bottle-fed babes. In the vomiting of pregnancy it approaches the character of a specific. Ingluvin is beneficial in dyspepsia when produced by functional inactivity. It checks diarrhœa caused by indigestion. By reason of its influence upon the stomach and bowels it is of service in cases of *cholera infantum* and *cholera morbus*.<sup>1</sup>

<sup>1</sup> See paper by author on "The Clinical Application of Ingluvin" in the *Medical Bulletin*, June, 1893.

**INULA.**—*Inula* (Elecampane).

**Dose,** 1 to 4 Gm. (or gr. xv-5j) in infusion.

**Pharmacology.**—"The root of *Inula helenium* (Compositæ)" contains **Helenin**, **Alantic anhydride**, and **Alant-camphor**, all crystalline bodies, and **Alantol**, a yellow liquid. Alant-camphor, in taste and smell, suggests peppermint. It is difficult to isolate these substances in quantity, and the alantic anhydride probably differs from helenin only in being less oxidized. Helenin presents itself in the form of colorless crystals, free from odor, insoluble in water, soluble in boiling alcohol, ether, and oils. Alantol is a yellowish, oily fluid, having an odor and taste resembling that of peppermint, soluble in alcohol and boiling at 392° F.

The substance which has lately been used to some extent in medicine under the name of helenin appears to consist of a combination of the camphor, the anhydride, and helenin proper. Elecampane also contains some bitter extractive, and about 20 per cent. of **Inulin**,—a peculiar kind of starch not colored blue by iodine. Inulin occurs in the form of a white crystalline powder. It is hygroscopical, without odor or taste, slightly soluble in water, insoluble in alcohol, and, chemically, appears to be the anhydride of levulose. C. Tanret has separated two substances resembling inulin, which he designates as pseudo-inulin and inulenin.

**Physiological Action.**—The active principles of elecampane have been the subject of an investigation by Mr. T. J. Bokenham.<sup>1</sup> Korab, in 1885, had found that the drug inhibited the development of tubercle bacilli, while Baeza stated that, added to the urine, it prevented putrefaction; that it diminished all the secretions, but especially those of the trachea and larynx. In small doses it was said to prevent the sialagogic and diuretic action of jaborandi. Bokenham has demonstrated that any of the crystalline constituents of elecampane will prevent the growth of the tubercle bacillus, if present even in the proportion of 1 to 10,000. The result was the same in the case of all the solid nutrient media usually employed in bacteriological experiments. Liquid media containing large quantities of bacilli in suspension become, upon addition of helenin, incapable of producing tuberculosis, or even an enlargement of the nearest lymphatic glands, when inoculated into healthy guinea-pigs. In studying its effects upon other organisms, Bokenham found that rapidly-growing microphytes were practically unaffected by the presence of even 1 part of the drug in 1000 of the nutrient medium. On the other hand, the streptococci pyogenes, streptococci erysipielatis, and bacillus typhosus refused to grow on these prepared media. In experiments upon guinea-pigs no ill effect was produced by the drug itself, however great the daily dose administered. In no case was the course of the disease following inoculation with virulent material arrested, although it was considerably retarded. The writer cited does not consider himself justified in stating that any one of the constituents of elecampane-root possesses greater value than the mixed product. Marpmann states that the excretion of urine and uric acid is increased by inula, and he, therefore, suggests that it may prove useful in chronic gout.

**Therapy.**—From its influence upon tubercle bacilli, it is possible that helenin may prove useful in the treatment of tuberculosis. A few clinical experiments have been made, but not sufficient to warrant any decisive conclusions as to the results.

<sup>1</sup> *British Medical Journal*, Oct. 17, 1891.

Good effects have been reported from its use in malaria, catarrhal diarrhoea, whooping-cough, and chronic bronchitis. On account of its antiseptic properties, powdered helenin has been employed as a surgical dressing with alleged benefit. Helenin is said to exercise a favorable influence also upon tuberculous diarrhoea.

Hamonic has reported very good results from the use of helenin in uncomplicated leucorrhoea. Applied locally, it irritates the vaginal mucous membrane, but, given by the mouth, it exerts a special influence upon the glands of the cervix uteri. A few doses cause the disappearance of the glairy discharge of catarrhal endometritis. Hamonic has given the drug in the form of a pill containing about 0.01 Gm. (or gr.  $\frac{1}{6}$ ) of crude helenin, two to four pills to be taken in the twenty-four hours.

Inulin has been used, in the dose of 0.065 to 0.13 Gm. (or gr. i-ij), in dyspepsia and chronic pulmonary affections. An inulin bread has been prepared for the use of diabetic patients. This principle has also been administered in whooping-cough.

Alantol has been given in the dose of 0.01 to 0.02 Gm. (or gr.  $\frac{1}{6}$ - $\frac{1}{3}$ ), repeated every hour or two, in chronic bronchitis and pulmonary tuberculosis.

The powdered root of elecampane is used in decoction (15.5 Gm. to 473 c.cm., or  $\mathfrak{zss}$ - $\mathfrak{Oj}$ ), sweetened and flavored, which is taken freely as a diaphoretic and expectorant in chronic bronchial and pulmonary affections, dyspepsia, dysmenorrhoea, etc. It has been used, both internally and externally, in eczema and psoriasis.

**IODOFORMUM** (U. S. P., B. P.).—**Iodoform** ( $\text{CHI}_3$ ).

**Dose**, 0.13 to 0.32 Gm. (or gr. ii-v).

*Preparations.*

**Unguentum Iodoformi** (U. S. P., B. P.).—**Ointment of Iodoform** (10 per cent.).

**Suppositoria Iodoformi** (B. P.).—**Iodoform Suppositories** (0.2 Gm., or gr. iij).

**Pharmacology.**—Iodoform was discovered by Serullas in 1822, and introduced into medicine in 1837 by Bouchardat, and also by Dr. R. M. Glover, of London. It is produced by the action of iodine in the presence of alkalis upon alcohol, aldehyde, ether, acetic ether, acetone, lactic acid, and in minute quantities carbohydrates or proteid compounds. It occurs in yellow, scaly crystals, which are insoluble in water, but soluble in alcohol, ether, and the fixed and volatile oils. By a temperature of above 239° F. it is fused, giving off violet vapors, and finally decomposes into iodine and hydriodic acid. Iodoform is obtained from the ash of sea-weed in France. It may be made by subjecting a hydroalcoholic solution of potassium iodide to electrolysis, while a current of  $\text{CO}_2$  is passing through the liquid. Filhol's process consists in adding iodine to a warm mixture of sodium bicarbonate, alcohol and water. It is volatile and should be kept in well-stoppered bottles, in a cool and dark place.

Iodoform has a sweetish taste and a peculiar, penetrating odor, which adheres persistently to the vessels in which preparations of it have been made, and to the clothing and hands of those who use it. Many attempts have been made, with indifferent success, to mask the peculiarly offensive odor of this substance. The essential oils, balsam of Tolu or of Peru, Tonka bean, menthol, eucalyptol, thymol, naphthalin, tar, and creolin have all been used for

this purpose. Lindermann's mixture consists of iodoform, 1; balsam of Peru, 3; and vaselin, 8 parts. Instead of vaselin, 12 parts of alcohol, glycerin, or collodion may be employed. *Pulvis iodoformi dilutus* (N. F.) contains iodoform, 2; boric acid, 3; naphthalin, 5 parts, with oil of bergamot q. s. It is a fine powder, and the odor is entirely masked. The *iodoformum aromaticatum* (N. F.) contains 4 per cent. of coumarin. Other expedients which have been suggested are the addition of a small quantity of the oil of citronella or mixture with recently-ground coffee. One of the best is that discovered by Shufelt, of dissolving the iodoform in the volatile oil of camphor. This combination was used both as an ointment and a paste. If preferred, the odor of camphor can also be removed by the admixture either of oil of bitter almonds or of Canada balsam. According to Pagenkopf, the addition of a small quantity of Russian turpentine-oil imparts a peculiar and not unpleasant odor. Klingmann endeavors to accomplish the same purpose by preparing a solution of iodoform in olive-oil. He adds 1 part of iodoform to 6 parts of olive-oil, and shakes for twelve hours. The clear, saturated oil filtered off contains about 3 per cent. of iodoform.

The odor of iodoform may be removed from utensils or the hands by washing with a watery solution of tannic acid. Dr. W. Washburn, of New York, points out that, as chloroform and ether are solvents of iodoform, they may be successfully used in order to remove the odor of that substance from the hands, nails, and clothing. Bienert states that washing the hands once or twice with flaxseedmeal in water causes rapid disappearance of the odor of iodoform. Oil of turpentine is also a good solvent.

The use of iodoform has been almost abandoned since odorless substitutes have been introduced.

**Physiological Action.**—Applied to the sound skin, to mucous membranes, or to ulcers, pure iodoform (although containing 29 out of 30 parts of iodine by weight) is not irritating, but, on the contrary, blunts sensibility and acts as a local anæsthetic. Exceptions to this rule, however, occasionally occur. Dr. Edward Martin has, for instance, reported five cases of leg-ulcers which were decidedly aggravated by the use of iodoform as a dusting-powder. In two cases observed by Hahn, a vesicular eruption followed the topical use of this drug, and a case of generalized urticaria, due to the local use of iodoform, has been reported by Dr. C. H. Powell, of St. Louis, Mo. Commercial iodoform has been found to be adulterated with picric acid and other substances, which may explain some of the unexpected results.

Internally, in doses up to 0.32 to 0.38 Gm. (or gr. v-vj), it produces no symptoms, except slight increase of appetite; iodine appears in the urine and saliva within two hours and traces continue for several days. In larger doses, iodoform produces decided narcotic effects in dogs, with inco-ordination and staggering, convulsions, and death. In man, poisonous effects have followed its very free use in wounds, the principal symptoms being prostration, headache, faintness, and persistent iodoform taste in the mouth. The temperature is affected, being increased to 104° F. or more; the pulse becomes soft, feeble, and rapid. The face may be flushed, the pupils contracted, and the respiration stertorous. Delirium and suicidal mania have also been noticed. Several cases of death have been caused in this way, preceded by great anxiety and restlessness and sudden collapse. In a few instances amblyopia has

been observed in consequence of the absorption of iodoform. Mr. Priestley Smith has described the case of a patient in whom toxic amblyopia developed after having taken 64.5 Gm. (or gr. m) in forty-one days. A fatal case is reported<sup>1</sup> in a woman in good health, who died of iodoform poisoning. On the left leg there was a small varicose ulcer which had been dressed with iodoform powder. After this treatment tumefaction set in and the leg became red and painful, and at the end of eight days there was a generalized eruption, which was manifestly due to the action of the iodoform. On the legs, the thighs, and the body the exanthem was like that of measles; on the arms and the buttocks it was characterized by a very diffuse scarlatinous redness. On the red ground of the eruption there was a great number of small, miliary vesicles, which were detached and contained a lemon-colored liquid. She suffered greatly; her face was red and tumefied, and there was profuse lacrymation, but no fever. The general condition rapidly became worse, the face pale and drawn, and albumin was found in the urine. Dyspnoea and weakness became progressive, and, in twenty days after the onset of the symptoms, death occurred. Some years before the patient had had a similar eruption following upon the employment of an iodoform dressing.

A simple test for iodoform intoxication has been suggested. A test is made of the urine to note the quantity of iodine eliminated by it. A small pinch of powdered calomel is placed upon a white saucer, and then a few drops of the urine to be examined are dropped upon it; a mixture of urine and calomel is then made with a glass rod. If the urine contains a notable amount of iodine there is produced a well-marked yellow discoloration, which should indicate that the iodoform is being absorbed in sufficient quantity to produce danger.

In cases of death from this substance the kidneys, liver, heart, and voluntary muscles have been found in a state of fatty degeneration. There is no doubt that in some patients an idiosyncrasy exists with regard to iodoform, just as there is with regard to the other iodides. In a case witnessed by Demme, chorea appeared as one of the manifestations of iodoform poisoning. A severe general dermatitis, followed by desquamation and accompanied by a profuse diarrhoea, was observed by Kloman in consequence of the application of iodoform to a chronic leg-ulcer. Urticaria has been witnessed as a result of the external use of iodoform, and its administration internally has been known to produce a purpuric eruption.

The first step in the treatment of toxic symptoms is the prompt removal of the iodoform from the body in order to prevent further absorption; in many cases this is all that is necessary. As remedial agents, stimulants are required, and elimination favored, by sponging the skin frequently with warm water and alcohol, and the administration of mild diaphoretics. It is especially advised that iodoform should not be used with carbolic acid; that only small quantities should be dusted over the wound; that close sutures and tight bandages be avoided and free drainage maintained. Some specimens of iodoform have been found to be adulterated, and this fact may have been responsible for the reported bad results as already pointed out. Potassium bicarbonate, given hourly in the dose of 0.65 Gm. (or gr. x), is said to counteract the toxic effects of iodoform.

<sup>1</sup> *Revue Médicale de la Suisse Romande*, 1896, p. 431.

The potassium bromide is also regarded as antidotal, not only as a neutral potash salt, but also by virtue of its specific bromide action, and the fact that it excels all other salts as a solvent for iodoform. Iodoform escapes by the breath under its own form, and, by the urine, as iodide with a little iodate.

**Therapy.**—The anæsthetic and antiseptic qualities of this agent make it a useful application, especially in gunshot and infected wounds, chancre, phagedæna, and sloughing ulcers. It acts as an antiseptic, not by destroying bacteria, but by sterilizing the soil in which they might develop, and, possibly, by neutralizing or destroying bacterial products. Either in the form of powder or the official iodoform ointment, it is valuable in bed-sores, lupus vulgaris in the ulcerative stage, and enlarged or ulcerated scrofulous glands.

An antiseptic and sedative combination, praised by Cavazani, is as follows:—

R Pulv. iodoformi .....	62	Gm. or 3ij.
Acid. salicylici,		
Bismuthi subnitratæ .....	aa 23	Gm. or 3vj.
Pulv. camphoræ .....	6	Gm. or 3iss.—M.

Iodoform constitutes a serviceable application also to syphilitic lesions. The ointment reduces inflammatory action in buboes and may prevent supuration. It is at times attended with very good results in chronic eczema, and has been recommended in prurigo. In half or quarter strength this ointment is useful in ophthalmia and granular lids. An ointment composed of 0.065 to 0.32 Gm. (or gr. i-v) of iodoform rubbed up with 31 Gm. (or 3j) of excipient is recommended as an effective application in pannus, corneal ulcers, trachoma, and chronic conjunctivitis.

An ointment composed of 10 Gm. (or gr. cl) of iodoform and 14.5 Gm. (or gr. cccxv) of carbolic acid to 31 Gm. (or 3j) of excipient is a serviceable local application in nasal catarrh, due to chronic rhinitis.

Iodoform diminishes the pain of ulcerated carcinoma. In cancer of the womb, a bolus or anodyne suppository is recommended by Ringer, containing from 0.50 to 1 Gm. (or gr. viii-xv) of iodoform, incorporated in cacao-butter. This suppository can be deposited in the cavity of the malignant ulcer. The swelling and pain of orchitis are diminished by the application of iodoform ointment. A saturated solution of iodoform in chloroform relieves the pain of neuralgia and chronic gout.

It is a useful application, in the form of ointment or soluble bougies, to the urethra in the treatment of gleet or chronic gonorrhœa. T. Thierry finds it useful in the acute stage of gonorrhœa. He injects thrice daily a mixture of 1 part of iodoform and 6 parts of oil of sweet almonds. In painful affections of the rectum and bladder, fissures, and hæmorrhoids, suppositories of iodoform containing 0.32 Gm. (or gr. v) afford great relief.

An iodoform rectal suppository is likewise recommended for the relief of chronic prostatitis, 0.30 Gm. (or gr. v), in coca-butter or gelatine.

Its solution in ether (1 to 4), kept in red-glass bottles, is a valuable agent in treating ulcers of the mouth and throat. It has been shown by P. Carles that a saturated solution of iodoform in ether is very unstable, liable to sudden decomposition, the liquid assuming a reddish color as a result of the liberation of iodine. The addition of alcohol and absence of light retard this change. Combined with tannin and triturated together,

iodoform is a good astringent for soft hypertrophies in the nose, or insufflated into the pharynx for post-nasal catarrh, and into the nasal chambers for ozæna. Finely powdered iodoform, used by insufflation, is a good application in laryngeal tuberculosis, relieving hoarseness and pain.

In order to overcome the practical difficulties in the application of powdered iodoform to tuberculous ulcers of the larynx, Dr. Siemon proposes that it be administered by inhalation. He employs a solution of iodoform in essential oils. An inhalation flask being half-filled with ordinary turpentine-oil, 0.60 to 1 c.cm. (or *mx-xv*) of an iodoform solution are added and this quantity is inhaled three or four times a day.<sup>1</sup> The following emulsion is recommended by L. Frey as an injection for cystitis:—

Iodoform.	.....	50 parts.
Glycerin	.....	40 parts.
Distilled water	.....	10 parts.
Tragacanth	.....	25 parts.

A teaspoonful of this mixture is added to a pint of warm water, and, after being shaken thoroughly, used as an injection. The procedure is repeated every three days until four injections have been given, after which once a week will suffice. The late Professor Billroth obtained most gratifying results from the use of an iodoform emulsion in cold abscess and tuberculous caries. His mixture contains 10 Gm. (or *℥iiss*) of pulverized iodoform in 100 c.cm. (or *℥jiiif℥iiss*) of glycerin. After most scrupulous antiseptic precautions the abscess is cut down upon and opened, the carious bone is scraped thoroughly, and the cavity in each case cleansed. The inner surface of the abscess-wall is firmly rubbed by a large pledget of iodoform gauze, the wound is then stitched up, except a large opening through which the emulsion is poured into the cavity of the abscess or the bone. Recovery sometimes takes place by the first intention. Usually a second dressing is soon required; drainage-tubes are inserted, the deep parts close by first intention, and the superficial granulating wound heals under an ointment. In other cases more suppuration occurs and recovery is less rapid, or, perhaps, the operation must be repeated. The most forbidding cases of large abscesses, with numerous fistulae, yielded the best absolute results. He applied the same method to the treatment of echinococic cysts, but added the caution that if the cavity is very large there is danger of iodoform poisoning. This procedure is also of value in the tuberculous joint disease of children and adults. Dr. K. Garré, of Tübingen, reports favorable results in goitre from the interstitial injection of iodoform, dissolved in olive-oil and ether.

A 4-per-cent. solution of iodoform in spirit of turpentine has been found useful, administered in the form of inhalation, for laryngeal or pulmonary tuberculosis and bronchorrhœa.

<b>R</b> Iodoform.	.....	4	Gm. or 3j.
Ol. terebinth. rectificat.	.....	30	c.cm. or ℥j.

Administer from 0.18 to 0.30 c.cm. (or *miij-v*) by inhalation in phthisis and bronchiectasis with high temperature.<sup>2</sup>

Shufelt's combination of iodoform and volatile oil of camphor has given good results when inhaled in bronchiectasis and phthisis. Chibret states

<sup>1</sup> *Provincial Medical Journal*, Sept. 1, 1892.

<sup>2</sup> Dr. Powell, *Quarterly Bulletin of Clinical Surgery of New York Post-graduate School*.

that iodoform, freely sprinkled in the sick-room, diminishes the number of paroxysms in whooping-cough and shortens the course of the disease.

Kapper has advantageously employed injections of iodoform in the treatment of goitre. He makes use of a solution of 1 part of iodoform in 7 parts each of ether and olive-oil.

It may merely be added, in conclusion, that in children intoxication rarely occurs as a result of the local use of iodoform, but that old people are very susceptible to its action.

For venereal sores:—

R. Iodoform. ....	4	Gm. or 3j.
Ol. camphoræ ....	15	c.cm. or f3iv.
Acid. salicylic. ....	15	Gm. or 3iv.
Amyli .....	q. s.	

M. Sig.: Make a stiff paste for application to ulcerated surface.

It can also be obtained combined with dressings, as iodoform gauze, cotton, or wool, for use as tampons. When applied to the surface of the body dissolved in collodion, it reduces temperature. In cancer of the breast, iodoform in powder, or in ointment, markedly relieves pain and renders the progress of the disease slower.

Internally, iodoform has been employed as an alterative and as a means of bringing the system under the effects of iodine in phthisis, scrofulous affections, and liver disorders, but has not always fulfilled anticipations. Dr. Whittia speaks in very favorable terms of the internal use of iodoform in phthisis, confirming the reports of Dreschfeld and other writers. It is administered in pills, together with extract of gentian or other stomachic tonic. The same combination has been employed in hæmoptysis with the most satisfactory results by Chauvin and Jorissenne. They have seen it succeed where ergotin had failed. If considered judicious, tannin may be incorporated in each pill. Thus given, it creates no gastric irritation. Dr. Gavoy reports decided amelioration of tuberculous bronchitis from the hypodermic injection twice daily of a quarter of a syringeful of a solution of 1 part of iodoform in 100 parts of oil of sweet almonds. In some cases of neuralgia the internal administration of iodoform has given relief.

Some writers regard it of service in catarrhal jaundice and the early stage of cirrhosis of the liver. In constitutional syphilis iodoform has failed to approve itself as a superior remedy. In gastric catarrh iodoform renders service in checking fermentations, but its powerful odor renders it objectionable to patients. Drs. Lardier and Pernet have obtained good results in dysentery from the administration of iodoform in daily doses of 0.25 to 0.38 Gm. (or gr. iv-vj), given in capsules with opium. Favorable reports have been made by Professors Moleschott and Bozzolo concerning the use of iodoform in diabetes. The remedy was given in daily doses of 0.50 Gm. (or gr. viij). Other observers have failed to confirm these results. In 0.065 Gm. (or gr. j) doses it has been used by Professor Sim and others in cases of tænia and ascarides.

**Odorless Iodoform** has recently been brought to the attention of the profession of the country by Messrs. Johnson & Johnson. It has the full equivalent of iodine and has the physical characters of iodoform without the objectionable odor. It is a cicatrizant and causes the rapid healing of wounds, acting in all respects like iodoform.

**Di-iodoform.**—This is another substance which has been brought forward for the purpose of obtaining the benefits of iodoform without the disadvantages pertaining to its offensive odor. Di-iodoform is a definite iodide of carbon, and is derived from ethylene or olefiant gas. It is a yellow substance, almost free from odor at ordinary temperatures, melting at  $377.6^{\circ}$  F., decomposing into its constituents under  $392^{\circ}$ . Di-iodoform contains 4.62 per cent. of carbon and 95.38 per cent. of iodine. It volatilizes when heated, and can be sublimed. Di-iodoform is insoluble in water, and slightly soluble in alcohol, but it readily dissolves in carbon disulphide, chloroform, and benzin. It undergoes alteration when exposed to the light. It is said to be well borne by the stomach, and to be comparatively non-toxic. Di-iodoform has been used with success by M. Maquenne in the treatment of ulcerated chancroids and wounds.

**IODOLUM** (U. S. P.).—Iodol ( $C_4I_2NH$ ), **Tetra-iodo-pyrol**. By the action of iodine upon the base pyrol a chemical compound is formed containing 88.97 per cent. of iodine,—therefore a little less than iodoform,—but having the important advantage of freedom from odor. Iodol occurs as a grayish-white powder, which darkens upon exposure to light; insoluble, or nearly so, in water; freely soluble in ether, chloroform, or alcohol, and in fatty oils. It is soluble in the gastric secretions, and, like iodoform, is decomposed in the organism. Iodol is rapidly absorbed, and iodine soon appears in the saliva and urine. It is said not to produce stomatitis or nasal catarrh. Professor Pick found that, when given in quantities as large as 2 to 3 Gm. (or gr. xxx-xlv) a day, it produced no further inconvenience than some headache and diarrhoea, which, however, soon disappeared. The effects of iodol are similar to those of iodoform, but it is said never to produce toxic action when used either as a topical application to wounds or when administered internally in the ordinary medicinal doses. This statement, however, must be regarded as too positive. Dr. Marcus saw iodol cause death in animals from fatty degeneration of various organs, and a case has been reported by Lauenstein in which the external application of iodol caused vertigo, vomiting, fever, and albuminuria.

**Therapy.**—Iodol may be dusted over wounds in the form of an impalpable powder, or it may be used in ointment or solution. An ointment of iodol may be made of any desired strength, from 0.65 Gm. (or gr. x) to 31 Gm. (or 5j) upward, and constitutes an excellent antiseptic dressing to venereal and common ulcers, furuncles, and carbuncles. A weak ointment containing this substance is beneficial in variola, in which it mitigates the active cutaneous inflammation. A stronger preparation may be employed in tinea tonsurans, and is capable of modifying the course of psoriasis. Iodol ointment is used with advantage upon the enlarged glands of scrofula, or upon the ulcers consequent to their caseous degeneration. Schmidt considers iodol superior to iodoform in the treatment of fistulæ. An ethereal solution (1 to 8) is used as that of iodoform is: in ulcers of mucous membranes. Dr. Tarbau, of Davos, obtained good results in ozæna from the use of equal parts of iodol, tannic acid, and borax as a snuff. Cervicitis, endometritis, and metrorrhagia have been decidedly benefited by the local application of powdered iodol. The topical application of iodol has been found of service by Professor Pick in vaginitis, whether of simple or gonorrhœal origin.

Administered by insufflation or inhalation, this remedy has afforded relief in tuberculosis of the larynx or lung, and in bronchorrhœa. The powder has been found of service in various diseases of the eye, and is of special value in catarrhal conjunctivitis. It is useful, likewise, in otorrhœa associated with caries of bone. Iodol is also made into suppositories, soluble bougies, iodol cotton, iodol gauze, etc. It may be administered internally in any form—since it has very little taste and yields iodine to the organism very readily—in the treatment of the tertiary stage of syphilis, in scrofula, phthisis, etc. In these affections from 0.32 to 1.30 Gm. (or gr. v-xx) have been given daily, and in the dose of 0.13 to 0.38 Gm. (or gr. ii-vj) thrice daily Cerna has seen good results from the use of iodol in diabetes. Favorable results have been published by Pick, Cervesato, Martin, Lublinski, Seifert, Szadeck, and other observers. Cervesato, in three cases, saw absorption of pleural exudations promoted by the internal administration of iodol. Good reports have been made of the use in cerebro-spinal meningitis of a combination of 0.32 Gm. (or gr. v) of iodol and 0.17 Gm. (or gr. iiss) of acetanilide every third-hour. Iodol is best given in wafers or capsules.

**Caffeinated Iodol.**—This is a crystalline product obtained by mixing alcoholic solutions of caffeine and iodol in molecular proportion. It contains 74.6 per cent. of iodol and 25.4 per cent. of caffeine. The compound is of a light-gray color, destitute of odor or taste, and is proposed as a substitute for iodol. Caffeinated iodol is a stable body, and is nearly or quite insoluble in most menstrua. This remedy is too expensive for general use.

#### IODUM (U. S. P., B. P.).—Iodine.

Dose, 0.03 to 0.065 Gm. (or gr. ss-j).

#### *Preparations.*

**Ammonii Iodidum (U. S. P.).—Ammonium Iodide.** Dose, 0.32 to 2 Gm. (or gr. v-xxx).

**Argenti Iodidum (U. S. P.).—Silver Iodide.** Dose, 0.065 to 0.13 Gm. (or gr. i-ij).

**Ferri Iodidum Saccharatum (U. S. P.).—Saccharated Ferrous Iodide.** Dose, 0.13 to 0.65 Gm. (or gr. ii-x).

**Hydrargyri Iodidum Flavum (U. S. P.).—Yellow Mercurous Iodide.** Dose, 0.006 to 0.02 Gm. (or gr.  $\frac{1}{100}$  to  $\frac{1}{50}$ ).

**Liquor Iodi Compositus (U. S. P.).—Compound Solution of Iodine, Lugol's Solution** (iodine, 5; potassium iodide, 10; distilled water, 85 parts). Dose, 0.30 to 1.20 c.cm. (or  $\text{m}\nu$ -xx).

**Zinci Iodidum (U. S. P.).—Zinc Iodide.** Dose, 0.065 to 0.20 Gm. (or gr. i-iiij).

**Syrupus Acidi Hydriodici (U. S. P.).—Syrup of Hydriodic Acid** (1 per cent. of absolute acid). Dose, 2 to 15 c.cm. (or f3ss-f3ss).

**Pilulæ Ferri Iodidi (U. S. P.).—Pills of Ferrous Iodide.** Dose, 1 or 2 pills.

**Tinctura Iodi (U. S. P., B. P.).—Tincture of Iodine** (iodine, 7 per cent.; with potassium iodide, 5; B. P., about half this strength). Dose, 0.06 to 0.30 c.cm. (or mi-v). B. P., double this dose.

**Unguentum Iodi (U. S. P., B. P.).—Iodine Ointment** (U. S. P. contains iodine, 4; potassium iodide, 1; water, 2; benzoated lard, 93 parts).

**Liquor Arseni et Hydrargyri Iodidi (U. S. P., B. P.).—Solution of Arsenic and Mercuric Iodide** (Donovan's solution, 1 per cent. each of arsenic iodide and mercuric iodide). Dose, 0.06 to 0.60 c.cm. (or mi-x).

**Syrupus Ferri Iodidi (U. S. P., B. P.).—Syrup of Ferrous Iodide.** Dose, 0.60 to 4 c.cm. (or mx-f3j).

**Potassii Iodidum (U. S. P., B. P.).—Potassium Iodide.** Dose, 0.32 to 2 Gm. (or gr. v-xxx).

**Unguentum Potassii Iodidi** (U. S. P., B. P.).—Ointment of Potassium Iodide (U. S. P. contains potassium iodide, 12; sodium hyposulphite, 1; boiling water, 10; benzoinated lard, 77 parts).

**Sodii Iodidum** (U. S. P., B. P.).—Sodium Iodide. Dose, 0.32 to 2 Gm. (or gr. v-xxx).

**Arseni Iodidum** (U. S. P., B. P.).—Arsenic Iodide. Dose, 0.003 Gm. (or gr.  $\frac{1}{32}$ ).

**Sulphuris Iodidum** (U. S. P., B. P.).—Sulphur Iodide. Dose, 0.065 to 0.25 Gm. (or gr. i-iv).

**Hydrargyri Iodidum Rubrum** (U. S. P., B. P.).—Red Mercuric Iodide. Dose, 0.0016 to 0.006 Gm. (or gr.  $\frac{1}{64}$  to  $\frac{1}{16}$ ).

**Plumbi Iodidum** (U. S. P., B. P.).—Lead Iodide. For external use.

**Unguentum Sulphuris Iodidi** (B. P.).—Sulphur-Iodide Ointment (2 Gm., or gr. xxx, to lard, 46 Gm., or 3iss).

**Liquor Iodi Fortis** (B. P.).—Strong Solution of Iodine (iodine, 50 Gm.; potassium iodide, 30 Gm.; distilled water, 50 c.cm.; alcohol, 90 per cent., 360 c.cm.). Dose, 0.06 to 0.12 c.cm. (or mi-ij).

**Pharmacology.**—Iodine is a bluish-gray, non-metallic element, obtained principally from the ashes of sea-weeds. It was discovered in 1811 by Courtois, and its properties investigated by Gay Lussac in 1813. Iodine melts and sublimes at about 225° F., but volatilizes at ordinary temperatures, so that the upper part of the bottle containing it is usually filled with the characteristic violet vapor of iodine. It is very slightly soluble in water, requiring 7000 parts of water; on the contrary, alcohol and ether dissolve it freely, forming dark-brown solutions. The addition of water to the alcoholic solution precipitates part of the iodine, unless potassium iodide be added to the solution. The tincture of iodine may be decolorized by the addition of a small quantity of ammonia-water, followed by a few drops of carbolic acid, or by combination with sodium hyposulphite, making colorless tincture of iodine. The ammonia preparation should not be made in quantity or kept on hand, as it may deposit the iodide of nitrogen, which is a dangerous explosive compound. The combinations of iodine are numerous, and many of them are official. Ethyl-iodide is not included in the pharmacopœia, but has considerable medical interest. It is prepared by the action of alcohol on iodine in presence of amorphous phosphorus. Phosphorus iodide is formed and reacts upon the alcohol, yielding ethyl-iodide and an acid of phosphorus. The former distills into the receiver together with the alcohol, which escapes the reaction. Water is added and the lower layer of liquid is separated, dried with calcium chloride, and rectified in a water-bath. Ethyl-iodide is a colorless liquid, but becomes brown when long kept, if exposed to light. The syrup of hydriodic acid contains 1 per cent. of absolute hydriodic acid, which is a gaseous body containing 99  $\frac{1}{4}$  per cent. of iodine by weight; it is readily decomposed, and is a valuable agent for the purpose of introducing iodine into the system in the least irritating form, though therapeutically active. The iodide of starch, *amylum iodatum* (not to be confounded with *amyl iodidum*, iodide of amyl), was formerly official as a means of administering iodine, but it has been given in quantities as high as an ounce at a time with little noticeable effect, and is seldom used at present. This may be explained by the fact that starch is the antidote to iodine, and is the chemical test for free iodine, by which it is turned from a white color to blue. Iodine trichloride occurs in yellow pieces, and is decomposed by water into hydrochloric and iodic acids. It is liquefied by the addition of iodine. Iodine trichloride is a stable compound if preserved from contact with organic matter. Iodine tribromide has also been utilized to a certain extent as a local application. The following are some newer

Administered by insufflation or inhalation, this remedy has afforded relief in tuberculosis of the larynx or lung, and in bronchorrhœa. The powder has been found of service in various diseases of the eye, and is of special value in catarrhal conjunctivitis. It is useful, likewise, in otorrhœa associated with caries of bone. Iodine trichloride is a stable compound if preserved from contact with organic matter. Iodine tribromide has also been utilized to a certain extent as a local application. The following are some newer

compounds: *Atropine iodate* ( $C_{17}H_{23}NO_3 \cdot HIO_3$ ) occurs as colorless needles soluble in water and in alcohol. Its solutions remain free from germs for quite a length of time, so that the addition of an antiseptic is unnecessary. *Codeine iodate* ( $C_{18}H_{21}NO_3 + 2HIO_3$ ) occurs as white needles slightly soluble in water or alcohol; with age the salt decomposes, assuming a brown coloration from the liberation of iodine. *Lithium iodate* ( $LiIO_3 + 1-2H_2O$ ) is a white powder freely soluble in water. *Mercuric iodate* ( $Hg[IO_3]_2$ ) occurs as a white, amorphous powder, almost insoluble in plain water, but soluble in water containing sodium chloride or potassium iodide. *Quinine iodate* ( $C_{20}H_{24}N_2O_2 \cdot HIO_3$ ) is a white, crystalline powder, soluble in water. *Scopolamine iodate* ( $C_{17}H_{21}NO_4 \cdot HIO_3$ ) occurs as colorless crystals, soluble in water and in alcohol. *Strychnine iodate* ( $C_{21}H_{22}N_2O_2 \cdot HIO_3$ ) comes in long, colorless needles, usually conglomerated and soluble in water.

As the iodides are easily decomposed, this fact must be borne in mind when prescribing them, and, as a rule, it is best to administer them simply dissolved in water or combined with other iodides. When potassium iodide is present in solution with corrosive sublimate the biniodide is formed, which is again dissolved in an excess of the potassium iodide. Alkalies, alkaloids, and metallic salts generally are incompatible with iodine and its salts.

**The Iodine Test for Semen.**—The difficulty of identifying spermatozoa by the microscope in the case of old stains is admitted. Florence, of Lyons, has introduced a chemical test which appears to be valuable,<sup>1</sup> judging by recent reports. The reagent is one used in testing alkaloids, known as the tri-iodide of potassium ( $KI_3$ ). The formula is: iodide of potassium, 1.65 Gm. (or gr. xxv); iodine, 2.46 Gm. (or gr. xxxviii); and distilled water, 30 c.cm. (or f̄ij). When a drop of the liquid obtained by moistening a seminal stain is placed side by side with a drop of this solution on a slide large numbers of peculiar brownish-red, pointed crystals appear. They are rhomboidal, and closely resemble hæmin crystals. Dr. Wyatt Johnson states<sup>2</sup> that he readily obtained the reaction with stains a year old. He also confirms Florence's statement that other secretions of the body—such as blood, urine, sweat, saliva, tears, bile, milk, pus, nasal or vaginal mucus—will not give the reaction. With the semen of animals in some cases he obtained a doubtful reaction. Dr. W. F. Whitney<sup>3</sup> also obtained the reaction readily. But as alkaloids give a precipitate with the reagent, its value, like the guaiacum test for blood, is chiefly negative. The last writer has found the following method of examining a seminal stain even as old as two and a half years successful. A drop of fluid obtained from the moistened stain is evaporated and fixed by a flame. The film is stained with eosin and methyl-green and mounted. At the base of the head of the spermatozoa is an hemispherical portion, which stains a deep green, while the anterior part and tail stain red. This serves at once to identify them, as there is no other oval spore or cell which has an eccentric hemispherical nucleus. He furthermore claims that the test proves them to be human, as in no other animal is there a deep staining. When this test is combined with Florence's there ought to be no difficulty in coming to a conclusion.

**Physiological Action and Toxicology.**—Iodine discolors the skin, turning it brown, and, if sufficiently concentrated, acts as an irritant, and may

<sup>1</sup> *Archives d'Anthropologie Criminelle*, Jan., Feb., and March, 1896.

<sup>2</sup> *Boston Medical and Surgical Journal*, April 8, 1897.

<sup>3</sup> *Boston Medical and Surgical Journal*, April 8, 1897.

cause vesication or sloughing. After a coat of iodine there is some hyperæmia, and the sensory nerves are stimulated so that the effects of a counter-irritant are obtained; subsequently, the superficial epithelial layer becomes dry and peels off, leaving a reddened surface. Its vapor is rather irritating to the air-passages. Iodine is a valuable antiseptic, and, when inhaled into the bronchial tubes, or separated from the general circulation and deposited upon the surface of the bronchial mucous membrane, it exercises a beneficial influence upon the tissues and prevents decomposition of the secretions. In the stomach it is at first irritant, but rapidly forms combinations with organic or starchy compounds and passes into the blood, where it acts as an alterant, and especially counteracts the effects of the syphilitic virus and promotes the absorption and removal of its products from the body. To a less marked degree this remedy acts upon the tissues affected by tuberculosis, removing debris material and rendering them less favorable for the development of bacilli. The alkaline iodides are very soluble (potassium iodide dissolving in its own weight of water), and diffuse readily into the blood. Stockman and Charteris found that sodium and potassium iodides, when given in the ordinary doses, to man, by the stomach, have no depressing effects on the action of the heart, or on the arterial tension.<sup>1</sup> They are excreted especially by the air-passages, and frequently set up a coryza and profuse mucus discharge from the bronchial mucous membrane.

The most common form of iodide eruption is that of papules, or wheals, which are darker than the adjoining skin and surrounded by a zone of inflammation (acneiform); but occasionally, from some peculiar susceptibility to the action of the drug, the degree of hyperæmia is so great as to lead to effusion beneath the epidermis, and vesicles are formed, filled with clear lymph, which afterward becomes white or milky. Sometimes the eruption is so universal that it resembles chicken-pox, purpura, or small-pox, but is unaccompanied by fever, or by more than a transient elevation of temperature. An acute eczema, accompanied by constitutional disorder, has been observed as a result of the ingestion of this drug. Dr. R. W. Taylor has described a remarkable case in which, after large doses of potassium iodide, a number of large tumors appeared upon the face.

Other symptoms—such as headache, unpleasant taste in the mouth, pyralism, disordered digestion, malaise, and emaciation—appear after the system has become saturated with the drug, and these symptoms indicate the condition of **iodism**, which varies in degree from merely a few acneiform papules upon the forehead to a state of irritant poisoning. Oedema of the glottis is an occasional effect of the ingestion of potassium iodide. This manifestation, which takes place in the absence of any pathological condition of larynx or kidney, has been made the subject of a paper by Dr. Groenouw. This writer refers the origin of the accident to idiosyncrasy, and remarks that it does not follow the repeated administration of large doses of the salt, but manifests itself after a few comparatively small doses have been taken.<sup>2</sup> Other unusual manifestations of iodine poisoning are occasionally witnessed. Gautier has reported a case in which the symptoms were thought to be due to prolonged inhalation of sea-air, and another in which iodism was caused by inunction with potassium iodide. Each of these cases was marked by emaciation and prostration. In the second case fixed delusions and melancholic mania were present. Severe neuralgia, especially of

<sup>1</sup> *British Medical Journal*, June, 1901.

<sup>2</sup> *Revue de Laryngologie*, etc., Sept. 15, 1890; *Medical Bulletin*, Feb., 1891.

the trifacial, sometimes follows the administration even of small doses of potassium iodide. Pains in the extremities are also occasioned in some instances. Jonathan Hutchinson has frequently noted a sense of numbness, simulating sensory paralysis, but disappearing when the use of the iodide is discontinued. Affections of the nerves of special sense may be caused by this drug; hyperæsthesia of the retina, photophobia, fixed contraction and dilatation of the pupil have been seen as the result of the ingestion of iodine. Dr. Ernest Finger points out that, as iodine has been experimentally shown to produce dilatation of the cerebral blood-vessels, with retardation of the circulation, it should be cautiously given whenever intracranial lesions exist. He has known paralysis and retinal hæmorrhage to be excited by its use.

The phenomena of iodism are particularly apt to occur in persons who suffer from renal disease. Death on the sixth day, followed the free application of iodine to the legs of a negro boy.

In the absence of special idiosyncrasy, large doses are most productive of iodism in children and old people. Maniacal symptoms have supervened in consequence of massive doses.

Dr. W. L. Russel has reported a case of death from iodism. The administration of a few small doses of potassium iodide combined with syrup of ferrous iodide was followed by inflammation of the eyes, nose, and throat, together with a bullous eruption upon the skin. Death occurred on the tenth day after the first dose had been taken from a low grade of pneumonia and inanition. A case of fatal cachexia thyreopriva<sup>1</sup> from the administration of iodide of potassium has been reported. The goitre was a large one, and the attending physician ordered the application of a salve containing iodine, and the internal administration of iodide of potassium, 4 Gm. (or 5j) *pro die*. The effect of the medicine was very striking, and in three weeks the tumor had grown much smaller; but from the beginning of the treatment, in addition to symptoms of iodism, other symptoms—such as vomiting, trembling, and tachycardia—were present. The iodine was given up, but these symptoms of cachexia thyreopriva continued, and the patient died in about one month after the beginning of the treatment, with marked circulatory and respiratory disturbances, similar to those seen in exophthalmic goitre. It appears that goitrous patients are liable to a form of iodine intoxication, which is called by Geneva physicians "Constitutional iodism," which may result from comparatively small doses. Trousseau denied that this was attributable to iodine directly, and claimed that it was a condition of latent Graves's disease, aggravated by iodine. Indeed, as pointed out by Jaunin,<sup>2</sup> the symptoms resemble closely the condition known as thyroidism, sometimes seen after administering preparations of thyroid gland. Whatever may be the explanation, it must be admitted that some persons show a marked intolerance to the iodides, while others may take very large quantities, not only with impunity, but with marked benefit.

Hare has called attention to a practical point, which is that, with the administration of small doses of carminatives, the iodine reaction appears more quickly in the saliva than when the potassium iodide is given alone. He, therefore, recommends the combination of 0.60 c.cm. (or *mx*) of tincture

<sup>1</sup> *Correspondenz-blatt f. Schweizer Aerzte*, 1896, No. 3.

<sup>2</sup> *Revue Médicale de la Suisse Romande*, May 20, 1899.

of capsicum, with each dose, which also causes it to agree better with the stomach.

The treatment of iodism is largely symptomatic, using starch if there is free iodine in the alimentary canal, deodorized tincture of opium, warm baths, and large draughts of water and demulcents. Ehrlich has drawn attention to the probable value, on theoretical grounds, of sulphanilic acid in overcoming, or neutralizing, the effect of iodine. With regard to the dose, 5 c.cm. (or f5iss) may be given during the day without inconvenience. It should be given in conjunction with sodium bicarbonate to facilitate the solution of the acid.

Chemical considerations have suggested the theory that the phenomena of iodism are due to the liberation of iodine by nitrites present in the blood. This change can only take place in regions where the reaction is acid. According to Röhmann and Malachowski, from 8 to 12 Gm. (or ℥iii-ij) of sodium bicarbonate, given in two doses within twenty-four hours, will cause the symptoms of chronic iodine poisoning to disappear. These writers likewise claim that, when potassium iodide and sodium bicarbonate are administered in combination, the symptoms of iodism are prevented. The carbonate or the aromatic spirit of ammonium has been given with the iodide for the same purpose, but with doubtful results. A few drops of Fowler's solution, given in conjunction with the iodide, is, however, more effective, and will usually prevent the development of iodism. The association of a small dose of belladonna or an equal quantity of the potassium bromide with iodide is also recommended as a preventive of toxic manifestations from iodine. It should not be forgotten that even a small dose of iodine will, in some persons, produce marked physical and mental depression without the occurrence of coryza, sore throat, or disturbed stomach. An acute form of intoxication may also arise from the administration of iodine, the symptoms being those of acute gastro-enteritis, the treatment consisting of starch-water, evacuation of the stomach, external heat, and hypodermic injections of cardiac and respiratory stimulants. In a case of chronic poisoning, with alarming prostration, Whittall availed himself of the fact that elimination takes place largely by the salivary glands, and directed his patient to chew pilulario-root: a powerful sialagogue. A hypodermic injection of pilocarpine would have a similar effect.

Death has occasionally been caused by iodine, whether taken into the stomach or injected into the cavities of the body. The fatal event may be delayed for a number of days and may then take place suddenly from heart-failure. The vomiting excited by iodic intoxication is of a yellowish-brown color, or blue if starchy matter had been present in the stomach. Dr. W. O. Calpeper has recorded a case in which the application of the tincture of iodine externally caused extensive sloughing, symptoms of acute iodism and death on the sixth day. The patient was a child of eleven years. In some of the cases where iodine was absorbed from the cavities of the body the regesta contained the drug. Iodine, after absorption, enters into all the tissues and fluids of the body. It is chiefly eliminated by the kidneys, partly in the form of an alkaline iodide and partly in organic combination. According to Professor Séé, it accumulates within the system when given continuously, and can be detected in the saliva after it has disappeared from the urine. Iodine is probably excreted to some extent by all the mucous membranes.

The iodides remove certain metallic poisons from the system by combining with them to produce soluble salts; in such cases large doses of iodides might liberate so much of the metal from the tissues as to produce symptoms of metallic poisoning. This is exemplified by the fact that potassium iodide may occasion salivation in an individual who has been upon a mercurial course. If a considerable quantity of the metal have been stored up within the system, its solution and entrance into the circulation may be followed by ptyalism. On the other hand, when there has been less accumulation of the mercury, potassium iodide will rapidly remove it from the system. The iodide thus exerts an apparently paradoxical action, in that it sometimes relieves and at others augments mercurial ptyalism. In recent cases of mercurialism, however, the iodide will but add to the mischief.

Patients should be warned, on the appearance of such symptoms or on the occurrence of iodism, to discontinue the remedy at once. Some are unable to bear more than a few grains, and even so small a quantity as 0.32 Gm. (or gr. v) may produce coryza, salivation, or a general vesicular eruption upon the skin; others can take as many drachms without the slightest inconvenience, and some dermatologists give from 46.5 to 62 Gm. (or 3xii-xvj) of potassium iodide a day for tertiary syphilis without producing iodism. Part of the good effects of codliver-oil in these disorders is ascribed to a small proportion of iodine which it contains.

In the normal condition the iodides and iodine have no effect upon temperature or blood-pressure, when administered by the ordinary channels. Introduced into the veins, they cause slight increase, soon followed by decrease, of pressure. According to Germain Sée, potassium iodide reduces the size of the heart.

Anaphrodisiac effects are observed after the long-continued use of potassium iodide, and the belief is generally entertained, though disputed by some, that such protracted use causes atrophy of the mammary glands and testicles. A full or somewhat excessive dose of iodine has been known to cause sexual excitement, and Professor Stillé states that it may give rise to profuse menstruation or occasion abortion during pregnancy.

Owing to its solubility, potassium iodide is rapidly absorbed and rapidly eliminated. Within fifteen minutes after its ingestion it is present in the saliva and urine. It is likewise removed by the skin, and in the milk of nursing women. Iodine has been found in the urine of a suckling babe, whose mother was taking potassium iodide. The urine is increased in quantity by potassium iodide, though we lack exact knowledge of the effect of the drug upon the urinary constituents. It often causes oxalates to appear.

In some instances its administration has been followed by albuminuria.

In a series of experiments upon himself, M. Georges Doux took 3 Gm. (or gr. xlv) of potassium iodide twice daily for twenty consecutive days. After the second day the quantity of the salt present in the urine varied but little, and amounted to about 90 per cent. of the dose ingested. The normal proportion of urea was decreased by about one-fifth. Seventy-five hours after discontinuance of the drug no trace of it could be discovered in the urine. The experiments were twice repeated with the same results. The amount of iodide eliminated fell to 60 per cent. if a little absinthe had been taken on the preceding day.<sup>1</sup>

<sup>1</sup> *British Medical Journal*, Sept. 27, 1890.

The effect of small doses of potassium iodide upon nutrition has been studied by Volkoff and Stadnitzki, of St. Petersburg. These writers report that the assimilation of carbohydrates in the food is but slightly diminished, the nitrogenous exchange is increased, oxidation is diminished and the destruction of organic albumin is increased, judging by the augmented quantity of sulphur in the urine. The weight of the body is but slightly decreased and the assimilation of fat is diminished to a very slight extent. Dr. Haig believes that the iodides diminish the excretion of uric acid and the urates.

**Antidotes.**—The treatment of a case in which iodine has been taken into the stomach, should begin with the administration of starch in warm water; or flour and water. Sodium bicarbonate may also be given. The starch-iodine compound should not be allowed to remain in the stomach, but be removed by stomach tube, or by vomiting. Small doses of pilocarpine may assist elimination. The subsequent treatment is that of gastritis, mainly.

**Therapy.**—Iodine in substance may be used as a disinfectant for drains, but it has no advantage over much less expensive agents which are better antiseptics. In the form of tincture it is very generally used as a counter-irritant and resolvent for various swellings, enlarged glands, buboes, swollen joints, abscesses, chilblains, and inflammation of the gums.

The antiseptic action of iodine is utilized in surgery, by Nicholas Senn,<sup>1</sup> of Chicago, in preparing patients for operation. Douches containing iodine have been used in obstetrics, to overcome septic infection. The parasiticide effects are shown when this tincture is painted over a spot of tinea or ringworm, which may yield to this treatment. In chronic ring-worm, Dr. C. W. Cutler, of New York, uses with good results the following mixture:—

R Phenolis liq.,		
Chloralis hydratis .....	aa 3i	Gm. or ʒj.
Tr. iodi .....	30	c.cm. or fʒj.—M.

The local application of tincture of iodine is efficacious in tinea versicolor when the patches are not too large or numerous.

For toothache from exposed pulp, Garretson recommended the following:—

R Creosoti .....	37 c.cm. or mʒj.
Tinct. iodi.	
Liq. plumbi subacetatis .....	aa 4  c.cm. or fʒj.
Chloroformi,	
Tinct. opii .....	sa 2  c.cm. or fʒss.

M. Sig.: Apply on absorbent cotton to the pulp. Brush the same on the surrounding gum.

The local application of the tincture of iodine has been recommended in order to arrest retraction of the gums in aged people.

The dental ointment of potassium iodide, recommended by Flagg, consists of the following:—

R Potassii iodidi .....	1130	Gm. or gr. xx.
Liquoris potassæ .....	12 vel	18 c.cm. or mʒj vel fʒj.
Cerati simplicis .....	31	Gm. or ʒj.
M. et ft. ungt.		

<sup>1</sup> *Columbus Medical Journal*, August, 1905.

This is a valuable ointment, which will not discolor the skin, used in producing absorption of indurations on or about the face and jaws.

A colorless iodine ointment may be prepared according to the following formula:—

R Iodi .....	1½30 Gm. or gr. xx.
Potass. iodidi .....	25 Gm. or gr. iv.
Sodii sulphitis .....	2½60 Gm. or gr. xl.
Aque .....	q. s.

Rub the ingredients with the water till the solution is colorless. Then add:—

Adipis benzoinat. .... 3½ Gm. or ½j.—M.

Dr. Dunin has given potassium iodide in about 100 cases of biliary colic with considerable success. It acts most favorably in cases characterized less by pain than by frequency of attacks and especially in those exhausted by loss of sleep, anorexia, or prolonged use of narcotics. He prescribes 0.32 to 0.65 Gm. (or gr. v-x) twice daily for four or five weeks and this is followed by a course of Carlsbad water.

In pneumonia and pleurisy, especially of the chronic form, or fibroid phthisis, great benefit results from painting the affected side of the chest with iodine, giving several coats of the tincture with a camel's-hair brush, repeated each day until sufficient action is set up or the skin peels off. Part of the iodine is absorbed and exercises a local alterative effect.

In chronic bronchitis, also, the tincture of iodine is serviceably applied to the chest. The ointment, tincture, or liniment of iodine affords relief in intercostal neuralgia and rheumatism affecting the intercostal muscles. The conjoined internal and external use of iodine is of great value in bronchocele. In simple glandular hypertrophy, the compound solution of iodine or potassium iodide, preferably the latter, is administered by the mouth; while the tincture, liniment, or ointment is locally applied, care being taken to avoid vesication. The ointment of potassium iodide is sometimes employed for the same purpose or the B. P. official ointment of the red mercuric iodide. The remarkably successful method practiced by the East-Indian army-surgeons consisted in the application of the ointment of the red iodide, after which the patient was made to sit for some hours with his neck exposed to the rays of the sun or to a hot fire. Assuming that the action of the remedy was increased by the influence of heat, Dr. Dawson Turner, of Edinburgh, suggests that the fact may be explained by the physical properties of iodine. A solution of iodine in carbon disulphide cuts off the visible rays of the sun, but transmits the invisible heat-rays. From this circumstance the deduction is drawn that diseased parts to which iodine has been applied should not be covered, but subjected to the action of the heat.

Another excellent method consists in the injection of tincture of iodine into the substance of the goitre. It is best to begin with no more than 0.30 c.cm. (or *mv*), the operation being repeated weekly or semiweekly and the quantity gradually increased to 0.60, 1, or 1.20 c.cm. (or *mx*, *xv*, or *xx*). In cystic or calcareous degeneration of the thyroid this plan of treatment is of no avail. Other hypertrophies are amenable to the same method, as, for instance, enlarged lymphatic glands prior to caseation and enlarged spleen. The cavities of abscesses and monocystic tumors are, after evacuation, advantageously flushed with water impregnated with a small quantity of tincture of iodine. Empyema has been treated in the same way after aspiration.

Since proposed, in 1848, by Dr. Brainard, the injection of iodine has been practiced with varying and doubtful success in spina bifida. Cures have been reported, while, on the other hand, many failures, whether reported or not, have occurred. If this operation be undertaken the quantity injected should be small and the solution weak. No more serum should be withdrawn than the quantity of fluid about to be injected. Pepper and others have injected the tincture of iodine into pulmonary cavities with a view to disinfection, and, possibly, obliteration by healthy reparative inflammation. Though the plan seems rational, it is not always feasible, is attended by some pain and reaction, and certainly has never been generally approved or adopted. The injection of iodine, as in the Shurley-Gibbes plan of treating tuberculosis, usually gives rise to considerable pain. In order to overcome this disadvantage Dr. A. O. Squier incorporates with the original mixture a small quantity of creosote or guaiacol and some iodoform. His formula is:—

R Eucalyptol. ....	2	12 c.cm. or mxxxij.
Guaiacol. pur. ....	1	c.cm. or mxvj.
Iodoform. ....	50	Gm. or gr. viij.
Iodi. ....	25	Gm. or gr. iv.
Ol amygdal. dulc. ....	q. s. ad 30	c.cm. or f5j.

M. Sig.: From 0.60 to 2 c.cm. (or mx-xxx) to be injected daily or alternating with gold and sodium solution as desired.

A solution of iodine has been employed by Professor Durante, of Rome, injected subcutaneously or into the substance of a muscle in cases of pulmonary and articular tuberculous disease. Dr. Mennella has made use of the same method in non-tuberculous affections of joints. Periarticular injections of iodine caused rapid disappearance of the fluid in two cases of hydrarthrosis of the knee of traumatic origin. A similar procedure was efficacious in glandular enlargements, syphilis, grave malarial cachexia, and other maladies.

The parenchymatous injection of a few minims of tincture of iodine causes resolution of enlarged tonsils. In performing this operation the close proximity of the carotid artery should be borne in mind. The ointment, applied directly to the tonsils by means of a camel's-hair brush, is said by Cerchiari to accomplish the same result. The application of the tincture diluted with seven or eight times its bulk of water will also generally produce the same effect.

The following prescription can sometimes be used with good effect in enlarged tonsils or in chronic pharyngitis:—

R Tinct. iodi. ....	4	c.cm. or f3j.
Glycerini,		
Fluidextracti ergotæ. ....	aa 30	c.cm. or f3j.

M. Sig.: Apply once or twice a day with a camel's-hair brush.

Garretson employed in sore throat, especially that which occurs in clergymen and public speakers, the following combination of iodine:—

R Liq. iodi compositi. ....	5	c.cm. or f3imxx.
Phenolis liquefact. ....	75	c.cm. or mxij.
Glycerini. ....	60	c.cm. or f3ij.
Aquæ. ....	420	c.cm. or f3xiv.

M. Sig.: To be used as a gargle from eight to a dozen times a day.

The tincture of iodine is often painted upon or around patches of erysipelas, and, although the application sometimes does good, it not infrequently aggravates the condition. It is judicious to dilute the preparation with an equal quantity of glycerin or alcohol, or combine the iodine as follows:—

R Tinct. iodi .....	2	c.cm. or f3ss.
Phenolis liquefact. ....	2	Gm. or 3as.
Glycerini .....	120	c.cm. or f3iv.

M. Sig.: Apply with a camel's-hair brush several times a day for erysipelas.

In ringworm iodine may be used in the form of colorless tincture, or in combination with the colorless oil of tar (1 in 4):—

R Potassii iodidi .....	8	Gm. or 3ij.
Ol. menth. pip. ....	120	c.cm. or mxx.
Adipis lane hyd. ....	31	Gm. or 3j.

M. Sig.: Embrocation for painful joints, neuralgia, chronic rheumatism, etc.

Ringworm may also be efficaciously treated by means of iodized collodion, 0.50 to 0.75 Gm. (or gr. viii-xij) of metallic iodine being dissolved in alcohol and ether and added to 30 c.cm. (or f3j) of collodion. The mixture is painted upon the affected part for several successive days until a thick layer is formed. This layer is left undisturbed for a fortnight.

The tincture of iodine is one of the articles employed to prevent pitting in small-pox. The solution should be painted over the surface of each pustule. An ointment containing iodine is occasionally followed by good results in keloid and scleroderma. Alone or combined with an equal quantity of glycerin or carbolic acid, the tincture of iodine is sometimes beneficial when painted upon lupous areas. Lentigo and chloasma may be cured by the local application of tincture of iodine, and the same preparation added to salt water forms a beneficial wash in chronic ozæna. In orchitis, after active inflammation has subsided, the cautious local application of the tincture promotes absorption of the exudation material. The same treatment is of service after subsidence of inflammation of the mammary gland or ovary.

Boils and carbuncles may be checked by painting iodine freely upon a neighboring vascular area. Iodine may be used as a stimulant to old ulcers, especially in gynæcology, as iodized phenol, although iodoform, on account of its anæsthetic effects, has largely taken the place of iodine. A saturated solution of tannic acid in tincture of iodine is also a useful topical application in chronic inflammation of the uterine canal. Dr. Routh states that the vomiting of pregnancy is arrested by brushing the cervix and lower part of the cervical canal with a mixture of equal parts of iodine, potassium iodide, alcohol, and water. Professor Tarnier made use of a mixture of tincture of iodine (30 c.cm., or f3j) and potassium iodide (6 Gm., or 3iss) in distilled water, 1 quart, as an intra-uterine douche after labor. Dr. Chibret has proposed the application of tincture of iodine in certain forms of corneal ulceration, touching the affected surface once or twice daily with a small roll of cotton-wool moistened with the liquid. M. Sedan, who has made a trial of the local use of the tincture in the case of rebellious ulcers of the cornea, declares that the treatment is painful and unmanageable, and has a tendency to produce ciliary blepharitis.

Russian physicians have employed iodine with marked advantage in

hemorrhoids. Ivanoff describes a severe case, rebellious to ordinary methods, in which the daily application of the tincture for three days caused almost complete disappearance of the large tumors. Preissman extols, in the same condition, the application of a compress moistened in a glycerin solution of iodine and potassium iodide. The iodide of starch is valued by Mr. Marshall as a dressing to syphilitic ulcers. Hydrocele is cured by evacuation of the contents of the sac and injecting 1 to 1.20 c.cm. (or *mxv-xx*) of tincture of iodine into the cavity. Severe inflammation results and the sac becomes obliterated. Iodized wool is useful for making extemporized pessaries. I. Rosenberg has found a 20-per-cent. solution of potassium iodide, painted upon the tongue, efficacious in the treatment of leucoplakia.

Internally, tincture of iodine and camphor may be inhaled for acute coryza and hay asthma.<sup>1</sup> Inhalation of the vapor of iodine is very beneficial in chronic bronchitis with bronchiectasis, or profuse and fetid muco-purulent expectoration.

The inhalation of iodine and turpentine is recommended in laryngeal and pulmonary tuberculosis by Dr. Jolly and others, who claim that it is an excellent adjuvant to the other methods by which it is sought to relieve the disease. This formula may be quoted:—

R Pulv. iodi .....	10 parts.
Alcohol. ....	20 parts.
Mix in a flask and add:—	
Ol. terebinthin. rectificat. ....	20 parts.
Spt. lavandulae .....	10 parts.—M.

When the mixture is shaken the free iodine is lost and exists in the form of a terebinthinate compound. It has no irritant effect upon the mucous membranes.

Bartholow spoke favorably of the internal use of ammonium iodide in acute catarrh, 0.065 Gm. (or gr. j) being given every second hour. Hay asthma is ameliorated by larger doses of the same remedy, which is useful, moreover, in capillary bronchitis and bronchorrhœa. An acute coryza may not infrequently be aborted by 0.65 Gm. (or gr. x) of potassium iodide taken at bed-time. Ammonium iodide is also recommended for the same purpose. Potassium iodide in the same dose repeated several times a day is said to relieve paroxysmal sneezing.

In phthisis, good results have been reported from inhalation, by means of an atomizer, of fine spray containing 1 part each of potassium iodide and corrosive chloride of mercury in 1000 parts of water, the solution being made stronger or weaker, according to the effects upon the patient. From its stimulating effects upon the kidneys potassium iodide is occasionally used to heighten the effect of other diuretics. The œdema of Bright's disease is, in some instances, markedly decreased by this remedy, though it has little power to check the escape of albumin. Potassium iodide, from its special determination to the mucous membrane of the air-passages, is frequently combined with expectorants and cough-mixtures in order to render the secretions more fluid. Its stimulating action upon the absorbents renders iodine useful, both internally and by topical application, in cases of inflammatory exudation or chronic enlargements. Where these are of syphilitic

<sup>1</sup> *Therapeutic Gazette*, Oct. 15, 1890, p. 678.

character the iodides are pre-eminently serviceable. For many brain diseases, more especially those occurring during tertiary syphilis, where gum-mata form or meningitis with exudation occurs, causing great pain, potassium iodide in combination with bromide, is more efficient than any other agent known; here the iodide must be given in 2 to 4 Gm. (or 3ss-j) doses, and pushed in order to get its full effect. If given well diluted with water, when the stomach is empty, no serious danger exists of producing iodism. In aortic aneurism, potassium iodide, in doses of 1.30 to 2 Gm. (or gr. xx-xxx) four times a day, with low diet and rest in bed, favors deposit of fibrin and obliteration of the tumor; the treatment must extend over many months or for a year or more. Many of these cases may be occasioned by syphilitic disease of the aorta, and under these circumstances the iodide is doubly serviceable. In the primary and secondary forms of syphilis iodine compounds are of little use, but in the later changes of the skin, mucous membranes, and deeper structures they act promptly, and we may prescribe them with confidence.

In some of the late varieties of syphilis<sup>1</sup> the author can recommend the following formulæ containing the iodides:—

R Potassii iodidi .....	19/4	Gm. or 3v.
Tinct. cimicifugæ .....	7/5	c.cm. or f3ij.
Syr. sarsaparillæ comp. ....	150	c.cm. or f3v.
M. Sig.: Two teaspoonfuls in water three or four times a day.		
R Sodii iodidi .....	10	Gm. or 3iiss.
Vini cocæ .....	300	c.cm. or f3x.
M. Sig.: A tablespoonful three or four times a day.		
R Ammonii iodidi .....	19/4	Gm. or 3v.
Tinct. nucis vomicæ .....	4	c.cm. or f3j.
Fluidext. rhamnus pursh. ....	30	c.cm. or f3j.
Glycerini .....	120	c.cm. or f3iv.
M. Sig.: Two teaspoonfuls in water three or four times a day.		

According to the investigations of Leone Levi, potassium iodide, administered to syphilitic subjects, improves the quality of the blood, increases weight and strength, but decreases the quantity of urea excreted. Pellizzari concludes that this salt has a chemical action upon the products of tertiary syphilis and neutralizes the toxic material as it is formed.

An efficient combination for use in tertiary syphilis is:—

R Hydrarg. iodid. rubri .....	20	Gm. or gr. iij.
Potassii iodid. ....	31	Gm. or 3j.
Tr. iodi. ....	4	c.cm. or f3j.
Syr. ferri iodid. ....	30	c.cm. or f3j.
Aquæ .....	90	c.cm. or f3iij.
M. Sig.: A teaspoonful in water after each meal.		

A combination of iodides is sometimes more efficient in late syphilis.

In the treatment of gonorrhœal rheumatism, Schüller, of Berlin, gives potassium iodide (0.32 to 0.45 Gm., or gr. v-vij) every two hours for two or three days. He considers it especially beneficial in the acute form. For local treatment he uses, in acute cases, compresses wet with carbolic-acid solution (1 to 100), and in chronic cases mercurial ointment. Aspiration of the joint

<sup>1</sup> For the general medicinal treatment of late syphilis see author's "Practical Treatise on Diseases of the Skin." D. Appleton & Co., New York, 1901.

is done where there is abundant effusion, and this procedure aids the action of the remedy. In chronic gout and in gouty affections, potassium iodide affords great relief, as it will also in chronic rheumatism. Considerable improvement sometimes follows the use of potassium or ferrous iodide in rheumatoid arthritis. Acute rheumatism is often relieved by large doses of potassium iodide, or the latter in combination with sodium salicylate or salicin:—

R Potassii iodidi,		
Sodii salicylatis .....	aa 14	Gm. or ℥iiss.
Spiritus ætheris nitrosi .....	60	c.cm. or f℥ij.
Syrupi aurantii .....	90	c.cm. or f℥ij.

M. Sig.: Two teaspoonfuls in water every two or three hours.

R Potassii iodidi,		
Salicin. ....	aa 0/50	Gm. or gr. c.

M. et ft. capsulæ no. xx.

Sig.: Two or three capsules every two or three hours.

In acute rheumatism or gout, when attended with constipation, the following prescription, containing potassium iodide, is serviceable:—

R Potassii iodidi,		
Potassii acetatis .....	aa 14	Gm. or ℥iiss.
Fluidext. rhamnus pursh. ....		
Glycerini .....	aa 30	c.cm. or f℥j.
Aquæ cinnamomi .....	90	c.cm. or f℥ij.

M. Sig.: Two teaspoonfuls in water every two or three hours.

Potassium iodide is the most efficacious remedy in the treatment of actinomycosis. In a case reported by Buzzi and Valeirio the fistulæ began to close, the swelling and pain to disappear in a few days, and recovery was complete in three months. In the treatment of psoriasis<sup>1</sup> large doses of one of the iodides, and preferably potassium iodide, is at times attended with complete removal of the eruption. Psoriasis is, however, more frequently controlled or cured by potassium iodide when the disease depends upon rheumatism or gout. In periostitis, resulting from exposure to cold or wet, the iodides are rapidly curative, and the tincture may also be applied locally. In chronic mercury or lead poisoning the metal may be removed from the system by iodides, but the dose should be small and the treatment continued for some time. Chronic bronchitis with thick, tenacious sputa, and asthma are very much helped by the administration of the iodides. Catarrhal pneumonia, acute or chronic, is benefited by doses large enough to liquefy the sputa:—

R Potassii iodidi .....	14	Gm. or ℥iiss.
Tinct. lobeliæ .....	15	c.cm. or f℥iv.
Spiritus ætheris comp. ....	60	c.cm. or f℥ij.
Syrup. aurantii .....	75	c.cm. or f℥iiss.

M. Sig.: From one to two teaspoonfuls in water every two or three hours until relieved. Serviceable in chronic bronchitis and in asthma.

In the broncho-pneumonia of measles, Dr. Bicente relies upon potassium iodide, which seldom fails to produce amendment within a few days, provided tuberculosis be not present. Dr. Valten asserts that the adminis-

<sup>1</sup> See paper by the author on "The Cause and Treatment of Psoriasis," "Transactions of the Pennsylvania State Medical Society," 1888.

tration of a large dose of potassium iodide—not less than 6 Gm. (or gr. *xc*), given singly or in divided portions within twelve or, at most, twenty-four hours after the initial chill—will bring about a rapid lysis or crisis of the fever in croupous pneumonia. This method does not abridge the course of the disease, but, it is claimed, obviates the danger of cardiac collapse. After the first twenty-four hours no benefit is derived from the use of the remedy. The writer furthermore states that excellent results are obtained in epidemic cerebro-spinal meningitis from the administration of potassium iodide in doses of 3 to 6 Gm. (or gr. *xl*-*xc*), given once or several times during the day. Moody gives an account of several cases of the fulminant type and also of a local epidemic in which the iodine treatment recommended by Tanner was strikingly successful. His conclusions were as follow: In the fulminant or apoplectic form of cerebro-spinal meningitis no known treatment offers any hope of cure. In the ordinary form, commonly known as "spotted fever," potassium iodide is the only drug which has shown any power to modify the disease. That drug should not be depended on alone, but any means known to therapeutics should be employed whenever it renders the patient more comfortable or aids him to resist the exhausting conditions of the disease. Finally, the writer does not consider the known influence of the iodide on absorption a sufficient explanation of its usefulness in the disease, but thinks it more likely that it either has some quality that acts as an antidote to the toxins secreted by the pathogenic organisms or is unfavorable to their development.

In cardiac dropsy sodium iodide alone or combined with digitalis and buchu is often most beneficial in its effect. It can be prescribed thus:—

**R** Sodii iodidi ..... 15/5 Gm. or 3iv.  
 Infus. digitalis,  
 Infus. buchu ..... aa 90| c.cm. or f3ijj.  
**M.** Sig.: Two teaspoonfuls every three or four hours.

In Bright's disease Semmola prescribes:—

**R** Potass. iodid. .... 1| Gm. or gr. *xv*.  
 Sodii phosphatis ..... 2| Gm. or gr. *xxx*.  
 Sodii chloridi ..... 0| Gm. or 3iss.  
 Aquæ ..... 600| c.cm. or 3xxf3ijj.  
**M.** et ft. sol.

**Sig.**: The entire quantity in divided doses to be taken during the day.

Potassium iodide is likewise of value in pulmonary emphysema and in asthma, especially in that form associated with chronic bronchitis and emphysema. In asthma dependent upon gastric conditions it is of little or no avail.

In chronic bronchitis and pleurisy the following combinations are useful:—

**R** Potassii iodidi ..... 15/5 Gm. or 3iv.  
 Syr. ferri iodidi,  
 Glycerini ..... aa 45| c.cm. or f3ias.

**M.** Sig.: A teaspoonful in water four times a day.

**R** Potassii iodidi ..... 1/55 Gm. or gr. *xxiv*.  
 Potassii bromidi ..... 4| Gm. or 3j.  
 Ammonii chloridi ..... 8| Gm. or 3ij.  
 Syr. eriodictyi aromat. (N. F.)  
 Aquæ ..... aa 45| c.cm. or f3iss.

**M.** Sig.: A dessertspoonful every two or four hours, for cough with scanty expectoration.

Potassium iodide may be combined with potassium bromide for the treatment of epilepsy, as employed by Brown-Séquard.

Dr. Lauder Brunton states that potassium iodide is the most efficient remedy in preventing the recurrence of attacks of angina pectoris. For this purpose he prescribes it in doses of 0.32 to 2 Gm. (or gr. v-xxx) three times a day. Dr. Schweighofer has reported<sup>1</sup> a case of cretinism, associated with myxœdema and goitre, in which decided amendment followed the use of a like quantity of the same remedy, continued for nine months. The myxœdema and goitre were favorably influenced and the patient gained in intelligence.

Dr. Schleich, from his observation of ninety-two cases of deep wounds, believes that the administration of potassium iodide, in doses of 0.32 Gm. (or gr. v) three times a day, promotes repair.

The tincture of iodine has been administered internally in 0.30- to 0.50-c.cm. (or *mv-viii*) doses in the treatment of malarial affections; and the compound solution (Lugol's solution) is widely known as a remedy in scrofulous affections of the skin and of the lymphatic glands, especially in syphilitic children. The solution, with arsenic, is very serviceable in some old syphilitic skin diseases attended by thickening and scaling.

Rothe advises the use in whooping-cough of a combination of iodine and carbolic acid.

Dr. Renzi has observed a favorable influence upon the progress of pulmonary tuberculosis produced by the administration of a mixture containing iodine, potassium iodide, and sodium chloride.

Zinc iodide is in white, needle-shaped crystals, and is unstable. It is best administered as a syrup (4 Gm. in 30 c.cm., or *ʒi-fʒj*); dose, 1.20 to 2.50 c.cm. (or *mxx-xl*). It has been used in ointment, with lard (10 per cent.), in the treatment of tumors, and a solution (0.065 to 0.13 Gm. to 30 c.cm., or gr. *i-ij* to *fʒj*) has been injected in gonorrhœa. Stronger solutions have been applied to enlarged tonsils.

Small and repeated doses of ammonium iodide are efficacious in catarrhal jaundice. This salt may be serviceably employed in bronchitis and broncho-pneumonia. It is also considered of advantage in the early stage of cirrhosis of the liver and in chronic malaria, associated in the latter condition with arsenic.

Drop doses of the tincture of iodine will sometimes allay the vomiting of pregnancy. In the form of tincture, compound solution, or potassium iodide, this agent has been employed in typhoid fever, and, though no marked influence is exerted upon the course of the disease, the temperature, or the diarrhœa, Liebermeister believes that it effects a notable reduction of the mortality. Bartholow's combination of the tincture of iodine and carbolic acid seems to moderate the severity of typhoid fever:—

R Tinct. Iodi ..... 7½ c.cm. or fʒij.  
Phenolis liq. .... 4 | c.cm. or fʒj.

M. Sig.: One to three drops thrice daily.

Chantemesse uses in furunculosis during typhoid fever, a solution of iodine (2 parts) in acetone (5 parts), applied with absorbent cotton. This iodine-acetone is stronger than tincture of iodine, and is more irritant when freshly made. One application is usually sufficient to abort a boil. If used

<sup>1</sup> *Lancet*, Dec. 16, 1893.

freely, it may excite an eruption, and even cause ulceration; applied to a granulating surface it causes pain.

Dr. Phillips has given with success the tincture of iodine in doses of a few minims in cases of atonic diarrhœa. This writer states, moreover, that the preparation, used in the same manner, will often cure the tormina and tenesmus of dysenteric diarrhœa.

Ringer states that "in some epidemics of diphtheria" the inhalation of the vapor of iodine proves of signal service, and Dr. S. N. Zenenko<sup>1</sup> has spoken very highly of the internal administration of potassium iodide in this affection. From 0.03 to 0.20 Gm. (or gr. ss-ijj) was given to children, 0.32 to 0.50 Gm. (or gr. v-vijj) to adults, and repeated every second, third, or fourth hour. Antiseptic gargles, alcoholic stimulation, and inunction of the enlarged cervical glands with mercurial ointment were used in conjunction. Of a series of twenty-one patients so treated, none died, while of nineteen cases treated during the same time, in the same hospital (at Nijni Novgorod), after ordinary plans, 84 per cent. ended in death. The internal administration of potassium iodide will sometimes reduce enlargement of the mammary gland or testicle, and by some physicians is said to check the secretion of milk. Sciatica and lumbago are sometimes relieved by the same remedy. It is useful in the first stage of hepatic cirrhosis, in hypertrophic metritis, and in various syphilitic manifestations, especially when other remedies are not well borne by the stomach. Uterine fibromyomata have been materially decreased in size by the use of this remedy either given by the mouth or injected into the substance of the growth. Chronic urticaria has been successfully treated with potassium iodide. Stern reported<sup>2</sup> five cases treated in this way. None were syphilitic, and all were rapidly cured. The itching was promptly relieved, and one patient became well after only 10 Gm. (or 5iiss) had been administered, although he had suffered previously for four months.

Baczkievicz states that potassium iodide is readily absorbed by the rectal mucous membrane, iodine being detected in the saliva in five to fifteen minutes after administration by enema or suppository. According to the numerous experiments of Calantoni on men and animals, potassium iodide is absorbed as rapidly by the bowel as by the stomach; if speedy absorption is particularly desirable it may be obtained by heating the solution to 98° F. Elimination after injection into the rectum is as rapid as when it is taken by the mouth.

Kobner administers a potassium-iodide combination by means of enema. Given once a day at first, but subsequently twice daily, the therapeutic action is said to be very rapid. He combines mercurial inunctions, and believes that this method is equally efficacious and better tolerated than subcutaneous injections. His formula is as follows:—

R Potassii iodidi .....	3j	Gm. or gr. xlv.
Potassii bromidi .....	1	Gm. or gr. xv.
Extract. belladonnæ folior. ....	32	Gm. or gr. v.
Aquæ .....	210j	c.cm. or f3vij.—M.

Twenty-four c.cm. (or f5viss) of this solution are added to 60 or 90 c.cm. (or f5ij-ijj) of water and thrown into the rectum. Kobner frequently adds from 0.30 to 0.60 c.cm. (or mv-x) of pure tincture of iodine to each enema,

<sup>1</sup> *Vratch*, No. 42, 1890; *Satellite*, Jan., 1891.

<sup>2</sup> *London Medical Recorder*, Nov. 20, 1890.

and finds the mixture well tolerated by the large intestine. He has never observed any resulting local inflammation.

The potassium iodide and chlorate are incompatible, a deleterious salt, potassium iodate, being formed.

**Iodized starch** has lately been employed with asserted benefit by a number of Russian physicians as an intestinal disinfectant in typhoid fever and various septic affections of the bowels. It was given in the dose of 0.50 to 0.65 Gm. (or gr. viii-x). **Iodine trichloride**, obtained by passing chlorine-gas over iodine, occurs in the form of reddish crystals, is soluble in its own weight of water and freely soluble in alcohol. Either its aqueous or alcoholic solution can be mixed with glycerin without decomposition. Iodine trichloride has been employed by Belfield, of Chicago, in genito-urinary and surgical affections. He finds it of advantage in tuberculosis and suppuration. For instillation in the posterior urethra, for irrigation of the bladder, and for hypodermic injections, he made use of a  $\frac{1}{10}$ - to  $\frac{1}{2}$ -per-cent. solution, either in distilled water or in 4 parts of water with 1 part of glycerin. Serous cavities were injected with the same solutions. For cleansing suppurating wounds 1- to 5-per-cent. solutions were employed. To ulcerated carcinoma and venereal sores he applied a 5- to 20-per-cent. solution in equal parts of water, glycerin, and alcohol. Dr. Pflueger, of Berne, recommends iodine trichloride in various affections of the eye. For subconjunctival injections a 1 to 1500 solution was employed. As a collyrium, solutions from 0.1 to 1 per cent. were used. Gottschalk treated three cases of puerperal septicæmia, of which two recovered, by means of hypodermic injections of a 1-per-cent. solution, from 1 to 2 c.cm. (or *mxv-xxx*) being injected once or twice each day.

**Iodine tribromide** has been used by Kraus for gargles and inhalations in diphtheria. His solution contained 1.30 Gm. to 531 c.cm. (or gr. *xx-f3xviij*) of water.

**Ethyl-iodide** is administered by inhalation (0.60 to 2 c.cm., or *mx-xxx*) whenever necessary to relieve coughing, especially in bronchitis, asthma, and phthisis, and is the most direct method of introducing iodine into the blood.

**Iodantifebrin.**—This substance results from the interaction of iodine chloride and acetanilid. It crystallizes in rhombic tablets, which are slightly soluble in cold water, alcohol, and ether; more freely soluble in hot alcohol and glacial acetic acid; is without odor or taste, and appears to pass through the organism unchanged. Dose, 0.13 to 0.50 Gm. (or gr. *ii-viii*).

**Iodantipyrin.**—This combination is prepared by a similar process to that which produces iodantifebrin. Iodantipyrin crystallizes in colorless, lustrous, and prismatic needles, is without taste or special odor, is scarcely soluble in cold water or alcohol, but dissolves when these menstrua are warmed. Dose, 0.03 to 0.13 Gm. (or gr. *ss-ij*).

Clinical experiments with both these bodies were carried on in the clinic of Professor von Jaksch, and the results have been published by Dr. Munzer. The antipyretic effects of iodantipyrin are identical with those of antipyrin, and, in all probability, it is decomposed in the stomach into antipyrin and iodine. The reduction of temperature was accompanied by sweating, but was unattended by collapse or chills.

**Iodiphenin.**—Iodiphenin, an iodine derivative of phenacetin, is a chocolate-brown powder, which, upon recrystallization from glacial acetic

acid, yields crystals of a steel-blue color. It is soluble in alcohol, ether, and chloroform; almost insoluble in water; but releases a large proportion of iodine when brought into contact with water. It is said to be very destructive to the staphylococcus aureus, but, according to Dr. W. Siebel, its physiological action depends upon the iodine which it liberates. It discolors, and, if left long in contact with the skin, produces irritation. Iodine poisoning is liable to result even from small doses of the compound, when given by the mouth.

**Iodipin** is a trade designation for a solution of iodine in sesame-oil (10 per cent.) analogous to bromipin. The taste of the preparation is rather unpleasant, but patients are said not to object to it after they have become accustomed to it. Iodipin is taken internally for the same purpose as other iodine preparations: for struma, cold abscesses, etc. It may also be administered subcutaneously, 50 c.cm. (or f̄xiiss) daily being employed in children. The dose by the mouth, in children, is 4 c.cm. (or f̄j) three times daily. Klingmüller claims especial advantages in the treatment of tertiary syphilis by the subcutaneous use of iodipin. For hypodermic use, a 25-per-cent. iodipin is employed. It also may be used for inunction, in struma, tuberculosis, and syphilis.

**Iodo-eigon** (alpha-eigon) is a pale-brown powder, tasteless and odorless, containing, it is said, 20 per cent. of iodine. It is used as a wound dressing as a substitute for iodoform, but is claimed to be a more efficient disinfectant. It is insoluble in water, but mixes with the secretions, forming an emulsion-like dressing. It may be employed suspended in water as an injection into sinuses, or simply dusted upon the wound surface. (See also **Eigon**.)

**Nosophen**.—This compound, obtained by the action of iodine upon a solution of phenolphthalein, is a light-yellow powder free from odor or taste, and contains 60 per cent. of iodine. It is insoluble in water, and combines with metals to form salts. Nosophen has been used in rhinitis, after operations upon the nasal cavity, and in venereal affections.

#### **IPECACUANHA (U. S. P.).—Ipecac.**

#### **IPECACUANHÆ RADIX (B. P.).—Ipecacuanha-root.**

**Dose**, as an expectorant, 0.015 to 0.13 Gm. (or gr.  $\frac{1}{4}$ -ij); as an emetic, 1 to 2 Gm. (or gr. xv-xxx).

#### *U. S. P. Preparations.*

**Fluidextractum Ipecacuanhæ**.—Fluid Extract of Ipecac. **Dose**, as an expectorant, 0.03 to 0.12 c.cm. (or mss-ij); as an emetic, 1 to 1.20 c.cm. (or mxv-xx).

**Syrupus Ipecacuanhæ**.—Syrup of Ipecac. **Dose**, 4 to 7.5 c.cm. (or f̄3i-ij).

**Vinum Ipecacuanhæ**.—Wine of Ipecac. **Dose**, 0.60 to 4 c.cm. (or mx-f̄j).

**Pulvis Ipecacuanhæ et Opii**.—Powder of Ipecac and Opium, Dover's Powder (1 part each of opium and ipecac and 8 parts of sugar of milk). **Dose**, 0.13 to 0.65 Gm. (or gr. ii-x).

**Tinctura Ipecacuanhæ et Opii**.—Tincture of Ipecac and Opium (deodorized tincture of opium, 100; fluid extract of ipecac, 10; diluted alcohol, q. s. to make 100 c.cm.). **Dose**, 0.06 to 1 c.cm. (or mi-xv).

#### *B. P. Preparations.*

**Extractum Ipecacuanhæ Liquidum**.—Liquid Extract of Ipecacuanha. **Dose**, as an expectorant, 0.03 to 0.12 c.cm. (or mss-ij); as an emetic, 1 to 1.20 c.cm. (or mxv-xx).

**Acetum Ipecacuanhæ.**—Vinegar of Ipecacuanha (liquid extract, 5; alcohol, 90 per cent., 10; dilute acetic acid, 85). Dose, 0.60 to 2 c.cm. (or *mx-xxx*).

**Vinum Ipecacuanhæ.**—Ipecacuanha-wine. Dose, as an expectorant, 0.60 to 2 c.cm. (or *mx-xxx*); as an emetic, 15 to 22 c.cm. (or *f3iv-vj*).

**Trochiscus Ipecacuanhæ.**—Ipecacuanha Lozenge (0.016 Gm., or gr.  $\frac{1}{4}$  to each lozenge). Dose, 1 or more.

**Trochiscus Morphine et Ipecacuanhæ.**—Morphine and Ipecacuanha Lozenge (morphine hydrochloride, 0.0018 Gm., or gr.  $\frac{1}{32}$ ; ipecacuanha-root, 0.005 Gm., or gr.  $\frac{1}{32}$ ). Dose, 1 or more.

**Pulvis Ipecacuanhæ Compositus.**—Compound Powder of Ipecacuanha, Dover's Powder (1 part each of opium and ipecacuanha and 8 parts of potassium sulphate). Dose, 0.32 to 1 Gm. (or gr. *v-xv*).

**Pilulæ Ipecacuanhæ cum Scilla.**—Pill of Ipecacuanhæ with Squill (compound powder of ipecacuanha, 3; squill, in powder, 1; ammoniac, in powder, 1; syrup of glucose, to make a mass). Dose, 0.25 to 0.50 Gm. (or gr. *iv-viii*).

**Pharmacology.**—The dried root, to which may be attached a portion of the stem not exceeding 7 cm. in length, of *Cephaelis Ipecacuanha* of A. Richard<sup>2</sup> (Rubiaceæ), known commercially as Rio, Brazilian, or Para Ipecac, or the corresponding portion of *C. acuminata*, Karsten, known commercially as Carthagena Ipecac, yielding when assayed not less than 2 per cent. of ipecac alkaloids. In the British Pharmacopœia it is called *Psychotria Ipecacuanha*. Ipecac-root contains about 3 per cent. of an alkaloid, **Emetine**, and a glucoside, **Ipecacuanhic acid**, with a trace of volatile oil, tannin, starch, gum, etc. Owing to the scarcity of the Rio root (*C. Ipecacuanha*), the cheaper Carthagena variety (*C. acuminata*) is now generally used. The former contains Emetine, the more purely expectorant principle, in excess; the latter contains Cepæline, the more purely emetic principle, in excess.<sup>1</sup> Recent experiments seem to show that emetine is not homogeneous, but is a mixture of two or more different substances. Paul and Cownley confine the name **emetine** to the amorphous alkaloid, and state that it properly is **methyl-cepæline**, the crystallizable alkaloid being named **cepæline**. Emetine is slightly soluble in water, but it dissolves readily in ether, alcohol, and chloroform.

**Physiological Action.**—The prolonged application of ipecac to the skin causes irritation, followed by vesicles, pustules, or even ulcers. Inhalation of the powdered root irritates the air-passages and occasions coryza, or, in some persons, an asthmatic attack. The powdered root has a slight, but characteristic and nauseous, taste. Taken into the mouth, it increases the salivary secretion and excites nausea; and, in the stomach, in a similar way, small doses (0.015 Gm., or gr.  $\frac{1}{4}$ ) promote secretion, while large ones cause nausea and vomiting. Ipecac is a systemic emetic, and causes vomiting when swallowed, and also when injected hypodermically in the form of fluid extract, or the alkaloid, **Emetine**. This drug has a peculiar effect upon the pulmonary circulation, sometimes causing hyperæmia, and at others reducing the amount of blood in the lungs and producing relative anæmia. Small doses stimulate the liver, and larger ones, after tolerance has been established, act as cholagogic cathartics. The active principle is excreted by the liver and gastro-intestinal tract. The skin is relaxed and perspiration increased; the secretions of the broncho-pulmonary mucous membrane are also increased. No marked effect upon the circulation is noticed, but emetine exercises a solvent action upon the red corpuscles when injected into a

<sup>1</sup> *New York Medical Journal*, 1905, p. 1330.

vein. The pulse is reduced in tension as a result of the act of vomiting, which also favors diaphoresis. Urticaria is occasionally caused by the internal use of *ipecacuanha*.

**Therapy.**—*Ipecac* has been used externally with benefit for insect-bites.

In the dermatitis caused by *rhus toxicodendron* the free application of a wash containing powdered *ipecac* in the proportion of 12 Gm. to 473 c.cm. (or 3iii-Oj) of water, is warmly recommended by Dr. W. S. Gilmore. In the form of a spray with a hand-atomizer a dilute solution of the wine of *ipecac*, as recommended by Murrell and Ringer, is of great service in emphysema, fibroid phthisis, chronic bronchitis, and winter cough, in allaying the spasmodic vomiting and liquefying the secretions. Ringer dilutes the wine with 1 or 2 parts of water, and, using an ordinary hand-atomizer, twenty or more squeezes of the bulb are made, and the spray deeply inhaled, once daily at first, afterward more frequently. The mouth should be well rinsed out afterward and a piece of lemon-peel chewed to avoid a nauseating effect. When fractional doses of wine of *ipecac* are administered (0.06 c.cm., or *mj*, every hour or half-hour) they may act as a stimulant, and overcome obstinate vomiting and retching, just as small doses of brandy do. In the vomiting of pregnancy it is said that a single drop, taken every hour, is curative; it certainly makes a decided mental impression, and also may overcome the morbid action of the stomach by substitution. Bartholow, however, declared that it had always failed in his hands. In hæmoptysis, small doses of the following combination have sometimes proved of service:—

R Pulveris <i>ipecacuanhæ</i> .....	75 Gm. or gr. xij.
Bismuth. subnit. ....	155 Gm. or gr. xxiv.
Creosoti .....	37 c.cm. or <i>mvj</i> .

M. et ft. chartulæ no. xij.

Sig.: A powder every hour or two until relieved.

In hæmoptysis small doses of the powder, short of producing vomiting, serve to reduce the bleeding by decreasing the pulmonary congestion. It has also given good results in the treatment of epistaxis and uterine hæmorrhages. The fact that small doses of *ipecac* have a favorable influence in arresting and preventing hæmoptysis induced Onimus to apply the same treatment to metrorrhagia, and he recently announced at the Paris Société de Biologie that he had found it remarkably effective.

The wine of *ipecac* has been successfully employed in doses of 0.60 to 1 c.cm. (or *mx-xv*) for the purpose of overcoming uterine inertia in the first and second stages of labor. It is said that the drug does not excite tetanic contraction, but normal and regular expulsive efforts.

An attack of asthma may be cut short by full doses of *ipecac*, and an occasional emetic is useful in whooping-cough and capillary bronchitis to dislodge the secretions. Bond<sup>1</sup> reports excellent results in a case of epilepsy from *ipecacuanha*, beginning with 0.60 c.cm. (or *mx*); the dose was gradually increased to 2.30 c.cm. (or *mxxvj*) three times a day. The severity and frequency of the fits gradually diminished for a year, and then ceased entirely.

When, in bronchitis, the secretions are viscid and the cough hard, *ipecac* in combination with other expectorants is generally resorted to. The appended formulæ containing *ipecac* are to be recommended in bronchitis:—

<sup>1</sup> *Lancet*, Sept. 17, 1898.

<b>B</b> Vini ipecacuanhæ .....	7½	c.cm. or f3ij.
Syrup. scillæ .....	60	c.cm. or f3ij.
Tinct. opii camph. ....	15	c.cm. or f3ss.
Glycerini .....	q. s. ad 150	c.cm. or f3v.
<b>M.</b> Sig.: One or two teaspoonfuls whenever necessary for the relief of cough.		
<b>B</b> Syrup. ipecacuanhæ .....	15	c.cm. or f3ss.
Ammonii chloridi .....	8	Gm. or 3ij.
Spiritus ætheris nitrosi .....	45	c.cm. or f3ss.
Morphinæ sulphatis .....	0.65	Gm. or gr. j.
Syrup. pruni Virg. ....	q. s. ad 150	c.cm. or f3v.
<b>M.</b> Sig.: Two teaspoonfuls every hour or two for the relief of cough.		

For bronchitis, especially of elderly persons, ipecacuanha can be combined thus with advantage:—

<b>B</b> Syrup. ipecacuanhæ .....	30	c.cm. or f3j.
Potassii nitratis .....	8	Gm. or 3ij.
Cressoti .....	30	c.cm. or mv.
Glycerini,		
Aquæ aurantii florum .....	aa 60	c.cm. or f3ij.
<b>M.</b> Sig.: Two teaspoonfuls in water every two or three hours.		

In croup, especially where the mucus is not expelled, but is swallowed or accumulates in the air-passages, an emetic dose of syrup of ipecac often gives great relief and may prevent suffocation. For cases of this kind, it is much superior to tartar emetic or the compound syrup of squill, also containing this salt, which is too depressing. In delirium tremens, or acute alcoholic poisoning, ipecac produces evacuation of the contents of the stomach and stimulates the action of the liver. It is too slow in its action as an emetic to be of much service in other forms of poisoning. In dysentery, 2.60 to 4 Gm. (or gr. xl-lx) are given with wonderfully successful results; if necessary to quiet the stomach an opiate is administered about twenty minutes previously; no liquids swallowed for an hour after the ipecac has been taken, and absolute rest in the recumbent posture observed. The same treatment is useful in cholera morbus, and has been recommended in Asiatic cholera.

Ipecac deprived of its emetine has been found by East-Indian physicians equally efficient in dysentery. It is administered in about the same doses as ipecac and is less apt to excite nausea or vomiting. In dysenteric diarrhœa, when blood and mucus appear in the stools, small doses may be given, combined with opiates or Dover's powder. Ipecac, with mercury and opium, often acts well in both diarrhœa and dysentery:—

<b>B</b> Pulveris ipecacuanhæ et opii .....	4	Gm. or 3j.
Massæ hydrargyri .....	65	Gm. or gr. x.
Camphoræ,		
Pulveris capsici,		
Pulveris kino .....	aa 1	Gm. or gr. xv.

**M.** et ft. pil. no. xxx.

**Sig.:** One or two pills every hour or two until relieved.

Ipecac has been used in tuberculous diarrhœa with alleged advantage. It is said to have the power of restraining night-sweats.

Emetine has been successfully used in diarrhœa due to indigestion. It is given in the dose of 0.0002 Gm. (or gr.  $\frac{1}{500}$ ), preceded by a calomel purge. Nausea disappears and diarrhœa is rapidly controlled.

Ipecac is also used in fractional doses for insufficient excretion of bile and torpor of the liver, and may be combined with extract of digitalis, or other agents, as follows:—

R. Pulv. ipecacuanhæ .....	25 Gm. or gr. iv.
Quininae hydrochlorat. ....	4   Gm. or 3j.
Pepsin. ....	1   55 Gm. or gr. xxiv.
Olei eucalypti .....	18 c.cm. or miiij.

M. et ft. pil. no. xxiv.

Sig.: Take one after meals.

Small doses of ipecac, given after meals, are of service in flatulent dyspepsia. When the tongue is heavily coated and the stomach contains indigestible food, especially at the beginning of a fever, an emetic dose of ipecac will prove very serviceable in relieving symptoms; it is a means of treatment that has been allowed to fall into undeserved neglect. In the treatment of malarial poisoning, this method of stimulating the liver is very useful previous to the administration of quinine or other antiperiodics. It is of service likewise in the treatment of catarrhal jaundice.

In laryngismus stridulus, an emetic of syrup of ipecac usually aborts the paroxysm and affords time for the use of potassium bromide to produce its effects. Trousseau recommended its use in the puerperal state, in cases of post-partum hæmorrhage, and dysentery, etc. In other forms of hæmorrhage, such as epistaxis, menorrhagia, and metrorrhagia, ipecac is serviceable when given in doses sufficient to provoke vomiting. Dr. C. Burland testifies to its value in controlling hæmatemesis. He administers it in the dose of 4 Gm. (or 3j) or more, made into a bolus with enough glycerin to produce the necessary consistency.

The *Euphorbia Ipecacuanha* (Euphorbiaceæ), Ipecacuanha spurge, growing in the eastern part of the United States, from New York southward, although belonging to a different natural order, yet contains in its root an emetico-cathartic principle, which renders it a good substitute for ipecac where emesis is required and catharsis is not objectionable. It is commonly administered in the form of powdered root, but a fluid extract may also be obtained. It is of more agreeable taste than ipecac.

**IRIS.**—*Iris* (Blue Flag).

Dose, 0.20 to 0.25 Gm. (or gr. iii-iv).

#### Preparations.

Extractum Iridis.—Extract of Iris. Dose, 0.015 to 0.065 Gm. (or gr.  $\frac{1}{4}$ -j).

Fluidextractum Iridis.—Fluid Extract of Iris. Dose, 2 to 4 c.cm. (or mxxx-f3j).

**Pharmacology.**—The *Iris versicolor* (Iridæ) is a common inhabitant of moist places and borders of ponds of the United States, and is one of the most attractive among our wild flowers. It is an herbaceous perennial, with a thickened root-stock. The dried rhizome and roots were formerly official in the United States Pharmacopœia (Revision of 1890). The flowers are large and showy, violet-blue, variegated with greenish-yellow and white, with purple veins; they appear in May and June. It contains an acrid resin, upon which its medical activity depends, besides ordinary vegetable principles. Iridin is an impure resin, precipitated from alcoholic tincture by water.

**Physiological Action.**—The powdered root, when fresh, is a powerful emetic and cathartic, less so after drying. It is a decided cholagogue, and also diuretic and alterative, having a stimulant action upon the intestinal glands. It is best given in combination with aromatics and milder purgatives.

**Therapy.**—In chronic hepatic derangements, especially of malarial origin, the preparations of blue flag are very useful, and particularly the recent saturated tincture. In duodenal catarrh, obstructive jaundice, bilious remittents, iris preparations are frequently used with advantage. In dropsy they are also useful, both as diuretics and cathartics. Iris, administered in small doses, is very beneficial in sick headache dependent upon indigestion. In larger doses it has vermifuge properties and may be used to expel the round worm, *ascaris lumbricoides*.

R Fluidext. iridis.

Fluidext. hydrastis . . . . .	aa 15	c.cm. or fʒss.
Elixir aromatic. . . . .	30	c.cm. or fʒj.

M. Sig.: Take a dessertspoonful in hot water before meals for indigestion.

**IRIS FLORENTINA.**—**Orris-root.** Several species of the genus *Iris* (*Iridacæ*) furnish the rhizome known by the name of orris-root. It contains a volatile oil of violet color and pleasant odor, much used in perfumery; besides an acrid resin, starch, mucilage, etc. The powder, which is said to be alterative, cathartic, and diuretic, is rarely employed internally, but is used in making sachets, tooth-powders, and in alcoholic tincture, in perfumery and flavoring extracts.

**ISO-ETHYLIN** is the name of a new antiseptic formed by the destructive distillation of ethyl alcohol, as formaldehyd is produced from methyl alcohol, and possesses some of the characteristics of the latter. Its germicidal power, however, is slightly below that of formaldehyd. Dr. G. M. Randall, of Augusta, Me., hopes it will prove capable of keeping milk from spoiling, while harmless. Experiments lately made on animals led him to believe that, in minimum strengths capable of arresting bacterial growths, the iso-ethylin does not interfere with digestion. Being volatile at 100° F., he thinks that the body-temperature is sufficient to drive it out of the milk and thus keep it from interfering with the action of the gastric juice.

**IZAL.**—Izal is a by-product obtained in the manufacture of coke. It was found by Dr. Klein, of London, that a 1 to 200 solution was destructive, within five minutes, to various species of microbes. It is not irritant, however, in this strength to the human integument. This solution has been used for the purpose of disinfecting sponges and instruments, and for impregnating gauze intended as a dressing to wounds.

**JABORANDI FOLIA** (B. P.).—(See *Pilocarpus*, U. S. P.)

**JALAPA** (U. S. P., B. P.).—**Jalap.**

**Dose,** 0.32 to 1.30 Gm. (or gr. v-xx).

#### *Preparations.*

**Resina Jalapæ** (U. S. P., B. P.).—**Resin of Jalap.** Dose, 0.005 to 0.25 Gm. (or gr. ʒ-iv).

**Extractum Jalapæ** (B. P.).—Extract of Jalap. Dose, 0.13 to 0.32 Gm. (or gr. ii-v).

**Pulvis Jalapæ Compositus** (U. S. P., B. P.).—Compound Powder of Jalap (U. S. P. contains jalap, 35 Gm.; cream of tartar, 65 Gm.). Dose, 0.65 to 4 Gm. (or gr. x-3j).

**Tinctura Jalapæ** (B. P.).—Tincture of Jalap (contains 1.5 Gm., or gr. xxij, of resin in 100 c.cm., or f3xxvij). Dose, 2 to 4 c.cm. (or f3ss-j).

**Pharmacology.**—“The tuberous root of *Ipomœa Jalapa* (Convolvulacæ),” obtained from Mexico, contains not less than 8 per cent. of resin (U. S. P.); “the dried tubercles of *Ipomœa Purga*,” and should yield not less than 9 nor more than 11 per cent. of resin (B. P.). The resin is official and composed of **Jalapin**, a soft resin soluble in ether, and **Convolvulin**, a hard resin insoluble in ether, the latter of which has been found to be the more active; also starch and sugar, of each about 18 per cent. According to Professor Poleck, jalapin is a resinous glucoside, and separates by the action of hydrochloric acid into sugar and jalapinic acid. G. A. Kayser found that the resin is composed of a hard and a soft portion: the former, constituting 70 per cent., is called **Rhodeoretin** (identical with **Jalapin**). This substance purges violently in small doses (0.20 to 0.25 Gm., or gr. iii-iv), and is the most important active principle. It was renamed by Mayer, who called it **Convolvulin**. Poleck suggests the name **Orizabin**, as a substitute for Jalapin, and confirms the statement that this resin is identical in composition and chemical properties with scammonin.

**Physiological Action.**—Jalap is an hydragogic cathartic, increasing the intestinal secretions and the flow of bile; overdoses may produce hypercatharsis and prostration. Convolvulin is an irritant, and may cause gastroenteritis and collapse; it is a local purgative, and is not excreted in the urine or fæces, but is probably destroyed by oxidation or by the hepatic cells.

**Therapy.**—The compound powder of jalap is one of the best hydragogic cathartics for dropsy, either of heart or kidney disease; and in cases of pulmonary congestion and distended right heart, with lividity, shortness of breath, and so-called cardiac asthma, a teaspoonful of compound jalap-powder affords great relief.

In dropsy dependent upon cardiac or renal disease, Prof. Joseph Jones, of New Orleans, employed with advantage a diuretic and purgative wine thus composed:—

R. Fluidext. jalapæ,		
Fluidext. scillæ	aa 11	c.cm. or f3ij.
Fluidext. pilocarpi	30	c.cm. or f3j.
Fluidext. digitalis	2	c.cm. or mxxx.
Potass. nitrat.	15½	Gm. or 3iv.
Vini Angelicæ	1000	c.cm. or Oiiif5j.

M. Sig.: A tablespoonful every three hours. The quantity can be gradually increased if necessary.

As an ordinary laxative, the compound powder of jalap may be combined with compound licorice-powder where the latter fails alone, and is a good cathartic for children. Jalap may be used as a cathartic after administration of santonin or calomel, or where a tæniacide has failed to bring away the parasite. As a purgative, it is sometimes combined with calomel, but, as it acts more rapidly than the latter, the effect of the mercurial is lost unless it precedes the former from four to six hours. Jalap is not so rapid in its action as croton-oil, but is more manageable. In hæmorrhoids it does not

cause increased irritation, but relieves them by emptying the vessels above and clearing out the liver.

Convolvulin is an efficient purgative and may be prescribed in doses from 0.10 to 0.20 Gm. (or gr. iss-ij).

**JAMBOL.**—Jambol. The *Eugenia jambolana* (Myrtaceæ) is a tree indigenous to tropical America and the West and East Indies, where the acid fruit is eaten as food and as a remedy for diarrhœa and diabetes by the natives. It has also been used to some extent in Europe in the form of an extract in the treatment of diabetes. In some experiments<sup>1</sup> made in Professor Binz's laboratory, it was shown by Dr. C. Graeser that in dogs in which diabetes had been artificially induced by the administration of phloridzin, the simultaneous exhibition of jambol reduced the proportion of sugar materially (80 to 85 per cent.). There were no signs of toxic action after administration of large doses, 6 to 18 Gm. (or  $\text{Ziſs-ivss}$ ) daily, of extracts partly made from the whole fruit and partly from the rind or kernel. Mr. Thomas Stephenson also finds that jambol possesses the power of checking the action of diastasic ferments in converting starch into grape-sugar. The result of his experiments was to show conclusively that the greatest influence over the action of diastase was exerted by a preparation of the fresh kernels by a process avoiding the use of heat. The difference in the preparations made use of by different observers probably explains the varying results reported.

Scott added powdered jambol to malt and starch, and found that the formation of sugar was prevented. M. Villie, however, who repeated the experiment, obtained more sugar when jambol was present than when it was absent. Hildebrandt states, as the result of his experiments, that jambol prevents the action of plant-diastase and the sugar-forming ferments in the blood-serum, saliva, and pancreatic extract, but is without effect upon pepsin and trypsin. Many reports, for the most part favorable, have been made in regard to the efficacy of jambol in the treatment of diabetes mellitus. In the majority of cases the amount of urine was reduced, the proportion of sugar lessened and the general health improved under its use. In a number of instances this amendment has taken place in the absence of the usual regulation of diet. In pancreatic diabetes, on the other hand, Dujardin-Beaumetz asserted that the quantity of sugar in the urine is actually increased. This writer regarded the drug as merely an adjuvant to the dietetic management of moderately-severe cases of diabetes. Though the evidence of different observers is not always in accord, yet from what has been published the drug certainly merits a trial and the closest study of its therapeutic worth. In India jambol has long been esteemed of value in diarrhœa.

**JOHIMBIN** is derived from the bark of the johimbehe-tree of the Cameroons. Berger<sup>2</sup> writes of his success with this drug as an aphrodisiac. He cites 7 cases: 5 patients were suffering from "paralytic impotence"; the remaining 2 were healthy individuals (sexually) and received the treatment to demonstrate its harmlessness. The writer prepared a solution containing 0.01 Gm. to 20 c.cm. (or gr.  $\frac{1}{4}$ -f3vss) of water, of which 1.20 c.cm. (or *max*)

<sup>1</sup> *Lancet*, Nov. 2, 1889; *Therapeutic Gazette*, Jan., 1890.

<sup>2</sup> *Deutsche medicinische Wochenschrift*, April 25, 1901.

was given as a dose. The exhibition of the drug produced erections and power for coitus in a few days. Berger also states that if no reaction is obtained within a week the dose should be increased to 2.50 to 4 c.cm. (or *mxl-lx*). A. Eulenberg has used *johimbin* in cases of neurasthenic impotence with excellent results in doses of 0.60 c.cm. (or *mx*) of a 1-per-cent. solution. In some of the cases the effect of the drug passed off after a time and required a repetition of the treatment. In animals the drug produces a swelling of the testes and erections and large doses, 0.01 Gm. (or gr.  $\frac{1}{6}$ ), had no deleterious effect upon the general health of the animal.

**JUGLANS.—Juglans (Butternut).**

Dose, 4 to 8 G. (or *ʒi-ij*).

*Preparation.*

*Extractum Juglandis*.—Extract of Butternut. Dose, 0.32 to 2 Gm. (or gr. *v-xxx*).

**Pharmacology.**—The bark, collected in the autumn, of the root of *Juglans cinerea* (*Juglandaceæ*), a large tree of North America, contains **Nucin** or **Juglandic acid** (resembling chrysophanic acid), also resin, volatile oil, and fixed oil and tannin.

**Therapy.**—It is a mild cathartic, useful in chronic constipation and dysentery.

**Nut-oil** is the fixed oil obtained by expression from the crushed seeds of several species of *Juglandaceæ*. Walnuts and hickory-nuts yield about 25 per cent. of a fine, bland, pleasant-tasting oil, which can be used in pharmacy, or in medicine for massage, like other fixed oils. It is a drying oil, containing linolein.<sup>1</sup>

A decoction of walnut-leaves, used both externally and internally, is said by Dr. Rodionoff to be of value in *scrofula*.

**JUNIPERUS.—Juniper, Juniper-berries.**

*Preparations.*

*Spiritus Juniperi Compositus* (U. S. P.).—Compound Spirit of Juniper (oil of juniper, 8; oil of caraway, 1; oil of fennel, 1; alcohol, 1400; water, q. s. ad 2000 c.cm.). Dose, 7.5 to 15 c.cm. (or *ʒiii-iv*).

*Spiritus Juniperi* (U. S. P., B. P.).—Spirit of Juniper (oil of juniper, 5; alcohol, 95 c.cm.). Dose, 4 to 15 c.cm. (or *ʒi-ʒss*). B. P., 1.20 to 4 c.cm. (or *mx-ʒj*).

*Oleum Juniperi* (U. S. P., B. P.).—Oil of Juniper. Dose, 0.30 to 1.20 c.cm. (or *mv-xx*). B. P., 0.03 to 0.18 c.cm. (or *mas-ij*).

**Pharmacology.**—The fruit of *Juniperus communis* (*Pinaceæ*), an ever-green of this country and northern Europe, contains from 2 to 2  $\frac{1}{2}$  per cent. of a volatile oil, about 15 to 30 per cent. sugar, etc.; also a non-crystallizable principle, **Juniperin**. The volatile oil also exists in the leaves and other parts of the plant, and by macerating them in alcohol or spirits a liquor is produced, commonly known as gin, or spiritus *Genevæ*. As the commercial article is frequently adulterated with oil of turpentine and other ingredients known to the trade, the U. S. Pharmacopœia offers a substitute in the compound spirit of juniper. The oil of juniper obtained from

<sup>1</sup> "A Companion to the U. S. Pharmacopœia," Oldberg & Wall, New York, 1887.

the wood is inferior to that distilled from the berries, which is the official form from which the spirit and compound spirit are made.

**Physiological Action.**—Juniper stimulates the kidneys, but in health, while the discharge of urea is increased, the urinary water may be actually diminished temporarily; an overdose producing strangury and suppression of urine. In diseased conditions, however, the flow of urine is much more free, and especially where dropsy exists. The oil is carminative as well as diuretic, and in alcoholic solution is a frequently-used stimulant. It is contra-indicated in acute inflammation of the kidneys.

**Therapy.**—In various forms of dropsies, juniper is useful. In the form of an infusion, to which 15.5 Gm. (or  $\mathfrak{zss}$ ) of cream of tartar is a good addition, a pint being drunk through the day, the effects are soon manifest in Bright's disease and its attendant cedema and effusions. A combination with potassium acetate is also very effective, as:—

R Potassii acetatis .....	23	3	Gm. or $\mathfrak{zvj}$ .
Spiritus juniperi comp. ....	45		c.cm. or $\mathfrak{f\ssiss}$ .
Infusi scoparii .....	135		c.cm. or $\mathfrak{f\ssivss}$ .

M. et ft. sol.

Sig.: A tablespoonful three or four times a day.

Juniper gives relief in passive congestion of the kidneys and the lumbar pain which accompanies that condition. This remedy is inappropriate, however, in acute nephritis, on account of its stimulant properties. In large doses it sometimes excites priapism, strangury, or hæmaturia. Benefit is obtained from juniper in chronic pyelitis, prostatorrhœa, and gleet. Chronic catarrh of the bladder is also relieved by its use.

The juice of the berries has been successfully used in doses of 7.5 to 11 c.cm. (or  $\mathfrak{f\ssii-iij}$ ) as a diæretic for young children and in renal dropsy. The oil may be dropped in boiling water and inhaled to produce the same effect. In infantile colic a few minims of the compound spirit in hot water relieves flatulence and pain.

Juniper-wood by destructive distillation yields an oil known as oil of cade, official in both the United States and British Pharmacopœias (see *Oleum Cadinum*).

#### KAMALA.—Kamela (*Rottlera*).

**Pharmacology and Therapy.**—"The glands and hairs from the capsules of *Mallotus philippinensis* (Euphorbiaceæ)," a small tree of India and China, come to this country in the form of a finely-granular powder. It was dropped from the last revision of the United States Pharmacopœia. Kamala is inflammable, and is insoluble in cold and nearly so in hot water, but is largely soluble in alkaline solution, alcohol, and ether. From these solutions a resin is precipitated by the addition of water. Kamala is liable to be largely adulterated. The resinous material consists of several distinct principles, the most important of which is called *Rottlerin*, which is obtained by exhausting the drug with ether. In full doses, 4 to 12 Gm. (or  $\mathfrak{z\ss-iij}$ ), it is a drastic purgative, and in India it is used largely as a vermicide. For tape-worm the quantity named is given at a dose, mixed with molasses or other vehicle, with a little hyoscyamus to prevent griping, and its operation may be made more active by a dose of castor-oil, given after the last portion of kamala. A fluid

extract and a tincture (6 to 16 unofficial) are also used to expel lumbricoid worms. In the form of ointment kamala is used in the East in the treatment of scabies and ringworm.

**KAOLINUM** (U. S. P., B. P.).—**Kaolin** ( $\text{Al}_2[\text{Si}_2\text{O}_5]_2 + \text{Al}_2\text{O}[\text{OH}]_2$ ). Fuller's earth.

**CATAPLASMA KAOLINI** (U. S. P.).—**Kaolin Cataplasm**.

A native aluminum silicate, powdered and freed from gritty particles by elutriation. Porcelain clay is employed in medicine as a dusting-powder for intertrigo and eczema, to relieve irritation, and protect the surface from the air. It is employed pharmaceutically in pills as an excipient for silver nitrate, potassium permanganate, etc. The cataplasm contains glycerin as an excipient, with boric acid, methyl salicylate, and oil of peppermint. It has been found useful in relieving cellulitis, and in inflammation of internal organs. It should be applied warm and confined with a bandage.

**KAVA-KAVA**.—**Methysticum**. The *Macropiper latifolium* (Piperaceæ) is a shrub of the Hawaiian Islands, having a large root, which yields about  $2\frac{1}{2}$  per cent. of soft resin (consisting of two kinds, distinguished as **a** and **b**); about 1 per cent. of a neutral, crystalline principle, **methysticin** (or kavahin); and some yellow, volatile oil. This resembles piperine and cubebin, and is probably inert, the medicinal qualities depending upon the resins and volatile oil. It is best given in the form of a tincture or fluid extract (N. F.), made with alcohol as a menstruum.

**Physiological Action**.—In the Hawaiian Islands the natives prepare an intoxicating beverage by chewing the root and infusing it with water or cocoa-nut-milk to grace their festivals. In consequence of prolonged use Lutz has observed that the skin of the Islanders, especially upon the extremities, assumes a decidedly ichthyotic appearance, associated with a certain degree of atrophy resembling that of old persons.

The physiological action of kava-kava has been investigated by Lewin, Randolph, and others. Dr. David Cerna has published an account of a series of experiments<sup>1</sup> upon the same subject. When the fluid extract or the resin is placed upon the tongue, a burning sensation is at first produced, soon followed by an increase of saliva and local anæsthesia. The loss of sensation endures for hours, and normal sensibility slowly returns. The same benumbing influence is exercised upon the cornea and conjunctiva by a local application. A few minims of a solution injected hypodermically caused complete anæsthesia in the neighboring parts. The loss of sensibility persisted for a week.

The mucous membrane is rendered anæmic. Taken internally in considerable quantity, it induces somnolence. As the result of his researches, Cerna concludes that kava-kava produces general anæsthesia, and is especially a powerful local anæsthetic. It diminishes and finally destroys the action of the afferent nerves by affecting their peripheral ends. Reflex action is diminished and ultimately abolished. Paralysis of spinal origin is an effect of the drug. The action of the heart is rendered slower and more powerful; arterial pressure is at first reduced and subsequently raised. Respiration is

<sup>1</sup> *Therapeutic Gazette*, Jan. 15, 1891.

at first stimulated, afterward depressed, and finally paralyzed. Small doses of kava-kava slightly increase, while large quantities reduce, bodily temperature.

**Therapy.**—In cystitis and chronic gonorrhœa, kava-kava is often remarkably successful. Acute gonorrhœa, retention of urine, and incontinence of urine have also been notably ameliorated by the exhibition of this remedy unaided by any other form of treatment. It is likewise beneficial in leucorrhœa and vaginitis. It has also been recommended for gout. It is suggested that the anæsthetic properties of this substance may prove useful to dentists, and that, though irritant to the conjunctiva, it may be employed subsequent to cocaine for the purpose of prolonging the anæsthesia due to the alkaloid, and may be used, also, to disguise the taste of bitter or nauseous medicines.

**KEFIR.**—Kefir is a product of the fermentation of milk, brought to general professional notice by the writings of Russian physicians. It is prepared by the natives of the Caucasus by the addition of a ferment collected from a mountain-bush. The ferment consists of bacilli and yeast-cells, the latter alone being essential to the fermentation. Kefir is a pleasantly-acid fluid, containing 8 parts of alcohol and 9 parts of lactic acid in 1000 parts.

**Therapy.**—Kefir is well tolerated by the stomach and has been employed with good results in the treatment of dyspepsia, gastric catarrh, gastric ulcer, anæmia, chlorosis, and scrofulosis. It is useful in maintaining nutrition in pulmonary tuberculosis and cancer of the stomach.

**KINO (U. S. P., B. P.).—Kino.**

**Dose, 0.32 to 1.30 Gm. (or gr. v-xx).**

#### *Preparations.*

**Tinctura Kino (U. S. P., B. P.).—Tinctura of Kino (5, or B. P., 10 per cent.).** Dose, 4 to 7.5 c.cm. (or f3i-ij).

**Pulvis Kino Compositus (B. P.).—Compound Powder of Kino (kino, 75; opium, 5; cinnamon, 20).** Dose, 0.32 to 1.30 Gm. (or gr. v-xx). This powder contains 5 per cent. of opium.

**Pharmacology.**—Kino is "the inspissated juice of *Pterocarpus Marsupium* (Leguminosæ)": a tree of the East Indies. It occurs in fragments of a ruby-red color, without odor, of a sweetish, astringent taste; scarcely soluble in cold, but entirely soluble in boiling water; soluble also in alkalies. **Kinotannic acid** is the most important constituent; there are also present **Kinoïn**, a crystalline neutral substance, **Pyrocatechin**, **Pectin**, etc. The official kino is the so-called Malabar kino; there are other varieties, notably one from Botany Bay, obtained from several species of eucalyptus.

**Physiological Action and Therapy.**—Kino is a mild astringent, useful in diarrhœa, especially with chalk mixture and paregoric. Kino, locally and internally, possesses some value as an hæmostatic, and is a serviceable remedy in pyrosis. The tincture is often an ingredient of injections in gonorrhœa, and may be applied as a stimulant dressing to chronic ulcers. The compound powder (B. P.) is used especially for gastro-intestinal disorders attended by diarrhœa. It has 5 per cent. of opium. Kino may also be employed in solution as a gargle, but has no advantage over tannic acid for this purpose.

**KOLA.**—*Cola*. The recent or dried cotyledons of *Cola vera*, or of *Cola acuminata* (Sterculiaceæ) are used by the natives in various parts of Africa. The seeds are chewed, and from the powdered dried seeds an agreeable stimulant and nutritious beverage is prepared with milk and honey. The tree grows to the height of thirty to sixty feet, bears some resemblance to the horse-chestnut, is a native of the western coast of Africa, and is found as far inland as five hundred or six hundred miles. It has been introduced, and with success, into other tropical regions of Asia and South America. From five to fifteen seeds, some red and others white, are contained in a single capsule. They contain a large proportion of **caffeine** or **theine** (2.348 per cent.), together with tannic acid and theobromine (0.023 per cent.), other constituents being sugar, albumin, cellulose, starch, fat, and fixed salts. According to the investigations of Dr. E. Knebel, confirmed by A. Hilger, the fresh nut contains no caffeine, but a glucoside which, by decomposition, gives rise to caffeine, glucose, and kola-red.

These seeds have lately been employed in a number of clinical experiments. An alcoholic extract has been made by exhausting the fresh nuts with 5 parts of 60° alcohol, and a wine by macerating in a sweet white wine for a fortnight. But neither of these preparations extract all the caffeine. A tincture and a syrup have also been made, though water is an imperfect menstruum on account of the starch contained in the seeds. According to Simmonds,<sup>1</sup> there is also a false or bitter kola, the male kola, named also the *Garcinia kola*, the seeds of which are oval or cuneiform; these are four in number, contained in a large berry. The false kola-nuts are destitute of alkaloid.

**Physiological Action.**—The taste of the fresh seed is at first sweet, becoming astringent and slightly bitter. From his investigations upon himself and others, R. H. Firth concludes that kola increases the secretion of urine, stimulates the nervous system and heart, and increases arterial tension. It prevents the feeling of exhaustion from exercise or hunger. It communicates an agreeable taste to water or food, and, according to Armitrous, renders tainted meat edible and clarifies polluted water by a mechanical action.

Dr. Kotliar studied the action of kola-nut upon seven healthy young men during periods of rest and work, 4 Gm. (or 3j) of the powdered nut being given daily to each subject. Both during rest and work the assimilation of phosphorus and sulphur was increased. The metamorphosis of the same elements was diminished during rest and at work, but more particularly during rest. The breaking up of phosphorus and sulphur compounds during periods of repose and labor, as compared with that of nitrogenous compounds, was diminished. The assimilation of chlorine was increased during rest, but unaltered during work. The metamorphosis of chlorine was diminished during rest and work, especially in the latter case.

**Therapy.**—Kola exercises a preservative action upon the teeth and gums, and promotes appetite and digestion. It favorably modifies the functions of the liver. It is, therefore, adapted to act as a remedy in dyspepsia, whether of gastric or hepatic origin. It relieves the vomiting, vertigo, and depression of seasickness.

For painful dyspepsia Dr. Monin recommends:—

<sup>1</sup> *Pharmaceutical Record*, Jan. 5, 1891.

R Tinct. opii camph. ....	15	c.cm. or fʒss.
Tinct. kola,		
Tinct. vanill. ....	aa ʒʒss	c.cm. or fʒiiss.
Mucilag. acacia ....	120	c.cm. or fʒiv.

M. Sig.: Tablespoonful three times a day.

Its combined stomachic and astringent properties render it of service in the treatment of acute and chronic diarrhœa. In its native country it is thought to protect Europeans against affections of the liver, and the natives esteem it as a prophylactic against dysentery. It has been proposed as likely to be of service in cholera. As a heart-stimulant, it may be employed in weakened conditions of that organ, in fever, and in phthisis. Kola is useful in cardiac asystole and in the debility attendant upon convalescence from influenza. It is directly serviceable in disease of the heart as a diuretic. Its favorable influence upon the nervous system suggests its employment in neuralgia. It is stated that kola has a remarkable power of promoting cheerfulness, and may be very serviceably used in hypochondria and melancholia. It is probably of value in overcoming the taste for alcoholic liquors. As a substitute for coca or tea, kola may be given in cases of weak digestion, employing the preparation kolafra, which is used like breakfast-cocoa. Kola has a tendency to cause wakefulness, and for this reason it is advisable to avoid its use in the evening. Dujardin-Beaumetz found kola of advantage in the treatment of diabetes mellitus. The following formulæ are taken from the columns of *Le Journal de Médecine de Paris*:—

R Ext. cinchon.,			
Ext. kolæ .....	aa 5	Gm. or gr. lxxv.	
Ext. rhei .....	2 50	Gm. or gr. xxxviiij.	
Ext. nucis vom. ....	50	Gm. or gr. viiiss.	
Ferri arsenatis .....	20	Gm. or gr. iij.	
Pulv. kolæ .....	q. s.		

M. et div. in pil. no. c.

Sig.: Two pills with each meal.

R Vini kolæ,			
Vini cinchon.,			
Vini gentianæ,			
Vini calumbæ .....	aa 240	c.cm. or fʒviiij.	
Liq. potass. arsenit. ....	60	c.cm. or gtt. x.	
Tinct. nucis vom. ....	30	c.cm. or gtt. v.	

M. Sig.: A claretglassful after each meal.

The preparations made from the fresh seeds—the fluid extract, wine, or elixir—are elegant and very valuable restorative remedies.

**KOUMISS. — Kumyss, Milk-wine.** Originally made in Asia by the Tartars as an intoxicating drink by fermenting mares' milk, koumiss has been introduced into European medicine as a food and as a remedial agent. It can be made for medical use by adding a small piece of compressed yeast to diluted cows' milk containing a small amount of grape-sugar; it should be kept in a cool place, with frequent agitation, and used on the fourth or fifth day. The late Prof. S. W. Gross (*College and Clinical Record*) gave the following directions for preparing koumiss: Dissolve 15.5 Gm. (or ʒss) of grape-sugar in 120 c.cm. (or fʒiv) of water. Dissolve 1.30 Gm. (or gr. xx) of yeast-cake in 120 c.cm. (or fʒiv) of milk. Pour both into a quart bottle and fill nearly to the top with milk. Cork tightly, fastening the cork with wire.

Put into a cool place and shake two or three times daily for three days. *Keep for use no longer than six days.* A champagne-tap introduced through the cork is necessary. Koumiss contains about 16 per cent. of alcohol, and is a pleasant, acidulous drink.

**Physiological Action and Therapy.**—The combined action of the carbonic acid and alcohol in koumiss produces an exhilarant impression. It raises the arterial tension and assists in assimilation. It adds tone to the stomach, aids the appetite, excites the action of the kidneys and skin, and favors sleep. Koumiss, by reason of its utility as a nutriment during inflammatory action, is of great service in phthisis, scrofula, chronic bronchitis, and in the treatment of surgical cases. In an irritable stomach it is a most beneficial remedy in its sedative and nutritive effect. In the nausea and vomiting of pregnancy, owing to the action just referred to, koumiss very often acts in a most happy manner, the nutrition and bodily vigor of patients being increased by the continued use of koumiss during this period. At the time of confinement, when nausea and vomiting supervene, followed by exhaustion, koumiss will often assist in restoring the flagging powers. During the state of lactation koumiss will be very grateful, will assist the nutrition of the system, and will be productive of better and more nourishing milk. Thominski has observed a decidedly beneficial effect from the use of koumiss in two cases of irregular menstruation and in one case of abundant nasal hæmorrhage.

In convalescence from acute diseases, in diarrhœa and dysentery, koumiss will be serviceable to feeble digestion, and will aid in assimilation. In cholera infantum, gastro-intestinal diseases of childhood, and in fevers koumiss is a most agreeable form of food. Koumiss serves as an excellent vehicle for the administration of lactic acid to children suffering with diarrhœa. D. H. Davies suggests the preparation of euonymized koumiss as suitable to cases of hepatic derangement attended by nausea and vomiting. It can be made by adding 11 c.cm. (or fʒiij) of fluid extract of euonymus to every pint of the diluted milk from which koumiss is obtained. In the same manner cocaine hydrochlorate may be incorporated with koumiss for the treatment of cancer of the stomach. It is also an admirable remedy and food in acute and chronic alcoholism, in albuminuria, diabetes, gastralgia; gastric ulcer, and in the various forms of cancer and dyspepsia. Koumiss is especially useful in cachexia of kidney disease (120 c.cm., or fʒiv, four or five times a day).

The amount of koumiss administered to each case should vary according to the disease. In some instances from 30 to 120 c.cm. (or fʒi-iv) can be given every one to three hours; in others as much as a good-sized glassful or two can be taken frequently during the day and night. The writer has administered as much as three or four quarts of koumiss a day in diseases attended with much exhaustion, and often with decidedly good effect.

**KRAMERIA** (U. S. P.).—*Krameria* (Bhatany).

**KRAMERIÆ RADIX** (B. P.).—*Krameria*-root.

Dose, 0.32 to 1.30 Gm. (or gr. v-xx).

#### *Preparations.*

**Syrupus Kramerie** (U. S. P.).—Syrup of *Krameria* (fluid extract, 45; syrup. 55).  
Dose, 4 to 15 c.cm. (or fʒi-iv).

*Fluidextractum Krameriz* (U. S. P.).—Fluid Extract of Krameria. Dose, 0.06 to 1.20 c.cm. (or *mi-xx*).

*Extractum Krameriz* (U. S. P., B. P.).—Extract of Krameria. Dose, 0.065 to 0.65 Gm. (or gr. i-x).

*Tinctura Krameriz* (U. S. P., B. P.).—Tincture of Krameria (20 per cent.). Dose, 4 to 15 c.cm. (or *f3i-iv*). B. P., 2 to 4 c.cm. (or *f3ss-j*).

*Trochisci Krameriz* (U. S. P., B. P.).—Troches of Krameria (each, 0.065 Gm., or gr. j, of extract). Dose, 1 or more.

*Trochiscus Krameriz et Cocainz* (B. P.).—Krameria and Cocaine Lozenge (extract of krameria, 0.065 Gm., or gr. j; cocaine hydrochloride, 0.00324 Gm., or gr.  $\frac{1}{m}$ ).

*Liquor Krameriz Concentratus* (B. P.).—Concentrated Solution of Krameria. Dose, 2 to 4 c.cm. (or *f3ss-j*).

*Infusum Krameriz* (B. P.).—Infusion of Krameria (50 Gm. to 1000 c.cm., boiling, distilled water). Dose, 15 to 30 c.cm. (or *f3ss-j*).

**Pharmacology.**—Krameria is "the dried root of *Krameria triandra*, of *K. linna*, or *K. argentea* (*Krameriacez* or *Leguminosz*)," (U. S. P.); "the dried root of (1) *Para Rhatany*, a species of *Krameria*, attributed to *Krameria argentea*, or of (2) *Peruvian Rhatany*, *Krameria triandra*" (B. P.), growing in South America. It contains about 20 per cent. of **Krameriotannic acid**, which is the active constituent.

**Physiological Action.**—Krameria is a powerful astringent.

**Therapy.**—In Peru it is largely used as a remedy for bowel disorders, diarrhœa, dysentery, etc. The infusion is a satisfactory gargle for relaxed throat, and the lozenge is also used for this purpose. The tincture of krameria may be combined with chalk mixture in the treatment of summer diarrhœa. Krameria is employed as a systemic remedy in epistaxis, hæmatemesis, hæmaturia, and other forms of hæmorrhage. It is of service, both locally and internally, in hæmorrhoids and leucorrhœa, and the tincture or the fluid extract is used, diluted and in combination with other astringents, as an injection, in gonorrhœa. A mixture of the decoction and the tincture was recommended by Trousseau as an injection for the treatment of fissure of the anus. The powdered extract enters into the composition of many tooth-powders.

**LACTUCARIUM** (U. S. P.).—Lactucarium, Lettuce-opium.

Dose, 0.65 to 1.30 Gm. (or gr. x-xx).

#### Preparations.

*Tinctura Lactucarii* (U. S. P.).—Tincture of Lactucarium. Dose, 0.60 to 4 c.cm. (or *mx-f3j*).

*Syrupus Lactucarii* (U. S. P.).—Syrup of Lactucarium (10 per cent. of tincture). Dose, 4 to 15 c.cm. (or *f3i-f3ss*).

**Pharmacology.**—"The concrete milk-juice of *Lactuca virosa* (*Compositz*)," a wild variety of lettuce growing in Europe, but also found in garden lettuce, *Lactuca sativa*. The only important constituent is the mixed substance, **Lactucarium**, obtained by evaporation of the milky juice. It is in flattened pieces or cakes, of reddish-brown color, internally white or waxy-looking, of heavy, opium-like odor, and a bitter taste. French lactucarium, being simply a blackish-brown extract of lettuce, is inferior to that of the pharmacopœia of the United States, which is made from the expressed juice. The French syrup of lactucarium (Aubergier), however, is considered an active as well as an elegant preparation. Lactucarium consists of **Lactucerin**, or **Lactucon**; and the bitter principles, **Lactucin**, **Lactucopicrin**, and

**Lactucic acid.** Mr. T. S. Dymond has stated that a small proportion of hyoscyamine is contained in lettuce, but this has been disproved. About 50 per cent. (consisting chiefly of lactucerin) of lactucarium is insoluble in water. There is no starch present.

The syrup is pleasant to the taste; a glycerite may be made of the same strength as the syrup, by using glycerin instead of simple syrup.

**Physiological Action.**—It is a feeble narcotic, and owes its reputation largely to the observation that eating lettuce causes drowsiness. Its preparations vary greatly in activity, but are not toxic, and are therefore much safer for children than those of opium. Some action upon the kidneys is also observed, and it allays spasmodic cough.

**Therapy.**—The syrup is used in cough-mixtures for children. To allay nervous irritability, and as a substitute for the soothing syrups containing morphine, it has decided value. On account of its insoluble constituents, lactucarium should be given in substance, or in the form of the tincture, or the fluid extract of the National Formulary. The fluid extract may be used in elderly persons, or where there is an idiosyncrasy against opium, to fulfill the same ends.

Lactucin has been employed as a sedative and hypnotic in the dose of 0.065 to 0.13 Gm. (or gr. i-ij).

**LAMINARIA.**—**Laminaria, Sea-tangle.** The cylindrical base of the thallus of *Laminaria Cloustoni*, and of *Laminaria digitata* (Algæ), when dried, are cut into appropriate lengths and shape, and their surface made smooth, to be used as substitutes for sponge tents in dilating the cervix uteri, owing to their property, when moistened, of swelling up to several times their original size.

**LAPPA (U. S. P.).—Burdock.**

**Dose,** 15.5 Gm. (or ̄iiv) in recent infusion.

*Preparation.*

Fluidextractum Lappæ (U. S. P.).—Fluid Extract of Burdock. Dose, 2 to 4 c.cm. (or mxxx-f3j).

**Pharmacology.**—"The dried root of *Arctium lappa*, or of other species of *Arctium* (Compositæ), collected from plants of the first year's growth." It contains a bitter principle, volatile oil, resin, mucilage, sugar, and a little tannin. There is no starch in burdock-root, but in its place inulin is found.

**Physiological Action and Therapy.**—Burdock is diaphoretic, diuretic, and laxative, without causing irritation. The fluid extract is used externally for swellings, hæmorrhoids, ulcers, etc., and internally for rheumatism, syphilis, and chronic skin diseases.

According to Squibb, the tincture<sup>1</sup> is a useful tonic and is held to be curative in psoriasis.

The root is used for similar purposes to those of sarsaparilla in syphilitic, gouty, and rheumatic affections, and in certain chronic skin diseases, such as psoriasis. A fluid extract of the seeds (dose, 1 to 4 c.cm., or mxv-f3j) and a tincture of the seeds (1 to 8) are employed; also an infusion or decoction of the seeds.

<sup>1</sup> "Ephemeris," vol. i, p. 116.

The fresh leaves have been used as an application to bruises and eruptive disorders.

**LARGIN** is a name given to silver-protalbin, by its originator, Lilienfeld, of Vienna. It is a gray powder of low specific gravity containing 11  $\frac{1}{10}$  per cent. of silver. It is soluble in about 10 parts of water, making a reddish-brown-tinged solution; such solutions should be made with hot water. Pezzoli and Neisser claim a special penetration power as an antigonorrhœic remedy, with destruction of the cocci in their nests, with avoidance of irritation of the mucosa. Pezzoli extols largin as the best of the silver compounds. Prolonged injections of  $\frac{1}{4}$  to 1  $\frac{1}{2}$  per cent. of 10 c.cm. (or *mclx*) are used three times daily, retaining the quantity in the urethra from ten to fifteen minutes, in treating specific urethritis. Furst has used largin internally, 0.50 Gm. (or gr. viij) in pill, as a substitute for silver nitrate, in gastric ulcer and hæmorrhage.

#### **LAUROCERASI FOLIA (B. P.).—Cherry-laurel Leaves.**

##### *Preparation.*

**Aqua Laurocerasi (B. P.).—Cherry-laurel Water** (320 Gm., or *3lxxxiiis*, in 1000 c.cm., or *Oilfijj*). Dose, 2 to 7.5 c.cm. (or *f3ss-ijj*).

**Pharmacology.** — “The fresh leaves of *Prunus laurocerasus*” (B. P.), which belongs to the Rosaceæ, contain **Laurocerasin**, a compound of amygdalin and amygdalic acid, and also **Emulsin**, which, when in the presence of water, form a volatile oil (benzaldehyde) and hydrocyanic acid, to which it owes its medicinal qualities. Cherry-laurel water is distilled from the fresh leaves, bruised and macerated in water; it contains the volatile oil and hydrocyanic acid, but is of such uncertain strength as to almost preclude its use in medicine.

**Therapy.**—It is used in Europe (very rarely in this country except by foreign physicians) for the same purposes as bitter-almond water, and chiefly as a vehicle for anodyne and antispasmodic remedies. A cherry-laurel ointment, consisting of 1 part of essence of laurel-water to 8 parts of lard, is used in Italy in painful affections, as neuralgia, herpes zoster, chronic rheumatism, and carcinoma. It would make an agreeable dressing for burns.

**LAURUS.—Laurel, Bay, or Bay-laurel.** The leaves and berries (*Lauri folia* and *Lauri baccæ*) of *Laurus nobilis* (Lauraceæ), a tree of Southern Europe, contain volatile oil, **Laurin**, or laurel-camphor; a liquid fixed oil; a solid fixed oil known as **Laurostearin**, and starch. The volatile oil of laurel-berries, consisting of a camphene and eugenic acid, is occasionally employed externally in rheumatism. By boiling the fresh fruit in water and using pressure the expressed oil of laurel is obtained, which is used in the form of ointment, as an anodyne. Leaves, berries, and oil are stimulant and narcotic. A laurel ointment is official in the French Codex. It is composed of 1 part each of fresh laurel-leaves and laurel-berries, with 2 parts of lard. This preparation is applicable to erythema, dermatitis, erysipelas, acute eczema, and superficial burns. The leaves are used in cooking for flavoring (bay-leaves, bay-laurel leaves); they should not be confounded with the leaves of *Myrcia acris*, from which the volatile oil of bay is distilled, that is used as a

perfume (and enters into spiritus myrciæ, or bay-rum), or **Myricæ Cerifera Cortex**,—bay-berry bark.

**LAVANDULA.**—Lavender, Lavender-flowers.

*Preparations.*

**Oleum Lavandulæ Florum** (U. S. P.).—Oil of Lavender-flowers. Dose, 0.18 to 0.30 c.cm. (or *miii-v*).

**Spiritus Lavandulæ** (U. S. P., B. P.).—Spirit of Lavender (oil of lavender-flowers, 50; deodorized alcohol, 950 c.cm.; B. P., oil of lavender, 30 c.cm. (or *f3j*); alcohol, 90 per cent., 270 c.cm. (or *f3ix*). Dose, 2 to 4 c.cm. (or *f3ss-j*). B. P., 0.30 to 1.20 c.cm. (or *mv-xx*).

**Tinctura Lavandulæ Composita** (U. S. P., B. P.).—Compound Tincture (formerly Spirit) of Lavender (U. S. P. contains oil of lavender, 8; oil of rosemary, 2; saigon cinnamon, 20; cloves, 5; nutmeg, 10; red saunders, 10; in alcohol, water, and diluted alcohol to make 1000 c.cm.). Dose, 2 to 4 c.cm. (or *f3ss-j*).

**Oleum Lavandulæ** (B. P.).—Oil of Lavender. Dose, 0.03 to 0.18 c.cm. (or *ss-ijj*).

**Pharmacology.**—The carefully dried flowers of *Lavandula angustifolia* (Labiata), much cultivated for their perfume, contain volatile oil, some resin, and tannin. The oil of lavender, distilled from the whole herb or flowering tops, is coarser than that distilled from the flowers alone; of the latter there are several varieties, differing in value and fineness. The English oil, distilled from cultivated flowers, (known as oil of garden lavender) is to be distinguished from the ordinary commercial oil, which is much lower in price, and is made from wild flowers (also known as French oil of lavender). An inferior, greenish, turpentine-like oil, distilled from *Lavandula spica*, is known as oil of spike-lavender. The oil of lavender has the property of checking decomposition. The compound tincture is an elegant preparation of aromatics and stimulants.

Lavender is carminative and stimulant. It is useful in flatulence, nervous dyspepsia, gastralgia, colalgia, hysteria, and syncope. Lavender is said to be possessed of considerable hypnotic power. It is used in perfumery, and enters into the unofficial spiritus odoratus and vinum aromaticum; also liquor potassii arsenitis (U. S. P.), liquor arsenicalis (B. P.), and spiritus ammoniæ aromaticus (U. S. P.).

**LEDUM.**—**Ledum, Wild Rosemary.** The small twigs, tops with undeveloped flowers and leaves of *Ledum palustre* (Ericaceæ), but without the fruit even partly formed, contain volatile oil, **Valerianic Acid**, **Ericolein**, **Leditannic Acid**, resin, etc., and are used in infusion, as marsh-tea. *Ledum* is said to be somewhat narcotic, astringent, and tonic; it is used externally to destroy parasites, and internally in diarrhœa and dysentery, gout, rheumatism, and chronic skin diseases. Dr. R. Hilbert, of Sensburg, reports that an infusion of the leaves of this plant (6 to 12 Gm. to 240 c.cm., or 3iss-iii to *f3viij* of water) acts as a good expectorant in bronchitis. It rapidly relieves the pain and fever, especially in juvenile patients. In chronic bronchitis it diminishes cough and facilitates expectoration. This writer regards *ledum* as especially valuable in bronchitis with emphysema occurring in aged persons, as it renders the secretion less viscid, stimulates the circulation, and lessens dyspnoea.

**LEONURUS.**—**Leonurus, Motherwort.** The flowering tops and leaves of *Leonurus cardiaca* (Labiata) contain a bitter principle, some volatile oil,

etc. It is used in recent infusion, and, as a fluid extract, with dilute alcohol, as a menstruum to promote the menstrual discharge, and in suppression of the lochia. It is also deemed useful in hysterical pains.

**LEPTANDRA** (U. S. P.).—**Leptandra** (Culver's Root).

Dose, 1.30 Gm. (or gr. xx).

#### *Preparations.*

**Extractum Leptandræ** (U. S. P.).—Extract of Leptandra. Dose, 0.20 to 0.85 Gm. (or gr. iii-xx).

**Fluïdextractum Leptandræ** (U. S. P.).—Fluid Extract of Leptandra. Dose, 2 to 4 c.cm. (or f3ss-j).

**Pharmacology.**—"The dried rhizome and roots of *Veronica virginica* (Scrophulariaceæ)" contain a bitter principle, **Leptandrin**; also saponin, tannin, resin, starch, etc. What is ordinarily designated leptandrin is merely an impure resin or alcoholic extract. Leptandra is common in woods from Vermont to Wisconsin and southward.

**Physiological Action.**—Leptandra-root, or Culver's physic, is a cholagogue cathartic. It should be dried, for in its recent condition it acts too violently. The extract is an eligible form in which to use the drug, which, in small doses, is tonic and laxative. Leptandrin in its common form is employed as a cathartic in doses of 0.065 to 0.13 Gm. (or gr. i-ij).

**Therapy.**—In indigestion, with deficiency of secretions and constipation, leptandra has been found useful, and may be combined with podophyllum, which it resembles in its effects, or with aromatics. When the stools are clay colored and show a deficiency of bile, this agent may be used to bring about bilious discharges, even when there is diarrhœa.

**LIMON.**—**Lemon.**

#### *Preparations.*

**Limonis Succus** (U. S. P.).—Lemon-juice. The freshly-expressed juice of the ripe fruit of *Citrus limonum* (Aurantiaceæ).

**Limonis Cortex** (U. S. P., B. P.).—Lemon-peel. "The recently-separated outer rind of the ripe fruit of *Citrus limonum* (Aurantiaceæ)" (U. S. P.); "the fresh outer part of the pericarp of the fruit of *Citrus medica*" (B. P.).

#### *Preparations from the Cortex, or Rind.*

**Oleum Limonis** (U. S. P., B. P.).—Oil of Lemon. Dose, 0.03 to 0.18 c.cm. (or mss-ij); also used for flavoring.

**Tinctura Limonis Corticis** (U. S. P.).

**Tinctura Limonis** (B. P.).—Tincture of Lemon. Dose, 2 to 4 c.cm. (or f3ss-j).

**Syrupus Limonis** (B. P.).—Syrup of Lemon. Dose, 2 to 4 c.cm. (or f3ss-j).

#### *Preparations from the Juice.*

**Syrupus Acidi Citrici** (U. S. P.).—Syrup of Citric Acid. As a vehicle.

**Acidum Citricum** (U. S. P., B. P.).—Citric Acid. Dose, 0.32 to 1.30 Gm. (or gr. v-xxx).

**Pharmacology.**—Lemons, owing to their pleasant flavor and agreeable acidity, are very useful in the sick-room. The rind is glandulous, and by expression yields an oil of great fragrancv, much superior to that obtained by distillation. When fresh, the rind of lemon, besides the oil above mentioned, contains a bitter, crystalline glucoside, **Hesperidin**. Each lemon yields from 7.5 to 30 c.cm. (or f5ii-vij) of acidulous juice, containing citric acid (7 to 9 per cent.), besides phosphoric and malic acids, in combination partly with potassa and other bases. A solution of citric acid in water (2.30 Gm. to 30 c.cm., or gr. xxxiv to f5j) corresponds in acidity with fresh lemon-

juice, but not therapeutically on account of absence of other constituents. Fifteen c.cm. (or ℥ss) of lemon-juice should neutralize 25 grains of potassium bicarbonate, 20 of sodium bicarbonate, or 14 of ammonium carbonate. Lime-juice, obtained from a smaller fruit of the same genus (*Citrus acris*), closely resembles fresh lemon-juice, but acquires a peculiar, slightly musty taste from the wood in which it is imported. When preserved, boiled in syrup and dried (candied), lemon-peel is useful in flavoring, for cooking, etc.

**Therapy.**—Lemon-juice is applied to the surface of the skin to remove freckles or ephelides, moth-spots, sunburn, pruritus, and ink-stains. Used internally, lemon- or lime-juice is antiscorbutic, probably owing to the presence of phosphoric acid or potash salts, as citric acid does not possess this property. It is now so constant a companion of voyagers by sea that scurvy is rarely seen, except where the regular ration of lemon- or lime-juice has been neglected. It is also curative in scurvy, and in various scorbutic manifestations upon the skin, or in the form of muscular pains. In some cases of chronic rheumatism the administration of several ounces of lemon-juice daily affords marked relief. Lemon-juice has been likewise used in acute rheumatism with, at times, apparent good results. Lemonade, made by diluting lemon-juice with water and adding sugar, is a useful drink during convalescence; it increases the urinary water and reduces the acidity of the urine. Hot lemonade is useful as a diaphoretic in recent colds; its effects are increased by the addition of a little whisky or gin. Neutral mixture, made by neutralizing fresh lemon-juice by the addition of crystals of potassium bicarbonate, is useful as a refrigerant and to satisfy thirst in fevers.

In typhoid fever the late Dujardin-Beaumetz advised the free use of a vinous lemonade, made according to the formula:—

R Syrup. acid. citrici .....	60	c.cm. or ℥ij.
Vini rubri .....	240	c.cm. or ℥viij.
Olei limonis .....	1	c.cm. or ℥xxv.
Aquæ .....	q. s. ad 1000	c.cm. or Oii℥ij.—M.

Atheromatous changes in the arteries are retarded by the persistent use of lemon-juice, which is also useful in obesity. In Italy, an infusion of the lemon, the rind being incised to allow the juice to escape, is administered in ague and other malarial attacks attended by fever. Lemon-juice is regarded as of material assistance to other remedies in the treatment of torpidity of the liver and catarrhal jaundice.

**LINDERÆ CORTEX.**—*Lindera*-bark, *Spice-bush Bark*. The Benzoin odoriferum (*Lauraceæ*), *Lindera benzoin*, or spice-bush, is one of our common forest shrubs, belonging to the same natural order as the sassafras, the cinnamon, and the camphor-tree. The bark and fruit contain a volatile oil, resin, and the common vegetable principles. The bark has a pleasant, spicy taste, due to the oil.

**Physiological Action.**—It is aromatic, stimulant, and tonic, and a recent, hot, weak infusion is diaphoretic.

**Therapy.**—In some disorders of digestion the carminative and tonic effects are available; the infusion is used in chills and to abort a cold. A decoction of the inner bark made into an ointment with cold cream is recommended by Hyde as a valuable remedy in rhus poisoning.

**LINUM** (U. S. P., B. P.).—**Linseed (Flaxseed).***Preparations.*

Oleum Lini (U. S. P., B. P.).—Linseed-oil.

Linum Contusum (B. P.).—Crushed Linseed.

**Pharmacology and Therapy.**—"The ripe seed (dried ripe, B. P.), of *Linum usitatissimum* (Linaceæ)," commonly called flaxseed, contains mucilage, linolein, and gum (15 per cent.). The latter forms mucilage with boiling water, which is not precipitated by tannin.

A nitrogenous glucoside, termed **linamarin**, has been obtained from the young plant by MM. Jorissen and Hairs. Linamarin differs in several physical and chemical properties from amygdalin, and occurs as colorless and odorless needles which have a very cooling and bitter taste. It is soluble in water and alcohol, but almost insoluble in ether. It is not present in the seeds, which contain about 25 per cent. of albumin, and no starch. The investing coat of the seeds yields a very viscous mucilaginous substance to boiling water. Linum is demulcent and emollient. A hot infusion (15.5 Gm. to 500 c.cm., or  $\mathfrak{z}\text{ss}$ -Oij $\mathfrak{z}\text{j}$ ), flavored with licorice-root or lemon-peel, is used in bronchial inflammations as a diaphoretic and expectorant; also in cystitis, strangury, and hæmaturia. A plain infusion is an excellent enema for use in inflammation of the rectum, fissure, hæmorrhoids, etc. Flaxseed-tea is used as a demulcent drink in gastritis.

Ground flaxseed mixed with boiling water forms flaxseed poultice, which is spread at least half an inch in thickness upon muslin or flannel, and applied as hot as possible in order to relieve pain and congestion in peritonitis, and in pneumonia, pleurisy, etc., as jacket poultices, renewed every two or three hours. They should be covered with oiled silk to retain heat and moisture, and, if desired to increase the counter-irritant effect, a little dry mustard or a few drops of turpentine may be sprinkled over the surface. They usually afford great relief to the patient. Laudanum, or lead-water and laudanum, is often used with a flaxseed poultice in inflammatory and painful affections. Flaxseed poultices are also applied to boils and abscesses to soften the skin or to hasten ripening. They are also applied occasionally to ulcers and wounds to encourage granulations and bring about healthy action.

The long-continued application of poultices is likely to bring out an eruption of small boils upon the skin, the result of hyperæmia and irritation. Poultices are often useful for temporary purposes, but too long applied are mischievous. The integument and the vessels subjected to their influence become relaxed, suppuration is prolonged, granulations rendered unhealthy, and the repair of ulcers or wounds retarded.

Oil of flaxseed is an old application to burns to exclude the air; combined with lime-water, it forms Carron oil, which was formerly used largely for this purpose, having been originally used at an iron works of that name in Scotland, where the workmen were frequently burned. It is dirty and soon smells badly, and is now abandoned in favor of petrolatum and kaolin. Whole flaxseed, in 15.5 Gm. (or  $\mathfrak{z}\text{ss}$ ) doses, have been ordered in habitual constipation as a laxative. Flaxseed candy is popularly used for pharyngitis, as trochees.

**LIPPIA MEXICANA.**—*Lippia Mexicana* (Verbenacæ), a creeping, evergreen shrub, with very long roots and numerous branches, grows abun-

dantly in southern Mexico. Its medicinal virtues reside in the leaves and stalks, especially in the leaves, which possess an agreeable, sweetish, and aromatic taste. The plant contains a small proportion of tannic acid, an ethereal oil, and a volatile camphor termed **Lippiol**. A fluid extract and a tincture have been prepared, the dose of the former being from 0.30 to 2 c.cm. (or *mv-xxx*), and of the latter from 2 to 4 c.cm. (or *f5ss-j*).

**Physiological Action.**—*Lippia* causes a sensation of warmth in the stomach, and in large doses may give rise to vomiting. This is succeeded by free perspiration and sleepiness.

**Therapy.**—The drug is endowed with valuable expectorant properties. It allays irritation of the bronchial mucous membrane and promotes healthy secretion. Its effects are rapidly manifested. *Lippia* is useful in both acute and chronic bronchitis. In the former it allays the cough, and in the latter it liquefies the viscid secretion and facilitates expectoration. It is of service in the cough of phthisis, has an excellent effect in irritative cough, and in whooping-cough mitigates the paroxysms, though it is not able to shorten the course of the disease. It has, in some instances, proved useful in spasmodic asthma.

**LIQUIDAMBAR.**—**Sweet Gum.**—The Liquidambar styraciflua (*Hamelaceæ*) of North and Central America supplies a brownish-yellow balsam, containing styrol ( $3\frac{1}{2}$  per cent.), cinnamic acid (5 per cent.), styracin, and resin. It is identical with storax, according to Professor Maisch. The syrup of the bark of the root, made like the syrup of wild cherry, is a remedy used for diarrhoea and dysentery in the Southern States.

**LIQUOR FORMALDEHYDI (U. S. P.).—Solution of Formaldehyde.**

**Pharmacology.**—Formic aldehyd, or formaldehyde, is a colorless gaseous body ( $\text{CH}_2\text{O}$ ), with a pungent, irritating odor, and very decided antiseptic and bactericidal properties. It was discovered by Hofmann in 1868. It may be produced by exposing a heated platinum spiral to the vapor of methyl alcohol; it is therefore an oxidation product. Formaldehyde gas is obtained conveniently by heating an aqueous solution. The official solution must contain not less than 37 per cent. by weight of absolute formaldehyde ( $\text{H.COH}=29.79$ ). It should be kept in well-stoppered bottles in a cool place, protected from the light. Formaldehyde solution is a colorless fluid of pungent odor and mixes with water in all proportions. This, when boiled, gives off the vapor of formaldehyde, and, less rapidly, at ordinary temperatures. *Paraform* is the commercial title of a preparation in the form of pastilles. This substance, which is a polymerized form of formaldehyde, may be used to generate the gas by means of a suitable lamp.

**Physiological Action.**—Formaldehyde is an efficient bactericide. The vapor readily condenses upon objects in an apartment where the fluid is exposed. It is, consequently, excellently adapted to the disinfection of surgical and dental instruments, sick-rooms, hospital-wards, furniture, clothing, books, discharges, drains, etc. It destroys foul odors, and penetrates fabrics without injuring them or destroying their color. Its inhibitory influence upon the growth of bacteria enables the investigator to fix, at any stage, those organisms for the purpose of study or demonstration. This property has been likewise applied to the diagnosis between the typhoid bacillus and the bacterium coli commune, which organisms exhibit a marked difference of susceptibility to the action of formaldehyde.
